INFINITE PAINS, WE SAID: Perhaps that's too big a term. But if you could know how great is the task—how unremitting the care—to guard against even one little error creeping into any one of these 8000 places—you'd grant us the word "infinite."

"THOSE PESKY LITTLE TROUBLES that are always happening with other cars, are unknown to the Reo owner," says one Reo dealer, "and that's why the demand for Reos is so great."

WHEN YOU STOP TO THINK about it, the troubles you've had with other cars were not big troubles. Your motor didn't drop out of your car or your transmission strip or your frame break in two.

IT WAS THE LITTLE THINGS that pestered your motoring life—parts shaking loose or getting out of adjustment. Dust in bearings—oil leaks—everywhere. Squeaks and creaks and rattles. Always the dread when starting out that you might not return. Always the fear when in a hurry that some pesky little trouble resulting from some pesky little defect, of which you were cognizant, might delay you. Wasn't there?

WELL THEREIN LIES the big difference between Reos and other cars—the big difference is in attention to the little things.

IT IS NOT UNCOMMON—in fact—it is the rule—for a new Reo owner to drive his car thousands of miles—a year, two years—without even seeing the inside of a garage or lifting the bonnet to make an adjustment or repair.

HONOR AND FAITH and a Good Intent—these and the attention to little things they dictate—result in Reo Reliability as it is known the world over, "The Gold Standard of Values" in automobiles and motor trucks.

How Ornamental Exotics Reached Here.

Fifteenth of a Series of Sketches in Which the Editor Presents Suggestions, Drawn from Long Experience, of What Californians Have Done and May Do for the Advancement of California Agriculture.

UST as California sprang, full-panoplied, into the sisterhood of sovereign States, without tarrying in a territorial purgatory, so California was bedecked, almost from the date of her American birth, with exotic vegetation from all quarters of the globe. Endowed by the Creator with native vegetation of unique grandeur, novelty, variety and charm of form, hue and growth-habit; enriched by the padres through introduction of the world's most important semi-tropical fruits, California came to her union with other American States clad in plant beauty beyond that of other States—"as a bride adorneth herself with her jewels."

First Display of Exotics.—The language is florid, as becomes the theme, and has glowing precedent, as the reader may now see. In 1851 there was an exhibit in San Francisco at which there was a wonderful display of fruits, vegetables, grains and forage plants, a prominent feature of which was an announcement by A. Williams, the orator of the occasion, that C. A. Sheldon "has this day received from Valparaiso a choice assortment of rare and valuable exotics—the entire stock of a greenhouse, including (aside from fruiting plants), fifty varieties of jessamines, four of African hibiscus, eight of chrysanthemums, twelve of althea, wax-plants, pinks, cacti, eighty-four dahlias, and over one thousand rose bushes." And the orator continued: "There is scarcely a fruit or plant, a shrub or a flower of which any land can boast but what is embraced within the limits of California—a bright, particular star in the constellation of States, the crowning gem in the tiara of freedom"—which is surely going some, oratorically and exotically.

Why Such Haste?—Exotics came to California in volume and variety and with speed unknown to new States, and why? The argonauts were men of high emprise. They were spenders of which this continent has never seen the like—either before or since. Unprecedented prices waited for plants, both from those who wished the plants themselves for local growth and from those who only desired their symbolism. Gallantry was at its apex and cried aloud for expression. Gold slugs and nuggets, plaques and jewelry became too trite for showers upon operatic and terpsichorean stars whom the populace worshipped and for other inferior luminaries by whom they were entranced. It was a time when knighthood was in flowers. Beyond such sensational outbreak of demand for rare bloom, there was the brisk call for exotics for homes and for home gardens. It was a grand joy to newcomers to know that plants which they had never before seen, except under glass, surpassed all memory of their size and vigor in the open air in California. And so the early Californians demanded exotics, of which they knew something in their old homes, so that they would have something by which to measure the capacity of their new homes. And they all had money to pay for what they yearned for. It is not strange, then, that trade was brisk, nor that it drew exotics from everywhere. This is the reason that Mr. Sheldon, aforesaid, bought the full of a Chilean greenhouse and shipped it bodily to San Francisco, as has already been noted, before the State was a full

year old perhaps. Think of it; if we include the work of others at about the same date, there was probably a shipload of potted plants sent to a community reputed to be largely flannel-shirted, with its trousers in its boots. There never was such a thing before in the world!

Whence Came Exotics?—Seeds, bulbs, roots, scions and living plants came to California from every country which sent gold-seekers. It was a popular movement, induced at first by trade opportunities and by native-plant love, dictated by desire of all to have something of the old home installed in the new home. Very soon another motive was added, viz., to establish plant industries in California, which were important in other countries. Quite a number of pioneers who came for gold revisited their old homes to secure collections of plants with which to establish production new to this continent. The State staked some of these undertakings and men of wealth freely indulged in similar ventures, even larger in their money requirements. And beyond these large undertakings, nearly all individuals brought something. Quite a number brought as wives the girls they left behind them, and they, themselves the loveliest exotics of pioneer days, brought their dearest posies with them, of course. And so, by prairie schooner, and by real ship from Mexican ports, from

A Marvelous Display of Indian Azaleas—10,000 Blooming Plants Grown at Cottage Gardens Nurseries, Eureka, Calif.

Panama or "the horn around"; across the Pacific from the Orient, from the islands of the southern seas—from everywhere, came exotics from all the world's climates, and found congenial home in California—the strictly tropical under glass, all others in the open air.

Which Exotics Came First?—The data which the writer has now in hand do not make it possible to determine priority in the arrival of particular plants, after the inrush of Americans in 1849. We know that from 1769, during several following years, probably, the padres introduced from Mexico (and possibly direct from Spain also all the commoner deciduous and evergreen fruiting plants. We also knew that the few Americans who came to California during the two decades before the gold discovery in pursuit of peltry, trade, Spanish land grants (with or without wives attached), and finally for war and conquest, made homes, for the adornment of which many plants were brought from Mexico and Central America. These forerunners of American occupation must be counted first in appreciation of California. They were in part of American and in part of European origin. William Wolfskill planted citrus trees in orchard as early as 1838 in Los Angeles, and during the years immediately following that

HUMIDITY OF THE SOUTH COAST.

ONE crosses the mountains now, from the upper Salinas valley to the old town of San Luis Obispo, to find the higher foothills, on the coast side, verdure-clad, and the coast valleys below stretching away like newly-made lawns. This is not common to see so early in the autumn because it is exceedingly rare that early rains on the south coast are so copious, and it is reasonable to expect that the four to six inches of precipitation before the middle of October will hold the new growth until still more water falls—thus giving abundant fresh pasture to replace the dry feed which was ruined. But there is a darker shade to the situation in the loss which has fallen on the bean growers in this southern coast region, which is so great in the bean world. Far and wide, from the very dunes of the shore up the valleys extending toward the mountains, one sees hundreds of acres of lawn-like verdure marked with black dots in regular lines, as though the provident lawn-makers had cleaned up thousands of corrals and dropped the scrapings in little piles convenient for spreading. If that were the fact we surely could claim high efficiency in the improvement of pasture land for these coast-side farmers. But unfortunately the fact is otherwise. What now has so much the distant appearance of manure piles is really much of the bean crop which had been root-cut and raked to wait for the threshing, which will probably never come for much of the crop. Dank and blackened now, decay will probably overtake much of the product. Drying conditions have not been good. The oldest inhabitant refuses to recall so thick and wet a fog as has prevailed since the rains. Thus many lost beans must be added to the lost raisins and other penalties which follow Nature's indulgence in a different sort of autumn from that which the prophets prescribe.

SANTA BARBARA AND THE NURSERYMEN.

WE ARE writing in Santa Barbara, whither we have flown to be early at the opening of the annual convention of the California Nurserymen's Association, which will occur after this issue has gone to press. We find much interest manifested in this assembly of plant-loving propagators and distributors of horticultural foundation-material. The nurserymen were in at the very beginning of agricultural development which is now making California so rich—and beautiful from the point of view of cultural achievement. It is the progenitors of the present generation of nurserymen to whom credit must be given for the remarkable achievements with exotic plants which we have joyed to sketch on other pages of this issue, and the nurserymen of today are zealous to continue and extend the work of their commercial and horticultural ancestors. This they are doing with much of the same spirit and industry which made great achievements possible in the early days. The size of their establishments, the total number of them, the investment they make in lands and buildings, the amount of money which they disburse to their employees are all proportionate to

the results which they achieved in co-operation with the exceptionally favorable growing conditions which California affords, and place this State very high in the rank of baby-plant production in the United States. As representatives of this benign and delightful industry, the people of Santa Barbara are preparing a very warm welcome for the nurserymen and women. They can understand their spirit and appreciate their achievements, because Santa Barbara is, as goes the slogan, "the Mecca of Plant Lovers," and the local professors and amateurs in plant beauty are confident they can show their guests of this week much to delight their hearts and strengthen their hands in the multiplication of desirable growths for the adornment of highways, parks, grounds for recreation and education, etc., as well as for ministrations to the joys of those who bring enthusiasm to the beautification of private homes. And Santa Barbara could hardly feel otherwise than thus toward an organization of plant growers and distributed in local gardens, than any other section of the State has larger collections of the most interesting exotics and more intelligent and appreciative amateurs in plant collection in both large and small ways. It has been claimed without contradiction that Santa Barbara has more genera and species of exotic plants showing their mature charms and more of their offspring widely distributed in local gardens, than any other section of the State. We presume it is also true that no other section of equal population has exchanged more wealth for plant treasures than has Santa Barbara. And so it comes about that Santa Barbara is preparing really a florid welcome for all plant-lovers who shall come this week from beyond her mountain and ocean boundaries. The city and its thriving suburbs have been doing much of late in the way of welcomes to those who have undertaken pilgrimages from social and fraternal motives, and more grand panjandrum of world-wide orders have floated on the wings of decorated motors through her suburban shades than have spread their regalia in any other California residence town, and yet none of these startling experiences have dulled her deep and sincere satisfaction that those who give their lives to the growth of plants of use and beauty should choose to assemble beneath her affectionate hovering. We see all this in advance, and therefore we expect for the nurserymen's association a most notable convention.

POTASH FROM THE OCEAN.

COMING wealth from sky and sea is now above the horizon. We refer, not to the possibilities in aeroplanes and submarines, when the close of the war consigns these new engines of civilization to more peaceful pursuits. There will be plenty of time for such efforts at foresight when the end of the war draws nearer. There seems at the moment to be no hurry about it, for we have been beaten at the only game of prophecy we ever took a hand at. We did say last winter that the war would end before the prunes came home—which we mention now simply to make forgetting easier. But there are other treasure-seekings of sky and sea which seem surer to make for peaceful wealth than flying and diving. So we skirted the Santa Barbara channel the other day and saw the outcroppings of kelp floating idly on the dawdling azure, we remembered that results are accruing from the co-operative effort between the U. S. Department of Agriculture and the Los Angeles Chamber of Commerce to determine how much patriotic American potash can be harvested from our kelp beds and how it should be undertaken. This seemed to be necessary study to settle kelp practice and to allay the fears of the fishermen who were disposed to claim that if we dragged all the kelp from the ocean for potash we should have no fish left for phosphate, and so in paying Peter we would be robbing Paul. And so the government put up \$175,000 for expenses, and the Los Angeles Chamber of Commerce helped to spend it wisely. We judge this has been done because we now have a formula for kelp-farming which will gather the crop and save the roots, and probably save the fish also, for they will be undisturbed in the basement of the kelp forest. Briefly, the way it should be done is to cut kelp with reciprocating knives or shears at depths not greater

than six feet; to permit harvesting at any given time in certain sections only, giving a bed a rest of six months for re-growth; to impose a tax of one cent per ton of kelp, using the fund, estimated at from \$12,000 to \$15,000 a year, for strict policing and supervision. The report claims that the present method of harvesting is to attach a wire to two power boats and pull it through the bed. This uproots much of the kelp, and new ocean currents prevent the kelp from acquiring new "hold fasts" on the floor of the ocean. Also much of the kelp is not picked up and is a total loss. It looks as though the coming legislature might have something to say about the kelp-farming of the future.

NITRATE FROM THE SKY.

ALTHOUGH apprehension of the decadence of the Chilean nitrate supply is being allayed by reports of discovery of new abundance of it in that country, the government is pursuing its quest of captivity of atmospheric nitrogen. It seems that inasmuch as availability of immense water power is the first essential in a plant for extracting nitrate from the atmosphere, for which it is planned to expend \$11,000,000 by the government, the construction of such a plant in California is intimated by Hoyt S. Gale of the United States geological survey. California has a chance for this establishment because of the vast amount of water she has, high up in the mountains, which will insist upon its natural right to run down hill, and is willing to turn wheels on the way and generate all the electricity that can be used in shooting the air. It is by no means certain that California will secure this establishment, for there are other mountain States which have high-up water. It is well enough to speculate on the chances of such endowment. Besides the direct advantage of having abundant short-haul nitrate for agricultural uses, there is possibly an indirect result which might be made of value. Theoretically, taking nitrogen from the air makes the relative percentage of oxygen greater. Therefore, there should be within certain distance of the extracting plant an atmosphere of exceptional stimulating effect on those who breathe it. It would be unnecessary for resort managers to advertise ozone as an alleged product of forest vegetation, thunder storms, etc. They could get the by-product of the nitrogen plant piped directly to their establishments, for we hold it to be reasonable that super-oxygenated air can be had by taking nitrogen out as well as by pumping oxygen in. The only drawback which occurs to us at the moment is the prospect of higher meal-rates, because of the fierce appetites which oxygenated guests would acquire.

TO STEAL THE MAKIN'S.

ALL our readers who are contemplating rural credit should be reminded that the government is complaining that financial grafters are trying to roll up for themselves profits from the rural credit plans recently enacted by Congress to smooth the pathway of farmers to millionaire-ship. It is the clear intention of the law that farmers desiring to secure the benefit of the new law should create their own machinery of organization. This is for the double purpose of restricting operations to real farmer borrowers, and to rule out all cost of promotion so that farmers should pay the lowest possible interest rates. And yet, it is announced from Washington that sharks already infest rural credit waters, and "one of the greatest financial frauds the United States has known" is threatened. Some time ago the Loan Board announced a ruling that no proposed joint stock land will be chartered if it has spent money for promotion. In the face of this ruling, it is said, promoters have continued to sell stock in proposed land banks and to take parts of the proceeds for their own services. One of these concerns failed before it could even have applied for a charter, but it has sold stock to the amount of several hundred thousand dollars, which farmers had paid for so-called "stock" in the organization. While we have urged our readers to begin organization of "loan associations," in which borrowers only are entitled to membership, we have also distinctly stated that such associations issue no "stock" and can sell nothing of the kind. Later "land banks" will be organized in which borrowers

will be required to stock up to 5 per cent of their loans, but that has nothing to do with the affairs which are now being fraudulently promoted. The Loan Board has also telegraphed from Washington this warning, which ought to be clear enough:

Farmers who borrow through the national farm loan association are not required to pay any advance commissions. So all of these enterprises requiring payments from farmers are declared by the board to be fraudulent, and the attention of the department of justice has been called to the matter and an attempt will be made to bring the offenders to justice.

HIGHWAY ROBBERS.

ANOTHER kind of farm robbery is that practiced by auto marauders along the highways. There has been some effort made to check the robberies in the citric districts by the auto-tourists, and surely this kind of depredation should be ended. But the invasion of orange groves by winter residents seems to be acting under the influence of picturesque temptation which would defend the robbers in their own eyes, probably, as an extenuating circumstance. Still it should be punished as a greivous trespass upon rights and

property, which must be well paid for. But something worse than a fine is needed to requite low-down thievery, such as is reported by an auto driver who says he was hired to carry a party for ten days through California valleys. During the entire ten-day absence from San Francisco anything that could be stolen from a farmer's field was taken without compunction. To stop the machine in the road, pick a basket of peaches, dig a half sack of potatoes or acquire quantities of other produce was apparently considered legitimate business. They carried a gun which they employed, not for the purpose of shooting game, but to shoot turkeys, chickens, ducks and geese. They did everything but invade meadows and dairies and milk the cows. About all they actually took with them was a few cans of condensed milk. Everything else they stole from the farms along the highways. Of course farmers must defend themselves against such depredators. If there are not laws enough already, there will be a legislature in session this winter. Owing to the particular escape facilities which such thieves possess it may be necessary to make their work more dangerous than common stealing.

willing to pursue your plan of cultivation and buy seeds of both winter and summer growing legumes, as your experience showed you which came most abundantly under your conditions and at the times needed to make an all-the-year green cover, you would come nearer to realizing your desires both for the land and the pigs. We do not say that it would be good for the trees.

Home-Made Squirrel Poison.

To the Editor: What is the best home-made squirrel poison?—R. A., Sanger.

This is answered in "Second Thousand Answered Questions in California Agriculture," as follows:

The best poison to use is strychnine, the barley being coated with it in accordance with the "Government formula," as follows: Whole barley (re-cleaned), 18 lbs.; strychnine sulphate, 1 oz.; soda (bicarbonate), 1 oz.; saccharine, 1 oz.; thin starch paste, 1 pt.; corn syrup (Karo or equal), 2 oz. The best results are obtained by scattering the poisoned grain on the ground early in the morning, back of the hole, not upon excavated dirt that the squirrel has thrown out. It should not be spread before a rain or when the ground is wet, as the poison will be washed off and no results obtained. It should be widely scattered so that the squirrel will be compelled to pick it up a grain at a time and place it in the cheek pouch.

Cover Crop for New Clearing.

To the Editor: What cover crop for November or December planting would be adaptable and advantageous to land cleared last spring of live oak, white oak, and manzanita, in the chalk rock formation of Paso Robles, about to be planted to pears and almonds, to be plowed in in the spring; and should you advise a mixed crop, kindly indicate the proportion, and what would be a fair seeding per acre, and whether it would not be too late to plant mellilotus at that time?—D. W. L., San Francisco.

Mellilotus wants a seed bed and irrigation, which you do not seem to have. November would be a little late any way. Try bur clover, 20 pounds per acre, or horsebeans as recommended in another article. The bur clover will not need harrowing, but ought to have a fair show against the weeds and grass that will be pretty thick by November. Vetch would probably be good.

Roots for Almonds.

To the Editor: Which would you advise for almond root, bitter almond or myrobalan? The soil is inclined to be adobe.—A. McH., Chico.

Either the sweet or bitter almond seedlings are good and are chiefly used, most growers declaring that they can see no advantage in one over the other. The peach is also good for the almond. The myrobalan has been used to some extent and has been supported by some growers, but we understand that some large propagators who at one time made a point of adapting the almond to a wet soil by using myrobalan have changed their minds. We do not consider the use of the myrobalan sufficiently demonstrated to be dependable.

Strawberries and Raspberries.

To the Editor: Can ever-bearing strawberries and raspberries be set out soon after the first rain? There is very little frost in my garden. Will the young raspberry plants that come up around this summer canes set out last spring be good roots to set out, or would the whole root be better?—S. A., Carpinteria.

Surely the best time to set out such plants under your conditions is as soon as the soil is deeply wet by the rains. The raspberry shoots you speak of will do to start with if you get them with a root-start and handle them carefully. If you are buying plants you ought to get all the wood which grew last summer—shortened back, however.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., October 24, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Sensonal To Date	Normal To Date	Max'm	Min'm
Eureka	00	1.90	3.32	62	42

By the Editor QUERIES AND REPLIES

Inquirers Must Give Full Name and Address.

Beet Pulp Balances Alfalfa.

To the Editor: What is the proper way to balance a ration for a family Jersey cow, using alfalfa hay and beet pulp? What is the food analysis of the latter? Would beet pulp be a good thing to feed chickens if short of greens?—C. R. M., Sebastopol.

Prof. F. W. Woll of University Farm, Davis, answers this on the basis of dried beet pulp as follows: This feed contains, on the average, about 4 per cent digestible protein and 65 per cent digestible carbohydrates and fat, and is, therefore, a low-protein or starchy feed and supplements alfalfa hay very well. Twenty-five pounds of alfalfa hay and five pounds of beet pulp will make a balanced ration and supplies sufficient feed for a good dairy cow. Somewhat better results will, however, be obtained by feeding a mixture of two or three concentrates rather than beet pulp or any other feed alone, say a mixture of beet pulp, cocoanut meal and barley, in the proportion of 3 parts of beet pulp to 1 part of the two other feeds. At present market prices for feeding stuffs, beet pulp and cocoanut meal are much cheaper than either barley or mill feeds, and the more pulp included in the mixture, the cheaper the ration will be. Beet pulp is not especially palatable to stock when fed alone, although cattle and sheep will eat it readily when once accustomed to it. It may be fed either dry or soaked in water, preferably the former.

Beet pulp is not a good chicken feed, mainly on account of its relatively high content of fiber, and will not take the place of greens in feeding poultry when fed wet.

Lime for Orchard.

To the Editor: When is the proper time to apply lime to an orchard, and what kind is most economical? Can hydrated lime be applied to a clover lawn without injury?—C. R. M., Sebastopol.

Ground limestone is least expensive, but does not act so promptly as hydrated lime which is harmless. Apply whichever form you prefer, as soon as you determine that the soil is at all acid and before plowing if convenient. Apply so winter rains won't wash it away. If there is danger of leaching, the quicker acting form will probably be best. If it is for lightening of heavy soil other than correction of acidity, the hydrated lime gain is considered best.

Prune Tree Cavities.

To the Editor: In my 40-acre orchard of 20-year prune trees, a larger proportion have a cavity in the main fork of the tree. It is quite large and deep in some cases and collects water, leaves, etc. I have heard of filling the cavity with tar or asphaltum or cement.—J. H. L.

Whatever you put into the cavities, shave out every vestige of decay, or it is likely to proceed after the cavity is filled up. The principal trouble

with cement fillings is that with heavy crops or swaying trees in wind, cracks may be opened which will admit water and spores of decay. This may be prevented by inserting screw eyes on the insides of big limbs, one to four feet above the filling, and drawing them tight with heavy wires so there will be no giving while cement is being tamped in or afterward. It may be better to mix as much as convenient of fine dry redwood sawdust with hot asphaltum; and after cleaning and disinfecting the holes, pack it in with a hammer or heavy tamp. If the trees should spread, it can be further packed at any time.

Ripe Seed and Green Feed.

To the Editor: Please give me a proper idea of sowing a twelve-acre orchard with two objects in view: first, to build up the soil; second, to do it economically and at same time make plenty of feed for sucking pigs and small shoats. I mean to plow three furrows on each side of every row and run a harrow over it once a week. Let the middles all grow till seed is ripe enough to grow for next year's crop. The soil is inclined to be light clay, hill land. Old hogs would be fenced off from orchard and sucklings have a "creep" to get to the feed. How many kinds of plants should I sow and how much per acre? Is it proper to let pigs run on the orchard all summer which would get a summer's growth on both pigs and crop and have seed ripen before it is turned under?—Subscriber, Sebastopol.

You have planned a very complicated machine which will require very favorable conditions and adjustment of parts for its working and always be in danger of slipping a cog somewhere. The design seems to be to get plants which will make green feed winter and summer without irrigation and ripen enough seed in the fall to start again on the same contract, year after year. We are not sure that we have any such annual plants. The plant which will do most toward making seed while its growing top is being eaten off, is bur clover because that shoots laterals and makes seed-balls soon after starting, and keeps on growing beyond them—therefore it can be grazed above and make considerable seed blow—if not grazed too close. But bur clover will make good winter growth and go dry early in the summer and give you bare land until the seed is started by fall rains. Thus you fail to get the summer greens which is a part of your scheme—though you will get greens from it during fall, winter and spring and keep the land seeded with it. Theoretically, if you could get your land seeded with bur clover and Dakotah vetch, you would get from it the summer verdure and keep the land seeded with it also—but we do not know where you can get the seed, unless you find it growing for your own gathering.

If moisture enough remains in the land you can get summer greens with cowpeas, but they will have to be re-seeded every spring in most places, and that is what you wish to escape. If you were

University Rejuvenates Old Orange Trees

[Written for Pacific Rural Press.]

Twenty acres of commercial orange orchard planted near Riverside on level land in 1891, had been declining steadily of late years. According to R. McBride of the University Citrus Experiment Station, it produced an average of 28 fruits per tree in 1914-15. In 1915-16, it produced a little better than 3 1/2 boxes per tree, as vouched for by Gordon Wallace and C. M. Clark, also of the Experiment Station, which took charge of the orchard in April, 1915. It now has a crop equal to last year, including more inside fruit; though Riverside county in general has 80 per cent of a crop and many orchards in this district have not over 25 per cent. The leaves are of better color and have less mottling. The soil is mostly underlaid by hardpan at 18 to 48 inches and by river sand at 9 feet.

The trees had not been pruned since the freeze, and were barely alive when the University undertook to rejuvenate them. In 1914 they were badly infested with scale, but were fumigated that fall. The University gave it three degrees of pruning in successive sections of four rows each. About 20 trees were not pruned at all. Last September, and the year before, those not pruned heavily averaged more fruit than those pruned moderately or lightly; but fruit on the unpruned trees was scratched by the dead twigs.

The orchard was laid out in 42 plots for various treatments. Each plot is separated from the next by a row of whitewashed trees which are being used for extra pruning experiments. Each plot has different fertilizers except every fourth one which is a "check" plot untreated for comparison. Half of each plot except a few has a winter cover crop.

On one plot, alfalfa has been growing since the start, one-third having no fertilizer, the next having

blood and nitrate of soda, and the next third of this plot has superphosphate, sulphate of potash, and gypsum. The alfalfa is mowed every month and laid in a constantly enlarging circle around each tree, being left as a mulch. Results from the alfalfa are not showing up as yet. But a plot where 150 pounds alfalfa hay was plowed under with 20 pounds rock phosphate takes double the water after the first irrigation; and in cultivating, it has no bottom. Two plots have both summer and winter covercrops of buckwheat, cowpeas, and melilotus.

The most noticeable change has come on the plot basined, mulched with straw, and fertilized with blood, superphosphate, and sulphate of potash. Hardpan is nearest the surface here. When the soil tube was first used here, it could scarcely be pulled out, but now the soil is much more mellow. One plot has manure in trenches two feet deep around the drip of the tree. One line of plots is fertilized with 10 cubic feet manure per tree and with rock phosphate and plowed 10 inches deep every spring. Other fertilizers and lime are being tried on various plots.

Three lines of underground pipe cross the orchard and each plot drains independent of all the rest to avoid mixing fertilizers, and other complications.

Soil samples for moisture content are taken before and after each irrigation at 1, 2 and 3 foot depths, and some at 4 feet. The usual irrigation run is 48 hours every 4 or 5 weeks, but some plots are watered for 24 hours twice as often. Two mulch plots are irrigated by furrows, four by basins.

Almost every cultural problem of the owner of declining orange trees will have at least a tentative answer in a year or two.

Coast County Orchard Cover Crops.

[Discussion Begun in Last Week's Pacific Rural Press by John J. Fox.]

Horse Beans.—I have grown horse beans in Napa Co. six years and they do well—remarkably well in good ground and the nodules on the roots are as large as those seen on melilotus roots. Moreover, the horsebean has a large, strong taproot that will penetrate the plowsole and help drain the soil. It is frost-resistant and does not do so well in warm weather and almost always gets a black bean aphid on the terminals. The principal objection to the horse bean at present is the difficulty of planting the seed we have seen, which is large, flat, and very irregular in size. It is known as the Broad Windsor and is a poor sample of this improved variety which is largely used in Europe as a vegetable.

The horse bean proper, which is used so extensively for horses and sheep in Europe, is much smaller, less flat and sufficiently regular in size to pass through a corn planter. I have been trying for the past two years to get shipment of these beans from England, but shall probably not get them till the war is over.

The largest and best—the winter bean—I have known to attain a

height of 8 feet and produce 56 bushels of seed to the acre weighing 65 pounds to the bushel. The meat contains very little saccharine or fat-forming matter, but almost as much protein (gluten) as rye. This applies to all the horse beans.

Culture.—I should plant them now, and the amount of seed to the acre would vary according to variety of bean and the quality of the ground. As a cover crop, I should plant 200 lbs. to the acre and not less than 100 lbs. to the acre in the orchard even on strong land. The rows in tree row can be 30 inches apart and need not be cultivated in our county. They do not do so well in hot weather. If, however, they are grown as a field crop for seed they should be cultivated and cut at harvest time, not pulled. I always plowed my beans in here—dropped them every 3rd furrow. This awkward and time-taking method of planting cannot, however, be recommended. In England I planted the field beans with an ordinary drill. Perhaps a lima bean planter would answer to plant the variety we have—the Windsor. As soon as I can, get a shipment of Tick Beans, I will

send a sample to your office.

We should also try the Mazagan Bean and Tick Bean—the latter a comparatively small seed, but a very heavy producer. The extra number of seeds for the space they occupy would make them very economical to plant. If the crop is matured, the straw is valuable as a fertilizer and a fine absorbent in the stable, but of little value for anything else. The horse bean is one of our future cover crops.

GRAPE GROWERS' OBSERVATIONS.

Loss of fertilizer by leaching where the subsoil is porous is indicated by a vineyard underlaid by hardpan owned by F. H. Booth of Fresno county. He has fertilized high places and watched effects on vines to which the fertilizer had run along the hardpan. The limit was very noticeable.

A Thompson vine belonging to B. H. Fisher of Fresno county was so badly frosted last spring that it died back to the stump. One bud started from an old spur close to the ground and the trunk was cut off 3 inches above ground. Four small canes grew from the end of the spur and two from the base bud. One of the latter became over 1/2 inch in diameter. The other became an inch in diameter one way and 1 1/2 inches the other.

Malagas color better and bring about \$100 a car better price where grown on light soils, as observed by A. B. Cate of Fresno county.

UP-TO-DATE FRUIT INFORMATION.

[Written for Pacific Rural Press.]

The most compact and up-to-date information on citrus and apple culture in California is that contained in the report of the Cal. Fruit Growers' Convention held last February at San Bernardino. The report is just off the press.

The most up-to-date information on deciduous fruit and grape marketing, rural credits, how to use the College of Agriculture, and improvement of nursery stock will be contained in the papers to be written and read by highest authorities at the California Fruit Growers' Convention to be held at Napa Nov. 13-17 inclusive as per programs elsewhere in this issue. The first two days are for the county horticultural commissioners, but the public is invited.

PROGRAM STATE FRUIT GROWERS' CONVENTION.

Nov. 15, 10 a. m.—Report of Committee on Legislation. The Dried Pear Industry, Fred G. Stokes, Kelseyville; and Frank T. Swett, Martinez.

Nov. 15, 2 p. m.—Weaknesses in Our Fresh Fruit Standardization Law, F. B. McKevitt, California Fruit Distributors. Practical Application of the Standardization Law with Grapes, Fred P. Roullard, Fresno. Practical Application of the Law with Deciduous Fruits, H. E. Butler, Penryn. The Future of the Wine Grape Industry in California, E. M. Sheehan, Sec'y State Viticultural Commission. The Future of the Raisin Industry, Jas. Madison, Cal. Associated Raisin Co.

Nov. 16, 10 a. m.—The Prune and Apricot Growers' Information Bu-

reau, J. H. Bone, San Jose; Harry Dunlap, Napa; J. C. Shinn, Niles. Standardization of the Apple Under the Act of 1915, F. S. Jerome, Watsonville Apple Distributors.

SANTA BARBARA APPLES.

[Written for Pacific Rural Press by Chas. F. Bauman.]

A private label, careful handling, and a good location on the sandy loam mesa overlooking Lompoc Valley, Santa Barbara county, brings Chas. Beutebaugh 50 cents per box more for his apples than his valley neighbors get, though all are packed and shipped by the same people.

"The Famous Mesa Apples" are grown on two mesa orchards where drainage is perfect and wind blows less. One orchard is 20 years old, the other, eight years. They consist mostly of Bellflowers, White Winter Pearmain, and Jonathans. The young orchard has averaged from the beginning over \$35 per acre according to Mr. Beutebaugh. The old orchard averages 10 boxes a tree.

He is particularly proud of his Winter Bananas, grafts for which were put on Jonathan stubs. The trees are very widespreading, admitting lots of sun, and adding high color to the sweet juicy apples. The fruits are almost twice the size of Jonathans, more solid, and yielded in greater quantity.

Individual records of the trees are kept.

WINTER BARTLETT PEARS.

To the Editor: Will Winter Bartlett pears do well on rather heavy soil wet until late in spring, located near Stockton? Would it be advisable to set 7 acres to have a late pear on the market when the summer Bartletts are gone? Are they raised to any extent? How do they keep? I am told that only the summer Bartlett will do well in the San Joaquin Valley.—H. B., Stockton.

[The only Winter Bartletts we know are on well-drained land not in the San Joaquin Valley. Summer Bartletts are very often planted in draws too wet for most other fruits and Winter Bartletts on the same root should do as well. The standing of the variety is not yet established. We know one man who added 40 acres to his original 20 acres after the latter came into bearing. The fruit is considerably less attractive and coarser than the summer variety. We have eaten some in February which had been stored simply in the farm cellar. There is an attractive market for the few that are now produced. Pears thrived in the San Joaquin Valley years ago until the blight cleaned them out.]

Modern Walnut Packing Plant.

[Written for Pacific Rural Press.]

One of the best-equipped walnut packing houses in California (except for lack of a cracking machine) is that of the Fullerton-Placentia Walnut Ass'n, of which Arthur Staley is Secretary. It costs 3½ per cent of the gross sales last year for expenses of the local house, including interest on some money borrowed for the investment.

Nuts are received from the growers, in sacks which are weighed and stacked inside the house on low tables so they can be picked up with lemon trucks. Each man's crop is kept separate, and after they are dumped to begin their journey through bleachers, graders, etc., to the car, an interval of about two minutes is given so that all the No. 2's, culls, and blanks picked out at the suction from that lot can be weighed and recorded separately.

They are dumped onto a large-mesh wire screen which is agitated to carry the nuts forward under a suction hopper which picks out all trash which has not fallen through the screen, and also picks out the shrunken-meated nuts, so the cracking test becomes high. These lightweight nuts are screened off and sacked. The air is drawn on through a chute, by a revolving fan which forces it over a furnace to be used later to dry the dipped nuts. A damper regulates suction force according to the general character of the nuts.

Bleaching.—Those which pass under the suction hopper run directly into the revolving churn-like "bleaching drum," passing through at the rate of three tons per hour, each nut remaining in the dip 1½ to 3 minutes, according to H. A. Thatcher, House Manager. Longer soaking and less capacity are required with badly weather-stained nuts. One man attends the bleacher and the furnace which heats air for drying the nuts.

The bleaching mixture is a patented formula owned by the Cal. Walnut Growers Ass'n, for the benefit of all its locals. It is made of chloride of lime and monohydrate crystals of soda mixed with a solution of sulphuric acid. It is made up ahead of time in two cement tanks of 600 gallons each, being stirred by a machine-run propeller. The salt bleach has been discarded because salt-bleached nuts tend to draw moisture from the air. The sulphur dip does not work well unless the nuts are smooth.

The nuts coming out of the dip are shaken over a screen to take out halfshells, etc., and remove excess dip water. A belt and bucket ele-

vator dumps them into one or the other of two graders, high up. These are horizontal revolving cylinders of wire mesh of 1 1-64-inch diameter. Nuts which fall through are dried and weighed separately as No. 2's. Each grader has a capacity of 1½ tons per hour, and an extra grader is set up when "budded" nuts are to be handled.

Drying.—From the grader, the No. 1's are distributed into four driers beside the one used for No. 2's. These driers are 20-inch metal cylinders about 20 feet long, sloping downward from the level of the grader. A wire mesh lines the inside of the pipes, being held 1½ inches clear of the metal by wooden strips. Protruding about three feet into each of the driers is a 6- or 8-inch pipe connected to a manifold through which the rotating fan mentioned above forces air which has been heated so it keeps the temperature in the driers at 90 to 100 degrees F. The driers are rotated by chains and sprockets so the nuts get a good rolling downhill in the hot air. They are usually dry when they tumble out onto a wide belt which carries them past several people who pick out the remaining culls, spotted and cracked nuts. An elevator distributes them to slatted hopper bins in the peak of the building. This allows ventilation and further drying if necessary.

In the last of September, the Fullerton-Placentia Walnut Growers' Ass'n was shipping out two or three cars daily. These are packed from the slatted bins into sacks of 4 to 100 pounds, the sacks resting on scales for exact weights. The packer is near the door through which nuts are loaded into cars for the East, 240 100-pound sacks per standard car.

Power to operate all the machinery is supplied by two electric motors of 7½ h.p. each.

Inspection.—Since the Cal. Walnut Growers' Ass'n markets the nuts under a quality guarantee, they inspect every carload before it is shipped out. Their inspector for Orange county is C. S. Head, who often visits each packing house in the county twice a day; and always, once per day.

A double handful of nuts is taken from every tenth sack. These are shaken together to mix them and 200 picked out at random and cracked by the inspector. Count is kept of light and amber colored meats as well as bad nuts. The percentage of bad ones is considered representative of the car. A four-pound sample of the whole nuts remaining is sent to the Central Association with the report for that carload.

The sample cracked in our presence showed 145 light meats, 45 ambers and 10 bad, making a "cracking-test" of 95 per cent good. Report is also made on the bleaching, size, and appearance of the nuts for information of the Association in selling that car. The minimum requirement this year is 87 per cent good. Last year it was 85 per cent. All shipped from the Fullerton-Placentia Walnut Ass'n this season have tested 90 per cent or above.

How Ornamental Exotics Reached Here.

(Continued from first page.)

date various other fruits were planted in the central part of the State by Dr. Marsh, John Wolfskill, George C. Yount and others. Probably most of these planters took their start from the gardens at the missions, though Mr. Wolfskill brought apricots from Mexico. In the late forties the "black pepper tree" was planted both in Los Angeles and San Jose—the early reporter mistaking our now popular Chilean pepper for the pepper of commerce—as many new comers have done since his time. Early in the fifties more plants were brought from Mexico and Central America and at that time the sapota, aguacate and mango were seen growing in Los Angeles. In 1851 R. W. Bourse of Stockton brought an oleander from Mexico, and a visitor in 1857 says of it: "It is the largest and finest oleander we have ever seen. It has grown to enormous size and sheds its fragrance all over the garden." No wonder it impressed the visitor who had probably never seen an oleander before

except as an Eastern house plant. And this reference must cover all the sensations which giant open air callas, geraniums, lemon verbenas, fuchsias, etc., gave the pioneers and continue to produce on the minds of new-comers to the present day.

Exotics Which Came with a Rush.

—As already intimated, exotics came in such quantities with the American pioneers that just what they were and just when each of them came is not now determinable. Probably all of the exotics which were being carried about the world seventy years ago reached California at about the same date, because as already shown, plant importers brought whole green house collections and had them suitably housed and were actively trading in them remarkably soon. The house plant collections at the east, whence most of the stock came, had undergone great enlargement during the '40s and a new American interest had arisen in growing under glass everything of tropical and semi-tropical requirements, which botanical explorers, travellers and commercial prophets made famous. California received immediately all that European and East American collectors had secured during several previous decades of ransacking the five continents and all the islands that lay between and around them. We have therefore to consider exotics en masse and note what California did with her acquisitions.

It will, of course, be remembered that California received as "house plants" many broad shrubs and tall trees, acacias, palms, araucarias, ficuses, bamboos, fruits tender at the north, etc., etc., which went almost at once to the open air because they needed no protection and so it was only for plants strictly tropical or for blooms of high quality that glass was provided. And yet it is evident that before 1856 the San Francisco florists had notable establishments. Official reports of the State Agricultural Society for 1856 to 1858 present these records:

H. A. Sontag & Co. of the Mission district of San Francisco are celebrated for the excellence of their roses and other choice shrubbery. It is doubtful whether a more extensive or finer collection than theirs can be found this side of Europe. Besides large open garden they have three glass houses, 120 to 165 ft. in length. They are constantly importing all the rarest and choicest varieties of plants to be found in other parts of the world.

James O'Donnell had two houses filled with choice plants and he was a pushing sort of a man for he took

premiums at State Fairs at San Jose, Marysville and Sacramento for the best and largest collections of potted plants.

W. C. Walker is also credited with having one of the largest and rarest collections of fine plants: in fact, it is doubted whether it can be excelled in any of the Atlantic States. No expense is spared in introducing the newest and rarest kinds. It augurs well for the cultivated taste of the public which appreciates and sustains an establishment that requires so much time, labor and expense to support it. Mr. Walker also had a large greenhouse full of exotics and ample open-air cultures.

Besides these three establishments, which are cited because the largest and because of their function in the distribution of exotics, there were others of the same kind. There were also popular recreation gardens and private gardens and plant houses of notable conservatories like that of John Center, which was filled with choice plants and had a fine fountain in the center—and all this within five years from the gold discovery, for they were all reclaimed from the sand dunes, built and planted some time before the record was made.

Although it is natural that there should be greatest activity in exotic plants in San Francisco where there were most people and where gold and gallantry were freest in expression, there were also exotics of the ornamental class to be found in abundance and profusion in Oakland, San Jose, Sacramento, Stockton, Marysville, and at other points, as quickly, though in less amount, than in the metropolis.

The Most Popular Flowering Exotics.—The most popular exotic flowers of California's first decade were roses, camellias and dahlias. This claim is based on the fact that special premiums were offered for displays of these flowers at the fairs of the early '50s while others were not particularized. Just what this preference was based upon it is not easy to determine. Were they the most popular exotics everywhere at that date or was it because their bloom seasons in the open air in California were different and practically covered the year. It is an interesting question to remember and to answer as one may feel confidence.

Little need be said of the supremacy of the rose: it exists to the present day. It is interesting, however, to note how soon the early California propagators worked largely with the best roses of their time. A. P. Smith of Sacramento (who was really the first man to start a California nursery; even before the gold-rush) had in 1857, 12,000 rose plants of 200 varieties; L. Prevost of San Jose had in 1858, 20,000 rose plants of 120 varieties; W. S. Osborne of Los Angeles had 20,000 plants of 118 varieties, and so on with many other growers.

Of the popularity of the camellia with the pioneers one can hardly say more than that it was as highly prized then as it is now neglected. It was splendidly grown in the open air in San Francisco, but the pioneer leader with the camellia was A. P. Smith of Sacramento of whom an official report in 1858 says: "No man has been at greater expense with

TREE PROTECTORS FOR WINTER USE

Why let rabbits bark your trees at this season of the year when for about a penny a piece you can save every one of them. We also have a heavy fiber one that will absorb the frost and save your tree from moderate freezing. If it's squirrels, tell us your wants. We have protectors for every need that will save your tree.

COLLAPSIBLE PLANTING POTS. Are you going to raise some Olive Cuttings, of Eucalyptus, or Rose Cuttings? Why not grow them in these pots and have every plant a single root system, and be assured every one will grow?

Why not plant your early Cabbage, Chilis, Tomatoes, and have good healthy plants to set out that will not stop growing a single day, for you can plant both pot and plant?

These pots are the up-to-date method of plant growing. Don't take our word for it: try them yourself. Write for samples of pots or protectors. Tell us which you are interested in.

THE EXPAN PROTECTORS CO.

camellias nor succeeded so well." He was at that time credited with 2000 plants of 200 varieties. When Mr. Smith's establishment was dismantled, early in the '60s probably, his camellias, some of which had reached a height of ten or twelve feet, were transplanted to San Francisco by E. L. Reimer and produced abundant blooms some of which were sold at \$100 each, for their popularity was then still strong. It is probable that some of the large camellias in the Sacramento gardens, from which blooms are now sold at a nickel each for the buttonholes of California legislators, are from the old collection at Smith's Gardens so famous in the '50s among visitors to the State capital.

The early popularity of the dahlia when the bloom was chiefly the formal rosette of our grandmothers is not easy to understand, and yet W. C. Walker had in 1856 a collection of 100 varieties which, "cultivated in the shaded sandy loam of San Francisco, far excelled any noticed in this country or elsewhere"—as the visiting committee said of them. The tremendous popularity of the dahlia at the present day is therefore but a recrudescence of the excitement of sixty years ago, but our grandmothers could surely not have imagined the size, gorgeous colorings and abandon in form and attitude recently assumed by the flower whose self-restrained primness commanded their admiration.

How the Pioneers Used Exotics.—As the pioneers sought exotics grandly and lavishly, so they used them picturesquely and gorgeously. A few brief extracts from the records of 1856 to 1858, indicate what was to be seen in those days. A charming place must have been Hock Farm, the home of John A. Sutter, who was a pioneer of pioneers. It was situated on the river bank about six miles below Marysville, on the river side of the residence, of which it is written:

The well arranged ornamental grounds are laid out in the old English style and present a scene of rare beauty and interest. There are 120 distinct species and varieties of evergreens gathered from the equator to the highest latitudes in which vegetation thrives. There are fine Oriental cypresses together with rare and beautiful shrubs all being well arranged and presenting beautiful effects.

The account given in 1857 of the home of J. W. Osborne in the Napa Valley is rather more dazzling. It is as follows:

The house is new, large, convenient, unique, plain, rich, droll, labyrinthian and unfinished. It is of the Elizabethan style, applied to a Swiss suburban villa, surrounded by East Indian verandahs and topped out with a touch of the Burmese pagoda covered with a China-built roof. It is all very pretty, surrounded by hedges, clumps of trees, evergreens and shrubbery. It is approached from the road by three wide avenues, half a mile long, bordered by ornamental shade trees.

But even more striking, in landscaping if not in architecture, is the layout of Dr. T. J. White in 1858, the site of which is now in the center of the business district of Los Angeles:

The dwelling is situated about three hundred yards from the street and approached by a drive bordered by noble English walnuts and luxurious pomegranates to within a hundred feet of the house where it branches and encloses an oval con-

taining a large fountain, ornamented with shells, coral, evergreens and flowers. On either side of the fountain, in a triangular form, there is another fountain embowered as is the central one. The whole plat between the house and the street, about 300 yards square, is laid out with serpentine walks and set with ornamental trees and shrubbery presenting a view from the elevated porch of the dwelling which is both picturesque and beautiful.

There are many more instances of the arrangements which the pioneers made for using their wealth of exotic plants, but these will serve to indicate their devotion and interest. Another phase of the attitude of the pioneers toward beauty in its various manifestations is shown by the following paragraph from the report of an official visit-

ing committee in 1857:

One and a half miles above Marysville on the Yuba river is the farm of C. Covillaud. The proprietor being absent, his wife volunteered to show us the place and upon our objecting that the sun was too hot for her comfort she broke off a branch of a tree, to supply the absence of a parasol, and continued to lead us on, from point to point, explaining the designs and proposed improvements and many objects of interest, with a true womanhood which scorns all aristocracy not founded on the faithful prosecution of some laudable calling. The place contained 1200 ornamental trees. The approach to the residence was on either side skirted with double rows of ornamental trees intermingled and entwined with a great variety of standard and climbing roses producing an effect at once unique and beautiful. There was also a broad corri-

dor surrounded and shaded by a luxuriant growth of clematis, indigenous and exotic.

Thus the early-day records present to us the pioneer woman in her environment of exotic plants in the lofty calling of home-making in a new State. Probably no single material fact has given our women more courage and comfort in their homes, and more cheer amid difficulties to be overcome, than the gift of the world's best plants for California home adornment and the delight which they manifest in their new environment.

The Railroad Commission has denied the application of the railroads for a rehearing of the recent decision lowering freight rates on paddy rice.

Plant Hills to Trees

Save the Soil

Don't Let Your Land Wash Away Like This

FRUIT TREES PREVENT EROSION

Yes, they not only save your soil and keep it from washing away—but increase the value of your land. \$100 land can easily be doubled and trebled in value by planting a few trees—a few each year, if you don't feel like doing it all at once.

What is more pleasing to the eye than a well planted orchard? — and what is more pleasing to the farmer than the handsome profits received from ROEDING'S pedigreed TREES?

Roeding's True Trees--Bear Fancy Fruit

—the kind that tops the market—the kind that is always in demand. For over a quarter of a century the names "Roeding" and "Fancher Creek Nurseries" have been household words with horticulturists all over the Coast and in many foreign lands. Thousands of satisfied growers will gladly testify to the superior quality of our stock.

A Superb Collection

—of olives, walnuts, peaches, pears, plums, oranges and fruits of almost every kind awaits your selection. We also grow a very large variety of ornamental trees, shrubs and vines—including palms, roses, evergreens, etc.

Let Roeding Help You

We are always glad to consult with prospective planters without any obligation on their part. Tell us the nature of your land and what you think of setting out and we will give you the benefit of our experience and knowledge of conditions.

Enforcing Strawberry Standardization.

[Written for Pacific Rural Press.]

Of the 180,000 crates of strawberries shipped out of the State from the 2,000 acres of commercial plantings in Sacramento county between April 1 and May 26 last spring, 6,800 were condemned for Eastern shipment under the Standardization law, with great benefit in holding up prices. One grower, warned several times, was arrested, plead guilty, and had his fine suspended during good behavior.

Last spring was the beginning of enforcement of this law. It provides that berries for inter-state shipment shall be packed in uniform packages of dry quart and dry pint, and shall be reasonably uniform in size, quality, and maturity throughout each container, practically free from insects and fungous diseases, and all packages except subcontainers must be stamped with the name and address of grower and locality where grown.

The berry districts were divided into five, one for each inspector. All of the inspectors were under the direction of Deputy Horticultural Commissioner F. C. Brosius. Early in the season the picking was done by day work and this facilitated the inspection.

Hard green berries, distorted ones, and small ones were used in bottoms of containers of all sizes and shapes. The district attorney said 10 per cent variation in size was reasonable, but the growers said more; and 25 per cent was allowed as a starter, though not over 15 per cent was encouraged because that is the Canadian law, where many of our berries go. To make 12-ounce baskets, too many green berries would be put in. These would color, but not sweeten en route. Many growers were using each other's crates, which had to be stopped, or relabeled.

There were about 180 berry growers, each with his own packing shed on a patch of ½ to 20 acres. At height of season, growers with over four acres were forced to employ contract pickers; and if any of these were fired for doing poor work, the rest would quit. It was hard for a Japanese boss to adequately supervise 20 or 30 pickers and this made inspection more difficult.

Picking could not commence until dew was off, or the berries would get white whiskers and rot en route. Inspectors visited the pickers and packers in the fields from 7 a. m. to 3 p. m., giving instructions, inspection, and advice. As many as 7,000 crates would be loaded on cars in a day between 3 p. m. and 9 p. m. at which time loading had to cease for the day. Several crates from each wagon load would be inspected at loading shed to see that instructions had been followed.

It was hard to get the proper 12 oz. net weight in boxes at first, for the berries had to be packed tighter than before. Jessies, which are lighter and softer than the Dollar, had to be packed higher.

Lots of green berries were colored by the north wind before they were sweet enough, and the inspectors had to watch for these. Overripe berries would arrive on eastern or northern markets soft and black, so

they were condemned and shipped to local markets where they were used before spoiling.

A complication arrived May 7 in shape of a frost. Ripe berries picked that morning oozed moisture from the whole berry. They had to be assorted and were sold in San Francisco the next morning, still in good shape. Berries picked the evening of May 7, which had ripened during the day, held up in good shape for distant markets. Less damage was done where the ground was most moist.

Lots of folks in Sacramento told Mr. Brosius the inspection work was helping the local berry business greatly, due to improved habits of picking and packing enforced for distant shipment.

Nothing has been done as yet about minimum weight of containers; but it will be discussed this fall while considering improvements of the law.

PRUNE ORGANIZATION PROMOTERS.

Mr. Hugh S. Hersman, president of the First National Bank of Gilroy, a large owner of orchard property and a former Santa Clara county supervisor, has been charged with the promotion work of the Prune and Apricot Growers' Selling Agency. Mr. Hersman and associates are now planting more than 300 acres of prunes of Pacheco Creek, where they have recently purchased a tract of land.

Mr. Hersman will be backed by the following committee: Messrs. W. G. Alexander, G. M. Fontaine, Geo. Howes, O. A. Harlan, W. E. Blauer, V. J. La Motte, A. Kammerer, Nathan Lester, Chas. E. Warren, C. C. Spaulding, Geo. Glendenning, H. G. Coykendall, I. E. Pomerooy, Royal Cottle, V. A. Hancock, Ed Carey, E. B. Scott, F. E. Goodrich, P. J. Dunne, O. B. Wood, J. W. Chilton, J. P. Munger, J. H. Bone, R. P. Van Orden, S. E. Johnson,

Here's good news for alfalfa growers---a new thoroughly

tested plant that will produce the greatest alfalfa tonnage known—and under all climatic conditions. Has been tried out and endorsed by Arizona State Experiment Station, and by growers in both hot and cold countries. Supt. of Arizona Station says: "Hairy Peruvian produces heavily in all climates practically the year round. Gives farmer maximum yield from his land. Does equally well at 5000 feet or at sea level. The plant is heavily leaved, thus giving highest food value. We recommend it above all other types." W. B. Cloyd of Yuma says: "Hairy Peruvian is greatest producer. I now get one more cutting per year." David C. Aepli of Yuma says: "Hairy Peruvian outyields other varieties 15% to 20% per acre." Write for complete information.

**KILLEFER
QUALITY**

Clean Cut Weeder and Mulcher

**KILLEFER
EFFICIENCY**

It is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigation on orchard, bean, beet, or grain land. It does twice the work with the same team of any other tool for this purpose, and as the knives overlap each other it is impossible to miss anything in their course. Our patented knives are formed with a straight throat so that they wear uniformly from heel to point and are all stamped with our quality trade-mark.

The orchardist will find this tool a valuable one for leveling down furrows and for preparing the ground for the cultivator. The large range of work makes it almost indispensable, and the extremely low price at which it is sold brings it within the reach of all.

Heavy Yielding Hairy Peruvian Alfalfa.

[Written for Pacific Rural Press.]

Peruvian alfalfa under irrigation produces consistently better yields than other varieties. The Arizona Experiment Station announces that the hairy type of Peruvian alfalfa produces one and one-quarter to one and one-half tons more hay per acre

per season than the smooth Peruvian, which is probably a hybrid of the hairy type with common alfalfa and which itself yields better than the latter. This is principally due to the great abundance and greater size of leaves which grow upon it.

In 1899, the United States Government, through one of its representatives in Peru secured a small quantity of this seed which was distributed among some of the leading alfalfa growers in Arizona and California.

Characteristics. — Following is part of a report by D. C. Aepli, superintendent of the Arizona Experiment Station.

"In the variety test of alfalfa at Yuma, the hairy type of Peruvian again stands out in striking contrast to the remainder. The contrast here emphasizes the ability of this variety to grow at a low temperature and hence gives heavier crops than others in the late fall and early spring, and in most sections producing practically the year round, thereby giving the farmer the maximum yield from his land."

During the writer's investigation of the hairy type of Peruvian alfalfa he found that this variety thrives as well in an altitude of 4000 to 5000 feet as it does below or at sea level—having seen it planted and grown in Arizona, Imperial Valley, and Inyo county.

In the early stages of its growth, and also during the colder winter months, it has a very prominent coating of fine fuzz or hair, giving it a silvery appearance. This fine hair acts as a protection to the growing plant at the time when it is really needed, and gradually disappears as the warm weather comes on. It produces large leaves from the top to the very crown of the plant—which is not true of the other varieties of alfalfa—and as the leaves of the alfalfa contain the greatest and best part of the food value of the entire plant, this is the most important reason why the hairy type of Peruvian alfalfa shown be grown.

Conclusion.—One rancher has 160 acres planted exclusively to this variety. In asking him how he liked it compared to the smooth Peruvian and other alfalfas, the writer received this reply: "Well, I think enough of it to plant 80 acres which I am just getting into shape." Another rancher said, "I have planted the Chilean or common, also the smooth Peruvian, but I find that my hairy Peruvian is by far the best. It produces more hay, and my stock relish it."

Artificial silk manufactured from wood pulp for which several kinds of California timber are suitable is used annually in this country to the amount of seven billion pounds. It is utilized principally in the manufacture of millinery, sweaters, and hosiery.

Bigger Crops by Blasting

"The O'Connor prune orchard in the Santa Clara Valley was blasted in 1913," says the California Cultivator. "Its largest crop in six years was 3,900 pounds. After blasting the crop was 8,000 pounds—more than double—in a dry year. The prunes from the blasted orchard were much larger and the trees made a better growth." By using

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

in your orchard you can increase your crop, add to the water-storage capacity of the soil, and enable the roots to feed on fresh plant food in the subsoil.

Hundreds of fruit growers in all Pacific Coast States plant their trees in beds made with Giant Farm Powders. They have found that trees in blasted ground grow faster, bear earlier and yield better than those planted the old way. They use the Giant Farm Powders because these powders loosen and powder the soil instead of packing it. Ask your dealer for either of the Giant Farm Powders—Eureka Stumping Powder or Giant Stumping Powder.

Free Book on Fruit Growing

Every fruit grower will find valuable information in the Giant book, "Better Orchard Tillage," written to suit Pacific Coast conditions. It tells and shows how to plant trees and subsoil orchards in the most effective way. This handsome illustrated book—or others—free. Mail the coupon.

Certified Seed Potatoes.

Potato yield per acre in California has been steadily decreasing, due to disease and poor seed. Several hundred acres of seed potatoes now being grown under State inspection will be certified if they reach required standards.

[Written for Pacific Rural Press by W. V. Shear, Stockton.]

The yield of potatoes in the great potato-growing sections of the State has rapidly decreased in the past few years. This decrease in production has reached a point where the industry has become unprofitable to many, if not most, growers even at the high prices now prevailing for potatoes.

It would seem almost self-evident that good seed stock must be one important way in which the situation can be improved. The State legislature of 1914-15 passed a law known as the California Certified Seed Potato Act, which establishes a standard for good seed potatoes. The movement for the production of good seed potatoes in California is, therefore, well under way, and several hundred acres of such stock are being grown the present season. Of course these few acres will produce but a small fraction of what would be required should all potato growers in the State demand good seed. California has the honor of being the first of the States in the West to take up this matter of certified seed potatoes.

Certified Seed Standards.—Potato fields showing a mixture of more than two hundred and fifty hills per acre of any other variety or varieties, or showing more than five hundred weak hills, or more than fifty hills affected with blackleg, shall be disqualified for certification unless the mixed and weak or diseased hills are removed from the

field. The crop shall be disqualified if more than five per cent of the hills weigh less than 30 per cent of the average weight of all the hills.

The potatoes when graded shall be free from infestation of eelworms, larva of tuber moth, or infection of wart disease or powdery scab, and shall be practically free from net necrosis or infection of late blight. They shall be, in the judgment of the inspector, free from serious infection of scab or Rhizoctonia. They shall not contain more than eight per cent light infection of wilt diseases and not over two per cent deep infection of wilt. They shall also be free from any mixture of colors or distinct types, and shall be reasonably sound and free from cuts or bruises or second growth, and shall conform in shape to the varietal type. Not over five per cent of the tubers shall weigh less than one and three-fourths ounces and not over five per cent shall weigh more than twelve ounces.

In order to determine whether the potatoes attain this standard three inspections are necessary, one during the blooming period of the plants when freedom from certain diseases and purity of stock can best be determined. Another inspection is made when the plants are nearing maturity to determine freedom from infection of other diseases and uniformity of productiveness, throughout the field. A third inspection is made when the stock is

being graded to determine purity of stock, freedom from tuber infection of various diseases, and proper size. The cost of these inspections is borne by the grower.

Cost of Production Great.—It is evident that the cost of producing certified seed is much greater than the production of the ordinary miscellaneous assortment of so-called seed potatoes, which often represent nothing more than what may properly be called the culls from ordinary potato fields.

The next step in securing better yields of potatoes throughout the State is to educate the growers that it is a profitable investment for them to buy this good seed at a price which it is necessary for the producer to get in order to make good seed production a remunerative undertaking.

Care for Crops from Good Seed.—It must be borne in mind, however, that good seed poorly planted in poor soil and poorly cared for is likely to prove a poor investment. But for the grower who wants to give his potato field proportionately good care, the best of seed should be considered the only kind to plant, for without it his efforts will be in large measure wasted.

It should not be expected, however, that all "Certified" potatoes have an equal value for all localities and all purposes. Certified potatoes necessarily differ as to varieties, strains, and localities where grown—all of which may affect the results when planted in other localities and under other soil and climatic conditions. But potato growers should welcome the opportunity which certified seed affords to begin right by using what is known to be good seed stock.

MORE NAPA SCHOOLS.

To the Editor: It is because your article in Pacific Rural Press on the rural school campaign as conducted by the Napa County Farm Bureau has brought results that I take this occasion to tell you about it.

At a meeting of the Carneros Farm Center, W. L. Mitchell, director, had a copy of the Press, in which your article appeared, and read it to the people present. He then opened a campaign for a better school for Carneros with the result that on September 1 the people voted 51 to 6 for a \$5000 bond issue. The money thus raised is to be used to construct a modern, reinforced concrete, tile-roofed school house which will contain all modern equipment. This building will be erected in the near future. Please accept my congratulations and thanks for having written such a splendid article and having given it the valuable space which you did in your paper.

H. J. Baade.

Napa County Farm Adviser.

BROOM CORN SEED.

To the Editor: What is the value of broom corn seed for chickens as compared to gyp corn?—W. D. C., Laton.

[Practically the same value if allowed to mature. If picked immature for the straw, the seed is likely to be shriveled and of relatively less value because it will be mostly hulls which are mostly valueless fiber. Do not feed any one kind of grain sorghum all the time. Chickens do better on a variety of feeds.]

Canadian farmers are confident that wheat will reach the unheard-of figure of \$2 a bushel this winter.

"Eureka" is Not a Clover.

To the Editor: Several communications requesting information in regard to a new and wonderful forage plant, called "Eureka clover," prompt me to state what the possibilities of the plant are from an agricultural standpoint.

The name "Eureka clover" is misleading as it is in no sense a clover, nor can it compare with the true clovers in feed value. It is commonly known in agricultural literature as "sachaline," *Polygonum sachalinense*. It is a native of the island Sachalin, north of Japan in Russian territory. It was introduced into cultivation as early as 1869 and first considered as a forage plant in France. Since that time, about every decade or so, it is much advertised and extravagant claims made for it. We have before us at this time one of these circulars, which says the plant "extracts nitrogen from the air and potash from the deep soil and fertilizes itself."

Sachaline is a member of the buckwheat family, *Polygonaceae*, to which belong such well-known plants as rhubarb and our common weedy docks. The plant itself is not unlike a huge buckwheat, often reach-

ing a height of eight to ten feet. The leaves are very large and coarse, frequently one foot or more long and half as broad. It does not extract nitrogen from the air, for so far as is known, only the legume family has this power. It is also more likely to use up the potash in the soil than it is to add that substance to it. When once established, it has been known to become a veritable pest, as it is a vigorous, strong perennial. Where other things can be grown for forage, it should not be planted. Stock like it, but it has no special features in this respect over grasses and clovers.

The circular states that it yields from 300 to 400 tons per acre. Ordinarily the yield is from 8 to 16 tons of green matter to the acre.

It has been tried at many American experiment stations, but is not considered worthy of cultivation except as an ornamental. The *Cyclopedia of Horticulture* recommends it for planting in rough places where a thick covering is desired.

It might be found useful under some unusual conditions and circumstances, but to introduce it as a farm crop on good, arable land would

certainly be a mistake.

The bean growers of the Goleta district plan to hand-pick their crop. Much of the Southern California lima bean crop is on adobe land. Clots of adobe cannot be kept out of the beans, and when these approximate the size and shape of a bean no machine can separate the two. There are also discolored beans that have become damp or crushed in the thresher. The mud-discolored beans and those injured cannot be caught by any machine built to sort for size and weight only. Growers have, therefore, installed a hand-picking belt table at their warehouse and planned to set a crew of men or girls to work on the job. This will cost one-twentieth of a cent per pound extra.

BIG BULL TRACTOR

Superphosphates Increase Alfalfa Yield.

[Written for Pacific Rural Press.]

One of the interesting experiments in alfalfa growing tried out by A. B. Humphrey, on his ranch near Escalon the past year, was the application of 200 pounds of superphosphate per acre on alfalfa planted the year previous.

In spreading the superphosphate a wagon was used having a distributing box on the rear end but not extending out over the wheel tracks and as the driver drove back and forth over the field he followed the wheel tracks of the previous trip. In this manner at regular intervals over the field small strips were left bare, the harrow which was later used not spreading it thoroughly.

At the time of the writer's visit the second cutting was almost ready to mow, and without knowing of the experiment, we saw quickly the long thin rows across the field on which

the alfalfa was from six to ten inches shorter than on the main field and upon inquiry we learned of the experiment. Mr. Humphrey estimated that the superphosphate had increased the yield of the first and second cuttings fully 75 per cent on sandy loam soil that is naturally adapted to alfalfa and on which heavy tonnages are the rule. Furthermore it was thought that following crops would be equally as much benefited.

But to get such results it is necessary to harrow the phosphate in directly after spreading as was shown on a separate check where the same amount had been applied but where no harrowing had been done. The alfalfa on this check at the time of our visit was no higher than on adjacent checks where no fertilizer had been applied.

Dry-Farmed Sorghum.

To the Editor: I send you two heads of sorghum: dwarf white milo and feterita. These are average size and condition of heads on my crop—though cut a bit green. There is nothing at all remarkable about either the samples or crop except the method of raising.

I had about five acres this spring which was above my water level and covered with a rank growth of weeds. I had expected to plow it up and let it lie until fall, but at the last minute drilled in sorghum. It was turned over without disking and harrowed twice before sowing. Since that time I harrowed it every two weeks after it came up.

The stand is thick; the feterita in particular has averaged five to eight or more stalks to a stool. The milo too has made a rank growth.

The land is far above any sub-irrigation and is the well-known "sandy loam" supposed to be "grained out." The strange part is that I have better corn than my neighbors who have used water two to three or more times with frequent cultivations!—G. L. H., Wintop.

[What you have experienced is just what sorghum ought to do. It will make more growth with the same water than any other plant, if it has enough heat. For a grain crop it is better without too much water, though when cut green it will use lots of water, making successive crops of green fodder. Your sample heads show you have had conditions just right for grain. Your neighbors probably used too much water for a grain growth. But you must remember that though sorghum will use water to such advantage your plants had moisture enough: if there had been less it would not have done so well. Sorghum is therefore a good plant for dry farming, but it must be good dry farming, which does not lose too much water.—Editor.]

REMOVING REDWOOD COLOR AND TASTE.

To the Editor: How Can I prevent a new redwood tank from coloring the water and making it taste of redwood?—D. L. T., Ripon.

[Answered by F. H. Flood, Redwood Manufacturers' Co.]

A new redwood tank can be prevented from coloring the water and making it "taste of redwood," in one of two ways. The first method is to fill the tank two or three times, allowing it to stand for an interval of two or three days, or as long as possible, before emptying. Of course, this cannot be done if time is essential.

This method is effective, for it dissolves the coloring matter from the wood, after which the water remains perfectly clear and tasteless, and can be used for a great many years—in some instances as long as 65 years.

The second method, which is quicker than the first, is to mix a sort of thick paste from slaked lime with water. This should be applied with a brush to the inner surface of the tank, coating it in the same manner as would be done if it were painted. After this is done, fill the

IMPERIAL Double Disc Engine Harrow

SPECIFICATIONS:

Axle, 1 1/4 inch square steel; Frame, 5/16x3 inch angle steel, double reinforced at the corners. Discs, 18 inch extra heavy, cutaway, 8 point. Bearings, hard maple with hand oil cups.

The principle of this machine is that of two Disc Harrows, one out-throw and one in-throw, built together under a strong, rigid, heavy angle steel frame. The forward Harrow works exactly like the ordinary Disc Harrow in cutting the ground and throwing it outward from the center. The rear Harrow works in the opposite direction, cutting the same ground and throwing it back. The result is equal to that secured by two workings with an ordinary Disc Harrow, but the soil is more thoroughly pulverized and the surface more effectively leveled. Requires but little more power than single disc of same width.

tank with water and allow it to stand for a day or two. The lime will settle to the bottom, after which the tank should be emptied and cleaned out. The lime neutralizes the stain, which is an acid one and after this is done clear water will be obtained. If hot water is available, the chemical reaction is hastened and a lesser time will be consumed in effecting the neutralization.

THE POTASH SITUATION.

[Written for Pacific Rural Press.]

While the agricultural need for potash fertilizers in California is subject to question, there continues a more or less urgent demand for it; but the supply is practically exhausted. We called up several fertilizer companies recently to locate some potash for one of our subscribers.

The German imported sulphate of potash, the form in which we used it mostly before the war, containing 50 per cent potash, was quoted at \$300 per ton, with practically none available. The Utah deposits are turning out about 25 tons per week of 40 per cent potash @ \$250. One or two companies are selling their limited supplies only to those customers whose trade is valuable in other ways. One lot of a few tons was located near Los Angeles for our subscriber. There are large undeveloped deposits of potash in Spain. The cement factories of Southern California are turning out considerable quantities as a by-product. California seaweed has been heralded as a source of fertilizer; but all the potash made from this is used for other purposes and is too expensive for fertilizers. A Spanish chemist announces in the Consular Reports that sea water evaporated for common salt, contains valuable potash very cheaply obtained from the water by further evaporation after the common salt has been deposited. This has not become commercially developed. Meanwhile farmers may seek means of unflocking the potash reserves in their soils.

GRAIN SORGHUM ON ADOBE.

To the Editor: What would be the most profitable to plant next April on adobe land that is to be plowed for summer fallow next Feb. or March—Feterita, milo or Egyptian corn? Will any of these injure my summer fallow for the grain crop to follow? How deep should I plow?—T. S., Byron.

[Answered by Prof. B. A. Madson, University Farm, Davis.]

All of these crops can be grown even on adobe land if proper precaution is taken to prepare a good seed bed and get the crop well started. Milo, however, is to be preferred, followed by Egyptian corn and feterita in the order mentioned.

It is advisable, where crops of this character are to be grown, to plow the land in the fall, allowing it to lie rough during the winter and then work it down to a good seed bed in the spring. The crops should be planted about the middle of April, in fact a little later planting is usually advisable on heavy soils than on light soils. In plowing the land in the fall I would recommend that it be plowed at least eight inches deep to break up plow-sole, and to provide a large volume of loose soil for the absorption of

the moisture, as well as for the rooting of the young plants.

If the crop is to be succeeded in the fall by grain, the yields of wheat or barley will not be so large as if the land had not been cropped to grain sorghums, but better results should be obtained than if following a cereal.

Two years ago there was not an acre of sugar beets in San Joaquin county. Now there are from 10,000 to 13,000 acres, and for the 1917 season a much larger acreage is assured.

Use Dynamite On Your Farm

If you have never used Hercules Dynamite on your farm you have no idea of the many tasks it may be made to perform—and perform more quickly, more thoroughly, and much more cheaply than can the methods usually employed.

In irrigation and drainage work especially does Hercules Dynamite prove its superiority. To run an irrigation ditch or a drain by its use is child's play when you consider the effort and time necessary to accomplish the same work with pick and shovel.

You simply plant the charges along the prescribed course. Connect with the blasting machine. Fire. There is the ditch. If you want to dress it up a bit, well and good. But usually it's ready for use just as the dynamite leaves it.

HERCULES DYNAMITE

is also most valuable for the work it does in subsoiling—an operation which, by the way, can be performed by no other means.

Every progressive farmer is familiar with the almost phenomenal crop results that have been obtained by subsoiling. Many, however, have not yet tried it on their own land. How about you?

In your own interest, in the interest of your farm, you should write us for a book which we have prepared

on the subject of the use of dynamite on the farm. It is called, "Progressive Cultivation", and sent free on request.

In it the subjects already mentioned, also many others such as tree planting, road building, land clearing, etc., are fully discussed and the best methods to follow carefully explained.

You will find the book well worth having. Write for your copy today. Please use the coupon below.

FIELD CROPS.

The Oakdale Cannery will begin to pack pumpkins December 1.

Considerable alfalfa hay was damaged by the rains, and the fifth cutting in many places will not be baled.

Sugar beet-growing is favored at Perris. A large acreage is planned by the American Sugar Beet Company.

Cotton consumption in the United States this year has averaged, thus far, more than 500,000 bales a month.

The Spreckels Sugar Company sent out checks to the amount of \$60,000 recently as second payment on beets to growers in the Manteca section.

It is reported that the San Joaquin Valley Sugar Company will pay the freight on all beets received from all parts of the valley to its mill on an equality.

Antone Baptiste, at his Somis ranch, succeeded in harvesting 116 100-pound bags of lima beans this season from a start of six single beans three years ago.

Between 600 and 700 acres of the Frank Sanders ranch in the Westport district near Modesto have been leased to two Japanese of Salinas, who will plant it to sugar beets.

Dyer & Co., of Cleveland, Ohio, sugar beet factory experts, have accepted the contract for the erection and equipment of the \$1,000,000 sugar refinery on the Whitehall Estates, near Tracy.

Rice growers are complaining of the depredations of mud-hens and will ask the next Legislature to repeal the provision of the game laws now protecting them.

Geo. J. Burris says he has discovered in the mountains east of Forest Home a potash and aluminum deposit. He says the aluminum will pay for mining the rock and the potash will run about \$30 to the ton.

The Pacific Rice Growers' Association controls 61 per cent of the rice to date in the State, which assures their success this year. Mr. Virden or Mr. Stephens will leave for the South the middle of the week to engage competent graders and rough rice experts.

Thousands of acres of the great "pocket" lying between the Modesto Irrigation District and the San Joaquin river, are being put in shape for rice cultivation, six miles west of Modesto this season. The services of an expert rice grower have been secured for the management of the new venture.

Plans whereby potash from the deposits of Seales lake, in San Bernardino county, will be marketed, have been completed, it is announced. It is believed that potash cheap enough for farmers' use will be available in the early spring. At present potash is out of the market for agricultural purposes.

The directors of the Southern Rice Growers' Association established prices for the new season as follows: No. 1, fancy Honduras, \$3.50; No. 1, Honduras, \$3.35; Blue Rose, \$3.25. Price minimums on lower grades were fixed as follows: No. 2, Honduras, \$3.20; No. 3, Honduras, \$3; No. 4, Honduras, \$2.80; No. 2, Blue Rose, \$3.15; No. 3, Blue Rose, \$3; No. 4, Blue Rose, \$2.80.

Cotton planters in the Imperial Valley are feeling the shortage of pickers. Cotton at 17 cents this year means a large increase in cotton acreage next year. Some buyers have already guaranteed 12½ cents a pound for 1917 cotton. A good many fortunes will be made this year in this staple. Ten million dollars derived from the cotton crop is the prospect for Imperial Valley farmers this year.

Hop growers and handlers are urged by the U. S. Dept. of Agriculture to make certain that the sulphur they use in curing is free from

arsenic. The presence in occasional shipments of American hops of minute traces of this poison, introduced by the use of impure sulphur, has lead at times to rejection of shipments, especially in cases of exports to foreign countries with rigid standards. Investigation just completed, establishes definitely that impure sulphur is the source of the toxic ingredient.

The Pacific Rice Growers' Association is circulating for signatures an agreement pledging the signers to place the selling of their rice crop in the hands of the association. It sets forth that the future of the rice industry in California is menaced by various Asiatic interests offering to sell their present crop for \$1.50 per cwt., when it costs the average grower \$1.35 per cwt. to raise same. Many large land owners, renters and agents of large tracts of land to be planted to rice in 1917, are signing this agreement.

DECIDUOUS FRUITS.

The Stewart Fruit Company of Porterville expect to ship about fifteen cars of pomegranates this season.

E. R. Pennebaker of the Stewart Fruit Company recently distributed \$6000 to the peach growers of Kings county in the form of a bonus.

The U. S. Dept. of Agriculture, co-operating with the California Fruit Growers' Exchange, has worked out a uniform system of accounting for local associations.

The Fresno county ordinance, extending the orange test of "eight to one" to all orange shipments from Fresno county, has been passed by the Board of Supervisors.

Since the Citrus Protective League was discontinued, its secretary, F. O. Wallschlaeger, is in charge of the statistical department of the Calif. Fruit Growers' Exchange.

John J. Foss, of Napa Co., gave a demonstration of tree surgery for orchard trees last week, and the attendance and interest shown has far exceeded his expectations—numbers of machines coming every day.

Herman I. Graser will spend about a month in Placer Co. helping Farm Adviser E. O. Amundsen. He will devote his time to giving demonstrations in pruning, control of peach thrips and the use of lime.

The American Embassy at London reports respecting American canned, bottled, preserved, and dried fruits, that the requirements of the British Foreign Office that they must reach the Atlantic seaboard by overland route in order to be permitted entry has been suspended.

Off of eight acres of 20-year-old Adriatic fig trees W. I. Hiatt of Zamora has about eighteen tons of dried product to show for his present year's proceeds. These have been sold at five cents a pound or approximately \$225 per acre. More over the same piece of ground, between the rows, produced about 12 tons of Sultana raisins that will increase the acre production to considerably over three hundred dollars for the current season. Mr. Hiatt this year increased his Sultana plantings fifty acres. His experience causes him to prefer this grape over the Thompson Seedless. "In this district they certainly out-produce the Thompson," says Mr. Hiatt. "Besides this they shatter far less in harvesting and also are much less subject to mildew."

CITRUS, NUTS, SEMI-TROPICAL.

Live Oak district is coming forward as a producer of almonds. Some important shipments were recently made.

All the almonds of the Sutter Almond Growers' Association have been shipped out, and its season's work finished.

Packing of 1916 olives started at the Tulare County Growers' Association cannery last week.

Present indications are that the orange crop of Tulare county this year will be from a week to ten days earlier than usual.

From 4 1/2 acres of Adriatic figs on the J. E. St. Louis Ranch near Colusa 30 tons of dried figs were harvested this year. The trees are 25 years old and touch in the row, though set 40 feet apart.

A carload of Fair Oaks oranges is en route to New Zealand. The shipment was made up of immature fruit, which will be ready for the table by the time it reaches New Zealand.

The University of California will hold a "Citrus Institute Week" at Riverside from Monday to Friday, November 20 to 24, inclusive. The University's orchard experiments will be demonstrated by scientists of distinction.

Word comes from Oroville that interest has been awakened in an early ripening olive grown from budded stock obtained from a parent tree in Palermo. These trees produce the true Mission olive, but ripen three weeks earlier than the common variety.

To guard against citrus canker, an absolute quarantine against all imported citrus fruits, trees, buds and scions has been established by Acting State Commissioner of Horticulture George P. Weldon. Formerly quarantine was imposed only upon citrus fruits coming from Florida. The new order is directed against all states.

Replying to inquiries from abroad, R. M. Tooker & Co., wholesale brokers of dried fruits, etc., San Francisco, inform us that this year, with conditions as they are, caused by the unusual early rains, there will probably be no black figs obtainable in California, certainly not enough for shipment to foreign countries.

A. T. Emory of Whittier, who is visiting in Kentucky, has sent home from Henderson, Ky., a sample of Sicilian lemons he found on the market there. It is scrawny and unattractive and much inferior to the California lemon. The merchant from whom Mr. Emory obtained the lemon says it cost him \$7.50 per box, while the California lemon would have cost him \$8.00 per box, hence the preference given the foreign lemon.

GRAPES.

The California Associated Raisin Company are able to make 100 per cent deliveries on the Muscat orders that have already been received.

In response to reports of an unknown disease affecting a number of raisin-grape vineyards in the vicinity of Dinuba, Visalia, Exeter and Parlier, the State Board of Viticultural Commissioners is about to conduct an investigation.

Sales or attempted sales of approximately 250 tons of raisins to outside packing companies, which were contracted to the California Associated Raisin Company by sixteen growers, has led to the filing of a like number of suits by the association, on charges that the contracts have been broken.

Probably the most popular exhibit with country people at Fresno Fair was that of Horticulture and Viticulture. Grapes were the major part. No grape exhibit equaled that of Frank Henry and A. B. Cate, though the Kerman booth had a cane with 16 bunches weighing 40 pounds, grown by J. W. Shuey. Henry & Cate had an arm from a Malaga vine, the arm of which had 39 good first crop bunches and 35 mature second crop bunches.

MISCELLANEOUS.

The bright warm weather of the last two weeks has been a great help to the farmers of Kings Co. A great many who did not expect to save any raisins are going to market over 50 per cent. Tons of hay that

were in the shock or windrow has been dried out and stacked. It is pretty black, but by going through a good sweat it will make good cow feed. Buyers are not objecting to the discolored Egyptian corn that is being marketed now. Grasses of all kinds are getting a good start and this is promise of a great deal of feed for winter pasture unless we have an unusual long dry spell at this time.

J. C. Galloway of Modesto writes us: "I have a little patch of Sudan grass near my barn that I have cut five times. It was sprinkled with a garden hose twice. Each crop was heavier than the preceding. I have fed it to my cows green, half dried,

and dry with no apparent injury to them."

The regular monthly meeting of the Sacramento Valley Development Association was held at the Plant Introduction Station, Chico, with a good attendance. The banquet in the evening was a very pleasant affair. Dr. B. T. Galloway, Director Cornell University Experiment Station, was the guest of honor.

The United States Bureau of Labor Statistics recently reported that of 210 brands of bread that retailed for 5 cents and weighed 15 ounces or over on May 15, only 14 remained at the same price and weight on September 15. Wheat

was 31 per cent higher in price on September 15 than on May 15.

Twenty-four champion boy farmers of California, who won this month's trip in a special car by defeating 1100 competitors in the University of California's annual crop-growing contests for high school agricultural clubs, have set forth on a 9,000-mile journey. They are to be led by Prof. B. H. Crocherson of the University on a visit to the most famous orchards, breeding-farms, and agricultural industries of America, so as to bring back to California the stimulation of knowledge of the best methods in farming in other parts of the country.

Same HUDSON SUPER-SIX Again Breaks Ocean to Ocean Record

On Return Trip Across America It Beats Best Previous Time and Establishes World's Endurance Record

The same Hudson Super-Six Touring Car which ran from San Francisco to New York in 5 days, 3 hours and 31 minutes, started back from New York on its arrival there and again made the transcontinental trip in shorter time than any other car ever made it.

Last spring the wonder record for the one-way trip made by a famous eight was 2 1/2 days longer than the time required by the Super-Six.

No other automobile ever made the round-trip against time. Yet in both the going and return trips the Hudson Super-Six lowered the best previous one-way record.

In a little more than 10 days the Super-Six covered 6,952 miles.

Counting all stops, and slowing down to the speed restrictions of 350 cities, towns and villages each way, the average time from San Francisco to New York and back to San Francisco was almost 700 miles a day.

In the last leg of the return trip, between Elko, Nevada, and San Francisco, heavy mountain rains were encountered. In the going trip that distance was covered in 20 1/2 hours. On account of the rain and mud, 35 hours were required on the return. Under similar road conditions as were met in the going trip the return would have been under 5 days.

Hudson Holds Every Worth-While Record

There are no important world's records which refer to a stock car that the Hudson Super-Six hasn't won. The best former records are too easy for the Super-Six. The events are too easily won. For instance, in the 24-hour record, 1819 miles, it exceeded the best former record by 52%.

And the Super-Six made the best time in the world's greatest hill-climb up Pike's Peak. The best time for 100 miles. The greatest distance covered in one hour and the fastest time for a stock chassis at the rate of 102 1/2 miles an hour.

Such Endurance Is Convincing

Here we prove again that the Hudson Super-

Six has more endurance than we have ever claimed for it.

What can be more convincing than that round trip across the continent made with a Hudson Super-Six light weight 7-passenger phaeton? Previous records were made with roadsters and stripped cars, but the Hudson at all times carried three, and sometimes four, passengers, and with its baggage weighed in excess of 5,000 pounds.

No Engineer Hopes to Excel It

Remember that the Super-Six is a Hudson invention controlled by Hudson patents.

A hundred cars have motors of like cylinder capacity. Many cars have more cylinders. But in the Super-Six vibration has been reduced to almost nothing. That adds 80% to efficiency.

The Super-Six is not one of the passing sensations. Ours is not one of those claims to motor supremacy which yields in a year or two to another. Mark what these records mean. There is plenty of evidence now to convince you that it cannot be superseded.

Save \$175 Now

For many reasons, now is the time to get a Hudson Super-Six.

In the first place you can get delivery now. Last summer thousands had to wait, and thousands must wait next spring.

Then by buying now you can save \$175. The price will be advanced December 1. The models will not be changed. You get the same Super-Six motor, the same wonderful chassis, and the same beautiful body. Your car you get now will be identical with those we shall sell after December 1, except for some minor details.

HUDSON MOTOR CAR COMPANY, DETROIT, MICHIGAN

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

THE FARM A FACTORY.

[From Address by C. W. Ward at Humboldt County Farm Bureau.]

Taking the proposition that the farm is a factory, it follows that the machinery to run that factory is of as much importance as the machinery in the shoe factory is for the manufacture of shoes.

The best and most thorough machinery for cultivation is none too good. Of course it costs money, considerable capital. So does the boot and shoe machinery cost money, but the boot and shoe manufacturer takes care of his machinery and does not allow it to be exposed to the weather and destroyed. So the modern farmer must invest capital in the best and most practical machinery; he must put up buildings and give that machinery proper care.

The Farm Tractor is thoroughly serviceable and practical. It is an expensive machine and one that must be properly cared for. If you own a tractor you cannot afford to leave it out in the field over night or during rainstorms. It should be provided with a building to shelter it at night and from storms. In this building there should be a work bench with a certain number of tools so that the engineer who runs the tractor will be able to take care of his machine and do whatever light repairing and tightening up of bolts and joints that may be necessary in order to keep his machine in first class condition.

Community Tractor.—The small farmer will say, "A tractor costs too much, my farm is too small." The owners of large areas of land are able to manufacture agricultural products upon a basis of cost with which the small farmer must compete. Consequently I would recommend serious consideration by this Farm Bureau of the problem of inducing a combination of small farmers to purchase one of the smaller and less expensive farm tractors. There are a number in the market which cost less than \$2500 and this means merely the investment of \$500 each for five different small farmers.

The 30 horsepower tractor we have upon the Cottage Gardens does the work of approximately seven heavy teams. The cost of the seven teams under present prices is a little more than the cost of the farm tractor and all of its machinery, including plows, disc harrows, and land leveler. The horse in plowing walks at about the rate of 1½ miles per hour and plows only one furrow. The tractor travels at the rate of 1½ to 2 miles per hour, plowing five to six furrows. The tractor continues this speed in plowing throughout the entire day, while the span of horses gets pretty tired at two or three o'clock in the afternoon and mighty anxious to quit.

Tractor Plows Deeply.—In the climate of California, where it is necessary to pulverize the soil deeply in order to give the roots opportunity to extend deep to reach sufficient moisture to carry it through

the dry season, this ability to cultivate deeply is one of the strong points of the modern farm tractor. Plant food must be distributed throughout all parts of the soil which are reached by plant roots in order to produce the best crops; and it must be put into the soil in such condition as will become available for plant consumption. In shallow cultivation, putting nitrogenous plant foods into the soil and plowing them only three or four inches deep, is simply a waste. On the other hand, if nitrogenous manure is plowed under deeply, say 10 to 16 inches, and this process of plowing thoroughly distributes the nitrogen throughout the entire mass of cultivated soil, it is only necessary to keep up the continuous surface cultivation, producing the well known dust mulch three or four inches in depth, which arrests evaporation, retaining the nitrogenous manures underneath the mulch where the plants can use them.

ALFALFA PASTURING IN MONTEREY COUNTY.

[Written for Pacific Rural Press.]

Healion Bros. of Monterey county are among those dairymen who have found pasturing more economical than cutting the alfalfa and feeding green.

True, they are on a rented ranch where the damage to alfalfa by pasturing is of no concern to them, but nevertheless they do not believe that the alfalfa has been damaged to any extent by pasturing and they would do the same thing if the ranch was their own.

But you want to use care in pasturing, both for the land and the cow's sake. They never pasture when the land is wet from irrigation, preferring to wait till the plants have put out a heavy growth, then stuffing the cows well with dry feed before turning out. This, they find, is almost a certain preventive against bloat and the cows keep up in their milk flow better than when fed in any other manner they know.

The 142 acres of alfalfa in the ranch they farm is all irrigated from a pumping plant and underground cement pipe distributing system. Once started in the spring the pumping plant is never stopped, surface distribution being rather slow with the galvanized iron pipe which it is necessary to use.

Besides the field set aside for pasturing an immense amount of hay is stacked each year, six good cuttings being the rule, the hay cutting and stacking following back of the irrigators all season.

In the winter this hay in connection with concentrates is all fed out, enough cows being kept to consume it. As a rule this calls for between 100 and 110 head, the average production of which is around 22 pounds of four per cent milk. Improvement in this yield is expected, however, as purebred Holstein bulls are in use and the herd gradually being improved on that account.

RAISES BEANS WITHOUT PLOWING.

[Written for Pacific Rural Press.]

"I have never found anybody that could tell me why we should turn land over," said F. E. Barnard of Los Angeles county when asked what is the philosophy of his "Barnard chisel" manufactured by the Killefer Co. for use with tractor engines.

Mr. Barnard farms 2500 acres of beans and has land that never was plowed. The only excuse for plowing is when weeds get ahead of the various cultivators.

The "chisel" consists of a strong frame holding about nine subsoiler standards with small double points which loosen the ground about a foot deep. One of his half dozen track-type tractors pulls this through the dry ground right after threshing and before the rains, tearing up a strip about 8 feet wide and breaking all big clods because the standards are not far apart. When rains come, they do not puddle the surface, being held there by a hard plowpan, but immediately sink away into the great subterranean reservoir opened up by the chisel. The loosened soil has every opportunity to aerate or weather without hurting the crop as extra-deep plowing might. The water there is shaded by a cultivated mulch on top and is not easily evaporated. Roots of the plants each year find a greater supply of plant food easily reached.

LOCATING IRRIGATION WELL.

To the Editor: I was informed yesterday that without fail water can be located by a scientific instrument as well as by the willow switch system. What do you think about it? I am very anxious to get a good well for irrigating and I am told water is scarce here.—F. J. K., Cupertino.

[The only scientific instrument which will locate water as well as a willow switch (which is not at all) is the machinery with which to sink a small test hole to a promising stratum. This is the practice in some sections of the State and enables you to measure the flow before you put down the expensive well. Ask your nearest neighbors who have wells in all directions from you, how deep they went, how near the surface the water comes in their wells, and how much of a flow they get. Then you can estimate how far your test well will have to go.]

PART OF TRACK ROTATES, RE- MAINDER MOTIONLESS.

To the Editor: A party told me that all the surface of a tracklaying tractor that is on the ground is still until the engine passes over it, and yet the machine is running. I can't get that through my head.—F. E. P., Guinda.

[When you see a track whose sections in contact with the ground are not still, you will see the dirt fly as we did on some overloaded tractors at the Puente demonstration. Set a stick in the ground at a joint in the track while a tractor is running and prove for yourself that it doesn't move until the engine has passed over it.]

HARVESTER CYLINDER SPEED.

[Answered by J. W. Givens, Lingard.]

To the Editor: What is the cylinder speed of an ordinary horse harvester?—E. B. B., Fresno.

[Cylinder speed varies from 800 to 1300 r.p.m. It is better to run it fast in tough or weedy grain. The

A Motor for Every Need

Livestock Facts and Fancies---VI.

[By the Editor.]

Enough has been said in previous talks, at least for the present, about the superior qualities and increased values of purebred individuals and how one should proceed by careful effort to recognize and appreciate it. There is another way in which we like to seek demonstration of the powers and values which may be concentrated in purebred animals and that is to observe how what marked effects they produce upon the livestock of a community, a district, a state or a nation, when they are introduced and used in a wise way for the improvement of the "common stock of the country," while a sufficient number of them are kept pure so that the influence of breeding in the purebred may be kept constantly at work during a period of time. Nearly every one has observed this, and so it need not be laboriously argued or demonstrated. Every one has seen forms change, weights increase, speed improved, milking made heavier, etc., etc., in each kind of animals, according as such improvements are desirable in the purposes for which they are kept. In addition to such personal observations, there is the general evidence of increased value which is found in the advanced estimation of the livestock of a state or county by those who are officially employed in the valuation of livestock as a national asset. Before the values of domestic animals became so sharply advanced by trade considerations as manifested by demand and supply, as it has during the last decade, there was in operation the steady increase in the intrinsic value of the animals themselves through the process of "grading up" by the use of purebred sires of different breeds upon the females of common stock. If one looks back through the records of several decades he will find increasing value of this kind duly employed in official valuations. It was of course only the generalized experience of all who had to do with the placing of price by buyers and sellers, with the weighing of animals of different ages, etc. It was an official recognition of the common experience that better animals are worth more either in growing, feeding, buying, selling or in eating. Better animals are worth more money and are easier to get to be worth it—if a man proceeds with any decent amount of intelligence and care in doing it.

But these things are too general to be more than mentioned in passing. What we particularly like to contemplate as a broad demonstration of the potency and value of purebreds, is the experience of Californians during the first decade of the development of this State. As shown with some detail in the Pacific Rural Press of September 16, the foundation stock of California in the cattle line was the so-called Mexican, plus the Texan, plus a small fraction of better common stock from the Mississippi Valley and farther east. At the very first a distinction was made between these classes. The Mexican which we found here, and the Texans which were driven in to fill the great de-

mand for meat for the miners, were both emphatically condemned and the man who had "good American cows" was in the nabob class, because he was seen to be on the way to better things. In the exhortation to increase dairying, when butter was worth a dollar a pound, this picturesque sentence was written by a pioneer: "Get good cows: discard all that have a mixture of Spanish breeds: you may as well choose oxen."

And they did get better cows, both for dairying and for the making of better beef. Shorthorns and Devons came first and made the impress of progress upon the despised Mexican. They imported also the best purebred horses, sheep and swine. The results attained were remarkable. A writer in Hutchins Magazine, in October, 1859, said this:

At one time it was a matter of some anxiety whether or not our supply of beef cattle and sheep would not decrease by overconsumption to justify fear of famine in fresh meats, but though population has greatly increased and consumption therefore is heavy, such has been the ratio of increase that our markets have been well supplied and still the number of animals of the finest breeds has been nearly doubled. Many of our horses already compare favorably with the celebrated stock of Kentucky and of Tennessee. Quietly but surely has progress been made with live stock of all kinds and with very profitable results. Therefore all should take courage to renew efforts and assist in progress that shall be lasting.

And all this was done in about five years after the introduction of purebred animals.

Another writer in a pioneer journal, the San Francisco Alta, also in 1859, gives other notes of progress:

The purchasing and raising of blood stock has not only become of extensive interest among our regular stockmen but many importations have been made by general farmers. The draft horse and racer of old England have their blood relatives on our ranches. Bakewells and Merinos, Southdowns and Leicesters are found in our flocks and Durhams and Devons in our pastures. Aside from direct importations by sea, among the herds that have crossed the plains we have many cattle from choice herds of Ohio and Kentucky.

There never was probably so sharp a contrast between good and poor animals as when these purebreds walked out upon the California plains, to be measured in the pioneer's eye beside the despised Mexican cattle.

It is hardly wonderful that the suggested contrast should have drawn gold freely from the pioneers. Gold was dirt: these animals were noble: they embodied the better things which the early Californians yearned for in a new American State, and the pioneers called to the world for them, with this result, as noted by a writer in the California Culturist, in the year already cited:

There is probably no State in the Union where more pains are taken or where money is more freely lavished upon the purchase of animals of high blood than in California.

At first there was apprehension lest the purebreds would not be hardy. Much was said then about the purebreds being pampered and

TREWHITT'S BIG TYPE POLAND CHINAS

The blood lines of the herd are unexcelled, the foundation stock having been secured from the Topnotch Herds of the Middle West. Sows of fine quality, yet big and roomy. The sort that have large litters of vigorous pigs.

Offering for sale a choice selection of gilts, boars and bred sows.

Standard Oil Company
(California)

all that, without thought that the pampering is not in the breed but in the man who keeps the stock for unwise or for temporary purposes. And there were sharp debates about it. In 1859 a Butte county cattleman, who did not give his name, wrote this:

I have since 1852 been engaged in stock breeding in northern California. Shorthorn grades I have invariably found to keep in good condition upon a smaller amount of feed than any of the native or common run of stock. Last winter I had a band of Shorthorn grades, common American and a cross between them and the native stock. Of the latter kinds I lost 18 per cent by starvation; of the grades not one. Because of half-starved condition many of common cows dropped small deformed calves which died when dropped. My neighbor lost 50 per cent of his calves this spring from that cause. I have not yet lost a calf from a grade cow.

And the editor who published the foregoing added this: "If the cross of improved breeds produced a

hardier animal, we can see nothing to be gained in a continuance of native blood in ill-formed carcasses. If they do not possess even the quality of hardiness or powers of subsistence on scanty forage, we can conceive of no reason for perpetuating them."

And they were not perpetuated. They were eaten when meat was high: they were killed for hides and tallow when meat could not be sold. Out of the depression in the early '60s, which nothing survived unless it was top-crossed enough to be "Americanized," there came the common stock which this writer found here in 1875 and considered as good as the common stock of New York State—which could not have been said of any other State stock west of the Missouri river at that date. Thus was the common stock of California transformed, within two decades, so that the old could no longer be recognized, except in remote localities perhaps, by the free use of purebred progenitors.

The Horse Makes a "Counter Attack."

[By Wayne Dinsmore, Secretary Percheron Society of America.]

Columns have been written to show that horses and mules are no longer needed in war by writers whose talents should be devoted to writing best sellers a la Chambers. It may bring some of them to earth to peruse the following figures from the U. S. Bureau of Foreign Commerce:

From September 1, 1914, to June 1, 1916, the United States exported 30,411 commercial automobiles, valued at \$81,295,986.00; 69,803 passenger automobiles, valued at \$57,623,261.00, and 22,502 motorcycles, valued at \$4,202,877.00—a grand total of 122,716 motor-driven vehicles, all kinds, with a total value of \$143,122,124.00.

Against these exports, which have caused the motor-driven knights of the fountain pen to indulge in ecstatic paeans of joy, regarding the elimination of horses and mules, the

cold figures show that during the same period—September 1, 1914, to June 1, 1916—611,790 horses, valued at \$134,943,456.00, and 167,387 mules, valued at \$34,198,955.00, were exported—a total, in value, of \$169,142,411.00.

This overshadows, very handily, the total of exports of motor-driven vehicles. To the exports of horses and mules, however, we must add the exports of wagons, valued at \$2,461,611.00; and of harness and saddles, valued at \$25,739,015.00.

The grand total for horses, mules, wagons, harness and saddles, exported during the 23 months ending June 1, 1916, comes to \$197,343,037.00—almost two hundred million dollars. This exceeds the exports of motor vehicles by more than fifty-four million dollars, and is conclusive evidence that horses and mules are not back numbers in war.

WORKING AND KEEPING BUTTER IN BRINE.

To the Editor: After buttermilk has been thoroughly washed out of butter and the salt worked into it, is it then ready for the table, or is it improved by standing awhile and then pressing out the water which the salt may have caused? How is brine made for packing butter for winter use?—T. S., Calistoga.

[It will not improve your butter to break it up again after it has become hard. It will be improved though by standing till hard before using. A satisfactory brine may be made by the use of cold water and salt, using all the salt the water will dissolve. After the brine is made, sprinkle a generous amount of salt in the bottom of the jar, set the butter in the jar and fill up with the heavy brine, being sure that it covers all of the butter.]

CHEAPENING STANCHION EQUIPMENT.

[Written for Pacific Rural Press.]

Economical but sanitary dairy barn construction is of growing importance to dairymen in this State and for that reason the method of hanging the patented iron stanchions at the Laurel Dairy in San Luis Obispo county is of interest.

As running water for flushing the concrete floors was desired in this barn, a two-inch pipe was run the entire length of the building. Valves were placed at regular intervals along this pipe and clamps made from which the iron stanchions were hung.

As seen in operation this pipe supports the stanchions and at the same time furnishes a water supply the entire length of the building.

PASTURING GRAIN SORGHUMS.

To the Editor: I intend putting some steers on Egyptian corn. Would like to know the best time to put them in to fatten, and to know if it is injurious in any way.—A. A., San Ardo.

[In the San Joaquin Valley, cattle are turned into green Egyptian corn about August. No damage results. Range cattle eat stalks and all to the ground—cattle from alfalfa or feed lots waste some of it. The grain has most nourishment and fattening value when practically mature; but at that time it has withdrawn most of the value from the stalks. Be careful not to pasture any of the grain sorghums which have sprouted after being severely checked by drouth or frost.]

Is Your Roof Insured?

Probably you have never heard of Roof Insurance—but when you use MALTHOID JUNIOR you have an insured roof.

California's Greatest Grade Dairy.

Eight years ago this herd averaged 350 pounds of fat yearly. Last year 80 of the cows averaged 427 pounds. This was due to purebred bulls and culling poor producers as shown by cow testing. Every dairyman in California now has a chance to increase production in the same way and gain part of \$4700 in prizes besides other trophies, by entering the California State Dairy Cow Competition.

[Written for Pacific Rural Press.]

What will 30 years of continuous breeding to purebred bulls and selection accomplish in the way of production with dairy cows? And when it is done, how can you know it definitely without weighing and testing? There are few herds of dairy cattle that have been managed in this way for so long a time.

Because of this the grade Jersey herd of John Hansen of Humboldt county is one of the most interesting and instructive examples in this or other States; for it is the result of over 30 years' continuous breeding and selection; and what is more, the exact benefits in production are shown by the records of the Fernald Cow Testing Association.

The story is told by pioneer dairymen of Humboldt county that the Van Duzer herd, this name being taken from the founder of the herd,

to give over 300 pounds of fat, and of course many of them do this. Those that don't come up to this mark are disposed of.

The original cows in the herd were low testers; and for that reason the herd sires have been selected both for the quantity and quality of milk that their dams gave. By this means the test has been greatly improved, although Mr. Hansen states that the size of his cows has been gradually reduced owing to the introduction of "island type" bulls into the herd.

Feeding.—Like all Humboldt county herds, feed plays an important part in this high production. Here is a lesson for dairymen everywhere. Mr. Hansen attributes a great deal of his success to the large variety of feeds he uses and it is doubtless due to this variety more

was originally made up of Durham cows, selected for milk rather than beef production.

Some 30 or more years ago a registered Jersey bull was purchased and the heifers from this cross proved so superior to their dams that Jersey bulls have been used ever since.

The present herd comprises 80 to 90 cows. Eighty of them produced the surprisingly large average of 427.18 pounds of butterfat during the year ending February, 1916, one 18-year-old cow producing 635 pounds of fat and none of them giving less than 301.6 pounds.

Primarily the purebred bulls have been responsible for these great records, but testing and the selection of heifers has played an important part in recent years. This is evidenced by the fact that when first entered in a local cow-testing association eight years ago, the herd average was about 350 pounds of fat yearly.

Culling after Testing.—Since then the practice has been to make two cullings of heifers, the first one being done while they are still calves and based on the producing ability of their dams. Usually 25 to 35 of these are saved each year and these are again culled over during their first lactation period for production. Provided conditions are normal, a heifer with her first calf is expected

than to climate that all cows produce more in this region than elsewhere.

From the first of March to the first of August, clover and rye grass, both as a pasture and a soiling crop, are the chief feeds, together with some cocoanut meal. By the first of August the pasture is about gone. From then, through the winter, silage made from oats and vetch or barley and vetch is fed in connection with clover and rye grass hay, cocoanut meal, carrots, and beets. The carrots are fed during August and September, followed by the beets.

Mr. Hansen thinks that most dairymen in Humboldt county do not feed well enough during the fall months when pastures become poor. He has found the silo an especially important factor at that time of the year. So much so, in fact, that he will erect the second one this year.

The morning milk is sold and distributed in Eureka; and the evening milk is separated and the cream sold to the creamery. All of the cows in the herd have passed the tuberculin test.

In almost every district there are examples of herd improvement along the same lines pursued by Mr. Hansen, but no place has the writer ever found a more definite and sure policy than is shown in the management of this herd.

Insure your feed supply against early frost and rain with

REMCO SILOS

The early cessation of the rains last spring and their unusually early opening this fall should be a warning to all feeders of livestock, especially dairymen, to no longer neglect the addition of silos to their equipment.

It is not yet too late to order a Remco silo to save your crop of corn from the frosts likely to follow the early rains, or to save your last cutting of alfalfa.

A Remco silo is your cheapest insurance against all such losses. Send in your order early and avoid delay.

DAVIS,

CALIFORNIA

While this herd is the highest producing lot of grade cows in the State, so far as known, Mr. Hansen expects to further increase the average production in the future.

To the dairyman that is undecided as to the advantages of purebred

bulls and a membership in the local cow-testing association or entry into the State Dairy Cow Competition, Mr. Hansen's experience should be most enlightening. To enter the State Competition, write Prof. F. W. Woll of Univ. of California Farm.

University Hog Feeding Results.

[By T. C. Jenkins, of University Farm Agricola, Davis.]

A green feed pasture is at all times necessary for economical hog-production. Self-feeders again receive the official stamp of approval. Coconut meal is a good partial substitute for barley, with barley at present top-notch prices. Milo maize seems to have great possibilities as a fattening food, in proper feeding mixtures. Good individuals of any of the four standard lard-type breeds will "lift the mortgages of the farmer"—it is proper care and feeding that make the real differences under average conditions. With average purebreds, average attention and average amounts of feed, 220-lb. pigs are easily possibly in 7 months.

The above statements may be given as the "headlines" of the 3 months' hog-feeding experiment at the California Agricultural Experiment Station at Davis, which ended Oct. 18. Ninety-six purebred Berkshires, Poland-Chinas, Duroc-Jerseys, and Chester Whites were divided into eight lots of 12 pigs each. On July 11 these animals, then averaging a little less than 4 months in age and practically 100 lbs. in weight, were started on the test. For the last three years, hog feeding experiments with the same feeds, etc., except milo maize, have been run at the University Farm and a bulletin may soon be issued covering the whole subject after such thorough research. Ninety-eight days later one lot averaged 254 lbs., a gain of 1.56 lbs. per day at an actual cost of 6.6 cents per lb. This lot was self-feeder fed on milo maize and tankage, and allowed to run on alfalfa pasture—the best of the eight lots. At the other extreme came those 12 pigs fed soaked rolled barley, without pasture, which averaged 193 lbs., or 0.9 lb. gain per day, at a cost of 9.6 cents per lb. Where would be the profit in this last case with pork around 8½¢?

All Self-Fed Lots Won.—Self-feeders again won. The four leading pens, as judged by economy of gain, were those that looked after their own needs through the "cafeteria system," and with an alfalfa pasture at hand to obtain exercise and appetites upon. Next to the milo maize lot came that pen fed rolled barley and coconut oil meal which gained 1.29 lbs. per day at a cost of 7.3 cents. This and similar tests tend to show that this oil meal, lower than other oil meals in protein, will well supersede part of the barley ration and now may be bought for \$20 per ton as compared with barley at \$32. Its fat content is about 10 per cent and its protein 20 per cent. The other self-fed lots were given rolled barley, and rolled barley and tankage, respectively, and the pork was put on both at a cost of 7.7 cents.

The next two pens were those fed on alfalfa pasture, rolled barley, and rolled barley and shorts—which made their gains at 8.7 cents per lb. The lots unpastured were the last of all and a poor last at that.

Weight was put on at over 9 cents per lb. Rolled barley and cut green alfalfa sounds like a good ration; and it might make money during years of low barley, but the cost per pound of gain was 9.1¢. The last lot has already been mentioned, soaked rolled barley without pasture, with a cost of 9.6¢, for \$32 barley means 1.6¢ per lb. of grain and these 12 hogs ate 6 lbs. per day to put on their 0.9 lb. gain. The leading pen ate 4 pounds of maize and 0.1 pound of tankage, with pasture, to put on their gain of over 1½ lbs. at 6.6¢.

Alfalfa pasture was figured at 20¢ per pig per month. All other feeds are figured at prevailing prices to any large buyer, though of course much of the feed was produced on the 800-acre farm at Davis. The protein (muscle- and bone-making) feeds of cut green alfalfa and tankage, were figured at \$2.25 and \$42 per ton respectively. The fat- and heat-making feeds of barley, shorts, oil meal, and milo maize came at 32, 33, 20 and 30 dollars respectively. The maize, which showed up so exceptionally well in this test, will be tried again in a number of feeding experiments of the University to check these results. It is of course an important feed in California in dry land sections.

The day after the conclusion of this important feeding experiment, Prof. J. I. Thompson took over 200 outside farmers and College of Agriculture Short Course students out to the cement-floored hog barn and there explained in detail all points in the research work just ended, with the animals present.

The Western Meat Co., which always encourages such practical experiment work, then took delivery of the 96 animals, will determine the shrinking and dressing percentages and will probably pay a premium of at least ½¢ per pound because of the uniformity and grain-fed-all-the-way pork.

All animals were University bred and raised and, on the whole, the four leading breeds showed up equally well in every way. No sickness, etc., spoiled the accuracy of the trials. All feeds were mixed in the various self-feeders except the tankage, which had a separate box—as did also, of course, the appetizers of salt, sulphur, slaked lime, and charcoal.

Chopped Alfalfa vs. Alfalfa Meal.—The next hog test, this winter, will experiment with chopped, regular-length, and "mealed" alfalfa, in conjunction with barley. Many just such practical and momentous experiments are now under way for other types of market animals under supervision by Profs. True, Woll, Thompson, and Miller, assisted by Messrs. Voorhees and Royce. All such experiments are run on a three-year basis so that nothing will be finally announced officially until the data is proved time after time at the University Farm.

DAIRYING AND DAIRYMEN.

The new cow testing association in territory near Patterson is ready to begin its activities.

The dairy industry in the Oakdale irrigation district has doubled within less than a year.

The combination of high prices and plenty of feed makes the dairy conditions ideal at the present time.

A. M. Smith recently made the first importations of Ayrshire blooded dairy stock into Tulare county. His herd includes four heifers and a bull.

The sum of \$25,000 was offered by Miss May Irwin and refused by C. I. Hood of Lowell, Mass., for Sophie the 19th, the world's record Jersey.

Stanford Vina Ranch recently sold from its purebred herd of Holsteins, a young bull to Clara K. Morse, Live Oak. The calf is sired by Colantha Johanna Lad.

An average of seven cents more was paid for September cream this year than last by the creameries of Kings county. The returns for the month were \$185,000.

P. B. Vantress, formerly of Danville, Contra Costa Co., has established himself in the dairy business near Live Oak. He expects to get together a herd of from 25 to 30 cows.

After a ten-year period of idleness the Alpine Evaporated Milk Co. resumed operations Oct. 4. Manager A. R. Patrick hopes to handle at the Hollister condensary plant of least 30,000 pounds of milk daily.

A shipment of high grade livestock left Goshen for Minneapolis last week, consisting of 25 head of cattle, several horses, and poultry stock. It was consigned by B. B. Scott of the Dirk Dairy Farm to the Minneapolis Holstein Ranch.

The N. H. Locke Co. of Lockeford sends us the latest record of Empress Lass in the following words: "Her record to date is 11,956.4 pounds of milk and 637.1 pounds of butterfat in 301 days. She will raise two calves within the 12 months."

Complaints reached the State Department of Health this week that tubercular cows are being sold to butchers, to be slaughtered and sold for human consumption. Dairymen, it is said, are beginning to sell off tubercular cows, knowing they will not come up to the tuberculin test required by the new milk law.

The State has "mustered into service" all dairy inspectors available through the civil service commission to carry out the provisions of the pure milk law. Another examination will be held in San Francisco, Sacramento, and Los Angeles, Nov. 4. The salary is \$4.50 per day. Candidates must be familiar with the dairy laws of the State and skilled in the testing of milk, cream, and butter.

The Gotshall Cattle Loan Co. of San Joaquin county were purchasers of a number of good Holsteins at the Hanford consignment sale which together with those purchased by them at the Rivera sale in Los Angeles county will comprise the foundation herd for their newly acquired ranch on the Stanislaus river. Mr. Gotshall states that they expect to erect modern dairy barns and silos at an early date.

F. Stenzel announces two more Junior 2-year-old records by daughters of his junior herd sire, Dutchland Pietertje Creamelle, Lady Storm Creamelle, 22.07 pounds; and Estudillo Bonnie Creamelle, 19 pounds. These, with the California champion 2-year-old record and Korndyke Ornsby, who recently made a record of 19.33 pounds gives his sire four junior 2-year-olds with records av-

eraging 21 pounds—a record hard to beat.

The cattle-raising industry in San Joaquin county looks even more attractive since the San Joaquin county exhibitors carried off many awards at the 1916 State Fair.

Dairy farmers in the Lahontan dam district are going to make this territory known as high-class producers. On Oct. 7th at Fallon was formed the Truckee-Carson Project Cow-Testing Ass'n. This for the better conditions in general in bringing out the best quality of dairying and economic feeding. Mr. A. L. Baker was elected president; vice-president, P. T. Walker, and Mr. E. R. Eichler, a graduate of University of California Agricultural School, was elected treasurer and secretary. There are already 28 members in the association, and the prospects are that many more will enter. Mr. V. E. Scott, State leader in dairying, was chairman at the meeting, and it was through his good work that Nevada and this district are coming to the front in this work.

SWINE AND SWINEMEN.

Hog raising is one of the big features on the ranches in the neighborhood of Willows. A carload of Berkshires was received recently by Robert Wilson.

The Pacific Improvement Co. of Santa Barbara have 89 head of hogs looking in fine condition, which have fed on nothing but tules for the last four months.

Turbulent times down in Old Mexico have not entirely eliminated efforts to produce pork and beef, four purebred Poland-China shoats having recently been shipped into that country from Chowchilla.

On Sept. 15 prices of sheep averaged throughout the United States \$6.25 per hundred pounds, against \$6.22 a month ago and \$5.06 a year ago. Hogs averaged \$9.22 compared with \$8.61 a month ago, and \$6.79 a year ago.

The first auction sale of Poland-Chinas ever held in California by an individual breeder will be the one held on the ranch of W. H. Browning near Woodland some time in November. All of the stock to be sold traces back to A. Wonder.

An unusually large number of hogs are reported to be going from points in the Sacramento valley to Portland and other northwestern markets. Quotations there have been considerably higher than at California points for several months.

Escalon Polly, a daughter of A. B. Humphrey's Berkshire boar, Grand Leader, was Junior Champion and reserve Grand Champion at the Oregon State Fair. She was exhibited by F. R. Steele of Grants Pass, who bought her at the Sacramento Fair.

Homer Hewins, Calistoga, Cal., has lately purchased an excellent Berkshire gilt from Winona Ranch, Grants Pass, Ore. She is a daughter of Laurel Champion out of Berryton Belle 31st, one of the first prize young herd at the 1914 Oregon State Fair.

Winona Ranch recently shipped to F. B. Glenn, Willows, Cal., the junior yearling boar Winona Champion 5th, a son of Laurel Champion out of Lady Princess Lee 3rd. This boar was third junior boar pig at the 1915 Oregon State Fair; and is already a proven sire of good pigs.

Squire Wilkerson, a colored farmer of Lompoc, has five acres in the Magdalena canyon upon which he is raising successfully over 50 hogs. He feeds them almost entirely upon hog beans, which ordinarily sell for \$10 a ton, but Mr. Wilkerson beats that. He gets just

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all ages, reasonable prices. Some fine bred sows and gilts, and top quality young boars. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, E. H. Whitten, Route 5, Box 647, Los Angeles.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superbas for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

MISCELLANEOUS.

DUROCS AND GUERNSEY BULL CALVES bred to 900-lb. boar. Ed E. Johnson, Turlock, Cal.

a little poorer grade after the threshers leave the field, for only the cost of hauling. These he cooks up in a cauldron to work extra fine for his hogs.

According to Prof. J. I. Thompson, who has just returned from a trip through the Middle Western States, the large type Poland China hog is by far the most popular type of the breed. He states, though, that quality is being combined with size and believes California breeders should give more attention to this phase of breeding. He also found that in Berkshires, California ranks right up to the top in quality, giving it as his opinion that our Berkshires are as good as any he saw at the Eastern shows.

Mr. Haden Smith of Woodland has just made the following sales: Boar to Geo. Rothney of Live Oak; boar to A. W. Bihlman, Live Oak; two bred sows, J. A. Sutton, Delevan; boar, Rio Bonito Orchards Co., Butte Co.; boar, H. M. Barngrover, Santa Clara; boar, E. A. Peabody, Vacaville; bred gilt, W. A. Hevener, Arizona. He also sold his boar, H. S. Royal Colonel, No. 200,237, who took second prize at the State Fair, to H. E. Boudier of Napa. Mr. Smith believes California can raise hogs equal in size and quality to anything produced in the East.

The Southern California Duroc Jersey Breeders' Association was organized at the Riverside Fair, 1916, for the purpose of presenting the merits of the Duroc Jersey to the public, and making Southern California a center for Durocs. In localities where all concentrate on one breed, better animals are produced and better prices obtained for stock than where breeders raise a number of different breeds. A prospective buyer will go a long way to see a group of breeders all raising the same kind of hogs where he would hesitate to make the trip for one herd.

BEEF CATTLE.

Eight hundred feeders have been sent from Oregon to be fattened on the Porterville Alfalfa Company ranch at Poplar.

Stock raisers of Monterey county are realizing the value of blooded stock and are getting only the best kind for their ranches.

A shipment of four carloads of steers, eighty-two head in all, were recently made by the Porterville Alfalfa Company to Los Angeles.

Yolo county stockmen are jubilant over weather conditions believing that this coming year will establish a new record for activity in output and sales.

The drives begun to rescue some 10,000 head of cattle caught in the mountains between the Kings and San Joaquin rivers during the snow storm of two weeks ago, have been successful. Little loss was sustained.

The Gibson Estate at Woodland recently sold two registered Shorthorn bull calves to the Newhall Land and Cattle Co., of San Francisco. The first named company will show at the Portland Livestock show in November.

To develop the stock-raising industry in California the San Francisco Cattle Loan Co. has been organized, and will lend money to

stockmen to enable them to market their cattle under the most favorable conditions.

SANTA ANITA SALE.

[Written for Pacific Rural Press.]

The first annual sale of the Santa Anita Rancho was held Monday, October 23, under most favorable weather conditions. The offerings, both by the Anita Rancho and the Edgemont Holstein Farm, owned by C. W. Anderson of Burbank, were a fine lot, showing good breeding, and many of them splendid individuals. The Baldwin cattle were mostly young bulls of high breeding. There was a good crowd in attendance, but not many buyers. Col. Ben A. Rhoades cried the sale and worked hard, but failed to enthruse the crowd. Bidding was slow, especially on the bulls, which were young. They failed to bring their worth considering their breeding. One bright spot in the bull sale was Paul Johanna Nig DeKol, a short two-year-old whose sire is brother to Sadie Vale Concordia 4th Pietertje, who produced 38.43 lbs. of butter in 7 days. He went to V. W. Bailey of Imperial for \$1500. Fourteen other bulls made an average of \$171.43, and 43 cows and heifers averaged \$289. Most of the cattle were taken by near-by buyers. J. J. Jeffries of Los Angeles got 27 good cows and heifers for which he paid \$270 to \$410.

The buyers are listed below:

Bulls: V. W. Bailey, Imperial; McAlister & Sons, Chino; C. F. Noland, Los Angeles; C. R. Taylor, Pasadena; G. C. Waterhouse, Chino; C. H. Merrill, Hines; E. P. Fay, Buena Park; F. H. Dailey, Imperial; Wm. Kertrick; A. L. Kraige, Los Angeles; and Arden Dairy, El Monte.

Cows and Heifers: J. J. Jeffries, Burbank; Mr. Bowen, Pasadena; McAlister & Son, Chino; G. C. Waterhouse, Chino; B. A. Rhoades, Los Angeles; L. B. Van Blarican, El Monte; and E. P. Fay, Buena Park.

THE HOLSTEIN SALE AT HANFORD.

The California Breeders' Holstein Sale at Hanford last week was a buyers' sale. A majority of the consignors expressed disappointment at prices received, while a number of the buyers were jubilant over their bargains. The buyers were mostly local breeders and dairymen.

The top price of the sale was \$710 for Aralia De Kol Pontiac Burke, a 32-pound bull consigned by A. W. Morris & Sons. H. E. Vogel of Fresno was the purchaser. The highest price for a cow was \$500 for Rosa De Oro Sarcastic, a blue-ribbon cow consigned by T. J. Gikerson. G. H. Loughery was the buyer. The average price was a little under \$250 per head.

Among the large buyers at the sale were Gotshall Cattle Loan Co., Ripon; F. M. Helm, Fresno; H. E. Vogel, Fresno; G. H. Loughery, Tulare; and J. K. Macomber of Tipton. Frank Morris was sales manager and Col. Ben A. Rhoades of Los Angeles, auctioneer.

POLANDS AVERAGE \$37 AT HANFORD.

[Written for Pacific Rural Press.]

At the auction sale of the Kings County Poland China Breeders last week 123 head were sold for \$4,550, an average of \$37 per head. There

was a good demand for the best hogs. The sale was topped by Bassett's prize boar Gold Boy, who went to J. L. Lane of Lemoore for \$135. The highest price for a sow was received for Wm. Bernstein's Candy Kid's Equal, who was bid in by J. K. Macomber of Tipton for \$115. The hogs of Mr. Bassett's consignment bred by him averaged \$59.00. Other good averages were as follows: W. Bernstein \$51. F. D. Ross \$48. The largest buyers were G. H. Loughery, Tulare, 11 head for \$385; J. W. Guiberson, Corcoran, 10 head, \$275; J. B. Lane, Lemoore, 8 head, \$337.50; J. A. Macomber, Tipton, 4 head, \$252.50; Dimmick Bros., Lemoore, 4 head, \$300.

"Good to the Last Drop"

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves. It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 117 Waukegan, Ill.

Purebred Registered
HOLSTEIN CATTLE

The world's champion advanced registry milk producer is the purebred registered Holstein-Friesian cow, Lutcke Vale Cornucopia, owned in the State of Washington. In 365 days this wonderful cow produced 31,239.4 lbs. of milk or over 15,000 quarts, exceeding the best previous milk producing record of 30,451 lbs. made by the Holstein Tilly Alcartra. The big "Black and White" cattle, not only by individual performances, but by matchless qualities and achievements as a breed, are proving their superior worth all over the world. Send for FREE Illustrated Descriptive Booklets. The Holstein-Friesian Association of America.

PIGS HAD FITS.

To the Editor: Fat sleek pigs began to stagger, feet drew up, they couldn't walk, acted like having fits, mouths jerked and frothed, most of them died. Sows fat, getting milk and pasture with sunflower thicket for shade. How do measles affect pigs? What is the cause of young turkeys' crops getting so large or breaking down?—A. B., Visalia.

[Open some of the pigs and determine whether they are free from worms. Overfeeding will cause a distension and paralysis of the craw of fowls. This can be operated on by making the incision at the top of the crop, evacuating, and sowing up.]

MARE'S ANKLE SPRAINED.

To the Editor: A mare sprained her back ankle a short time ago. I kept it bound tight until she could walk fairly well, but the swelling does not go down.

The Inter-State Vaccine Co. says they can immunize a 3-day pig for life. Is this true?—E. L. I., Orland.

[Paint the ankle with tincture of iodine daily for three or four weeks. Do not know the vaccine people you refer to. Pigs can be immunized at this age but it is better policy to wait till they are weaned.]

HOGS RUN AT NOSE.

To the Editor: My hogs and those of a good many of my neighbors run at the nose, breathe hard, fall off on their feed, and sometimes die. They have a dry cough, and are sick all the way from two weeks to a year. No worms can be detected. Is it swine plague, and what can I do for it? It seems a little contagious as the suckling pigs seem to get it from the sow.—W. B. H., Riverdale.

[This is contagious pleuro-pneumonia and in a chronic form. Cures and treatments are of little use. Prevention by hygiene and sanitation are the only practical means of combating this trouble.]

MILKY FLOW FROM MARE.

To the Editor: An old mare has been losing flesh several months. She flows a milky substance almost daily. She is on dry pasture with a little hay. Has had but little to do for the past three months. Last March she had a bad cold, recovered in about three weeks, but has not been so well since.—A. T. M., Galt.

[Give this mare ½ oz. Fowler's solution and one dram fluid extract nux vomica twice a day in her feed. Douch her out daily with one gallon water containing ½ dram potassium permanganate.]

HORSE COUGHS.

To the Editor: A horse started to cough semi-occasionally nine months ago. It began to bother his breathing two weeks ago. He has had a number of spells of very hard breathing. It seems to start in his throat. When he coughs up phlegm, he doesn't cough for a long time again. Is fed sudan grass, alfalfa, oat and barley hay, and always has access to a stack of barley straw. Has grain only when working hardest. He is not poor, does not run at the nose, and never did but very little. Hangs his head very low when standing—seems very hungry all the time.—E. S. U., Hemet.

[Give this animal what he will eat. Give 10 grains potassium bichromate in solution twice a day, and keep this treatment up over a period of at least three weeks.]

FORK WOUND—HORSE SCOURS.

To the Editor: A mule was injured with a pitchfork just below and in front of her hip bone. Pus keeps flowing from it. A horse scours continually though I have tried different feeds. Seems worse when on alfalfa.—G. H. T., San Diego.

[There is a pus pocket on the mule, which must be drained. Have the horse's mouth examined and give him one-half ounce aromatic sulphuric acid in one-half bucket water twice a day.]

LUMP ON HORSE'S SHOULDER.

To the Editor: A young work horse has a knot on this shoulder caused from plowing last spring. Have worked him very little this summer, but the lump stays.—A. G., Santa Clara.

[The only way to remove this is with a knife. Consult your veterinary.]

SOW THIN, PIGS RUNTY.

To the Editor: A brood sow gets thin and pigs seem runty. Has been that way for several litters.—I. Bros., Orland.

[Have this sow tested for tuberculosis.]

TRAPNESTS BREEDING HENS.

[Written for Pacific Rural Press.]

Trapnested hens for the breeding pen are the feature of Magnolia Poultry Farm in Riverside county. Pullets for trapnesting are selected at not less than a year old for size, vigor, mature development, shape, and for the large red comb which nearly always indicates good layers, according to Mrs. C. H. Hosford, who with her husband and the capable young Guy Wolcott, takes care of the Farm.

Only 200 to 240 of the best are trapnested, choosing the most alert and promising ones when they are beginning to lay. Only those laying 200 eggs or over are kept in the feature pen. Day-old chicks from these are sold at double the price of those from selected hens not trapnested. Last season six or seven lots of 200 to 250 each were raised from the trapnested hens. Their mothers, when seen late in September, 1916, were busy molting, but were scratching like mad in the well-littered open front house and in the orange-shaded yard. Their combs were bright red in striking contrast to the pens of many other farms seen about the same time.

The Trapnests.—Trapnests are made on the farm. They consist of boxes about a foot square and two feet long which project half way into the house which protects this lot of hens. They project half way out under an extension of the roof, under which egg-gatherers and nests are protected from wet weather. A partition across the center of each nest has a circular hole cut in it large enough to permit a hen to go through. A slatted door closes the henyard end. It slides up and down, being held up by a projecting eyelet which catches under the very short end of a stiff-trip wire. From the eyelet, this trip wire rises vertically an inch or two to the roof of the compartment and then horizontally back to the partition where it bends downward entirely across center of the circular hole. It is held in place loosely by staples into the roof.

When a hen enters the laying-compartment from the hen-yard end of the nest, she pushes the wire aside and that slips its end from under the eyelet tripping the door behind her. But her head is already in the laying-compartment, and she is not scared. The laying compartment is dark, and she stays there only long enough to lay; then goes back toward the light end of the nest without remaining to tramp and break the egg.

In September conditions, when

only a few of the hens are laying, and when the weather is cool, trapnests are opened four or five times a day; but when weather is hot, and in the heavy laying period, the hens are released every hour or two. As each hen is taken out, her number and her egg are recorded on a sheet of paper tacked to a light board which hangs by two little hooks from a wire along the house over the trap nests.

The value of the little extra work trapnesting is shown not only by the increased value of the chicks, but also by the increasing number of eggs laid to produce more chicks. In the laying contest at the San Diego Exposition Jan. 1, 1915, to Jan. 1, 1916, Mr. Hosford's pen of six White Leghorns laid 1095 eggs. This does not count Dec., 1914, when they had to be on the grounds, nor the average of 8 eggs each had laid previous to that.

QUESTIONS AND ANSWERS.

Hens Get Scared.—One hundred R. I. Red hens stay around the hen house and every once in awhile they run out as if something was after them; other times they stand bunched up and all at once they go up in the air as if a big animal had jumped among them, then they rush in the coops and peek out. They are not afraid of me, as I have to push them away when feeding, but sometimes on the hillside they go up in the air. I feed Surelay in a morning, moistened kale before them all the time, sprouted barley and wheat at night. They have wild meat chopped up and some days I cook it. The meat is squirrels, wild-cat, coon, fox, and coyote. I am only getting 12 to 14 eggs a day and I would like to know if it is the feed that causes them to act that way?—F. O. O.

[It is the smell of blood that the chickens get from the raw meat, some of it gets on the feathers and when they are standing around they smell it and their natural instinct causes them to be afraid of those animals from which the smell comes. Spray yards with distillate or oil, then give no more raw meat, but cook it. With such generous feeding as yours you ought to be getting at least fifty eggs a day.]

Vent Protrudes and Fowls Pick Themselves.—Three of my hens are troubled by the vents protruding about half an inch. This appears to be inflamed, but there is no open sore or eruption. Hens look well and have laid since this occurred. After awhile they begin picking themselves until blood is drawn. Killed two but could find nothing the matter, the vital organs appearing healthy.—E. C. B.

[Your hens have piles. Mix one part of finely powdered iodoform with twenty parts of pure vaseline and anoint the parts well, pushing the vent back in place. A few applications will cure. This is also a very fine remedy for chicken-pox, sore eyes in little chicks and ducklings. It is mild but effective.]

Breeding in Same Strain.—What will be the result and is it advisable to breed pullets to cockerel by same father but not same mother?—H. M.

[Yes, it is all right to breed pullets to father, provided you are sure this is the first case of inbreeding in the strain, and provided both are good healthy specimens, otherwise it would not be good.]

SELECTING AND FEEDING THANKSGIVING TURKEYS.

[Written for Pacific Rural Press by Susan Swagsgood, Pomona.]

This is about the time to look up what turkeys are to be marketed for Thanksgiving. It is not quite so easy as most people think and it takes time.

All breeders should be selected from last year's young stock in preference to this. A great many folks, especially when they have stock to sell, will persuade a person that young hens are best to breed from. Well, I know better. They will lay a few more eggs undoubtedly, but the baby turks will be neither so strong nor so large. A good yearling male, hatched early and showing good vigor, is all right; but he must be able to lead the band, and be in fact "cock of the walk"; if he ever walks alone or behind the band and only spreads his feathers when

the leader is not watching, turn him into a pot roast.

Set aside only the very likeliest of the turks to hold over for another year's breeders, for in this way only can you always have plenty of good two-year hens for breeding.

Then choose the most forward of the market stock for Thanksgiving. Separate them from the younger and smaller birds and give them a better chance to grow.

Now make the most of what turks are ready to prepare for thanksgiving. If they have been sleeping out let them still do so—no cramming into close, stuffy buildings. Just set up a couple of high rails, the higher the better, and then protect them with wire so fixed that they cannot fly over. A good way is to fasten stakes from the fence posts leaning in, then fasten wire netting one foot or 18 inches wide and two-inch mesh on these stakes; the bird tries to fly over and strikes that wire. He will not repeat it many times.

For the first few days after putting the birds in a fence, it is better to give very little feed of any kind, have grit and shell handy and a little beefscrap in hoppers. Turkeys will not stand feeding high very long unless plenty of green feed is at their disposal. So at first, get them used to confinement. About the fourth day a kettle of boiled vegetables with corn meal mixed in after the vegetables are cooked will be relished. Then boiled corn and other grains; all cooked food is easier to digest than uncooked, and that is why it proves a better diet for fattening turkeys.

The first thing that ails a turkey, and I might truly say the last, is indigestion. This indigestion is the root and stock of all their troubles and it is brought on among the domesticated turkeys by over-feeding and wrong feeding.

So even when we are fattening, the feed must be of such a character as they can digest. Warm mashers are more easily digested than raw corn. Some folks think a corn-fed hog and a corn-fed turkey are the greatest of good eats, but I like hog meat that has been fattened on peas and beans in preference to the corn. Corn when fed whole is a very hard thing to digest. If fed at all it should be fed at night when the birds have all night to digest it in, but if the corn is boiled it will fatten much easier because every bit of it will be used up by the digestive tract. If you are in the habit of feeding whole corn, just try it boiled for one season to fatten your turks and see how many more pounds of good turkey flesh you can produce with the same amount of feed plus a little fuel and time.

POULTRY NOTES.

Considerable interest is manifest in the second annual State Poultry Show to be held at Modesto Dec. 6 to 9.

To perfect the organization of State poultry growers on the plans laid down by Harris Weinstock, State Market Director, it will be necessary to secure the one million hens by the first of the year. At the present time three-fourths of the number have signed up.

Chas. H. Vodden's winnings on Barred Plymouth Rocks at the San Jose big Auditorium poultry show last week were as follows: First and second cockerel, first and third ex-

—Before the heavy winter rains come pouring down, mend those leaky spots that the early showers have shown you.
—Remember, we have one of the largest roofing stocks on the coast at lowest prices, quality considered.

Ready Roofing \$1.00 a Roll

—Our Special and really a most remarkable value at the price, like all our roofing, each roll will cover 100 sq. ft. of roof, the rolls being 108 sq. ft., to allow for laps at joints. Sufficient nails and cement are also included.

1 ply King,per roll	1.50	1 ply Asbestos,per roll	1.85
2 ply King,per roll	1.75	2 ply Asbestos,per roll	2.25
3 ply King,per roll	2.00	3 ply Asbestos,per roll	2.50

Black Graphite Roof Paint, 60c.

—Just the thing for an old shingle roof; fills up the cracks and makes it shed water like new. 60c a gal. in 5 gal. lots. Our most popular seller for 5 years past.

ELASTIC ROOF PAINT 65c.

—Use on old "Ready" or paper roofs; stops leaks and adds from 3 to 5 years of life to roof. 75c in single gals.; 65c in 5 gals; 55c a gal. in barrel lots.

BLACK ASPHALTUM, 40c.

—Used for small patches and leaks in flat roofs, covered with "Ready" roofing. 50c in single gallons; 40c in 5 gal. lots; by the barrel, 30c gal.

\$30 Wallboard, \$21 per 1000 sq. ft.

FINE STOVES, \$1.25.

—Airtight drum heaters, that burn wood, trash, papers, etc., so admirably, and give remarkable heat. Of high grade sheet metal and lined. Usually sold for \$1.75; our price \$1.25.

—Splendid wall board, under the usual price, because we buy such enormous quantities. All the stock lengths and widths carried on hand. Orders can be filled and shipped promptly.

Mrs. Best's Letter.

My Dear Friends:

With the approach of the rainy season, raincoats seem important articles of the wardrobe and there are some new and attractive models in the stores.

The loose ulster of cravenetted material in either brown or gray is always good and has the advantage of being suitable for wear at other times than in the pouring rain. It makes a very good coat for machine wear, and being cut usually on conservative lines can be worn indefinitely.

The more dressy coats are many of them made of taffeta silk in either checks or stripes and have a thin lining of rubber. These are very good looking garments, but have not been on the market long enough to be proven a success. There is danger of rubber applied in that manner cracking when laid away, thus making the garment useless another winter.

The most attractive of all the coats I saw though, was a silver grey silk poplin lined with rubber, cut on generous lines and having a high storm collar that was extended into a circular cape that came down over the shoulders. This coat, although utilitarian in purpose, had a dash and style you do not find in a raincoat.

Still another type of coat is the thin rubber one in light shades that is transparent and very light in weight. In one of the stores, it is called the gelatine coat, on account of its transparency and color.

With these coats, the girls wear the soft cloth hats that have been so popular with the men and do not carry an umbrella at all. There is a cunning little sailor shown made of black shiny material similar to oil cloth that is both good looking and weatherproof.

Reports from the East are that skirts are surely growing longer, but the stores here are still making them nearly to the shoe tops for slight people. Let us hope that our rainy season will be over before we have them flapping down around our ankles.

Rosabella Best.

KITCHEN HELPS.

There is a paste on the market for cleaning silver that is considered better than the old-time powder.

When frying potatoes, try chopping with empty baking powder can instead of knife. It is handy and much quicker.

Hot lard can be tested to see if it is at the right heat by putting in a small piece of bread. If it browns immediately, the lard is hot enough for frying.

In laundering muslin or lace curtains much better results are obtained if the curtains have been soaked in several changes of cold water before they are washed.

Enamel bathtubs and basins are quickly and easily cleaned with a cloth saturated in gasoline. Kerosene will answer, but necessitates washing again with soap and water.

To prevent cake from burning when using new tins, butter the new tins well and place them in a moderate oven for fifteen minutes. After this, there will be no danger of the cake burning in them.

THE HOME CIRCLE

THE NEW PATCHWORK.

Those of us who possess an applique patch-work quilt of our grandmothers are fortunate indeed now that applique is so popular in the fancy work line. The work a generation ago was done with wonderfully fine invisible stitches, but now it is more popular to buttonhole the patches into place.

Quilts of attractive patterns are used for bedspreads; and dresser scarfs, laundry bags, curtains and couch covers have the same design used.

To have an effective bedroom of this type, there should be a plain wall-color, rag rugs on the floor and Colonial furniture.

The foundation for this work is generally sateen or heavy cotton goods in white or cream and the same material in colors for the design.

CHRISTMAS SUGGESTIONS.

A cap, muff and scarf set made of the crushed plush makes a most acceptable and attractive gift for a young lady and can be made at home by anyone clever with the needle. The scarf should be about seven inches wide and about five feet long. The ends can be finished with a tassel or with a ball of the same material, stuffed with cotton. The muff should be small and fat, as that is the prevailing style. These should be lined with a pretty color silk as well as the padding. The style of the cap should depend upon what use it will have. For machine use, a cap the shape of the knitted ones would be pretty, but for street wear, a toque effect would be better and for those a buckram frame can be the foundation.

CACTUS FRUIT AS A SALAD.

Editor Home Circle: Select ripe cactus fruit, peel and cut into cubes, flavor with salt and a generous portion of vinegar; let stand about ten minutes then add a rich mayonnaise dressing. Make this up about 2 hours before serving. Just before serving wash some crisp lettuce leaves and serve salad on a bed of lettuce. This salad your palate will ne'er forget.

Another way to serve this dish is to peel the fruit and cut into cubes, then add tomatoes cut up into small pieces (add onions to this if liked), salt, pepper, oil and vinegar. Let stand two hours before serving.—Mrs. W. E. J., Sacramento.

HOUSEHOLD RECIPES.

Cheese Crackers.—Butter thin crackers, place on pan and cover well with grated cheese. Bake in the oven until the cheese is melted and a delicate brown.

Sandwich Butter.—Pour into a deep earthenware basin $\frac{1}{2}$ cup boiling milk and 1 cup cold milk. Add 1 pound fresh butter, broken into little bits. Beat this compound with an egg beater until it has reached the consistency of a thick cream. This is the ground material to which may be added different flavors, before spreading it between thin slices of bread. To prepare anchovy but-

ter, wash the anchovies well and soak in water for an hour. Then grind or mince very fine and mix with the butter. For green butter, take a handful of parsley and chive, mince well, add a little spinach juice and mix with the butter, adding a little salt and pepper.

For fairy sandwiches, add powdered sugar, either vanilla or rose water to the butter; beat well together and spread between thin slices of fine bread.

A HOME-MADE FIRELESS COOKER.

The principle of a fireless cooker is the conservation of either heat or cold and that principle can be worked out at home in a home-made contrivance as well as in a ready-made. For the box, use either redwood or pine lumber one inch thick and hinge the cover and use rollers to insure ease in moving the cooker about. The size of the box will be determined by the size and number of compartments. There must be at least a space of two inches around the compartments to be packed with asbestos.

The metal frame can be constructed of aluminum, galvanized sheeting or zinc. Aluminum is the most desirable as it wears well and does not rust readily. Zinc is easily formed into shape and a straight, galvanized pail with cover can be made to answer, but tin is unsatisfactory, because it rusts so badly.

Radiators or heating plates are used to lengthen the time of cooking. They are of soapstone or iron and can be purchased from firms selling fireless cookers. A good substitute is a flat, circular stone. This must be wound with wire so that it can be lifted after it is hot. If there are three radiators, two dishes of food may be baked at one time, by placing a radiator at the bottom and also at the top, with the third in between the dishes.

The utensils for fireless cookers can be purchased, but almost every housekeeper has articles that could be utilized.

FRESHENING THE BEDROOM.

If the daughter of the household longs for new furniture for her bedroom and is unable to procure it, let me tell you how we solved that problem. In the first place, as the bedroom was occupied by one person alone we decided to do away with the bed and use instead a single bed couch that can be purchased for \$5.00. This makes a very comfortable bed by night and a good looking couch by day. The bureau, table and two chairs that comprised the rest of the furniture, we painted with a good white paint, and while they would not compare favorably with high-priced enameled furniture, they were fresh and attractive looking.

The walls we tinted a pretty shade of blue and bought a pretty cut-out design of paper to use as a border under the picture molding.

In melting chocolate, always butter the pan to avoid waste.

Floral Department.

[By Geo. N. Tyler.]

Keep on putting in cuttings of anything you think will root. Do not delay with your bulb planting, as the soil is in ideal condition right now, owing to the early rains.

Fertilize.—You can also dress your lawns and flower beds with half-rotted manure, or if you think your soil is rich enough, you can put on an application of hydrated lime. Make the ground white with it and then hoe and rake it in, the later rains will do the rest. The lime will release a great deal of fertilizer, making it available for plant food. It will also sweeten the soil, if it is at all acid or sour. Repeated dressings of manure make the soil acid. If you have any doubts about the soil get some blue litmus paper from the drug store, and where the soil is moist make a hole and put in the small piece of paper, fill in with moist soil and leave one end of the paper sticking out. After ten or fifteen minutes take up the paper and if it has turned red it is a sure sign that the soil is acid and sour. In that case lime it.

Glasshouses.—All shadings should now be off the glass in small greenhouses and conservatories, but watch the plants carefully and do not let them go wilting dry—for they will dry out much quicker with the shade off. Give your house plants more sun from now on and less water. All plants have to rest at some stage of their growth, and the winter months is the best time for resting.

Roses are liable to be affected with mildew this kind of weather. A good remedy is permanganate of potash, one tablespoonful to two gallons of water. It will generally clean them up in one application, but give a second in a week if you see any signs left.

Weeds are beginning to sprout now. Hoe or rake the ground while they are small and it will save you a lot of work later.

Pansies.—I am now preparing my pansy beds for planting the small plants from seeds sown in middle August. I spade deep and then give about one and one-half inches of cow manure from a corral. This is not rotted, but I pulverize it very fine. After spreading I give a good watering and in a day or two spade the soil and manure again about four inches deep, working it well into the top soil. After a week, I put in the small plants; they have six to ten leaves. If you follow this method you will have no trouble to pick three-inch, and even larger, flowers in the spring.

HINTS TO HOUSEKEEPERS.

When a decanter becomes so discolored inside that shot or pebbles will not cleanse it, fill with finely chopped potato parings, cork tightly and let stand for three days. At the end of that time, empty and rinse in warm water.

Jewelry can be beautifully cleaned by washing it in warm water to which a good white soap has been added and a few drops of ammonia and then shaking off the water and laying the jewelry in a box of fine sawdust. This method leaves no marks or scratches.

A LONG-LEIT WANT.

One day wee Willie and his dog
Sprawled on the nursery floor.
He had a florist's catalogue,
And turned the pages o'er.

Till all at once he gave a spring.
"Hurrah!" he cried with joy:
"Mamma, here's just the very thing
To give your little boy!

"For when we fellows go to school
We lose our things, you know;
And in that little vestibule
They do get mixed up so.

"And, as you often say you can't
Take care of 'em for me,
Why don't you buy a rubber plant
and an umbrella tree?"

—St. Nicholas.

A MODEL WEDDING.

Clara and Nellie were chattering like magpies about a wedding to which they were invited, when grandmother suddenly dropped her knitting, with the air of having something of importance to say, as she asked,—

"Is it to be a fashionable church wedding?"

"Yes, yes," they cried in chorus, "a satin gown with a long train, and a lovely veil, a bridesmaid, and a flower-girl, and garlands of flowers each side of the centre aisle, and"—

"Now, see here, girls," grandmother interrupted, "let me tell you of a wedding, the best that ever was, and without one of these folderols, not one."

The girls eagerly assented, and grandmother began reminiscently:—

"It was long, long ago. The bride was the eldest of a large family and

an every-day helper to her mother. Her father was a minister, and the bridegroom was a minister, too, seeking his first parish.

"He had preached as a candidate in a distant parish, and while awaiting the verdict had gone to visit the girl to whom he had been engaged a year and whom he had not seen in several months. She was busy as usual, and when ironing-day came round she was ready for the task, not a small one either, with ten in the family. She had barely begun when the young minister came to the table with an open letter in his hand, and in a voice trembling with eagerness said: 'I have just received a call to the church which gave me such a favorable impression, and they wish me to begin my work next Sunday. In order to do so I must go at once, as it is quite a journey, and—and—I think we should be married before I go. Your father, fortunately, is at home this morning'—

"But why in such a hurry?" broke in the startled girl.

"Because one of their first questions is, if I have a wife, and I wish to say that I have, as I can if we are married now."

"But we are married," the girl insisted, "spiritually married, and no mere ceremony can make us more so. Besides, I have friends who expect, of course, to come to my wedding, and I want them to come."

"I am sorry to disappoint them and you, but, my dear, I cannot begin my ministry with a subterfuge."

"That settled it. The girl put her flat-iron on the stove, threw off her white apron, glanced in the mirror to smooth down her curly hair and peep at the pink and white gingham dress which she had made herself, and which was fresh and clean that morning. She went into the parlor, where the family had collected, being told of the young man's wish and the need of haste. The father married them, while his voice trembled, and tears were in his eyes, and tears were rolling down the face of her mother.

"After the family had all kissed the bride and shaken hands with the new son and brother, he had to make haste to catch the only train due that day, and the bride went back to her ironing.

"Before the young husband returned she had cut and made the lovely silk gown intended for the wedding and which now would do duty in the many receptions awaiting her. The gingham dress was used in the parsonage kitchen, but after fifty-three years of a continually happy married life she regretted that she had not saved it as an object-lesson to her girl friends, to convince them that it does not need fuss and feathers to make a true marriage."

Grandmother's trembling voice was silent, and her old eyes were filled with tears. The girls could restrain themselves no longer, but, hugging and kissing her, Clara cried:—

"O grandmother, that was your wedding, we just know it was; and it was perfectly lovely, too!"

Nellie added: "Oh, how I wish we had that dear little gingham dress! Why, we ourselves might be married in it some day, who knows?"—Christian Register.

When Nature Turns Outlaw

"Blow, winds, and crack your cheeks! rage! blow!—
Your cataracts and hurricanoes, spout"

Thus King Lear, in Shakespeare's tragedy, defies the elements. But man, even today, cannot challenge nature with impunity.

The unsinkable ship goes down like a rock from the impact of an iceberg. The fireproof building is burned. The monument, built for unborn generations, is riven by lightning or shaken down by an earthquake.

There are storms which make train service impossible, which delay the mails and which close the public highways to the usual traffic. Even in the cities there are times when the street cars do not run, and neither automobiles nor horse-drawn vehicles can be driven through floods or high-piled snowdrifts.

Such conditions increase the dependence on telephone wires, which themselves are not exempt from the same natural hazards. Fortunately, however, the Bell System has faced these dangers and well-nigh overcome them. Masses of wires are buried underground and lonely pole lines, even the most stoutly built, are practically paralleled by other lines to which their business can be transferred.

Each year the lines are stronger and the guardians of the wires are prepared to make repairs more quickly. So each year increasing millions of subscribers find their telephones more dependable and, within the limits of human power, they count upon their use in storm as well as in fair weather.

Good Health.

(By H. E. Pastor, M. D.)

Doping the Baby.

Mothers and nurses should be studiously careful never to give opiates in any form to infants or small children. Opiates are not always labeled as such. The proprietary medicines sold as soothing syrups and cordials almost invariably contain some opium, which if administered to children stunts their mentality, brings about serious derangements of digestion, and tends to establish the habit of constipation. Such nostrums are positively dangerous. The desire to pacify a fretful child or to lull to sleep one that is wakeful, is a strong temptation to a tired nurse or overworked mother to resort to the use of a doped preparation to secure respite and rest. But a peace thus brought about, it has happened more than once, has

been of the everlasting kind. Even when this disastrous result has not ensued, the lesser ills referred to are more than likely to follow. No conscientious mother will thus hazard the life or health of her child, and no nurse should be permitted to. What has been said of soothing syrups is largely true of cough mixtures, also. When the bronchial tubes of an afflicted child are clogged with the sticky secretion of a respiratory ailment, dislodgment by coughing is Nature's safeguard against the complete closure of the air passages. It is better to employ treatment that will diminish the mucous discharge by relieving the congestion rather than to deaden with drugs the sensibility of the bronchial nerves and smother the child by its own unexpelled secretions. Opium has its legitimate uses, but the doping of children is not one of them.

Who Are the Long-Lived.

Serbia the stricken is pre-eminently the land of centenarians. She boasts one such in every 2,260 inhabitants. Ireland comes next, with one centenarian in every 8,130 of her people. Spain, Norway, the British Isles, France, Sweden, Germany and Denmark rank in the order named. Switzerland, the land of tourist resorts, hasn't one according to the last returns. These figures, of course, indicate the condition of Europe's longevity under normal conditions. Centenarian prospects are not brilliant at the present writing. Simple habits and lack of the strenuous life, as well as climatic adaptation of peoples in old settled countries, doubtless accounts for examples of extreme longevity in some of the countries mentioned. America has few of these promotives to longevity, so far as most of its white population is concerned, except, perhaps, in some isolated sections, so the centenarian ratio is not high. Natural conditions in California are conducive to prolonged life, and some notable instances are on record. Generally speaking, however, the strenuousness of typical American life, lack of moderate outdoor exercise, over-eating, overdrinking, and undersleeping—these things militate against good health, and cut short the natural span of human life. Live temperately if you would live long; and long life is worth striving for, for when you die, you are dead for a long while, as our Gallic cousin says.

Confections vs. Medicine.

The following fruit and nut confection, taken from Farmers' Bulletin 712, School Lunches, is here given for its medicinal value as a laxative. Children are very prone to constipation, and any substitute for drug medication should be favored. 1 pound figs, 1 pound dried prunes or seedless raisins, 1 pound nut meats, confectioners' sugar. This provides twenty-four two-ounce portions.

Wash, pick over, and stem the fruits and put them with the nut meats through a meat chopper, and mix thoroughly. Roll out to a thickness of about one-half inch on a board dredged with confectioners' sugar, and cut into small pieces. If this candy is to be kept for some time, the pieces should be separated by means of paraffin paper.

WINCHESTER

RIFLE AND PISTOL CARTRIDGES

When you go to buy cartridges for your rifle or pistol, you want to consider that you're buying something "sight unseen." In other words, "you don't know what's in 'em." That's the very reason why you should buy a reliable make. The reputation of Winchester cartridges is sufficient for you. They are always reliable. They are made for all kinds of rifles and pistols, and you'll be sure to get this celebrated make if you ask for

SAN FRANCISCO.

San Francisco, Oct. 25, 1916.

WHEAT.

Export business in the East is surpassing all records, and the sensational advance has been reflected in Coast markets, local spot prices for all grades being considerably higher. In fact, very little is offered at the figures quoted, though buyers are unwilling to pay more.

[First-hand prices on strictly first-class grain, San Francisco.]
Sonora wheat\$2.25@2.30
Northern club2.30@2.35
Calif. club, ctl.2.25@2.30
Northern Bluestem2.60@2.65
Northern Red2.55@2.60

BARLEY.

The strength of wheat is reflected to some extent in the barley market, but it is also affected by large export shipments from this port, and prospects of a better rail movement East. Prices have advanced sharply.
Shipping, ctl.\$1.90@1.95
Choice feed, ctl.1.85@1.90

OATS.

The upward movement in other lines has had little effect on oats, though white are higher on account of scarcity, and red feed are in good demand. Texas red seed, said to be immune to rust, is in strong demand.

Milo MaizeNominal
Egyptian, new1.90@2.00

BEANS.

The bean situation has not eased off, but on the contrary is stronger than ever, with all offerings closely held and an active demand for most grades at a further advance. Local dealers report the damage in the river district less than was expected, but very heavy loss to the small whites in the south. While the situation looks very firm at present, the market is rather sensitive with prices at such a high level, and there is no assurance that these figures will hold, as consuming demand is being curtailed in many quarters.

HAY.

It is still very difficult to get cars at most hay shipping points, and arrivals here continue very light. The demand in the city is exceptionally quiet, however, and the shortage has caused little difficulty; though this, with the fact that most of the hay is now coming from warehouses, has caused a rather sharp advance on most lines, and the market is firm. Dealers complain of the bad condition of considerable hay that was in the fields during the rain. Alfalfa is moving well at the old figures, and stock hay is higher, notwithstanding the improvement in feed conditions. Straw is again higher. Country trade is reported brisk.
[Wholesale prices per ton, carload lots, San Francisco.]

POTATOES, ONIONS, VEGETABLES.

Potato crops in many parts of the country are short, and Oregon stock has advanced sharply, with little offered here. This has been reflected in Delta stock, which can no longer be had below \$1.75. Salinas potatoes also are higher, and rather closely cleaned up. Sweet potatoes are slightly easier. Onions all over the Coast are now well out of growers hands, and closely held at a further advance. Celery is now going out in large quantities from the Delta district, and the crop is said to be the largest on record. Lima beans are higher; otherwise the general garden truck situation shows little change.

Monterey Cheese14¢@16¢

DECIDUOUS FRUITS.

The last fortnight has brought a marked revival of the apple market, with heavy buying by speculators from many quarters. Some very large sales have been made for shipment to England, as well as for Eastern markets, and local interests also have been taking hold in good shape, taking most of the crop out of first hands. This applies mostly to Newtowns, which are moving at 80¢ in carloads, the street price being unchanged. Bellflowers are higher. Bartlett pears are cleaned up. Other fruits stand about as before. Berries are firmer on diminishing receipts, and grapes are steady locally. The Emperor crop has turned out much better than was expected, and dealers are taking care of shipping orders in good shape, the business being very active.

DRIED FRUITS.

The dried fruit situation shows little change this week, the market remaining strong and active, with offerings rapidly moving out of growers' hands in many districts. There is a good consuming demand all over the country, as well as a fair movement for export, and buyers show more willingness to take hold in a speculative way, notwithstanding the rather high prices in many lines. Apples are cleaning up in good shape, and few apricots can now be had in the country. Figs also are getting very scarce. Local buyers appear quite willing to take pears now at a 6¢ basis, though the 6 1/2¢ basis is only for scarce sizes. Pears are firm, and are getting more attention. The Associated Raisin Com-

pany has announced that full deliveries will be made on early orders, and has put out a list of advanced prices on layers and clusters.

HORSES.

At the Horst ranch sale at Wheatland, last week, only 150 mules were put up, and went to scattered country buyers at an average price of about \$90 per head. There were 300 horses sold, most of them being taken by local dealers, bringing about \$60 on the average. A few of the better ones, 1400 to 1500 lbs., brought about \$135. The stock was all in poor shape, owing to shortage of feed, and most of it was unbroke, which accounts for the low prices.

The local market is still slow, and stock received here gets little attention. Another local stable is selling out this week. Few heavy drafters are appearing. Military buyers have recently purchased a large lot of mules in the San Joaquin Valley, and local buyers have also picked up many horses for this purpose, paying about \$150 for good stock.

LOS ANGELES.

Los Angeles, Oct. 24, 1916.

BUTTER.

Receipts California by rail for week ending Tuesday, October 24:
1916255,600 lbs.
1915246,846 lbs.

There was nothing new in this market the past week. Receipts were again light, but about equal to the current wants of the trade. It was a steady 33c market throughout the week. On Tuesday on 'change there were several sales of extra creamery made at 33 1/2¢ but the market closed at 33c.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
1916	33	33	34	33	33	33
1915	26	26	26	26	26	26

EGGS.

Receipts by rail as reported to the Produce Exchange for week ending Tuesday, Oct. 24:
1916-677 cases.
1915-743 cases.

There has been a sharp break in this market since our last review. Prices had gotten so high that the trade refused to take hold save in an indifferent kind of way. Then, too, San Francisco broke 2c up to Friday which had its influence upon this market. The result was prices here up to Saturday broke 3c on hen eggs and 5c on pullets and no special demand at this decline. Tuesday the market lost another cent, closing at 44¢ for case count and no buyers. Railroad receipts for the week, 677 cases, and estimated by truck, 700 cases, total 1377 cases; against 2077 cases by rail and truck same time last year.

POULTRY.

Increased receipts of young stuff drawn in the past week by the high prices quoted in our last, caused a draggy market for broilers and fryers, though prices are unchanged. Heavy hens steady and in good demand. Light hens dull. Ducks and turkeys are moving a little more freely at steady prices. Geese dull.

Broilers, 1 1/2 to 2 lbs.24¢@25¢

Orchard run 3c per pound less.

SPECIAL DECIDUOUS REPORT

Sacramento, Oct. 24, 1916.

Continued favorable weather is extremely beneficial to the fruit interests in that grapes slightly affected by the recent rains have dried out in some cases sufficiently to risk marketing on cleaning up, account berries being over-ripe and soft.

Some disappointment is shown in the quality of Emperors from certain districts and the keg and drum pack will probably not turn out as heavy as was originally expected on account of the quality, though the crate output may increase.

Second crop Tokays are carrying remarkably well, the color in most cases being better than the first crop. The demand on all varieties continues active, thus on account of the Eastern grapes being short in some districts and the demand from the grape juice factories in excess of the supply. California's grape season will wind up with higher prices than for several years.

The following prices have ruled for the week:

New York-Tokay grapes averaged \$1.55; Malaga, \$1.40; Cornichon, \$1.55; Clairgeau pears, \$2.85.
Chicago-Malaga grapes averaged \$1.45; Tokay, \$1.67; Cornichon, \$1.84.
Boston-Tokay grapes, \$1.97; Malaga, \$1.62; Cornichon, \$2.15.
Total shipments to Oct. 24, 15,753 cars; total shipments same date 1915, 14,459 cars.

Special Citrus Market Report.

Los Angeles, Oct. 24, 1916.

There was a further improvement in the markets east the past week. The lateness of the season and light offerings and the falling off in the receipts of deciduous fruits favored the orange people and enabled them to get more money for good stock. Lemons too sold very well and brought higher prices. Locally the market continues quiet. A fair call was had for desirable sizes at 2@3 1/2¢ per pound for Valencia in the grove; and lemons 1 1/2¢@2c in the grove. No new oranges in yet and none looked for until next month. But it will not be long before Tulare county growers will be giving us some early navels.

FROM AUCTION SALES.

New York, Oct. 20, 1916.-Six cars of Valencia and one car of lemons sold. Market unchanged. Weather fair. Valencia averaged \$3.35@6.20; lemons averaged \$4.25@4.95.

Boston, Oct. 20.-Three cars sold. Market is doing better. Valencia averaged \$4.35@5.60.

Philadelphia, Oct. 20.-Three cars sold. Market continues strong on oranges and unchanged on lemons. Valencia averaged \$4.60@6.00; lemons, selected, \$4.40.

New York, Oct. 23.-Thirteen cars of Valencia and one car of lemons sold. Oranges strong and slightly higher on small sizes. Lemons slightly higher. Weather fair. Valencia averaged \$3.50@7.25; lemons \$5.75@6.85.

Boston, Oct. 23.-Five cars sold. Market strong and higher. Valencia averaged \$4.60@5.25; lemons \$4.15@5.25.

Philadelphia, Oct. 23.-Four cars sold. Market strong and higher on oranges; unchanged on lemons. Valencia averaged \$4.55@5.75; lemons, \$3.35@4.35.

Special Livestock Market Report.

San Francisco, Oct. 25.

CATTLE are firm with a prospective advance on steers; but cows are so plentiful that they may not hold present prices.

Los Angeles, Oct. 24, 1916.

CATTLE.—There is no change to note in this market from a week ago. Killers were all in the market and there was a fair demand for all good to prime beef steers and fat cows and

heifers. California and Arizona continue to give us most of the supply and some very good grass cattle.

Quotations are f. o. b. Los Angeles:

Beef steers, prime, 1000 to 1100 lbs.	\$7.00 @ 7.75
Stockers and feeders	5.50 @ 6.00
Prime cows and heifers	6.25 @ 6.50
Good cows and heifers	6.00 @ 6.25

HOGS.—The market holds up very well. Receipts not heavy and what hogs coming in meeting with very ready sale. California furnished most of the supply and the offerings were of very good quality. Idaho hogs continue to go east. Killers here are enabled to get what hogs they need nearer home.

We quote per cwt. f. o. b. Los Angeles:

Heavy, averaging 250 @ 300 lbs.	\$8.50 @ 9.00
Mixed, 200 @ 250	9.00 @ 9.25
Light, 175 @ 200	9.00 @ 9.25

SHEEP.—Good and rather firm market was had the past week. Offerings were not heavy and killers all wanted supplies. Heavy muttons and lambs both met with a ready sale and old quotations were fully sustained.

We quote per head f. o. b. Los Angeles:

Prime wethers	\$7.00 @ 7.25
Prime ewes	6.50 @ 6.75
Yearlings	6.50 @ 7.00
Lambs	6.50 @ 7.00

CALVES.—Market steady and demand fair for all offerings. Selling at \$8.50 to \$9.50.

North Portland, Ore., Oct. 23, 1916.

CATTLE.—Over 1500 head of cattle were received this morning. Best steers were sold for 6.85, while several loads of good steers went at 6.75, with other good loads going at 6.25 to 6.60. Cow tops were 6.00, with some good cows selling from 5.00 to 5.50. Heifers brought 5.50, bulls 4.25 to 4.50. Stockers and feeders were in good demand, best steers 5.50 to 6.00, with a number of calves at 7.00.

HOGS.—There was a very good run of hogs this morning, 3600 head went over the scales today. A few loads sold at 9.35 for tops, with several loads of good prime hogs going at 9.25 to 9.30. Prime hogs were in good demand and moved early, other stuff moved rather slow.

SHEEP.—There were more sheep in the yards this morning than there has been for some time, over 2900 being received. Packers were very liberal and a few loads of lambs brought 8.75, twenty-five cents over last week. Wethers 7.00, ewes 5.50. Demand is very good.

worth from your paper every week."—E. M. Shaw, Grass Valley.

Publisher's Department.

It is with sadness that many of our readers will learn of the death of A. H. Knox, from heart failure, at Palo Alto, his home, on Tuesday, Oct. 17. Mr. Knox had been employed for years in our subscription department, and was known over the greater part of the State. He was a man of great energy and force of character, honest and capable, and withal kindly and generous in thought. The whole Rural Press force join with his many friends in expressing sympathy to his wife and family in their great loss.

Read our market reports every week. They are gotten up for the benefit of our subscribers and we believe them reliable. Every effort is made to have them up-to-date and as accurate as possible. If you spend only two minutes a week in reading up on the special line of products you raise, the value in keeping posted will prove very great.

New subscribers are being added to our list regularly and collections on renewals are quite heavy at this time—which proves that farmers generally are prosperous throughout the State.

At this time of the year our books, "California Vegetables" and "California Flowers," both by Prof. Wickson, should be in your home, ready for instant and constant reference. Both of these books are very practical and go into detail on the everyday problems of the subjects they cover. Send to this office for them. Prices are: for "Vegetables" \$2 postpaid, and "Flowers" \$1.50 postpaid.

Here is what one subscriber to the Pacific Rural Press writes us: "It represents agricultural journalism carried to the Nth power. The low price of one dollar would seem to simply cover mailing expenses—the paper is a gift to the subscribers.—Alfred R. Eastman, Turlock.

"Will say with hundreds of others that I more than get my money's

SAN FRANCISCO

NOVEMBER 4, 1916.

LOS ANGELES

HERE are a number of high schools in the State now doing exceptionally good work in agriculture,—such, for example, as Pasadena, Gardena, Bakersfield, Lemoore, and Kerman. There were sixty-eight high schools teaching agriculture last year and undoubtedly a great many more will be doing agricultural work when the records are compiled this year.

"Those High Schools having the most livestock of their own are Gardena and Bakersfield. Pasadena has poultry and a couple of good dairy cows. Riverside is contemplating buying some purebred livestock, but I think have not purchased as yet. From these, I believe, you should get the information that you wish regarding the work of the schools and livestock owners."

So wrote Prof. W. G. Hummel of the University of Cal. in September; but data had already been obtained regarding the school at Gardena.

Read the following extracts from a letter written from Montana by two Los Angeles city boys in September, 1916, to Prof. J. B. Lillard of Gardena Agricultural High School, from which they graduated last spring:

"Harvest is just over, and fall seeding is in full sway. We both worked on threshing outfits and found plenty of hard work, which we enjoyed, not being used to it. We were pitching bundles and driving bundle wagons.

"Before harvesting, in-between, and after, we rounded up about 90 head of range cattle, branding and vaccinating their calves. We also cut the bull calves, which are going to be made into baby beeves. About 30 of the old cows are to be dehorned and fattened for the Chicago market. Range cattle are not dehorned, as cattlemen say it lessens their vitality. But in sending fat cattle to market, they are worth \$5 to \$10 more, if dehorned.

"We are on a 1515-acre typical Montana stock and grain ranch, seven miles from the nearest town. Getting lots of experience running the binder, mower, rake, manure-spreader, gang plow, disk, and seeder. Most of these are pulled by 4 to 6 mares.

"Mares are used exclusively as work animals, and raise a colt every year. We have a 1650-pound black Percheron stallion that is getting some mighty fine colts. The horse colts are not cut until two years old, as they say it makes a better shaped and thicker neck for a work horse.

"Delbert Kirchenschlager and A. E. Moore."

You will notice that the boys are seeing things agriculturally, are learning why, and are noting the marketing end of ranching. Their parents are among the city folks who support Gardena Agricultural High School for the primary purpose of training boys and girls for country life, and for the secondary purpose of giving them, as well as the Gardena children, whatever of the usual upper-grade and High School studies they need.

Faculty.—Prof. Lillard, who has had charge of the school since the establishment of the agricultural course in 1910, was raised on a Santa

City Boys and Girls Make Good Farmers.

How an Agricultural High School Molds City Boys and Girls into Up-to-date, Wideawake Farmers and Happy, Useful Prospective Farmers' Wives.

[Written for Pacific Rural Press.]

Barbara county ranch, has owned a farm all his life, and owns one now in Ventura county. He has the real agricultural viewpoint, and modern agricultural appearance. The other agricultural instructors are chosen for special agricultural experience and teaching ability. They include Messrs. Terry, Graham, and Minear.

Student Cafeteria.—Miss Anna Leland, vice-principal of the school who has charge of the hundred or more girls in the Home Economics Department, is just the sort to appeal to girls, and she is an enthusiast in her work. We found her supervising a dozen girls of about a dozen years each, canning tomatoes which the Department had bought at market prices from the Agricultural Department. They put up 10 boxes of tomatoes that day in two-quart glass jars, to be used in the school cafeteria next winter along with 45 dozen quarts of peaches and tomatoes already canned by students and stored away.

This is claimed by Prof. Lillard to be the first High School in California to have a complete cafeteria entirely run by students in their own Home Economics building. Students do all the cooking, serving, etc., in regulation cafeteria style, except that not until now did they have a large dining room available. Other students support the cooks loyally, by eating their noon lunches there. Everything is bought at market prices, and student patrons are charged enough to just pay expenses. The cafeteria has been running five years. Among the stored supplies, we noted several sacks of walnuts bought from the "Farm," having been raised on border trees.

Of the sewing, tailoring, drawing, and other feminine classes, we could write better if we were feminines, so we hasten back to the Farm.

Equipment includes 19½ acres, a two-story central building, twin brick buildings about 56x200 feet, one for Farm Mechanics, the other for Domestic Science, a modern bungalow just completed for domestic science work, lath houses, potting shed, and greenhouse, a milking barn 40x60 feet including hay storage, oiled corrals and open cow shed, a modernly equipped dairy house, small new horse barn at a distance, a new 600-hen laying house, a cement incubator cellar covered by a brooder house, a blacksmith shop, and numerous others.

Students have built all these structures except the bungalows and main school buildings. They have done the blacksmithing, plumbing, painting, most of the carpentering, and other work. A silo is one of this year's plans, to be built by the boys.

The fields this year include alfalfa, corn, beets, orchard and vegetables, and newly acquired athletic field of 4½ acres on which hay was raised this year and which was being flooded by the boys for leveling purposes when we saw it this fall. The orchard contains "no two of a

THE COUNTRY WILL BE SAFE!

THIS is the last week of the presidential election disturbance of public affairs and there will be a lot of people delighted to throw off the guise of guf and bluff with which they have concealed themselves for several months past. There probably never has been a presidential campaign in which there were so few issues and so many issues, and it is really joyful now to think how soon one can comb the webs off his face, as he does when he emerges from spider-infested shrubbery. It will probably not make a particle's difference to anybody who is elected president unless he has hopes of being rewarded for political services to one side or the other. There are, of course, tremendous issues pending in the world, and this country will have to secure its own place in the sun by the blasting of some aerial bombs among the clouds which will gather, but these issues so far transcend the political problems of the past that no man can foresee what they will be and therefore cannot prescribe any formula for their settlement. If we had a Joseph of the Hebrews among us in this Egyptian darkness, we might stand some chance of learning what our dreams should be and the interpretation of them—but we find no Joseph among the candidates. The future must be full of intellectual strife, for the world is too sick of the other kind to pursue it farther. In this coming strife the whole world will be alert to seek for everlasting principles of humanity's rights as a basis for attitudes and actions. In this strife the United States will have the vantage ground in that it has less to forget and repent of. Besides it is each day becoming more clear that the ideals which shone in the eyes of the founders of this republic, and toward the attainment of which their descendants have been resolutely advancing for nearly one hundred and fifty years, are really the ideals of human rights and relations upon which the world must reform itself. These ideals, and the approaches to them, are the personal property of no man nor the political property of any party of men: they dwell in the hearts and consciences of the whole American people. They constitute the "genius of America," as it is rightly named. As coming questions are of this transcendent character they will be answered, not by any man or set of men, but the collective convictions of the American people. The coming four years will be the greatest referendum-period this country has ever experienced. Every man who tries to do a thing of wide import will endeavor to get his finger on the national pulse and will be trying to plunge his diagnostic thermometer into every deep crevice in the body politic. Therefore it seems to us of particularly little moment which of the two great men, who will be voted for next week, is chosen. He will of himself originate little or nothing. He will catch the keynote of prevailing American sentiment or he will sing a swan's song for his own greatness. This is an ideal condition in a government for and by the people. We are about to realize it as never before. The country will be safe and it will save the world.

WESTWARD, HO!—FOR CALIFORNIA.

IT IS now pretty clear that California will have the greatest winter in all its history, in the eyes of the American people who come for winter luxury and for less ostentatious home-seeking. Eastern people have their pockets as full of money as the San Francisco banks are of gold—that is, more than either ever had before. These people are, therefore, fixed for winter-touring and for home-buying as they have not been in any earlier year. Eastern people who have recently come among us say that we can have no idea from our own affairs of the abundance and wide distribution of money on the other side of the Rocky Mountains—that the tide of prosperity has not yet reached the western rim of the continent. We have been mildly prosperous, surely, and what more there is in store for us we shall know this winter. The battle-fields of Europe are still too hot for tourists' inspection: the flood of travel must come this way. The railroad men who take pains to forecast popular movements assure us that the passenger traffic across the continent will be immense, and they are preparing for it. One rather novel phase of it will be special trains of automobilists, each accompanied by a special baggage-train bringing their favorite motors for long runs upon our new State highways. F. D. Cloud, manager of the Tourist Association, in speaking of the innovation, said:

"Our object in undertaking this enterprise is to demonstrate to as many Eastern motorists as possible that California is an ideal touring region at a season of the year when it is impossible to derive any pleasure or comfort from automobiling on the Atlantic seaboard or in the Middle West. We want to show them what 'blossom time' in California really means and let them contrast a California March with the March weather of the East. We desire, also, to introduce them to our new system of paved highways which makes automobiling in California a real pleasure at all times, whether winter or summer. And we know that once Eastern people get a taste of the joy and comfort of touring in California during the winter and the spring months, not only will they return another season, but will bring their friends with them."

And the beauty of all this is that the joys of the highway belong not alone to the sumptuous motor-tourists of the idle-rich class, but to all the people, whether they go in cars which furnish their own music, like the tin-peddler's wagons of the last century, or in juggernauts which only murmur the music of the spheres. And all these people will soon see that a winter outing in an all-the-year motoring country is but a sample of the joy of living in it.

WHOLESALE CALIFORNIA CLIMATE.

THINKING of the joys of sky, of mountain-set and sea-rolled landscapes and of climate and geography generally, reminds us of the nursery convention of Santa Barbara, which we had the pleasure of attending, as noted last week. It was a fine assembly of California plant-lovers and merchants in a most delightful environment of beauty, natural and acquired, and of men and women wise, companionable and accomplished. The members of the guild resident in the Santa Barbara region were generous and unwearying in welcome to their guests from other parts of the State, and every one who participated in the meetings must have grown in appreciation of natural beauty of plant, mountain, and sea, and in joy in their creation into the mankind line of being. Perhaps the feature of discussion and transaction which impressed us most was the dawn of vastly greater opportunity than usually discerned in translating the climatic and soil conditions of California into terms of plants and bulbs for American sale instead of similar supplies from Europe and the Orient. Much has been planned and less accomplished in this line for years past, but it has not been undertaken in a masterly way, though some Eastern distributors have maintained California-growing branches of their individual businesses. It came out at the Santa Barbara convention, in a discussion led by C. W. Ward, whose great enterprise at Eureka is already well known to our readers, that while growing conditions and their superior product have been amply demonstrated, California producers have been so handicapped by unfavorable classifications, carload requirements, and rates that large movement to the East to displace importations is

either prevented or unfairly circumstanced. It was shown that some of the obstructions on the rail routes really cancelled the tariff which importers had to pay, and gave the American producer a protection which did not protect, because of the unwisdom of the railway associations, which prevented competition with Eastern importers. Mr. Ward's statement and his individual efforts to get fair treatment for his California product commanded marked attention from the convention. Allied thereto was the report of Mr. Meriwether of Fresno, concerning discriminations against California nurserymen in other particulars. All these matters were earnestly discussed, and a call upon popular interest and support was made in order that duly impressive appeal might be made to the traffic associations to secure fair treatment for home-grown plants and bulbs which should receive the widest possible distribution to the American planting trade. Mr. Ward's wide experience and success in national plant distribution commended him strongly to the convention, and older California growers were impressed with the fact that by working together with the people, a new page in California commercial horticulture might be opened widely. Surely, transportation requirements should not limit the beneficent distribution of California climate throughout this country in the form of California-grown florist stock in the largest possible quantities.

* * *

DOINGS OF THE NURSERYMEN.

NATURALLY most of the proceedings of a three-day convention of a craft or guild must be of internal rather than general interest. Many lessons and suggestions of the assembly will reach the public in the form of more and better plants, and thus they will confer a public benefit. It is, however, of public interest that the presidency of J. S. Armstrong of Ontario was faithfully and acceptably discharged and was for the general good. It was in anticipation of a continuation of such service that Leonard Coates of Morgan Hill was chosen to the presidency for the coming year. Mr. Coates merits this distinction in recognition of his long career as a California plantsman and his many contributions to the progress of California horticulture in all its branches. H. W. Kruckeberg of Los Angeles was of course re-elected Secretary-Treasurer, for it is largely to his devotion and industry that the association owes its internal life-processes and its public career through the elegant annual publication of its proceedings. San Jose was chosen as the place of the next convention, and thus the nurserymen of 1917 will return to the place where their predecessors manifested greatest activity more than 60 years ago.

One of the features of the meeting of last week which commanded keenest interest on the part of the public was the wild flower exhortation and demonstration, by Theodore Payne of Los Angeles. Mr. Payne has made himself a leader in the conservation of California's natural plant beauty, and his efforts are making for the joy and patriotism of all coming Californians.

* * *

FAKED FARMING FIGURES.

THE advertising department of this journal usually keeps its own morals brightly polished, and as it has a lot of them to look after, it is surely to be credited with commendable vigilance. Once in a while, however, it seems to need professional advice on a moral question, and, as the editor is the only moral philosopher with a diploma in the outfit, the qualms of the advertising conscience are occasionally referred to us. In this case it was an advertiser who desired to induce people to buy a start with certain medicinal plants by emblazoning a declaration that the planter could make several thousand dollars per acre per year when the plants were duly established. Our advice to the advertising department was this: "Cut out the declaration of promised profits; advertise the plants, because that much is legitimate, and some people may like to try them." Later, we were informed that the intending advertiser would demonstrate on his own place that the figure named in his advertisement was not more than half what could be made on the crop, and that other writers were going to feature his crop and we could come along. We did not accept

the invitation, because we had not questioned the truth of the man's statement of his own experience, and it is not there that the danger of misleading people lies. It is in the generalization that the crop will yield other planters several thousands dollars per acre. There are several reasons why it cannot do that: First, if the crop is generally and successfully grown it cannot be sold for any such money, and perhaps not for any profit at all, because of the large quantity available. Second, if not salable to medicine makers it is a total loss because the grower can neither eat it nor feed it to stock. Third, if large returns are made for a small quantity, it is because it grows well only under certain conditions, or with great skill, or with a large amount of labor or other expense. Fourth, if the grower gets several thousand dollars per acre for what he can grow, why does he want to peddle out plants to others who, if they can grow it at all, will not only keep him, but themselves also, from getting any such acre-returns as he wishes to advertise. It will, of course, occur to anyone that the only kind of a man who could rationally wish to increase such a product at the loss of his own production must be a man who wishes to buy the crop for less than he can grow it. If, for instance, he should be a medicine maker, it would be good business for him to promote growing, and sell plants for all to start with, because the more there is grown the less he would have to pay for his raw material. That is legitimate enough, but it is not legitimate to advertise it in connection with a possible return which the very promotion effort may make impossible.

OUR MORAL CODE.
WE HAVE no space to codify all our morals, but this will be one section when we do it. It is not legitimate to advertise anything, even with a basis of fact, when in general experience that basis cannot exist. The promise of an unreasonable acre-product of anything is therefore immoral. It is doubly wrong to advertise a promise, even if it is based on a fact, when the very promotive effort itself makes it impossible for that fact to longer exist, even in the experience of the most skillful and best circumstanced. We do not care what other writers may do in promulgating unreasonable expectations; it will not induce us to take a hand at it. Even if our conscience were not so hot our common sense would save us. Our readers are too intelligent to be blinded by any such glare and glitter. There are others who are perhaps more gullible, and, judging by the new ways which are now brazenly invading the good, old, conservative field of farm journalism, there must be others. There must be a lot of near-farming readers, who do their agriculture under their reading-lamps, who may be electrified by the "oh, my!" stories of unreasonable profits from farm crops, which quasi-economic and pseudo-scientific writers are constructing for them, but we would not enter that line of publication if there were millions in it. The plain truth about farming and reasonable anticipations of profit therein are the only things a self-respecting journal can set forth, and a promise of several thousand dollars from an acre of land is neither plain truth nor reasonable anticipation.

Treating Bad Tree Trunks.
 To the Editor: What treatment would you recommend to stop the decay in the trunks of old prune trees, where they have been sunburned or where large branches have split off? Would tar applied to the affected parts answer? If so, can it be applied hot?—E. A., St. Helena.
 Chisel, gouge or scrape out all the rotten wood down to a hard bottom. Paint the excavation with hot coal tar and, where you get a cavity which will hold it, fill with Portland cement and smooth the edges so that new bark from the sides can grow over. Do not extend the hot coal tar treatment over live bark and do not apply so much that it will run down.
"Prune Rust" on Peach.
 To the Editor: What is wrong with the peach leaves which I send? What has caused it and what can I do for it?—C. N. G., Anaheim.
 The leaves are attacked by the fungus commonly called "prune rust" (puccinia pruni) which attacks almonds, plums, apricots and peaches. It is seen as dusty brownish pustules on the under sides of the leaves and is very seldom destructive enough to require treatment. It seems to be more troublesome in nursery stock than in open plantings. It usually comes on late after the leaves have finished their chief season's work, though there was once quite a visitation in the spring on apricots in Ventura county in which the disease seemed to carry over on peach leaves which were somewhat active all winter, but this is unusual. Winter spraying with Bordeaux or lime-sulphur will clean the trees and be protective against spring infection.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address.

A Close Schedule.
 To the Editor: I have sixty acres on which I intend to build up a poultry plant, keeping about 30 to 50 sheep in addition. I want to plant to cut down the feed bill next season—something which will not require expensive harvesting machinery. For the sheep I will plant about fifteen acres vetch and rye pasturage this winter and spring, with a similar acreage sudan grass next summer, using the same ground to colonize the poultry. What plants can I sow this fall to harvest early enough in the spring to get in a crop of milo, the fall crop to be for poultry use? I have considered planting some field peas, but believe it rather late to get these in now. Grain would ripen too late for my purposes.—J. L. L., Menlo Park.
 Unless you have a very low frosty place peas ought to give you plenty of green forage and green peas in February or March. Cabbage, rape, stock beets, etc., would also give you green feed. We do not think of any grain or seed which would stand frost and get in ahead of barley, and you will have to buy grain for the hens. But the vetch and rye ought to green-feed the fowls as well as the sheep, so you may not gain much by the other garden crops mentioned. Ripening grain or seeds to replace it is not a California winter attribute which can be counted on in your part of the State.
Killing Big Weeds.
 To the Editor: Is there any treatment known to kill out "lupus" weeds without digging large and deep holes?—E. J., St. Helena.
 We do not at this moment know what a "lupus" weed is, but if it is good Latin, it means some kind of a wolf-like creature. Presumably it has a big tap root, from what you say about digging. All such plants known to us can be killed by making a little hollow around the top of the root and pouring in gasoline—from a tablespoonful to a half teacupful, according to the size of the monster. It may seem an expensive treatment at present prices, but it will cost less than digging a "big hole." But usually a tap root cut a foot below the surface is done for. Why not try that?
Feeding Sudan Grass.
 To the Editor: Please tell me whether sudan grass is hard on the soil or not. After the seed begins to ripen, will it hurt stock to feed on it? I was told by a neighbor, who was told by another person, that he had lost ten head of cattle from feeding it after the seeds had started to ripen. A veterinary surgeon claimed the cattle were poisoned by the sudan.—E. L., Del Paso.

This is a matter of fact, not of opinion, and we have too few facts to answer confidently. We find no mention of trouble from feeding the seeds, and should apprehend no more than from feeding any other husky seeds which are harmless. All accounts speak of possible danger from feeding second growth, starting from a stop of activity in the plant, but this is true of all sorghums, and that is what your veterinary probably refers to. If the plant has been kept regularly growing, and has not started much new shooting, we should not fear it. Start it with small feedings at first.
Slitting Tree Bark.
 To the Editor: I will give you my experience in regard to slitting the bark of cherry trees. At two years old I always slit my trees. I start at limbs and run down about two inches under the ground, just through the outer bark, and always on the north side of the tree. I do this every two years, just as the sap starts in the spring. I think the wood and inner bark grow faster than outer bark and cause it to split and gum, if this is not done.—Eugene Brown, Santa Cruz.
 Thank you for your thought and practice. We do not wish to be hide-bound in our notion, but still we do not believe slitting necessary. The cherry tree has its own way of splitting its coat when it gets too tight. If it does not seem to be able to do this, your way and your time of doing it seem right to us. But out of the twelve thousand acres of cherry trees in California probably not a hundred acres have had slit bark and it is always the man who has fewest trees who is the surest slitter.
Oak Root Fungus.
 To the Editor: Does the large oak tree have spreading roots? Do they take away the nourishment of the soil? In setting out walnut and almond trees, would we have to take out the oak roots and enrich the soil in their locality?—O. L., Berkeley.
 They have usually quite a spread of roots. It is always desirable to fertilize the clearing of any large tree, and often lime is very desirable also. But the loss of many walnut and almond and some other trees on oak clearings is due to the specific fungus communicated from decaying oak roots to the young trees. It is therefore desirable to take out all the roots you can reach without too much deep mining. Their absence will make your trees less likely to fail.

James Lick's Cork Oaks.
 To the Editor: I will state that at Lick's Mills, Agnews, Santa Clara county, will be found a grove of cork oak trees planted by James Lick, claimed to be the oldest in the State. The cork oak and the carob trees are two of great value almost totally overlooked.—J. F. K., Paicines.
 James Lick was actively planting on his place in the late '50s and probably got his share of the Spanish cork acorns sent into this State at that time from the Patent Office in Washington. If he planted before that our records would show it. The conclusion, therefore, is that his trees are of the same age as those reported from San Gabriel, Visalia, Valley Springs, Sonoma and other points where trees were secured from the same lot of acorns.
Apricot Twig Borer.
 To the Editor: Twig borers begin on my young apricot trees in the spring when the young limbs are beginning to sprout. They start at the end of the sprout and work inwards.—J. R., San Jose.
 This is the same insect that works on peach twigs and fruit. The worms winter in holes in crotches of small limbs or roughened bark, and get busy on the first leaf buds. Spray them after they emerge but before they have bored into the twigs. Use lime-sulphur 1 gallon per 10 of water just before the buds open.
Vetch and Oat Hay for Stock.
 To the Editor: Is vetch relished by horses and cows? How much should be sown with oats for hay?—S. S. F., Santa Rosa.
 Vetch and oat hay is generally relished by horses and cows. About 50 pounds of the former and 25 of the latter per acre will make a good stand. If it grows well, it will be a mixed mess to mow. It is a good winter crop.
No Pears on Apple.
 To the Editor: Will Bartlett pears do well and the fruit have the proper shape grafted on apple trees seven years old?—B. H., Walnut Creek.
 They will not.
California Weather Record.
 The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., October 31, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		To Date	Normal To Date	Max'm	Min'm

Amboy GYPSUM

Increases Crop Production

Chemists agree that California soils need Gypsum badly. Amboy Gypsum increases the fertility and lengthens the life of your soil. It converts inactive elements into productive and available forms. It improves the soil texture. It aids in the decomposition of vegetable matter and the formation of humus. It counteracts black alkali, turning such land into productive soil.

Invaluable for alfalfa and field crops, citrus orchards, lawns, etc. Gypsumed soil requires less irrigation.

Amboy Gypsum greatly increases the value of manure by retaining the essential elements of the manure which are usually lost in the form of gases. Eliminate flies and germs.

California Prune and Apricot Growers.

[Written for Pacific Rural Press.]

The clothiers and bankers and milliners and real estate men of San Jose want the prune organization to carry. So do the other business men. They are donating hard cash to the promotion fund—\$10,000 of it. When a man puts his cash into a thing, it shows he has confidence in it. When a business man hands over his cash it is a good sign that he has investigated. These merchants believe the organization will be formed and will control the industry with benefit to growers, who, it is hoped, will spend their increased earnings with the merchants.

For some months, promotion work for the "California Prune and Apricot Growers, Inc.," seemed to be dragging. Prune and apricot growers were too busy harvesting their crops, to pay attention to organization talk, especially since most of them remember the failure of the loosely organized Santa Clara Cured Fruit Exchange of some 16 years ago.

The State Information Committee had in a measure crossed itself by its own remarkable success. Last year its influence and information led many growers to hold until they got good prices. This year their success was so marked that it became a thing of national comment. Thus the prices have been steadily pushed up. It looks to many growers like they can sell without organization. So quickly are the low prices of the past forgotten; and so hard is it to recognize that an organization controlling at least 75 per cent of the crop in interests of growers, is necessary through the years to set prices reasonable to all and maintain them, as the raisin growers, walnut growers, and almond growers have done for years.

Not enough money until recently was forthcoming for organization purposes; and the contracts could not be explained to growers personally enough without a systematic campaign.

The Growers' Information Bureau thought this matter so important, not only to growers, but also to business men, that they turned over their responsibility for promoting a selling agency to a committee representing business men and leading orchardists of the State. This committee chose H. S. Hersman chairman.

Bankers, business men, and fruit growers all over the Valley where he is well known, endorse Mr. Hersman and are backing his efforts with cash. Geo. Howes, of the Finance Committee, says the \$10,000 is the easiest money he ever went after.

J. H. Bone has charge of the organization work in Santa Clara Valley and G. E. Merrill in the rest of the State.

Cash on Delivery.—The chief objection encountered is that growers won't hang together; and the chief evidence offered is the old Cured Fruit Exchange. It seems hard for many to realize that the form of organization now proposed, safeguards this point in several ways.

There is some excuse for a man who is hard up to sell wherever he can for spot cash. The new organ-

ization is bound to pay 4 cents basis for prunes and 8 cents for apricots when the fruit is delivered. Later it must pay to the growers all excess over 4 cents for which the fruit sells, except 5 per cent of the total, which is reserved out of the excess for expenses, etc. Affairs of the organization are to be managed by 25 fruit-growing trustees elected by stockholders. One of these is nominated by the State Market Director.

If it should ever happen that four-fifths of these trustees agree that the price advanced to growers is more than can be obtained for the fruit, they may sell them for less and the growers must refund the difference pro rata. This is fair to all and is hoped to safeguard the organization.

If growers should sell contracted fruit outside, they are obligated to pay the organization 2 cents per pound for such. The raisin growers have included a few who had to be sued on this point; but this has scarcely been a ripple on the raisin organization's business.

Progress.—Forty per cent of the bearing acreage in Kings and Tulare counties was signed up in a short time before last Saturday, growers there having had a striking lesson in the money there is in co-operation. The Milliken district of Santa Clara Valley had signed over 75 per cent of its acreage; and about 250 acres had been signed in the Mountain View school district.

The "Russell Pool," for many years the most famous and successful of selling organizations of Santa Clara Valley growers, has signed contracts in the new organization unanimously, including Mr. Russell himself.

The Farmers' Union has resolved to join as soon as 65 per cent of the acreage is signed up.

Since the business men proved their confidence, the growers have been rallying in a splendid way toward the signing up of 75 per cent of the total acreage of either prunes or apricots or both, and \$750,000 capital, which we feel assured will be done before March 1.

SHALL HE PLANT PEARS?

To the Editor: Is the acreage of pears in California increasing or decreasing? Is the supply of fruit equal to the demand? Is there any way yet found to overcome pear blight?—G. M. B., Covelo.

The acreage of Bartlett pears is practically at a standstill, although there was a considerable increase in Los Angeles last season. The orchards destroyed by blight will probably equal the plantings so far.

The supply of pears is scarcely equal to the demand, as shown by the high prices received as a rule. The great advantage of growing pears is that they can be used for canning, fresh marketing, or drying; and when marketed fresh, can be kept for a long time.

There is a successful way of overcoming pear blight, but very few people practice it. We have treated this many times in the paper. It consists of cutting out all diseased twigs, etc.; sterilizing the implements absolutely. See one of our recent issues for a discussion of this.

Immature Oranges and Grapefruit.

Growers and shippers of citrus fruits are beginning to make inquiries as to the attitude of the U. S. Dept. of Agriculture toward the shipment into interstate commerce of immature and sweated oranges and grapefruit. Officials in charge of the enforcement of the Food and Drugs Act state that they will be guided by the position of the Department of Agriculture. This position is that sweating of the fruit, either before shipment or en route, is a violation of the Food and Drugs Act when the sweating misleads by making unripe fruit appear ripe. The sweating process turns the green color of unripe fruit to yellow, giving it the appearance of ripe fruit. However, this appearance is illusive, as extensive investigations by the Department have shown.

One way to determine the maturity of an orange is to apply the so-called "eight-to-one test," which is based on the ratio of the "soluble solids" to the acid contained in the juice of the orange. As an orange ripens, these soluble solids increase, while the acid content decreases. An orange is adjudged immature until its juice contains "soluble solids" eight parts or more to each part of acid. These soluble solids are practically equivalent to the amount of sugar contained, and the ratio of sugar to acid naturally determines the sweetness of the orange. For grapefruit, the standard of matur-

ity is set at seven parts of "soluble solids" to one of acid.

The U. S. Dept. of Agriculture will send to any grower or shipper, upon request, specific directions for making the eight-to-one test. The position of the Department in reference to the sweating of immature citrus fruit is set forth in Food Inspection Decision 133, and in Service and Regulatory Announcements of the Bureau of Chemistry numbered 11 and 15, which will be furnished upon application to the Department.

Tables for 8 to 1 Test.—With this 8 to 1 maturity test for oranges being more and more strictly enforced, the desirability of getting mature oranges to market before the holidays is none the less urgent. Knowing when the fruit has first become 8 to 1 means good money. The test is not intricate and may be performed by any grower in the orchard with simple apparatus. Figuring up the results of the test to the final ratio of soluble solids to acids is not difficult, but is rather laborious. Oscar Warner of the Butte County Citrus Association has prepared some tables by which the calculations are avoided. All that is necessary is to read the saccharometer, thermometer, and burette scale, then refer to the tables. It has required a large amount of labor to prepare these, and they are not for free distribution.

PEACH TREES DIE — ROOT FUNGUS.

To the Editor: The leaves of six peach trees close together turned yellow and dropped, while most of the others are perfectly healthy and green. Can't find where gophers have been and their trunks look healthy.—J. C. S., Ontario.

[Take the bark from some of the roots, which are probably all dead, and if you find a felty mass next to the wood or black threads a few inches long pushing out from the roots, or a little later in winter watch for a clump of toadstools which you can trace to the tree roots or crown. This is oak root fungus which we have repeatedly discussed. Fig, pear, black walnut, and cherry roots are less susceptible than the other fruits. To prevent spread, dig a trench three feet deep around the infected area, destroying all cut roots and refilling the ditch with uninfected dirt. If the fungus has followed any root as far as the trench, you will have to dig another farther away. This will have to be repeated about every two years to prevent growth of roots across the trench.]

GRAPE LITTLE-LEAF.

[Written for Pacific Rural Press.]

Little-leaf of grapes is purely a matter of too much or too little water in the soil, and to irregular supply through the season, according to Frank Henry of Fresno county. If waterlogged, not enough air is admitted to permit the roots to function properly; and in order to make leaves at all, they are made small. Likewise if too little water is present, or if, having been too long waterlogged, the roots have rotted off.

The surface of a nearby pond does not indicate the water table in a

Fresno county is a patch of low heavy vineyard from which he never picked natural grapes for raisins. They always shriveled on the vines for lack of food because the little mottled yellow leaves could not supply it. The vines persisted in rather unhealthy growth as long as the reserve food in trunks and roots lasted. Then the centers of vines would burn out and expose the grapes with a fringe of unhealthy leaves around them. They quit growing in June last season.

The remedy is proper drainage and then frequent and quick flooding to keep the ground moist but not waterlogged. Mr. Cate did not get the patch drained, but he did irrigate, and in mid-September these burned out little-leaf vines had new growth from the axils 12 to 18

inches long, and he expects to get a crop on them next year.

A parcel post shipment of shingles was made the other week by the Manning Shingle Company, Wash., consigned to Spring Camp, Idaho.

**"Over 25 Years Experience
back of every Tree, Vine,
and Shrub that we sell"**

When you order nursery stock from us you may be assured that it will produce exactly the kind of fruit that you anticipated.

Our years of successful experience in producing trees is your guarantee that the trees we sell can be depended upon.

When you set out nursery stock of any kind, you are investing a

great deal of time, labor and money, so it is very essential that your stock is dependable in the first place, that when the time comes for them to produce they will do so generously.

When you buy from us you may know that your time, labor and money will not be lost and that the production will meet with your expectations.

Satisfied customers for over a quarter of a century are proof that our trees are dependable.

Trees Grown From the Best Selected Buds.

Our Buds are selected from the very best orchards and carefully nursed until the trees are large enough to put on the market.

We carry everything in the nursery line. Citrus and Deciduous Fruit Trees, Ornamental Trees, Vines and Shrubs, each and every one in perfect condition.

El Dorado Potatoes Profitable.

To the Editor: I enclose part of my report to the Supervisors last month and it may prove interesting to a number of your readers who are looking for an opportunity to go into potato growing in a locality where land is cheap and plentiful.

A year ago a number of small ranchers experimented as to what could be accomplished in a profitable way by the use of certain commercial fertilizers at a rate per acre that would still leave a good profit after deducting first cost of seed, plowing, planting, cultivating, irrigating, cost of water and labor of digging.

It has evidently worked out on a paying basis as the increased plantings this year would seem to prove conclusively. These small growers are not out a cent for hired labor up to digging time as they do all their own work. I know one grower in particular who has a fine crop of five acres who has done all the work so far with the help of his little boy.

The cost of the commercial fertilizers used by parties east of Camino will average about \$55.00 per acre while others up Fruit Ridge have used a great deal less. It will be very interesting to note the difference in yield at digging time of these differently fertilized fields. We have inspected most of these plantings under the certified seed law.

The growing of potatoes in this section now seems to be a sound and profitable financial fact, and no get-rich-quick scheme enters the calculations of these small growers. As profits and experience increase and success attends these ventures we may look for a large potato growing district.

There are probably over 2000 acres in this section pre-eminently adapted to successful potato culture. The constant and increasing demand for and consumption of potatoes would apparently make the growing of this vegetable in localities where they grow to such perfection a proposition that would more nearly meet the requirements of the man of small means and would also give quicker and surer returns at a smaller outlay than fruit-growing.

I want it distinctly understood, however, that when I speak of potato soil I mean the so-called volcanic ash. Other varieties of soil would probably require different formulas of fertilizers in order to get good returns and this is a matter that can only be worked out through a series of trials and experiments before definite and dependable results could be established.

Here's good news for alfalfa growers---a new thoroughly

tested plant that will produce the greatest alfalfa tonnage known---and under all climatic conditions. Has been tried out and endorsed by Arizona State Experiment Station, and by growers in both hot and cold countries. Supt. of Arizona Station says: "Hairy Peruvian produces heavily in all climates practically the year round. Gives farmer maximum yield from his land. Does equally well at 5000 feet or at sea level. The plant is heavily leaved, thus giving highest food value. We recommend it above all other types." W. B. Cloyd of Yuma says: "Hairy Peruvian is greatest producer. I now get one more cutting per year." David C. Aepli of Yuma says: "Hairy Peruvian outyields other varieties 15% to 20% per acre." Write for complete information.

CITY BOYS AND GIRLS MAKE GOOD FARMERS.

(Continued from first page.)
kind"; for variety is part of the school work.

Students and Courses.—Since the school is primarily for city boys, a certain proportion of those who enter find the work distasteful. To hasten the weeding-out process, as well as to give a practical background for the school studies, the boys are put to outdoor field work most of the time for the first year.

About 60 boys are taking the regular four-year agricultural course this year. About 100 are taking agricultural subjects, and 50 more are taking ordinary high school subjects. Practically none of them has had any previous farm experience. In 1910, the total students in all courses were 69, including 5 in the regular agricultural course. This year there are a total of 300.

The course is principally practical, but may be somewhat modified so graduates may enter college. Home agricultural work is impossible with most of these students, but some are responsible for certain plots at school, some work for the teachers, and some work for neighbors, getting school credit.

They learn to keep records of crop yields and expenses, they test the cows, and keep records of the poultry pens. They had been husking and weighing corn when we were there. Some were spraying the compost heap. Some were irrigating from underground pipe lines, boxes, standpipes, etc., that students had made and laid.

A certain lot of corn had been reserved for seed selection which has been regularly practiced to get a good silage strain. The seed is planted one ear per row and records kept by the students.

Poultry.—About 600 White Leghorns are kept, also several other breeds for demonstration. These are changed at convenience, to keep representatives of all the leading poultry classes for study of form, color pattern, etc. Utility is emphasized above fancy.

"With us, egg production is a manufacturing business," says Prof. Lillard. The cafeteria is supplied at market prices; and the rest of the 30 dozen eggs being laid weekly while we were there are sold outside.

Livestock.—It is funny to watch some of the boys learn to drive the two big tractable farm horses. They have their fun milking too. Four cows only were being milked in September, but they represent high records and breeding. There were three registered Holsteins, one of which, Canary Concordia Mercedes, has a magnificent conformation and is out of an A. R. O. cow and A. R. O. bull. Her own record as shown by the school test is 24 pounds butter in 7 days, her milk testing about 3.4 per cent. She weighs about 1600 pounds.

The hogs have heretofore occupied poor quarters, but were of good breeding, and the boys have lately fenced and cross-fenced two acres of alfalfa and built a hoghouse. The boar and two sows are registered Berkshires. There are about 13 pigs now. About \$100 worth of pigs were sold in February and more since.

No animal dies or is killed on the

place without being post-mortemed in the presence of a class.

In all the school work, problems are stated in terms of the country, and in the form in which farmers meet them; and the boys and girls who finish their courses are making good.

WINTER SOWN PEAS AND OATS.

[Written for Pacific Rural Press.]

An acre and a half of Niles peas and red oats provided S. F. Bonner of Butte county with green feed for 20 cows for a month during the spring of 1915. As a result he planted 15 acres of his old alfalfa land to the same crop in November 1915 for spring feed in 1916.

In 1915 the winter was a long-

growing one, with rain at close enough intervals to keep the crop growing in fine shape. This year the conditions have been just the reverse. Yet, while most of the grain in his neighborhood looked badly in need of rain in late April, the oats had not yet headed out and were knee high, with peas densely covering the ground.

Mr. Bonner states that neighbors who planted after the first of January this year, as a result of his experience last year, did not secure a good stand, and that he therefore considers November a safer time to plant, taking one year with another. He mixes the peas and oats half and half when seeding. He has tried black-eye beans in connection with the oats but did not succeed in get-

ting them to withstand the cold, wet weather.

As experience in other parts of the State shows vetch and barley to be a good silage crop, Mr. Bonner's experience would seem to indicate that Niles peas and red oats might be valuable for the same purpose, besides being a good crop to precede corn where a rotation system with alfalfa is practiced.

The State Railroad Commission, after a rehearing, has decided that the reduction ordered in rates on paddy rice, moving from points in the Sacramento and San Joaquin Valleys to San Francisco, Sacramento, Biggs and Gridley, will not affect the earnings of the river boat lines.

Which Land is Worth More?

—grain land or fruit land?

The question answers itself, for you know that values are determined by net profits. Think of the years and years of productiveness of a well planted orchard! Think of the wealthy fruit growers you know who have started in a small way—with a few acres—and today are independent! Then stop and ask yourself why you shouldn't make a start towards greater profits and independence.

Plant Trees—Roeding's True Trees

—and make sure of results. It isn't enough just to plant "fruit trees", as that won't insure a profitable orchard. The planter's safeguard is to see that the name "Roeding" is on every tree he plants. It doesn't cost any more to plant, prune and care for pedigreed trees than it does those of inferior origin—and you know that it is always the fancy fruit that brings the big returns. The big red apple—the fine textured, rich flavored peach—the large fancy pickling olive—all bring to mind memories of successful growers who specialize.

Every Roeding Tree Bears a Guarantee

There is over a third of a century's experience—the combined knowledge of experts—the large resources of a successful firm in back of every tree you buy from us.

Do You Want a Copy of Our New Catalog?

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

POWER FOR WIDE AND NARROW FURROW WIDTHS.

To the Editor: What is the relative power required to draw a disk plow a given depth, cutting different furrow widths? Take a five disk gang cutting ten inches per disk, and then narrow the furrow down to six inches per disk. The narrowing to be done either by setting the disks closer together on the main beam or by adjusting the draft so that the disks will naturally follow one another more closely and thus cut a narrow furrow.—C. E. P., Woodland.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

The turning of a wide furrow requires more power per square inch of cross-section of the furrow slice than the turning of a narrow one, for the simple reason that more of the soil must be moved further and this takes power. On the other hand the cutting of the furrow slice with the edge of the disk involves quite a large part of the power required to move the plow; thus in cutting a narrow furrow this operation must be performed oftener than with the cutting of a wide furrow. It is clear that these two factors counteract each other and the width of furrow which will give the minimum draft or the best opportunity for these factors to balance will depend upon the condition of the soil. In turning a furrow in very hard soil considerable power is used in breaking up the soil. If the furrow is narrow the cutting action of the plow is substituted for this breaking. Our observation has been that the draft when the plowing is good and the soil moist will be less when the furrow is in the neighborhood of 10 inches or more; if the plowing is hard, the narrow furrow will give better results—6 to 8 inches.

FARM ELECTRIC PLANT.

The advantages of electricity have become almost a necessity in farm homes, and are regarded as such where it has been used any length of time. But there are lots of farmers who don't have electricity available. For these, the home plant is more economical than the old ways of lighting, running sewing machines, washing machines, fans, vacuum cleaners, feed grinders and mixers, compressed air pumps, grindstones, etc., if labor is counted of value; and if there is any more to life than just drudging with the hands what is so much more easily done by electricity. We are advertising such an outfit, and we saw another at the Fresno Fair. This one produced electricity at a cost of 2½ cents per kilowatt hour for fuel. It was claimed to run 15 20-watt lamps 8 hours from the 16-cell storage battery with the outfit. Its additional capacity with dynamo running was 32 lights. It would run motors up to ½ h.p. built for the 32 volt current which it generates.

Construction.—A 2 h.p. gas engine is direct-connected to the dynamo in one frame. It is started by pulling a switch, and is automatically stopped when the batteries are fully charged. It runs 900 r.p.m. and has an air cooler. To charge

the batteries requires four hours, using about a gallon of distillate.

Three things must be watched. The one oil cup must be replenished, the fuel tank must have fuel, and the battery plates must be kept covered with water.

TRACTOR DEMONSTRATION AT FRUIT GROWERS' CONVENTION.

[Written for Pacific Rural Press by John J. Fox, Napa.]

The following tractor manufacturers have contracted to take part in the demonstration at the 49th State Fruit Growers' Convention at Napa: Avery Tractor Company, 2 Wheel tractors; Bean Spray Co., 1 tracklayer; Best, 1 or 2 tracklayers; International Harvester Co., 3 wheel tractors; Holt, 1 or 2 tracklayers; Yuba Ball Tread, 2 tracklayers; Joshua Henry, 3 tracklayers and wheel; Ford Tractor, 2 wheel tractors.

In addition to these we have the largest collective exhibit of farm tools, implements, sprays, fertilizers and home industrial exhibits ever shown outside the State Fair in this part of the State. Demonstrations will be given each day at hours that will not conflict with the sessions of the convention. A little over 3 acres for each machine has been laid off on land adjoining exhibit grounds.

The names of the gentlemen on the program and the subjects to be discussed will draw a large crowd of the leading growers; and arrangements are being made to have comfortable accommodations for all visitors. An information bureau will be established at the Napa Chamber of Commerce for the convenience of guests. We expect yet other tractors to apply for space before the convention and have land for several more. Guests are already booking rooms at the leading hotels. Extra lighting and parking spaces have been arranged for by the city and fire protection at the Exhibition Hall.

COMBINED RICE HARVESTER.

To the Editor: We are threshing rice with a combined harvester made especially by the Holt Manufacturing Co. for the work. The harvester goes right into the field, heads the rice and sacks it. It has been cutting about twenty acres a day and working beautifully for two days and has brought rice growers from all over the State to see it.

It is figured that cutting rice by this process will reduce the cost of production at least one-third, and really revolutionize the rice-growing industry of the State, as it will enable the grower to get his crop off at least a month earlier than he is doing now.

We are using it on a Philippine rice called Pelitt, secured from the Biggs station of U. S. Dept. of Agriculture. Experts declare that we will not be able to cut the Waterbune rice grown in this State with it, because the straw is too green when the rice is ripe; however, there are two or three types of new rice

Layne & Bowler Pump in operation near Los Angeles.

LAYNE & BOWLER PUMP Minimizes Trouble

Are you having difficulties with your present pumping system? Are you getting only part of the water your well should produce? Is the expense of operation eating up the profits? Is your pump continually out of order? Almost always needing some kind of repairs? With the old-style pumping plant you are bound to have trouble of this sort, more or less. Install the LAYNE & BOWLER PUMP and be on the safe side. It's the final choice of the up-to-date pump user. Our new catalog No. 25 gives full details. Write for it.

LAYNE & BOWLER CORPORATION
900 Santa Fe Ave., Los Angeles.

SET YOUR OWN PRICE

That's what every man does who owns Properly Irrigated, Ditched, Tile Drained or Terraced Land. And if you don't want to sell, your increased yearly profits are just like turning waste land into cash. Progressive land owners in every State and practically every county in the Union have discovered that the only way to bring their land up to the desired state of production is to get a

Bostrom \$15 Farm Level

and make spare days the most profitable days. Also fills the bill for Grading, Road Building, Foundation Work, etc. The Bostrom Farm Level has been on the market over thirty years, the latest improved having a Telescope with Magnifying Lenses which enable you to see the cross on the Target a quarter of a mile away. Man Size Tripod, Leveling Rod, Target, Plum-Bob and full instructions included. Weight, 15 pounds. It is used and endorsed by Agriculture Schools and U. S. Farm Demonstration Agents, and you will endorse it, too, after using it—if not Your Money Back, including express both ways. Write today for description of Level and Telescope, details of our Money Back Guarantee, and names of Jobbers in San Francisco, Sacramento and Los Angeles who carry it in stock.

BOSTROM-BRADY MFG. CO. 000 Madison Ave., Atlanta, Ga.

developed the last year or two that will make it possible to use the combined harvester. The Pelitt rice is a long-grain rice, being the type of rice sought in the East and Middle West. W. E. Barnard.

Oct. 27.

GOOD WAY TO GET A TRACTOR.

Here is an arrangement that may help many people to get tractors with small outlay. Dr. G. E. Wanberg of Los Angeles county controls the water company which supplies at least 200 acres of small citrus orchards whose owners do not live on them. He figures on getting con-

YUBA BALL TREAD TRACTORS

A Yuba owner writes:

"Plowed 1000 acres early in the season, and have just plowed 370 acres, averaging 20 acres a day."

May we send you the Yuba literature?

THE YUBA CONSTRUCTION CO.
DEPARTMENT 1115
433 CALIFORNIA ST.
SAN FRANCISCO CALIF.

tracts to cultivate them, buy a tractor and go partnership with a man who will run it. The man will charge \$3 a day for running it and will make a uniform charge to orchardists per acre for doing the work. Out of his half of the net profits he will repay Dr. Wanberg half of the first cost.

Belting

That Must
Make Good

PUMP CO-OPERATORS SOLD OUT.

[Written for Pacific Rural Press.]

It sometimes happens that a co-operative farmers' project requires such a large plant to minimize overhead expense, that not enough co-operators are found to make the business economical for those who do undertake it. In such cases it may be well to sell at a good bargain.

Some years ago a few Ventura county farmers, of whom one was E. E. Dunning, co-operated to put up an \$80,000 pumping plant. It included a 2,000,000 gallon reservoir at an elevation of 265 feet in the hills three miles away, delivering water through an 18-inch pipe.

Recently they sold out to a local power company for \$40,000 with the provision that all the members must henceforth be furnished all the water they want at 25 cents per miner's inch per 24 hours.

On Mr. Dunning's 70 acres of lima beans, the irrigation does not cost over \$2.50 per acre per year when he uses the water at all. Since he has irrigated only 6 or 7 times in the 33 years he has been raising beans there, and since only in 1898 was he unable to raise a good crop, his investment in the plant did not bring him good returns because he could not use enough of its output. Now he pays for what he uses and has no overhead expenses.

FARMERS STORE ENGINE FUEL.

To the Editor: (1) What percentage of farmers are reached by the tank wagons of oil companies having rural routes? (2) Do farmers buy oil in barrel lots? (3) How much gasoline does the average farmer use? (4) Do the farmers who operate tractors carry gasoline to the tractor in the field or drive the tractor to the storage place for refilling?—W. B. M., Chicago.

[Answered by Standard Oil Co.]

The information given is merely estimated, but it is as nearly correct as our viewpoint will permit.

(1) The percentage of farmers reached by tank wagons of oil companies having rural routes we estimate to be about 75 per cent.

(2) Farmers reached by tank wagons of oil companies having rural routes purchase in bulk, delivery usually being made into storage tanks owned by such farmers.

(3) The farmer, unless he is operating an automobile, uses comparatively little gasoline. His power plant and tractor usually burn engine distillate.

(4) Farmers operating tractors usually arrange for delivery of the fuel to the tractor in the field, as against driving the tractor to storage places for refilling.

AUTO EXHIBIT AT LOS ANGELES.

The great Automobile and Auto Truck exhibition opened at Los Angeles last Saturday afternoon under most auspicious circumstances. A million dollars in cars alone is said to be represented, covering 250 cars and trucks, with accessories. The interest has been good and the attendance large.

Fast sales of Sandusky tractors following the Puente demonstration are reported by Wm. Rabb who has charge of the Los Angeles office and also has charge of a new branch opened at Sacramento about Oct. 1. Five were sold within two days, going to Antelope Valley and the Lompoc district.

IMPERIAL Double Disc Engine Harrow

SPECIFICATIONS:

Axle, 1½ inch square steel; Frame, 5/16x3 inch angle steel, double reinforced at the corners. Discs, 18 inch extra heavy, cutaway, 8 point. Bearings, hard maple with hand oil cups.

The principle of this machine is that of two Disc Harrows, one out-throw and one in-throw, built together under a strong, rigid, heavy angle steel frame. The forward Harrow works exactly like the ordinary Disc Harrow in cutting the ground and throwing it outward from the center. The rear Harrow works in the opposite direction, cutting the same ground and throwing it back. The result is equal to that secured by two workings with an ordinary Disc Harrow, but the soil is more thoroughly pulverized and the surface more effectively leveled. Requires but little more power than single disc of same width.

FIELD CROPS.

About 350 acres were planted to corn in Potter Valley this year.

Some Greek capitalists plan to plant big acreage to tobacco on Oroville lands.

The Argentine Republic is shipping corn to Peoria, Ill., the center of the corn belt of the United States.

The Agriculture Department at Washington reports the number of bales of cotton ginned in California this year at 6,852 bales, against 4,272 bales last year.

Mr. C. A. Carner of Potter Valley raised over 1500 lbs. of watermelon seed to half an acre which he sold to Germain Seed Company for 25c a pound—\$750 worth per acre.

Orange county led in lima bean shipments for the month of September, shipping out 17,336,406 pounds of beans, and Ventura county came next with shipments of 4,000,000 pounds.

A good deal of hops was bought up around Ukiah last week at 12½ cents a pound. Some are holding for higher prices. In one instance one grower got 15 cents, the highest recorded here so far for this year.

W. Hansen in the upper Ojai valley at Nordhoff never could get a stand of small white beans till this year he planted alongside alternating rows of pinks and whites. Was it interpollination, or what helped them this year to grow?

Milk-fed pumpkins is the latest thing in Southern California. Gamo Suki, a Japanese gardener, of Elsinor has been injecting milk into the stems of growing pumpkins and is producing some wonderful pumpkins both as to size and flavor.

The Sperry Flour Company is to conduct some experimental work in wheat-growing on 300 acres of leased land east of Stockton. This experimental work will be done with the co-operation of County Farm Ad-

viser Frank F. Lyons and experts from the agricultural college of the University of California.

W. F. Fowler of Willows has applied to the State Water Commission for permission to appropriate 250 cubic feet per second of the waters of the Sacramento river for rice culture on 15,000 acres, property of the Superior California Farm Land Company.

DECIDUOUS FRUITS.

Morgan Hill growers have formally endorsed the proposed Prune and Apricot Growers' Association.

Napa county unanimously endorsed the proposed Prune and Apricot Growers' Association.

The banner year in Vacaville's history came to an end Oct. 25 with a total shipment of 1,216 carloads of fruit.

Prices on peaches for November and December shipments have been increased from one-quarter to one-half cent by the California Peach Growers' Association.

Some shipments for export from Sebastopol to Europe last week consisted principally of dried apples, one car going to Glasgow, Scotland, one to Liverpool, England, and the other to a French port.

Two old pear trees planted 60 years ago in Long Valley near Auburn, have borne crops year after year since they came into bearing. This year they yielded 60 boxes of fruit, which sold for \$2.50 a box, or \$150.

A carload of quinces was shipped from the 25-acre Church orchard in Highgrove near Redlands last week. This is the first shipment of quinces from this section on what may be called a commercial scale. The trees are four-year-olds, and the fruit, which was consigned to Chicago, is of fine quality.

CITRUS, NUTS, SEMI-TROPICAL.

The Citrus Exposition for San Joaquin Valley will be held Dec. 6-13 in Visalia.

The supervisors of San Bernardino county have passed an eight-to-one orange test ordinance.

R. G. Benson, a grower at Oakdale, picked 89 pounds of almonds from one tree 25 years old.

Olive factories in the Oroville district are now well started on the season's run of Manzanillos and Missons.

At a meeting of the Fair Oaks orange growers strong resolutions were adopted protesting against the eight-to-one test.

The Northern California Olive Corporation is operating its Palermo plant. The orchards from which this company packs are reported to be yielding bountifully.

Porterville district pomegranates brought a record price in New York when a carload sold there the other day for \$1,485 gross at the rate of \$2.05 per half-box.

Prosecution of shippers of unripe oranges artificially colored was begun Oct. 30 when the U. S. Government filed an information against Welbanks & Co. of Los Angeles.

It is reported from San Bernardino that the yield of oranges in the San Bernardino Valley this season will run from 85 to 100 per cent normal. Last year the crop was 70 to 80 per cent normal.

Congressman Denver S. Church says that there is strong opposition to the proposed orange standardization law on the part of the Florida delegation in the House of Representatives.

Estimates of the orange crop in the Lindsay district now place the increase over last year at 22 per cent. The testing of fruit is being done every day and it appears that it is coming up to standard a little ahead of last year.

Prune, Apricot, and Peach Growers.

Spray NOW!

Take Advantage of the Good Weather to Give Your Trees a Thorough Clean-up. RIGHT NOW is the Time to do it.

For prunes and cots use BEAN'S BUG-GO (a perfect crude oil emulsion). Cleans off all scale and moss.

For peaches use Bordeaux Mixture—or Lime-Sulphur.

If you do not own a good spraying outfit, get a

Bean Power Sprayer

Made in a full line of sizes from the sturdy little one-man one-horse Eureka to the big Bean Double Giant, for stationary plants, which supplies 10 or 12 lines of hose.

You can't afford to waste time, temper, and money on a cheaply-built sprayer. Better buy a Bean at the start.

See any Bean agent, or write direct to us.

VALLEY SEED CO.

506-508 J STREET,

SACRAMENTO, CAL.

A \$10,000 olive processing warehouse has just been completed at Lindsay by the Lindsay Ripe Olive Packing Co. Heretofore olive growers of the Lindsay district had to send their olives to Los Angeles or Sacramento to be processed.

Prominent orange growers of the Ontario-Cucamonga district have persuaded the County Board of Supervisors to pass an ordinance prohibiting the shipment of oranges that will not pass the eight-to-one test.

Since the late heavy rains, oranges in the Porterville district have shown an increased tendency to split, the rain having given the growth of the fruit such an impetus that the pulp of the orange grows faster than the peel.

The Sunnyside Citrus Association (a reorganization of the Zante Citrus Association) has perfected its organization. It will pack in the Lisco house, in which washers and other improvements to insure a high-class pack have been installed.

The Northern Tulare County Citrus Association will start orange packing at Sultana, Nov. 11. The subsequent dates of packing will be determined by the test of the fruit, which will have to conform to the State Standardization Law which requires an eight-to-one test.

Oroville orange growers contend that the only solution for the shipment of immature fruit is to bar all sweating and to ship only tree-colored fruit. The shipment of tree-colored fruit from this district last year made a big hit with the trade in the East, and the results financially were satisfactory to growers and packers.

GRAPES.

A carload of Emperor grapes shipped from Dinuba recently brought \$2000 on the auction market in New York.

The California Associated Raisin Company will pay out more than \$1,100,000 to its members this year. Last year the Associated distributed a little more than \$400,000.

A. Dellavalle of Madera has shipped several carloads of Zinfandels and Muscats to Chicago in uniced cars. The grapes were received in good condition.

The California Wine Association has bought 25,000 tons of damaged Muscat grapes since the late storm, and will buy more up to the capacity of its wineries. It has paid \$12 per ton for them. They are converted into brandy.

Approximately 11,000 trays of raisins were destroyed by three different fires in artificial dryers in the vicinity of Hanford last week, the loss being estimated at \$4,276. The dryers were all hastily constructed buildings installed after the recent rains.

The Stockton Vineyard Co. has filled all of its big tanks with this year's vintage, the product amounting to 400,000 gallons of grape juice that will make excellent wine. Most of this yield is from the company's vineyard near Atlanta, surrounding the winery. The season promises to be the best in the history of the company.

MISCELLANEOUS.

An irrigation district has been formed in the Carmichael Colony, near Fair Oaks, and a pumping plant is being installed.

San Luis Obispo county is to have a farm adviser under the provisions of the State law and with the co-operation of the State University.

It is said that Chico's United States Plant Introduction Station will probably be increased by 100 acres or more, and its scope of activity extended.

Fernley Valley, Nevada, is coming very fast. Although it is only a few years since the project was opened, wonderful development has been made in this section. All that was needed was water and a bunch of progressive farmers. Good crops of alfalfa and potatoes can be seen all over the valley, and where corn has

been put in wonderful results have been wrought. More corn should be raised here. Recently 40 acres put to alfalfa sold for \$200 per acre. This speaks well for land that only a few years back was sagebrush.

As a result of the announcement that the \$11,000,000 nitrate plant to be constructed by the Federal Government would be located in a district possessing great hydro-electric possibilities, the Chamber of Commerce of Oroville has written to Hoyt S. Gale of the United States Geological Survey, inviting attention to the Oroville district. The method of manufacturing the nitrates is to extract the nitrogen from the air. The factory is designed both to furnish fertilizer and to render the country independent of foreign supplies.

Farmers Will Vote Yes on No. 5

Will the working Farmers vote with those whose only use for land is to hold a mortgage on it, or to reap its site value?

Will the land Users vote with the land Speculators?

Will Farmers continue to Pull Chestnuts Out of the Fire for bankers and brokers?

Will Farmers vote to keep on taxing their houses, furniture, barns, tools, stock, crops, autos—or to Un-tax these and Tax fairly million-dollar city lots, idle estates, mines, oil wells, and vast holdings of the Pacific railroads?

They say the Farmer is ignorant and selfish, and will always vote for the despoilers of mankind. It is not true. The Farmer's learning is different from the city man's, but not less. His heart is in closer touch with his head, and he is less a cynic than the city man. He will vote for a True Ideal.

Thousands of farmers are working for Number 5, the Land Value Taxation Amendment (Single Tax) because they understand it will throw open the unused resources to all on equal terms, break the "cinch" of trusts, stop the waste of human life—its needless suffering in a land of plenty, and bring a social order of good will among men.

Livestock Facts and Fancies---VII.

[By the Editor.]

Our last talk was of the wonderful transformation of the livestock which the pioneers found in California by their free importation of purebreds. This appealed to us as a very definite and very broad demonstration of the efficiency of the purebred in enforcing its distinct traits, forms and values upon common stock, in such abundance and with such easily recognized clearness, that reasonable prices paid for purebreds are the very wisest investments a practical grower of salable animals can make, no matter whether he is growing dogs or draft horses. And when such investments are widely made, as they were in California in the early 50s, the whole animal population of a state can be almost incalculably advanced in public service and in market values. If any one doubts this, let him ask himself how he would feel if he should go out some morning to find his pasture populated with long-horned, cat-hammed, long-legged Mexicans instead of the California common stock of the present day, which the pioneers made for him by their purebred foresight and generosity. And when he awakes from such a day-dream as that, how can he satisfactorily explain why he does not go on lifting common stock toward purebred standards of form and value? How can he explain to his little grandson, who has run away from his mother to follow him through the wet grass of the morning, why he does not continue to do, for the future prosperity of the kid he loves, just what the pioneers did for him!

But we surely did not intend to start in preaching so early in the morning—and yet if the poets can find sermons in stones, the farmer can surely find them in the wet grass of the sunrise. But what we thought of saying at this time is this: From the very earliest times, even before the sunrise of civilization, geography has been associated with the improvement of livestock, and our argument for better animals, based upon the wonderful transformation of the common stock of California, has historic propriety. Even beyond history, certain geographical areas have had improved animals and certain others have not. All of those peoples which conceived ideals of better animals for their various purposes, attained them by selection of sires and dams and guarded them from intrusion of scrub animals which would debase the offspring—but we do not intend to indulge in ancient history. In more recent times the beginnings of what we now recognize as breeds are found in definite geographical areas: Arabian, Percheron, Shire, Durham, Jersey, Ayrshire, Holstein-Friesian, etc., etc., are all geographical terms. And all of the breeds were evolved and given individual characteristics by the work of far-seeing men within quite definite geographical limits. Most of them secured elements of improvement from outside, by bringing animals of some fame from beyond their borders, but the chief work was done in the localities. These same facts of history are still a working basis for animal improvement. There is perhaps no need to

multiply breeds at this late day so we are not suggesting that California should enter upon the development of new breeds suited to her various conditions and environments. We do, however, suggest that California can still employ the old geographical method of developing distinctive improvement by specializing in certain areas of similar conditions for the development of existing breeds, in a way to especially serve those conditions and productive opportunities which they offer. By doing this with the insight and enterprise with which Californians are widely credited, it is distinctly possible, not to develop a California breed of this or that kind of animal, but to develop and offer to the world California types of many good breeds, because we have the mental force to do it and because our natural conditions are so distinctly adapted to the attainment of higher types of animals of all kinds. Enough has been done already to demonstrate the possibility of this. Our Berkshires are said by Prof. Thompson (as cited in last week's Rural Press) to be as good as anybody's. The University Farm has bunches of various breeds which are also thought to be, at least of similar standing. These ought to be tried out at eastern shows to determine just where they do stand. We need actual demonstration at the first possible moment of just how our California-bred specimens of the different breeds compare with national standards, and if they should be now "as good as any" all we have to do is to press onward until they are better than anybody's. When that is recognized, we shall have the basis for an invitation to the world to seek their purebreds in California, and the best always advertises itself.

Now, to work toward such ends, not only to supply our own factors of improvement, but to supply the fast awakening nations and regions to which we are geographically a supply district, it seems desirable to have a wider and more solid community interest in the breeds, and we use the term "community" in a geographical sense largely. It would be a great advantage, from the point of view of the great State interest, if we could have geographical districts devoted to the local development of different breeds. We have already some tendency toward segregation in this line, like Poland-Chinas in Kings county, Jerseys in Stanislaus, Shorthorns in Monterey, Holstein-Friesians in Sacramento sections, etc. Of course this is not an exclusive arrangement. It is only illustrative of what might be more prevalent. If we could go on along this line we would soon have in California headquarters or centers for each of the popular breeds as they have been long established and recognized in Europe and as they are coming to be realized in the older parts of this country.

It would be very desirable, it seems to us, if we should give more attention to development in districts rather than in scattered individual breeding farms. It would draw local livestock farmers closer

Shorthorn Bulls

BERKSHIRE SWINE

We will arrive about November 8 with the best shipment of Registered, Tuberculin-Tested

Scotch Topped Shorthorn Bulls

we have ever brought out from the East. We have visited the numerous herds in Nebraska, Iowa, and Missouri, and selected only large, growthy, heavy-boned bulls, ranging in age from 15 months up and in splendid condition.

The Great Adventure

To restore the land and its resources to the people on equal terms—and to do it now. Beginning in California with No. 5 on Nov. ballot—the Singletax Constitutional Amendment. Don't know about Singletax?

Let Henry George tell you. Send for any of these George pamphlets: The Singletax, What It Is and Why We Urge It—The Crime of Poverty—The First Great Reform.

Furnished free in any quantity—also by Clarence Darrow, Land and People.

SAN FRANCISCO, 530 Pacific Bldg.

together in sympathy, interest and understanding. It would give them all points as to what distinctive improvements are and would make it easier to attain them. Instead of being anchored away each by himself with no cattle of his kind but his own, and apt to get conceited and self-satisfied, he would be continually punched in the side by his neighbor and waked up to do better things which he might never see or think of if he saw nothing but his own work. Besides, he could freshen his own blood and help his neighbor to the same end, at a fraction of what it now costs to get new blood from a distance. And then when a community of breeders of the same breed has attained some increase, it invites purchasers who desire to buy in large numbers for their own use or for distribution to scattered clients. Such a community could fill a car of choice bulls, bucks, boars or what not and not cause a buyer to waste his time and money chasing around

the State picking up things here and there. But we are only roughly suggesting this desirability of building up geographical homes, of considerable area, for the different breeds in California by community interest—not merging individual interests at all in purposes or property, but simply feeling the touch of elbows as each one does as he likes, but for mutual interests builds up the name and producing capacity of his district and gives it world fame as the place to go when its kind of thing is desired in highest quality and in quantity to suit.

ALFALFA AND CORN FOR SWINE.

To the Editor: What is the feeding value of broom corn seed for swine, as compared with Egyptian corn when fed with alfalfa pasture and when fed in a dry lot? What would be the proper proportion of alfalfa hay to grind with (1) Indian corn, (2) Egyptian corn, (3) broom corn; to secure a balanced ration (1) for fattening, (2) for growing shoats?—A. J. S., Princeton.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

Broom corn seed has about 90 per cent of the feeding value of Egyptian corn when fed either in connection with alfalfa pasture or in the dry lot. It is generally considered not so palatable, however, and should in all cases be ground. It is not very generally used.

If the growing pigs weigh 50 to 100 lbs. they may be fed about one-fourth as much alfalfa meal as of Indian corn when at the 50-lb. weight, and this amount increased up to 30 per cent of the weight of the Indian corn by the time the pigs weigh 100 lbs. From 20 per cent to 25 per cent of alfalfa hay would be sufficient to feed with the Egyptian corn and with the broom corn. If the shoats are being fattened for market, 10 to 12 per cent of alfalfa will probably be all that you can use and get sufficiently rapid gains.

HORSE'S SKIN SCABS.

To the Editor: A horse's skin rises in patches sometimes two inches in diameter, turns to scab, and comes off. The belly is worst affected, but there are scabs around all the large veins. Between her eyes also the hair is off. Before it became so bad, I noticed little pink spots. Sheep dip which I have been using regularly for three months, does not seem to cure it. The horse is young and otherwise in good health.—H. D., Vacaville.

[Paint the diseased places with tincture of iodine every other day and give Fowler's solution in ½ ounce doses twice a day.]

Insure your feed supply against
early frost and rain with

REMCO SILOS

The early cessation of the rains last spring and their unusually early opening this fall should be a warning to all feeders of livestock, especially dairymen, to no longer neglect the addition of silos to their equipment.

It is not yet too late to order a Remco silo to save your crop of corn from the frosts likely to follow the early rains, or to save your last cutting of alfalfa.

A Remco silo is your cheapest insurance against all such losses. Send in your order early and avoid delay.

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

J. S. GIBSON CO., Box 97, Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

At prices within reach of
every Breeder and Dairyman.

When you buy a son of our herd sire, Prince Alcartra Korndyke, you get more than a Holstein bull with registration papers—you get a grandson of the world's greatest milk cow out of a high-testing A. R. O. dam. Our herd of females has been developed into one of the best in the State.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYMEN AND DAIRYING.

C. E. Kent of Stillwater, Nev., recently placed milking machines on his dairy.

F. W. McCulloch of Fernley, Nev., has a number of registered milking Shorthorns.

The first annual stock show which was held at Orland, Oct. 18, was an unqualified success. The prime object of the show was its educational feature. The event brought out 500 people. The auction sale was well attended and practically everything offered found a buyer.

Harold B. Rhoades, the only son of Col. Ben. A. Rhoades, whom he is training to succeed him in the live stock auction business, made his maiden effort at the recent sale of Holsteins on the Baldwin ranch and acquitted himself most creditably. He promises to make a worthy successor to his father.

George Wendt, in charge of the purebred herd at Vina, Tehama county, owned by the Stanford University, reports that they have recently done some official seven-day testing with records up to 25.85 pounds butter. Three others made above 22 pounds and a two-year-old made over 16 pounds. He states that they expect to put eight more cows on test at once.

Dr. Charles W. Keane, State veterinarian, believes that when all the tuberculin tests have been made under the State pure milk law, which became effective October 1, 1916, records will show that about 16 per cent of all the cows inspected reacted to the test. Milch cows on dairies adjacent to the larger cities, including Los Angeles, San Francisco and Alameda county, show a greater percentage of tuberculosis than the herds in the more sparsely settled districts.

Jay Dutter, who recently acquired the position of manager for the Henderson Company's herd of registered Holsteins near Galt, Sacramento county, writes that among other improvements which are being installed at that ranch is a fully equipped cheese factory in charge of Chris Kolbeck, an expert cheddar cheese maker from the U. C. Farm at Davis. He states that they are also doing a lot of official testing and have some very promising young heifers that will doubtless be heard from later.

Arthur Gregory of Redlands, who, last spring, bought 525 acres of land near Byrn Mawr, is now stocking it with Holstein and Jersey cattle and is fitting up an up-to-date dairy farm. Two cottages for dairy workmen have been built and an office for the foreman. An up-to-date creamery building has been built and a large concrete milking barn and shower baths for the cows. Four large silos and two big hay barns have been erected, the whole when finished making it one of the most complete and extensive dairy farms in Southern California.

SWINE AND SWINEMEN.

The Dos Hermanos Ranch, owned by Duveneck & Pickersgill, started in the purebred hog business with 10 sows purchased from Southworth of Napa, heading their herd with a 700-lb. year-and-a-half-old boar bought from Curtis of Napa.

The Whitehall Estates Co. at Tracy have recently sold 12 head of Berkshire sows to the Kings County Land and Cattle Co. of Corcoran, Kings county. These sows were of Rival's Champion Best breeding, the former company having 20 brood sows of that breeding.

At the Napa State Hospital the industry of raising hogs has turned out to be very successful. There are over 600 hogs on the farm of that institution, and as supply has increased faster than the demands of

the hospital it was determined to make ham and bacon instead of buying at contract prices. In the event that more meat is cured than can be consumed at the hospital it will be sold at market prices to other State institutions.

W. A. Young of Lodi, Cal., has recently made the following sales of Poland Chinas: Sow to Louis J. Marsh, Concord; sow to N. C. Anderson, Rio Vista; sow to C. Claffey, San Francisco; three sows to Chas. Olsen, Atwater; sow to E. M. Robinson, Napa; sow to H. I. Marsh, Modesto; sow to Leslie McCracken, Ripon; sow to Mr. Quackenbush, Lodi; boar to C. D. Bovard, Yerington, Nev.; boar to L. C. Mullis, Mendota; boar to Mr. Winters, Ione; boar to Mrs. Blascow, Newark, Cal.

D. O. Lively of the California Swine Breeders' Association, in a lecture on hogs at the Los Angeles Chamber of Commerce last week, said that Southern California was an ideal place to raise hogs and that there was money in hog-raising. As an evidence of the interest taken in this matter of hog-raising, he said, a convention of hog raisers of the State would be held in Los Angeles in January. Mr. Lively spoke of the great success in hog raising in the Imperial Valley and reminded his hearers that 70 per cent of the hogs and hog products used in California came from Idaho and east of the Rocky Mountains. This should not be. California should raise fully 75 per cent of the hogs used, if not the whole of its supply, and there is no reason why it could not be done at a profit.

BEEF CATTLE.

Although range conditions in the mountains of San Benito county were ideal for some time after the early October rains they are drying up rapidly at this time.

Chas. Hawkins, manager of the Pacheco Cattle Co. at Hollister, will leave next week for a trip through the Middle West where he will inspect a number of Shorthorn herds in the hope of securing a bull suitable to use on his registered Shorthorn cows.

The Rose Crest Farm of Perris won some valuable prizes on its stock exhibit at the Riverside Fair this year, among others 1st on Percheron stallion over 3 years; 1st on Shorthorn bull over 3 years; 1st, 2nd, and 3rd on cows over 3 years; besides 2nd on aged boar and 2nd on aged sow in the Berkshire class.

According to reliable reports there are no less than three California farmers, now in the East or who have representatives in the East, securing foundation herds of registered Shorthorn cattle. Besides these there are several of the older breeders of both Shorthorns and Herefords who are buying high-priced herd sires this fall.

The Barco Ranch at Hollister is offering a carload of choice Shorthorn bulls which they purchased in the East last spring but which they have not shipped to their own ranch because of lack of feed. Mr. Colomb, manager and part owner of this ranch, states that he may make a trip East this fall and bring out another carload or two of females to add to their already choice foundation herd.

H. L. Murphy of Sacramento county wires that the Shorthorn sale held by W. A. Forsythe and Sons last week in Missouri averaged \$493 for 52 head, the 44 females averaging \$510. He bought the heifer Miss Orange 12th, a winner of the Shorthorn breeders' trophy this year, and a show cow, Maud Alexandria. He is also bringing out some Scotch bred females and some Milking Shorthorn heifers for California customers.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all ages, reasonable prices. Some fine bred sows and gilts, and top young boars. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, R. H. Whitten, Route 5, Box 647, Los Angeles.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

POLAND-CHINAS—Bred gilts, \$15; young boars, \$10 and \$15; bred sows, \$25. Weanlings, either sex, \$6. Registered and crated, purchaser to return crates. E. A. Hall, Watsonville, Cal.

REGISTERED POLAND-CHINAS—Prolific, pabulous, profitable porkers. Choice boars now ready for service, \$25 each. Weanlings, \$15. Dr. J. A. Crawshaw, Hanford, Cal.

LAKESIDE STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

POLAND CHINAS—Big type. Shoats, either sex, or in unrelated pairs. O. L. Linn, Linview, Route 4, Modesto, Cal.

POLAND-CHINAS—Big type combined with quality. Choice bred sows, gilts, boars. W. D. Trehwitt, Box 82A, Hanford, Cal.

REGISTERED POLAND CHINA SWINE—Prize-winners. Finest stock in the State. \$20 up. M. Bassett, Hanford, Cal.

POLAND CHINA HOGS FOR SALE—Registration papers furnished free. O. A. Cooley, Durham, Cal.

REGISTERED POLAND-CHINAS and Duroc Jerseys. Cholera immune for life. T. H. Beckman, Lodi, Cal.

POLAND-CHINAS—Large type. The Browning Stock Farm. W. H. Browning, Woodland, Cal.

DEACON RANCH POLAND CHINAS—Prize winners. Young stock reasonable. Box 27A, Davis, Cal.

KNOB HILL STOCK FARM—Registered Poland-China Swine. A. M. Henry, Farmington, Cal.

REGISTERED POLAND-CHINA HOGS—J. A. Clark, R. 4, Lodi, Cal.

POLAND-CHINA HOGS—C. A. Stowe, Stockton, Cal.

REAGANS RANCH herd of registered Poland Chinas. W. J. Hanna, Gilroy.

POLAND-CHINAS—Prize-winners. Money-makers. W. Bernstein, Hanford, Cal.

Berkshires.

GRAPEWILD FARM BERKSHIRES—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion, but the sire of Champions. At the 1916 California State Fair his daughters won first in all of the senior sow classes, including the Grand Champion Sow. At the 1916 Oregon State Fair a Grand Leader sow was Junior Champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for Fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

WINONA BERKSHIRES—Won at the 1916 California State Fair and W. A. B. C. eighteen prizes, with four firsts and two championships. F. R. Steel, Winona Ranch, Route 1, A-Box 105, Grant's Pass, Ore.

REGISTERED BERKSHIRES—Progeny of Improver B. Young stock now ready for sale. Start your herd with breed and strain of established reputation for California conditions. Geo. G. Meckfossel, Berlin, Cal.

CHOICE REGISTERED BERKSHIRES—Line bred Rival's Champion's Best and Masterpiece pigs, \$15 each, trios \$40. Service boars, bred sows, and gilts at reasonable prices. W. H. Waugh, Riverside, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

BARGAINS IN BERKSHIRES—Write today for our Special List of high-class boars and open gilts. Both the offerings and prices will please you. Silver Birch Farms, Box P. P., Newnort, Wash.

REGISTERED BERKSHIRES—For sale bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Norato, Cal.

REGISTERED BERKSHIRES of prize-winning blood. Write for description and photos. Imperial Stock Farm, Morran Hill, Cal.

ROSE CREST BERKSHIRES—Rivals Champion Best blood. Open and bred gilts. Service boars. F. L. Hall, Perris, Cal.

SPECIAL—Six good service boars and a few sows in pig to Premier Leader due to farrow in October. Geo. M. York & Son, Berkshire breeders, Modesto, Cal.

HOPLAND STOCK FARM—Registered Berkshires. Prices on application. Hopland, Cal.

REGISTERED BERKSHIRES—Weanling pigs, \$10 each. G. A. Casey, R. 7, San Jose.

BERKSHIRES—Carruthers Farms, Mayfield, Cal. Second annual sale, August 2, 1917.

REGISTERED BERKSHIRES—Young stock for sale. F. W. White, Elk Grove, Cal.

BERKSHIRES—Butte City Ranch, Butte City, Cal. See our ad in another column.

CHAS. GOODMAN—Breeder of high-class Berkshire Swine. Williams, Cal.

Duroc-Jerseys.

DUROC JERSEYS—My hogs won highest honors at State Fair, taking first prize herd, first prize sow, second prize boar. Were the largest of their age exhibited. Stock all ages for sale. Prices reasonable. Breeding and satisfaction guaranteed. Haden Smith, Route 1, Box 84D, Woodland.

DUROCS from River Bend Farm, St. Helena, Cal., are large type, smooth, rangy, with fine backs and deep cherry color. We sell only those we'd like to keep in our herd. Don't write us if you want cheap stock.

RANCHO RUBIUS DUROCS—A few choice gilts bred for October farrowing; also good service boars, tried sow and weaned pigs, priced right. Elmer Lamb, Ceres, Cal.

REGISTERED DUROC-JERSEYS—Service boars from prize-winning stock are money-makers. They grow faster. New England California Corporation, Ripon, Cal.

DUROC JERSEYS—Herd boars. E. N.'s Colonel and Tulare Boy. Sweepstakes winner at Fresno, 1915. Choice breeding stock. J. P. Walker, Visalia.

REGISTERED DUROC-JERSEY SWINE—Both sexes. Big-boned type. B. F. Kendall, Hardwick.

REGISTERED DUROCS of guaranteed breeding. All ages. Weaned pigs \$10. H. E. Boudier & Son, Napa.

REGISTERED DUROCS—Crimson Wonder stock. Young stock, both sexes. L. D. Collins, Denair, Cal.

WINTON DUROC-JERSEY FARM, Winton, Cal.—High-class pure-bred hogs, both sexes, any age.

CURTIS DUROCS of either sex at all times. E. C. Curtis, Napa, Cal.

REGISTERED DUROCS—All ages. Either sex. W. A. Pack, Hollister, Cal.

REGISTERED DUROC-JERSEY SWINE—D. L. Henley, Lemoore, Cal.

REGISTERED DUROC JERSEY SWINE—Frederick M. Johnson, Napa, Cal.

REGISTERED DUROC-JERSEYS—S. S. Southworth, Napa.

Other Breeds.

BILLIKEN HERD OF IMPROVED CHESTERS—Prize winners at the State Fair. The Farmer's Utility breed. Size combined with quality; producers of big uniform litters of growthy pigs. 15 bred gilts due to farrow in Jan. boars and sows of spring farrows; first class and extra well developed; best blood lines obtainable; prices reasonable and every one cholera immune. Write for special prices and circulars. C. B. Cunningham, Mills, Cal.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

LARGE YORKSHIRE SWINE—Gilts to farrow in September and October. Service boars and Spring pigs. Both sexes. Riverina Farms, Paradise Road, Modesto, Cal.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

LARGE YORKSHIRES—The ideal hog for the progressive farmer. Young stock for sale. A. L. Tubbs Co., Calistoga, Cal.

REGISTERED IMPROVED CHESTER Whites—Grizzly Bear Ranch, East Auburn, Cal.

DAIRY CATTLE.

Holsteins.

FOR SALE—A carload of very fine registered Holstein heifers. They are sired by bulls of great producing ancestry and from dams of splendid type and large production. Some are bred to Prince Juliana Walker, a First Prize son of Prince Geleche Walker. Several will be old enough to breed next month. Some are calves. This is a great opportunity for some one who would like to start with a small capital as they will be priced low for a quick sale. I have an extra well-bred Kordyke bull to go with them whose granddam was a former World's Record cow. Write for full information or better some and see them at once if you are looking for a real bargain. Sold subject to tuberculin test. Geo. A. Smith, Corcoran, Cal.

REGISTERED HOLSTEIN BULL CALVES—Sired by Lorena Kordyke Alcarra, whose dam made 29.75 pounds butter fat in seven days as a four-year-old. J. M. Campbell, Escalon, Cal.

REGISTERED HOLSTEINS—Grandsons of King Begis and of world's record cow Creamelle Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

REGISTERED HOLSTEINS—Have a few Bulls from El Prado Wayne Colantha, whose dams and sires' dams average per cent fat at 4 years is 5.01. See my stock at the State Fair. J. W. Benoit, Route C, Modesto, Cal.

REGISTERED HOLSTEINS—Sired by King Kordyke Hengerveld Ormsby 53822. Dam Pietertje Maid Ormsby 78051, world's record when made 35.58. Send for pedigrees. Geo. Koulias, Modesto, Cal.

TULARE GUERNSEY AND HOLSTEIN Farm is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Higdon, Tulare, Cal.

THE MCLOUD RIVER LUMBER CO., McCloud, Cal.—High-class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

WANTED—High-Grade Holstein Milk Cows. Interested in nothing but the best. Address Box 340, Pacific Rural Press.

A SPLENDID 6-month-old Holstein bull with good A. R. O. breeding for \$135. E. W. Abbott, Milpitas, Cal.

THE HENDERSON CO.—Breeders and importers. Registered Holsteins. Sacramento Bank Bldg., Sacramento.

San Jose.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT
Co., Eugene R. Croley, Manager, solicits for-
eign orders for purebred registered and merit
breeding animals and fowls. California has
great diversity of climatic and other condi-
tions that enable us to select animals that
have been raised under conditions similar to
those of the location for which they are in-
tended. We should be informed regarding
these conditions and be allowed ample time
to make selections. Nearly all disappoint-
ments in buying afar are the result of insuf-
ficient information as to conditions or to lack
of time for proper selection. Our plan and
terms for "raising animals to order" to fit
into peculiar foreign conditions is worth in-
vestigating. References: Dun or Bradstreets,
or San Francisco banks. Office 219 Under-
wood Building, 525 Market St., San Francisco.

SHEEP.

Bankers have offered to buy sheep
and sell them on time to farmers in
Pennsylvania.

Eight cars of sheep were con-
signed to the Golden West Meat
Company and Roth Blum & Co. of
San Francisco, from Colusa last
week via the Northern Electric.

HORSES.

Jack London's famous imported
stallion Neuadd died last week at
the stock farm near Glen Ellen. He
was foaled in England in 1908 and
was brought to this country four
years later. He won the California
State championship first in 1912.

Steve Lorten, representative of
Allbright and Sons, San Francisco,
says that the man who has a horse
for sale any time within the next
four years is going to get an un-
heard-of price for the animal. Mr.
Lorten says there is not one stock
stallion in the whole of France.

El Centro Chamber of Commerce
is planning for a livestock fair for
Imperial Valley.

The University of California will
show its livestock at the Interna-
tional Show at Chicago.

GIBSON BREAKS STATE HOL- STEIN RECORDS.

That California has an excellent
chance of again claiming the world's
long-distance milk cow is the advice
received from Gion Gibson, manager
of the J. S. Gibson Company's regis-
tered Holsteins at Williams.

The cow that gives such great
promise is Winnie Korndyke Cornu-
copia De Kol, who has been on test
since last December and who made
in the first 300 days of her test 1020
pounds of butter from 27,000 pounds
of milk. Mr. Gibson states that she
is still milking better than 75 pounds
of milk a day and is safe in calf to
his herd sire, Prince Alcartra Korn-
dyke. At 272 days after calving
this great cow made 22.53 pounds of
butter from 558.4 pounds of milk
which is the world's record for a liv-
ing cow, only equaled by Aralia De
Kol Burke. Unless something un-
foreseen happens, Mr. Gibson expects
this cow to break the world's yearly
record for milk as she will have to
average only a little over 64 pounds
a day from now on.

Mr. Gibson has been making some
State records with other cows, Hazel
Aaggie of Oakwood Daughter, a
junior three-year-old having just
finished a yearly record of 861
pounds of butter from 21,220 pounds
of milk, the State record for butter.
The same cow made 17 pounds of
butter from 344.5 pounds of milk
in seven days, 304 days after calving,
which is a State record for both milk
and butter.

Another record was made by Inka
Tritomia Walker, a daughter of
Prince Gelsche Walker out of a three-
quarters sister to Tilly Alcartra. As
a senior two-year-old, 254 days after
calving she produced 15.26 pounds
of butter from 445.6 pounds of milk,
a State record for both milk and
butter. This same cow had made
620 pounds of butter from 16,423
pounds of milk the first 266 days of
her test and was still milking better
than 60 pounds of milk a day. Mr.
Gibson states that they have 20 cows
on yearly test and that he is expect-

ing the completion of other State
and world records during the com-
ing winter.

SACRAMENTO DAIRYMEN OR- GANIZE.

That the dairymen of the Sacra-
mento Valley who sell market milk
are dissatisfied with the present
marketing conditions was plainly
shown by the meeting held at Sacra-
mento October 25 which was at-
tended by close to 100 producers.

Mr. Jas. Henderson, who presided
at the meeting, stated that he had
made a careful investigation as to
the cost of producing milk and that
it was his belief that the average
cost of producing a gallon of milk
was right around 16½ cents. In
view of the fact that producers in
the Sacramento valley are only get-
ting between 12 and 14 cents a gal-
lon at this time he believes the pro-
ducers must organize or go out of
business.

State Market Director Harris
Weinstock confirmed Mr. Hender-
son's estimate of cost of production
by figures which he secured earlier
in the year in connection with the
producers' association located in San
Francisco. He also offered his as-
sistance to any such association
formed in Sacramento.

The practical workings of a pro-
ducers' organization was explained
by S. N. Ayers, secretary-manager
of the California Milk Producers'
Ass'n of Los Angeles which was or-
ganized June 5, 1915.

At the direction of those present,
Mr. Henderson appointed a commit-
tee of five consisting of F. Morris,
Woodland; J. Guill, Chico; C. E.

Mack, Franklin; H. R. Timm of
Dixon and Mr. Harvey of Galt, who
will in turn name a promotion com-
mittee of 11 dairymen to complete
organization details and secure mem-
bers. The names of this committee
will be given out at an early date.

SAN LUIS OBISPO DAIRYMEN FOR BETTER SIRES.

[Written for Pacific Rural Press.]

We are informed by Prof. E. L.
Westover, in charge of the Dairy In-
dustry Dept. at the California Poly-
technic School, that the meeting of
the San Luis Obispo Dairy Breeders'
Ass'n, held at San Luis Obispo,
October 12, was well attended and
much interest was shown in the ad-
dress of F. H. Scribner of Santee,
one of the leading dairy authorities
in this country, who talked along
feeding, breeding, care and selection
lines of dairy husbandry.

The meeting was presided over by
President A. B. Spooner Jr., and the
constitution and by-laws as sub-
mitted by the board of directors were
read and adopted. There was con-
siderable discussion on the subject
of importing a number of purebred
bulls into the county and it was
unanimously decided to get prices
and information on twenty purebred
sires.

DE LAVAL SEPARATORS

Make Fall and Winter
Dairying More Profitable

THERE are special advantages in using the best cream
separator during the fall and winter months. The milk
from cows long in milk is hardest to cream, and like-
wise hardest to separate with an inferior separator.

Moreover, cream and butter prices are highest, so that
the waste of gravity setting or a poor separator counts for most
at this season.

Then there's the sweet, warm skim-milk for stock feeding,
alone worth the cost of a separator in cold weather.

There is surely no reason to delay the purchase of a sep-
arator or to continue the use of an inferior one.

You can't afford to wait until next spring. Let the De Laval
start saving cream for you right now and it will earn its cost
by spring. See the nearest De Laval agent at once, or if you
do not know him, write us direct for any desired information.

Purebreds vs. Mongrels for Pork.

[Written for Pacific Rural Press.]

Purebred hogs return enough more than grades to warrant their purchase, from a pork-producing standpoint alone, according to the experience of S. G. Owens of Madera county who is raising market hogs as the principal product of his ranch.

When Mr. Owens first started to feed hogs, he purchased a lot of mountain-bred hogs for feeders. Unintentionally some of these got with pig to a Poland China boar that was on the ranch so they were reserved at marketing time and the pigs raised.

This year 100 pigs were farrowed that trace back to those sows, being the second cross from Poland China boars. These pigs have had access to alfalfa pasture since weaning time and have been fed grain regularly all of the time. In July it was estimated that their average weight was between 85 and 90 pounds.

Another bunch of 18 purebred Durocs, of the same age and grown under the same conditions for market purposes, averaged 190 pounds or more than twice the weight of the grades. The Durocs in this case are purebreds, but not eligible for registration. The difference in weights is so great that 23 registered sows have been purchased, largely with the intention of making quicker and more economical gains for the butcher trade.

Altogether there are about 300 hogs kept on this place, alfalfa pasture and grain being the chief feeds. All of the fields are provided with self-regulating water troughs. This, with movable shelters, eight feet wide and 16 feet long, enclosed on three sides, constitutes the field equipment.

A central farrowing house is provided near the barn in which all of the sows are confined at farrowing time, which is regulated by breeding so that it comes in September and in the early spring.

At farrowing time the brood sows are fed a ration of rolled barley and shorts, and at all times all of the hogs have access to troughs containing sulphur, charcoal, and salt. As a further precaution against disease, a concrete dipping tank has been built and all of the hogs are dipped at regular intervals. Before putting the sows in the farrowing houses these quarters are well cleaned out and sprayed with a strong solution of sheep dip, the stronger the better in Mr. Owens' opinion.

Unless he can turn off a hog weighing between 180 and 200 pounds at seven to eight months of age, Mr. Owens says there is no money in the business. But with proper breeding and plenty of alfalfa and grain he finds it comparatively easy to meet this requirement.

Another Big Holstein Herd on Test.

[Written for Pacific Rural Press.]

The Bridgford Company at Knighten have just started on 7-day and semi-official test Rilla Canary, who was a prize winner at the Oregon Fair, standing 2nd to Ormsby Lass, the P. P. I. E. Champion. Ten other cows of the Bridgford herd will go

Korndyke Mercedes, first aged cow, and dam of Junior Champion at Sacramento, and Panje Hengerveld De Kol, who has a 22 lb. record as a 3-year-old and who is now giving 35 lbs. of milk per day 17 months after freshening in spite of efforts to dry

her up. The Bridgford Co. is well equipped for record work. Their cows have the breeding and capacity. Their fine island ranch provides the feed. Corn silage, alfalfa, beets, and grain, and their buildings and equipment are up-to-date, having been completely installed within the present year.

At the head of the herd is King

Alcartra Abbekerk, a young bull sired by King Segis Pontiac Alcartra and out of Tidy Abbekerk Princess who has a record of 30.27 pounds as a 4-year-old.

Miss Korndyke Mercedes, First Prize Aged Cow State Fair, 1916, and Dam of Junior Champion.

on test as they freshen between now and Jan. 1. Among them are Finnerne Dream Korndyke who has the highest record as a 2-year-old on the coast (26.37 pounds), Miss

FRESHLY-CUT SILAGE.

To the Editor: I have a silo filled with corn about a month ago. It is still warm. I want to begin feeding it now. Would it injure the cows to feed them so soon on this silage?—E. G., Covelo.

[We know a number of dairymen who begin feeding as soon as the silo is filled, and continue through the various stages of fermentation, without injury to the cows. The corn does not become silage until it has fermented; but cows seem to relish it in all stages.]

GROWTH ABOVE HOOF.

To the Editor: Six months ago my five-year mare got a hard growth above each front hoof. Is it side bone? A neighbor stopped its growth, but it is enlarging again. Will it unfit her for work?—C. N., San Luis Rey.

[This is ringbone. Have your veterinary fire and blister the growths.]

Milk men of Visalia have raised the price of milk from \$1.50 per pint per month and \$3 per quart per month, beginning November 1.

The True Blue Pad gives relief from strain on bruised shoulders; aids in preventing galls, chafes and scores.

We've sold True Blue Collar Pads for many years to dealers all over the Pacific Coast who constantly receive repeat orders from their customers, which proves that these pads are considered the best by horse owners.

Sturdily made for hard continuous use. The pads show horse owners take pride in keeping their horses free from shoulder troubles; besides, it pays to keep a horse free from hurts.

When a dealer offers you a Hercules Harness, Horse Collar, or Saddle, he is offering you THE BEST THERE IS

Elmer Lamb Closing Out Durocs

AT PRIVATE SALE.

Owing to continued ill health I am obliged to take a year's rest and will sell all my herd of registered Durocs at prices little above the market for common hogs. Everything goes, including State and World's Fair Champions, 25 bred gilts and tried sows, 30 gilts ready to breed for next spring litters. Sows with litters, and weaned pigs, Service Boars, etc. Get my price on what you want. This is your chance and my sacrifice.

Veterinary Queries and Answers.

[Answered by Dr. H. B. Winttingham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

SWELLING ON BELLY.

To the Editor: A mare that has been running on pasture had a small swelling on her belly that increased till it was swollen from front legs to bag. The swelling was soft at first. It finally left, but the hide is stiff and hard as a drum. The mare walks stiff as if foundered. She eats well, both hay and barley, but has become very thin since being sick.—W. C. R., Sonora.

[Give this mare one dram potassium iodide twice a day in solution. Rub the skin once a day with iodine ointment.]

FRESH COW STRAINS.

To the Editor: A cow that has just freshened gives only enough milk for the calf. She eats hay but won't eat any flaxseed meal. She stands with her back humped as if she were straining. Today her urine was bloody. She was in good condition.—D. M. J., Winton.

[This cow has retained a part of her afterbirth which has become infected. Douch her out twice daily with a solution of a dram potassium permanganate to water one gallon.]

SCABBY SPOTS ON HORSES.

To the Editor: My horses have spots like a bite of some kind. The hair is all off from the spots, and some have scabs. Another horse got a wire cut and screw worms got in.—Subscriber.

[Wash off these animals with lime-sulphur dip every seven days. Wash the cut with a 2 per cent solution cresol three times a day.]

OPERATE AFTER CALVING.

To the Editor: We have been feeding barley hay and have had trouble with the stiff beards causing sore mouths in horses and sore eyes in cattle. A cow soon to freshen has a hard lump under the jaw which is loose in the skin. Will it be better to wait till after calving to operate?—N. M. L., Gridley.

[Have this bunch opened after calving.]

LUMPS ON PIGS' JAWS.

To the Editor: Five out of a litter of seven pigs eight months old have lumps on their jaws. Two have several small lumps close together; one has only one, as big as a fist; another has one still bigger. The lumps do not seem sore and the pigs eat well. Until a month ago they ran in wheat stubble and were fed alfalfa besides. Now they are fed cooked wheat and green alfalfa in a large corral.—H. B., Huron.

[This looks like tuberculosis. Slaughter will determine the trouble.]

SUPERBA BREEDS WELL.

Because we had heard that the Panama-Pacific Grand Champion Poland China boar Superba was not breeding well, we went to see him and his owner, W. H. Rough of Riverside county. In the young orchard close by the big boar's pen were about 45 thrifty young pigs sired by him, all with big hams, good bone, uniform shape, and strong backs. Superba was up on his feet with greetings, thinner than when shown at the Fair, but smooth of flesh, shields not at all prominent, ankles, strong, and back fine.

We were told that he was the only boar on the place, that he would give service quick as a yearling, never had to breed a sow more than twice, no litter by him contained less than 7 pigs, average litter about 8 1-3, one litter 11, of which 9 were raised, all sows on the place littered by him last spring and all were bred to him for fall litters. Do you like to keep track of noted animals in this way?

L. L. Grover of Potter Valley shipped two carloads of hogs to the San Francisco market last week. Jas. Eddie was a heavy consignor to this lot.

The Book of Dairy Books

It's the book, because it's the authority on the breed—the beautiful, ever-paying Jersey.

This book, "About Jersey Cattle," goes way back to the beginning of the breed, shows how it was line bred and protected from mixture by law, and shows why it has developed into the most economic and most persistent milking of all breeds. It gives tests, yields, etc., proving that the Jersey is the money cow—the "Giant of the Dairy."

The book is free but worth a lot. Send a postal for your copy today.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E. 1915; Sacramento 1916.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

HOLSTEINS AVERAGE \$338 AT SACRAMENTO.

[Written for Pacific Rural Press.]

The first Holstein sale of the California Breeders' Sales and Pedigree Co. at Sacramento, October 26-27, was a decided success, totaling \$47,405 for 140 head or an average of \$338.60 each.

Though not the highest average that has been secured in the State, it was the consensus of opinion that the majority of the animals were well sold. Two reasons can be assigned for this, namely, the responsible and generous guarantee given on every animal sold as to health, breeding ability, etc., backed by a thoroughly trustworthy organization of business men and breeders, and secondly the terms of the sale, which required but one-third cash provided the purchaser could show satisfactory bank references. Both are conditions which are thoroughly constructive salesmanship practices with purebred livestock and well worth remembering.

It was a well balanced sale in sex, age, and average prices received, 58 heifers averaging \$345.50, the 51 cows averaging \$332.25 and the 31 bulls, \$336.10. Over 40 buyers participated, a number of whom are establishing purebred herds in the State. All of the cattle sold will remain in northern and central California.

The feature of the sale was the buying of Gion Gibson, manager of the J. S. Gibson Co. at Williams, who purchased 22 females at an average of over \$520. Included in this lot were four underyear daughters of King Korndyke Sadie Vale consigned by E. J. Weldon, that brought an average of over \$831, one going at \$1350, the top price of the sale. He also paid the second highest price for females when he purchased Charlotte Walker 2nd, an aged cow from the Morris herd, at \$1,000.

What was admitted to be the greatest bull bargain of the sale was the seven-month-old grandson of King Valdessa, consigned by Toyon Farm and bought by the J. H. Harlan Co., Woodland, for \$500.

The popularity of Prince Gelsche Walker was expressed by the manner in which animals of his relation sold, his son Prince Juliana De Kol Walker going to Frank Helm of Fresno at \$1025 and one of his young grandsons out of a 27-pound dam going to Whaley, Guerin, and Higdon of Tulare for \$900. Females carrying his breeding also sold well regardless of individuality. The same thing applied to females bred to King Morco Alcartra, son of Tilly Alcartra, indicating that these two strains are the popular ones with a large number of breeders.

The Gotshall Cattle Loan Co. of Ripon were heavy purchasers of females, securing 13 head that will be added to their foundation herd. Other buyers were Frank Helm, Bert Vogel, C. H. Williams, Palo Alto Stock Farms, J. L. Lane, Toyon Farm, C. A. Miller, F. W. Hansen, R. F. Guerin, F. Hatch, Henderson Co., G. Robinson, Rev. Hobart, Geo. R. Carr, Clifford Farms Co., Mr. Yocum, F. M. Grier, F. Kiesel, A. A. Merkeley, Mrs. Anna Donders, L. A. Driver, Ginn & Son, I. G. Zumwalt, Alex Whaley, W. Higdon, Mahas Bros., Napa State Hospital, J. T. Cooper, H. H. Sturgill, H. Hewins, T. J. Cox, J. F. Troncatty, A. W. Morris, Bridgford Co.

BERKSHIRES AT THE NATIONAL SWINE SHOW.

[Written for Pacific Rural Press by H. L. Murphy, Perkins, Cal.]

The first National Swine Show held at Omaha, Nebraska, and which I attended, was undoubtedly the greatest show ever held in America. I would roughly estimate that about 1700 head were shown, and much credit is due the management for the manner in which the show was conducted.

Pacific Coast breeders should give due credit to Messrs. Talmage, Bunn, and Clark Bros. for the fine showing they made. It was a long and hard trip on the stock they showed, but

they came through it with ribbons to their credit and established the fact that the Pacific Coast is on the map in the Berkshire world.

The Berkshire aged boar class brought out eight entries, all of excellent type and heavy bone, Long-fellow Double Rival being placed first, senior and grand champion. There was little choice between the first three senior yearling boars, all being heavy boned, smooth and carrying wonderfully arched backs. Silver Tips 7th was placed first. If the junior boar pig Winona Royal Champion 5th, shown at Sacramento could have been here he would have won easily in his class.

The aged sow class was one of the

finest shows I have ever seen with wonderful type all down the line. Dukes Champion Lady 4th was first and senior and grand champion female. The aged herd and herd bred by exhibitor shown by Corsa and the four sows shown by Iowana Farms were the pride of the Berkshire show, the latter having won all over the circuit which is some record in this country.

While here I purchased two sows at the Berkshire Congress sale for Arlington Smith, one an under year sow, Iowana Queen 29th of Rival's Champion breeding on both sides, and the other an under six months sow, Iowana Peaceful 30th, a Rival's Champion and Charmers Duke sow.

I also purchased six head for our own herd including Riverby Princess 6th, a full sister to the P. P. I. E. grand champion sow, Iowana Peaceful 8th, Rookwood Lady 113th, Penrith Belle 2nd, the senior yearling boar Artful King 11th, second prize winner at the National Swine show.

Besides the Berkshires I have purchased three carloads of Short-horn heifers and bulls in Missouri, Nebraska, and Iowa that will be on our home ranch near Perkins, Sacramento county after November 10.

There are about half as many sheep as there are people in the United States.

Your HUDSON SUPER-SIX Will Advance \$175

You who now own a Super-Six will gain in the increase—no change in models

Your Super-Six will be worth more next year. And those who buy then must pay \$175 more. When cars under way are completed we must add to the price the added cost of materials. Price advances December 1st.

This is another unexpected attraction in the Hudson Super-Six.

The usual car, the first season, depreciates some 30 per cent. In addition to that, on later models makers often reduced the price. So the one-year drop in value averaged 40 per cent or more.

The Super-Six motor—almost without friction—hardly depreciates at all. And that's the chief part of a car.

The Super-Six price will advance with materials for we never shall lessen our standards. So December 1st, when materials on hand are exhausted, the price will advance \$175. And you who own the Super-Six will share that added value.

No Pretensions

That very announcement will reveal the strength of the Hudson position. Most weaker cars, we believe, will not dare to advance. Some way will be found to avoid it.

But the Hudson Company, on its Super-Six, will never make pretensions.

Hudson profits, considering our size and output are very small indeed. They have always been so, and all insiders know it. Our very balance-sheet proves that our margins are minimum.

On December 1st, we start using materials bought under this year's contracts. Prices on all of them have advanced enormously.

On a Hudson-grade car makers can lessen the quality without making the difference apparent at once. But that would be treason to Hudson standards.

So we do—and do frankly—what is obviously necessary. We add the extra cost of materials.

No Advance on Sold Cars

You who have already ordered—either open or enclosed Super-Sixes—will get delivery at the price agreed up to December 1st.

And many Hudson dealers, probably, have some cars yet to sell of our present production. We have 3500 cars under way, all of which will be sold at present prices.

If you can get one, get it. Buying now will save you \$175. And the present model will not be changed, unless in some minor refinements.

Another World Record

The Super-Six, as you know, holds a hundred records which no other car ever met. These include all the world's stock touring car records up to 100 miles. They include the 24-hour record of 1819 miles, where we broke the stock car record by 52 per cent.

They include the Pike's Peak hill-climb—the world's greatest event of its kind. The Super-Six won over 20 competitors.

Now we add the ocean-to-ocean record—from San Francisco to New York. The most sought-for record in America. That trip was made by a Super-Six in 5 days, 3 hours and 31 minutes—beating the record by 15 hours.

And that same car turned around at New York and went back to San Francisco in faster time than any other car ever made the ocean-to-ocean trip. It was the first car ever to make a round trip across the continent against time. The time for the round trip was 10 days, 21 hours, 3 minutes. That was only 2½ days longer than the best one-way trip made by a famous eight.

So the Super-Six today stands supreme. And there is no probability that a rival can match it, because we own the patents.

These are all-important facts.

Phaeton, 7-passenger . . . \$1475	Touring Sedan \$2000	Town Car \$2750

HUDSON MOTOR CAR COMPANY, DETROIT, MICHIGAN

Raising Poultry for Profit

ZEAS FOR HENS.

To the Editor: In the Pacific Rural Press of Sept. or Oct., 1915, was an article by Geo. H. Croley, in which he quotes from a book on Indian corn or maize (Zea Mays). The author states this maize is the staple crop of South Africa, is a fodder grass, grows 7 to 15 feet tall in four or five months, produces 15,000 to 30,000 pounds of green fodder to the acre. Can you tell me where to procure the seed; amount to sow per acre in drills, distance apart between rows, time of planting, and whether the assertions regarding growth and amount it would yield are approximately correct?—L. A. B., Oakland.

[Answered by Geo. H. Croley.]

The maize, Indian corn, or Zea Mays, is the ordinary corn that forms on a cob, the corn that is so extensively grown in the Middle West of America. There are many varieties and they all make good poultry greens. The sugar or table varieties do not seem to be superior to the ordinary yellow or white grain sorts that may be procured at most feed stores.

Poultry raisers generally have for years been so indifferent to the value of growing corn stalks for use as poultry greens, that I wrote the articles in a peculiar manner to create somewhat of a disturbance and thus wake up the poultry farmers to its value. I am told that it accomplished the purpose.

It is wonderful what a quantity may be grown on a small plot of soil (even a very heavy soil that is not considered good corn land), but it must be properly prepared.

This spring I sowed broadcast a small plot of ground that had been prepared as stated in the article. This spring it was simply spaded; no manure was added. Adjoining this plot was similar soil that had not been thus prepared. We sowed both plots at the same time, with the same seed, and treated both exactly alike. We kept pulling the most vigorous stalks as they outgrew those about them, and the result was amazing.

Surely the prepared ground produced ten times the quantity of greens we took from the untreated ground and it was more tender and juicy.

For convenience we sow broadcast in rows about a foot wide and leave about a foot for a walk between the rows.

Time of planting April 1 to Oct. 1. We have some planted about Oct. 1 that is more than two feet high, but we must feed it before we get frost.

POULTRY QUESTIONS.

[Answered by Susan Swaysgood, Pomona.]

Ducks Have Gizzards.—You published the statement recently that ducks have no gizzards!—Subscriber.

That was a mistake. Ducks have gizzards but no crops, which we intended to say in the article mentioned. Everything in feathers has a gizzard, and in ducks, the feed goes directly to this organ.

Hens Sing but Do Not Lay.—I have some old hens that are singing constantly and appear as if going to lay, but they do not. They are getting their new feathers and not all

the old ones are fallen yet. If I feed them well will they lay soon, or would you advise me to sell them now? When a hen sings is that a sign that she is a layer?—Mrs. P. T. W.

I certainly would not sell hens that are so nearly molted. It is the best way for hens to molt easily, because if all the old feathers were shed at once it is very hard on the hen's system to make even a slight covering for the body all at once. Nature tries to do that where a hen is entirely naked but often the hen dies under the strain. A singing hen is almost always a good laying hen, and the fact that these hens sin now while in the molt is evidence that, if fed right, they will lay just as quick as they have their new suit fitted on.

Chicks Have Pox.—I am having trouble with chicken pox and would like to know something of the method and cost of vaccination for pox. Where can vaccine be bought and would it pay to vaccinate chicks three weeks old from good stock after they had become badly infected?

You can obtain the vaccine from the University of California. The cost is about 1½ cents a head and the hypodermic syringe with which the vaccine is injected costs \$2.50. You write to the University, addressing your letter to Veterinary, state what you want and how many you wish to operate on. Dr. Wintringham of Petaluma also has a vaccine for this trouble. I would not want to assume the risk of vaccinating such young chicks. I would prefer to use a good salve made by mixing one part finely powdered iodoform to twenty parts of vaseline. Apply to the chicks' heads, then take a little sponge and dip it in tincture of iron and just wipe the mouth of every chick with the sponge for a few days in succession, feed the chicks all the nourishing food they will eat and that is about all that can be done for small chicks. If you have a large number, spray them at night on the roost. This is really more successful than a person would imagine; but having tried it several times, I know it works most successfully, besides being cheap and easy to apply. For small chicks I would spray with a teaspoonful of creolin to a quart of warm water. For hens, use Kresol Dip No. 1 and make it as strong as for dipping sheep.

Ducklings Die Suddenly.—Why do so many of my ducklings die? They mostly appear well until a few minutes before they die. Then they begin to tremble and are unable to stand. They also run a little at the eyes and mouth. I feed sweet mash several times a day; do not let them in the water until two months old.—Mrs. F. J. H.

You answer your own question. It is too bad you had to wait for me to answer, but anyway you will know now. Never let ducklings into water until they are fully feathered. The ducklings have cramps and that is all. The cold water inside that they have drunk in swimming, and that outside is too much of them.

REMOVING COCKS' SPURS.

[Written for Pacific Rural Press.]

Cocks with long spurs often tear

out feathers and even wound the flesh of hens, besides making themselves awkward.

The proper treatment for spurs, according to J. B. Roe of Los Angeles county, is to touch them with a hot iron when they are just starting.

But if you buy breeding cocks with long spurs, do not saw off the spurs; for that is cruel and the bleeding sets the fowls back or even kills them sometimes. Remove the spurs without bleeding, by use of a small ordinary rubber band not bigger than enough to slip over your thumb. Stretch it tightly around the base of a spur, wrapping several times until it gives good pressure. If it does not stay close to the cock's leg, file a slight notch at the base of the spur with a three-cornered file. Leave the rubber on until the spur falls off, which is usually within 30 days.

If for any reason long spurs are to be left on cocks, they can be rendered harmless to hens by covering with a piece of small rubber tubing.

POULTRY NOTES.

The Coalinga Poultry Association will give a poultry show November 15 to 18.

If you feed sour milk to poultry, do not feed sweet milk occasionally, as that disturbs digestion, says Mrs. C. H. Hosford of Riverside. She prefers sour milk for poultry because of its acid effect on the intestines.

Eighty thousand hens in the Riverside and Gardena districts have been signed up for the new egg marketing plan proposed by the State market commissioner. The new organization is to be known as the Poultry Producers of Southern California.

The products of more than a million hens have been combined for marketing purposes through the organization of the poultry producers of Central California, a co-operative marketing association, formed under the auspices of the State Market Director.

While geese and chickens will live without animal food, though they will not lay eggs or look well, ducklings can scarcely be raised at all without a liberal supply of animal food. What don't die will be stunted and ragged looking if even they live to get feathers.

The best pen of poultry at the Fresno Fair was adjudged to be the Buff Orpingtons shown by J. J. Graves of Oak Shadows Farm, Redwood. The birds were large, glossy, clean, alert heavyweights which drew three championship and one first in other classes.

If you kill or capture a wild duck bearing an aluminum band around one leg, send the band to the Bureau of Biological Survey, U. S. Dept. of Agriculture, Washington, D. C., which endeavors to determine the longevity of individual ducks and the routes of migration of the species.

M. A. Schofield and A. C. Olsen have opened a \$12,000 chicken-raising plant at Van Nuys. The plant contains five double brooders, which house 2,000 chickens each. An addition of five brooders will be made next year, and the capital increased to \$20,000. M. A. Schofield, the head of the firm, is president of the Federation of Poultrymen of Southern California.

WHITE WYANDOTTES.—Fine large cockerels, \$3.50. L. Haynes, Chowchilla, Cal.

Mrs. Best's Letter.

My dear Friends: As the season progresses and suits are more in evidence, the array of waists becomes greater. Many beautiful ones in colored crepe with a touch of contrasting color are shown and a great number of the high-priced ones are beaded. They are all soft and clingy and are very high-priced, but so simple in design that it is really not a great task to make them.

They are all long-sleeved and although we hear much talk about high necks, they are still all cut with a V neck and with soft rolling collars of some sort. The thinness of the material has revived the old full corset cover, for the tight brassieres do not look well beneath so sheer a waist. For more dressy wear, the camisoles made of a combination of satin and lace are very good. There is a plain net brassiere on the market for wear under the thin corset cover or camisole.

Petticoats of silk are as gay of coloring as the party dresses and messaline has given way to taffeta as the skirts grow fuller. One of the stores is showing what they term the Rainbow petticoat, an appropriate name, for they represent every color of the rainbow made with pretty flounces and much shirring. Black sateen petticoats for everyday wear are now very well shaped and have eliminated the old-fashioned draw-string at the waist, being finished with an elastic band and snapper. For evening wear with the party coats, a yard of tulle of the shade of the coat is used around the hair instead of the silk evening caps. This is newer than the caps and does not muss the hair so badly. Tulle scarfs are also popular for evening wear—they add a daintiness to the costume and are particularly becoming to girls with long necks.

This winter the silk stockings must match the party slippers in color; last year's style of stockings and slippers contrasting has passed on.

I saw a very novel set made of a Paisley shawl the other day. The scarf was wide and in shape was more like an oblong cape than a scarf. It tied at the throat with black ribbon. The hat was of black beaver with cut-out designs of the shawl cross-stitched on and the bag was of black silk with pieces of the shawl applied in points. The effect was certainly unusual, and worn over a very full black silk skirt made the wearer look like portraits of our grandmothers. Rosabella Best.

TWO SOAPINGS IN LAUNDERING.

Do not expect in washing out small articles in the washbowl to get them snowy white by washing in only one soapy water. The first soaping loosens the dirt, but does not entirely remove it. The best plan is to wash well in a strong suds, squeeze out and rinse slightly, then immerse in a second suds. After that, rinse in two or three waters to remove all soap.

Clean white sand makes a very good filling for a jardiniere that is to be used for cattails or grasses. By pressing the stalks into the sand, they can be arranged much more gracefully.

THE HOME CIRCLE

LANDSCAPE GARDENING.

Any community in the State that is contemplating the improvement of its district by tree planting, landscape gardening or floriculture can have, without charge, a representative from the Division of Landscape Gardening and Floriculture of the University of California to aid in the planning. When the work is of general civic value, no charge whatever is made, but if of value to individuals only, a charge is made, for the expense incurred. The University will also send experts to give public addresses on any phase of civic improvement or landscape gardening if desired by improvement clubs, school boards or other organizations interested in the beautifying of their home communities.

HOUSEHOLD RECIPES.

Making Potato Salad.—If potato salad is mixed while the potatoes are still warm, the flavors seem to blend much better than when the ingredients are all cold.

Quick Mustard.—Blend together thoroughly, 1 beaten egg, 3 tablespoons sugar, 1 tablespoon flour, and 3 tablespoons ground mustard; add 1 cup vinegar; stir and cook until thick as cream. Ready for use immediately.

Chutney Sauce.—Eighteen large, sour apples, $\frac{1}{4}$ lb. sugar, $\frac{1}{2}$ lb. salt, 1 oz. garlic, $\frac{1}{4}$ lb. onions, $\frac{1}{2}$ lb. mustard seed, $\frac{1}{2}$ lb. raisins, stoned and chopped fine, three pints vine-

gar. Mustard must be well bruised, garlic and onions sliced and pounded fine; the apples peeled, cored and boiled in the vinegar until well cooked, then mashed fine with a spoon. When cold, add other ingredients and blend well together.

SIMPLE REFRESHMENTS.

Editor Home Circle: I want to entertain some small children and would like suggestions as to the refreshments. — Miss A. M., Martinez.

Have the refreshments simple. Hot chocolate, nut and raisin sandwiches and sponge cakes will be sufficient. The simplicity of the menu may be made up by the service. Tie the sandwiches with ribbons. Float a marshmallow in each cup of chocolate and ice the cakes with colored icing.

TO ERADICATE BEDBUGS.

Practical information as to how to deal effectively with bedbugs is contained in Farmers' Bulletin 754 recently published by the U. S. Department of Agriculture. This bulletin contains information on the habits of these pests and suggests simple household measures, as well as more radical methods for getting rid of them.

Benzine, kerosene or gasoline used freely are very effective, while sulphur fumigation is recommended where the whole house is infested.

Peroxide of hydrogen is recommended for use on the bites, and for adults tincture of iodine is also good.

"Hurry, children—I've got a real treat for you."

Ghirardelli's
Ground Chocolate

is a fortifying food beverage for all—from childhood to old age.

It comes PROTECTED—as all chocolate should—in $\frac{1}{2}$ -lb., 1-lb., and 3-lb. hermetically sealed cans.

Since 1852

D. GHIRARDELLI CO.

San Francisco

Floral Department.

[By Geo. N. Tyler.]

Now is the time to make your fernery. Make it at least eight inches deep, of pure leaf mould, in a shaded situation and where you can give it abundance of water through the summer. Put in a number of large rough rocks, as ferns love to grow in among them. Put in also rotten pieces of wood, and well rotted sawdust—the wild ferns love sawdust. You can go out into the woods and gather the roots now. Five-finger fern is one of the best for a fernery. The coffee or rock fern another. Polystichum Californicum, which grows where the five-finger are found, is a lacy fern and very beautiful. Polypodium, or the licorice fern is good. Woodwardias and the wild sword fern are taller growers, and should be used for a background. The wild maidenhair does not do well, as it has to go dry in the summer—so does the sulphur-back fern.

Following is a list of the hardy domestic ferns that will stand frost: Nephrolepis tuberosa, Pteris cretica, Pteris cretica alba lineata, Pteris tremula, Pteris winiseti, Pteris Winiseti Multicaps, Pteris Adiantoides, Polystichum setosum, Pteris Wilsoni, Pteris flabellata, Aspidium tsussimense, Cryptomium falcatum, Cryptomium Rockfordi, Cryptomium fortunei, Dordia aspera, Alsophila Australis (Australian tree fern).

If you can get the above ferns in four-inch pots, they can be planted now and will make a fine growth in early spring and through the summer. But if the plants are small, you had better wait till spring before planting, unless you have a very favorable location. The Australian lace fern is another splendid variety. This is also called the mother fern, as it forms little plants on the old fronds when they fall to the ground. This variety is also one of the best house ferns.

You can also put in the fernery wild strawberries, also Yerba buena, a creeping plant that is very fragrant, and a number of other plants that you will find growing in moist places in early spring.

In gathering the roots of wild ferns now, cut off all the fronds and the roots will establish themselves in their new location much better, and be stronger plants in the spring.

LUSCIOUS GRAPE SALAD.

Harmony of foods has a new meaning similar to harmony of music since we enjoyed a grape salad made by Mrs. F. H. Booth of Fresno county. The grapes were Thompsons, but she said any kind are good with this dressing. She heats one cup vinegar with butter half the size of an egg. She mixes three eggs with one teaspoon mustard, one teaspoon flour, two tablespoons sugar, and one teaspoon salt. This mixture is added to the hot vinegar for the boiled dressing.

THE SAUCEPAN COVER.

When a saucepan cover seems useless because the little knob or handle is lost, push a cork part way through the opening and secure it by driving a small nail horizontally through the cork on the under side.

Good Health.

(By H. E. Pastor, M. D.)

Olive Oil as a Food and Medicine.

California olive growers are occasionally much exercised to find adequate outlet for their increasing crops of fruit. One of the best ways of recommending an article to others is to make liberal use of it oneself. While the consumption of the olive in its several forms of preparation is spreading as its value as a food and medicine is becoming better understood, Californians still fall far short of according this excellent and time-honored fruit the appreciation its virtues merit. As an article of food, and in other ways, it has been used in the countries bordering on the Mediterranean Sea from time immemorial, and is used there today with undiminished popularity. The olive takes kindly to our California climate and soil, which are similar to those of its ancestral home. Its cultivation in the State is destined to assume an importance in commerce and in home consumption as yet scarcely realized.

While it is not the province of this department to dwell at length on food values, it may be permitted to say that in those countries where the olive is commonly used as an article of diet it has been demonstrated that its use lessens the destruction of muscular tissue; hence we find among these peoples such prodigies of strength and endurance as the Japanese jinriksha runners, Chinese burden-bearers, Turkish porters, etc., whose diet is largely confined to rice and oils. The expressed oil of the olive has many physiological and curative properties which should be more widely known and made use of. As a nutrient in wasting diseases olive oil is only surpassed by cod liver oil, for which it is a very good substitute, besides being more palatable and cheaper. Even when applied externally, and rubbed into the skin, it is taken up by the lymphatics with a decidedly nutritive effect. It is a very good laxative for infants and small children, taken internally, and may be used in the form of an enema as well as per mouth, in which case it should be followed by an injection of warm water. It is also an excellent lubricant for the intestines, and is a handy antidote for use in corrosive poisoning. Were its use as an article of diet more general, we would have fewer cases of appendicitis and hear less of the fashionable but dangerous and expensive operation frequently following in its wake. It is not possible within the brief limits of this column to enumerate all the medicinal virtues of this valuable vegetable oil, but we will take space enough to mention one thing more in its favor, and say that it has high value in warding off those degenerative changes of advanced life indicated by hardening of the arteries. Don't sell all the olives you grow; keep some for home use.

Brieflets.

Avoid excesses and enjoy a happy and a long life.

Air-tight dwellings make the undertaker's business flourish.

Walking is no less valuable as an exercise because it is cheap.

—“woman's work is never done”

Especially on the farm. Busy from morn till night—cooking, churning, feeding the chickens, getting the youngsters off to school, washing dishes and a thousand and one odd jobs.

When the day is done and the lights are lit, out comes the darning basket. It isn't fair to mother. Let the whole family wear

DURABLE DURHAM HOSIERY FOR MEN, WOMEN AND CHILDREN

and darning will be a thing of the past. Durable as their name, this famous hosiery wears best where the wear comes hardest. Made of sturdy, stretchy yarn, shaped to fit, with extra strength at heels, toes and soles. Different weights for different purposes—a hose for every use, for every member of the family and at a price you'll be glad to pay. 10c, 15c and 25c a pair.

Ask your dealer for Durable Durham Hosiery. He ought to have it in stock, as we are the leading makers of low-priced hosiery in the world. Have him show you the 25c mercerized hose. Don't forget the name—Durable Durham.

Milo MaizeNominal
Egyptian, new2.00@2.25

BEANS.

According to recent reports the crop outlook in Michigan is very doubtful, and locally there is a great shortage in several lines. Small and large whites are especially scarce, offerings being much less than the demand, and prices have taken another big jump. Red kidney beans also are very scarce and high, and Mexican reds have advanced sharply. Pinks, bayos and limas stand as last quoted, but all varieties are quite firm.

[First-hand prices on wharf, San Francisco.]

HAY.

Alfalfa hay is coming in rather freely from the river, causing a slight increase in arrivals, but it is hard to get rail shipments of grain hay to this market. The local demand for hay is lighter than usual, however, and shows less strength as to values than last week. Dealers predict a weakening of the market during the early spring, when cars will be more plentiful and hay held in the country will be sent in. This, however, depends on the tonnage stored in the country; and the demand in rural districts is said to have been very good all season, and continues quite active, notwithstanding the rapid growth of green feed. There is still some complaint of alfalfa arriving in bad condition due to wetting. Straw continues quite firm.

[Wholesale prices per ton, carload lots, San Francisco.]

DECIDUOUS FRUITS.

The first-hand market for apples continues very strong and the New-towns are cleaning up in good shape, carload lots being held at 85c per box, while the street price is quite firm. The only difficulty now is to get cars to handle the shipments. The grape crop is about cleaned up in the country, after quite a successful stilling season. The local market is still fairly well supplied, and prices are steady as last quoted. Strawberries are somewhat higher. Persimmons are offered in considerable quantity, and seem to be gaining in popularity. White figs are gone, and the black variety soon will be. Casabas are lower, but are moving well.

DRIED FRUITS.

The upward movement in the dried fruit market continues, with a strong demand in practically all markets. The heavy orders recently received for raisins have resulted in prices being again withdrawn on all grades, and another advance on peaches is reported, though definite information has not yet been received here. With all white figs apparently cleaned up, black cannot be had below 5 1/2c for salable stock. Prunes also are getting rather scarce in the country, while the demand from consuming markets shows no let-up, and small sizes are held at a 6 1/2c basis. Apples show no further change, but the season's output is believed to be pretty well sold out.

BUTTER.

Receipts California by rail for week ending Tuesday, October 31:
1916322,600 lbs.
1915210,980 lbs.

There was more in the past week, but under the influence of light stocks and firm markets east a steady and rather firm 33c market was had throughout the week. While the production here on the coast may be expected to increase a little from this forward, the consumption may also be expected to increase during the winter months, and the eastern situation is growing steadily stronger each day, this being the time of year for the production to fall off in the Central West and East, which may be expected to offset the increased production here on the coast. The market closed Tuesday on 'change steady and firm at 33c for extra California creamery.

Wed. Thu. Fri. Sat. Mon. Tu.
191633 33 33 33 33 33
191526 26 26 26 26 26

EGGS.

Receipts by rail as reported to the Produce Exchange for week ending Tuesday, Oct. 31:

1916693 cases
1915576 cases

Life seems to be out of the egg market for the time being. Receipts the past week were light and a good percent of the arrivals were pullets and as they are coming in of better size they brought a little more money. Our review week opened 1c lower at 43c for fresh ranch case count and remained so up to Saturday. Trading on 'change was light even at that price. Much of the Street Trade giving preference to cold storage eggs at the difference in price, hence a slow market. Monday under very light receipts for two days and San Francisco being up 1c caused the market to advance the same. The market, however, was very quiet. Tuesday there was a further advance of 1c to 45c for case count, but no trading as buyers refused to go above 45c while holders wanted more. Receipts by rail for the week were 693 cases and estimated by truck 600 cases, total 11,293 cases. Same week last year receipts by rail and truck were 1176 cases. Daily quotations the past week:

Special Livestock Market Report.

San Francisco, November 1.

CATTLE. The cattle market continues to be anything but attractive, but the trade is expecting better things soon. Heavy killings are reported from all quarters.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F.]

Steers, No. 16 1/2 @ 7 c

Medium7 @ 7 1/2c
Heavy6 @ 6 1/2c

HOGS have swung back to a better price, packers finding conditions better than they had hoped for as the season advances. Lard is the principal factor in hog values at this time and if the war stops so that America can reach the German market prices are expected to sky-rocket. The largest exporter of pork and provisions at this time is the Belgian Relief Committee who are reported to be taking about 25 million pounds a month. Prices subject to seller standing one-half of any loss from condemnation by government inspectors.

Hogs, grain-fed:
100 to 150 lbs.8 1/2c
150 to 250 lbs.9 1/2c
250 to 325 lbs.8 3/4c

SHEEP. continue inactive, practically all of the lambs being in killers' feed lots and nothing attractive being offered in other lines.

Prime Wethers6 1/2 @ 7c
Spring Lambs, f. o. b.\$5.25@5.75

WOOL activity has been pronounced in the country on fall clips. Buying is on a speculative basis, the eastern markets not warranting present prices here. Reports indicate that most of the fall clip is now out of growers' hands. Eastern markets fair on year's staple. London 5 to 10 per cent higher at sales on good long staple goods but remains the same on defective wools. Mountain fall notably higher.

Los Angeles, Cal. Oct. 31.

CATTLE: There was a little better tone to the market the past week, though prices notably unchanged. California continues to give us a very fair supply of very good grass cattle. Killers were all in the market and wanted supplies and what came in were disposed of without much trouble, both steers and cows. The strength of the markets East having a sympathetic influence on the markets here on the coast.

Quotations are f. o. b. Los Angeles:
Beef steers, prime, 1000 to 1100 lbs.\$7.00@7.75
Stockers and feeders5.50@6.00
Prime cows and heifers6.25@6.50
Good cows and heifers6.00@6.25

HOGS: In sympathy with high markets East, the market here the past week was advanced 25c per cwt. on light and mixed packing hogs. California continues to furnish most of the supply and gave us some very good hogs. Killers were all in the market and wanted supplies and the light receipts were worked off without much trouble.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300\$8.50@9.00
Mixed, 200@2509.25@9.50
Light, 175@2009.25@9.50

SHEEP: A firm and very good market was had the past week. Both muttons and lambs were wanted. Utah gave us a very good supply of yearlings and lambs, but flock-masters were reluctant to sell their older sheep. Killers were all in the market and took everything coming in as fast as it arrived.

Per head f. o. b. Los Angeles:
Prime wethers\$7.30@7.35
Prime ewes6.50@6.75
Yearlings6.50@7.00
Lambs6.50@7.00
CALVES: Not so many coming in and market steady and demand fair. Selling at \$8.50 to \$9.50.

Daily quotations the past week:

POULTRY.

There was a better movement the past week in all desirable offerings. Broilers, fryers and heavy hens were all in very good demand, and were steady. Turkeys and ducks also sold in a fair way and turkeys were 1c higher. Ducks steady and geese continue dull. Receipts were very good and altogether local, the high price of feed causing growers to weed out their flocks, thus giving up an unusual supply for this time of year.

Broilers, 1 1/2 to 2 lbs.24@25c
 Fryers, 2 1/2 to 3 lbs.20@22c
 Hens, over 4 lbs.19@20c
 Hens under 4 lbs.15@16c

 Geese13c
 Roosters, 3 lbs. up (soft bones) 20c
 Turkeys, heavy, 12 lbs. and up. 22@23c
 Turkeys, light19@20c
 Squabs, live, per doz.\$1.50@3.00
 Dressed3.75@4.85

HAY.

Receipts the past week were again light, only 95 cars, a scarcity of cars checking the movement to market. Under the light offerings prices were held steady and firm. Demand, however, was light and only for such lots as had to be had for immediate use. We quote:

(F. o. b. Los Angeles.)

Barley hay\$14.00@16.00
 Oat16.00@18.00
 Alfalfa, Northern14.09@15.00
 Alfalfa, local16.00@17.00
 Straw7.50@ 8.00

WALNUTS.

A steady and firm market continues to be reported for all good nuts. Now that the weather has become settled marketing is well under way again and the crop is fast getting out of the hands of growers.

The Associated prices for this year and last are:

	1916	1915
No. 1	\$15.50	\$13.60
No. 2	12.50	10.60
Budded	19.00	17.00
Jumbos	17.50	16.60

Orchard run 3c per pound less.

Special Citrus Market Report.

Los Angeles, Oct. 31, 1916.
 Shipments of oranges from Southern California from November 1, 1915, to October 26, were 31,610 cars and lemons 6,873 cars. Same time last year shipments of oranges were 33,182 cars and lemons 6,773 cars. Shipments of oranges from central California from November 1, 1915, to October 25, 1916, were 5,404 cars. There was less life to the market the past week, but while the demand was not so active, good prices were obtained in all the markets. Lemons were again higher in the East under light offerings. No new oranges in yet. Reports from Central California, however, say the crop of early oranges is coming on nicely and there will be some ready for shipment in about two weeks. Locally the market continues quiet. A fair movement was reported in desirable sizes, but small and over large were hard to sell and lemons were very dull. Oranges selling at 2 1/2 to 3 1/2c per pound in the grove and lemons 1 1/2 to 2c per pound in the grove.

FROM THE AUCTION SALES.

New York, Oct. 27, 1916.—Seven cars of Valencia and one car of lemons sold. Market firm on both oranges and lemons. Weather fair. Valencias averaged \$4.10 to \$7.00.

Boston, Oct. 27.—Four cars sold. Market unchanged. Valencias averaged \$4.80 to \$5.30. Lemons \$4.05 to \$6.80.

Philadelphia, Oct. 27.—Two cars sold. Market unchanged. Valencias averaged \$3.85 to \$4.95.

New York, Oct. 30, 1916.—Sixteen cars of oranges and 3 cars lemons sold. The market is easier on Valencias, but strong and higher on 360-size lemons. Weather cloudy. Valencias averaged \$3.60 to \$7.05. Lemons averaged \$5.20 to \$6.50.

Boston, Oct. 30.—Six cars sold. Market stronger and higher on both oranges and lemons. Valencias averaged \$4.60 to \$5.50.

Philadelphia, Oct. 30.—Four cars sold. Market strong. Valencias averaged \$4.25 to \$5.40.

Publisher's Department.

During the past week 215 new paid subscribers were added to our list. Renewals have also been received at a very gratifying rate, the number being larger than any preceding week in our experience.

Geo. L. Horine of Winton, when renewing his subscription, writes: "It is the biggest dollar's worth of information I have ever received from any source, and what is more, we always feel sure everything within the covers can be taken at face value."

J. L. Gish of Laws, Inyo county, has decided to raise purebred hogs for the market only. He will no longer supply breeding stock as he says he is too far from the market. Mr. Gish has good stock and we trust will be paid extra prices for the fine pork he will furnish the butcher.

The first edition of the book "Pro-

ductive Feeding of Farm Animals" by Prof. F. W. Woll of the University of California, which was issued in January, 1916, has been exhausted and a new one has just been issued by its publishers, the J. B. Lippincott Co., East Washington Square, Philadelphia, price \$1.75 net. In this new edition Prof. Woll has revised the former text and also added a chapter on feeding poultry by Prof. J. E. Dougherty of the University Farm. The new edition will prove more valuable and we trust will meet with as hearty a reception as the first.

Again we wish to call the attention of our readers that all subscribers sending in queries for reply, to the Rural Press, must sign their names, or no attention will be paid to the request for information. We now receive so many inquiries daily that all the time possible is devoted by the editorial staff to the proper care of them. We want the Rural Press to be of the greatest service possible to its patrons and in order to give this service we must limit it to our subscribers. On the day this is written one mail brought in nearly twenty queries, of which three were not signed; one came from Edenville, another from Laton, and the third from Calistoga. None of these will be answered unless the writers will send us their names.

Eight Feet Wide, or Better

International Harvester Spreaders
Low Corn King
Low Cloverleaf

ONCE you have seen both kinds of work you will say: "There is certainly a wide gulf between the ordinary spreader and the modern IHC machine, with its good, wide-spreading device. Give me the up-to-date, time and labor-saving spreader."

International Harvester spreaders—Low Corn King and Low Cloverleaf—are made with wide spreaders that throw the manure out in a wide, even spread, and broken up into fine particles by the disks that give it a second beating. In this condition the soil takes up quickly and evenly the fertilizing elements.

Though they are narrow, conveniently handled spreaders, easy to drive right into stables for loading, they spread to a width of 8 feet, or better. This cuts the spreading time in half, increases the tractive power of the spreader by keeping the wheels off the slippery manure, and gives you the best machine made for top dressing. IHC spreaders are simply built, and very strong. They are low for easy loading. They are built in sizes to suit any buyer, and they do work that is uniformly satisfactory.

Be sure to see the IHC dealer who can sell you a Low Corn King or Low Cloverleaf—or write us for catalogue.

The Complex Problem of Marketing Hogs.

University Test Shows Great Advantage of Ground Milo Over Rolled Barley, in Rate of Gain, Cost of Gain, and Dressing Percentage.

[Written for Pacific Rural Press.]

DISSATISFACTION seems to be general among growers, buyers, and packers of hogs in California if one is to judge by comments heard in private and public meetings. From the growers comes the most emphatic criticism of present hog values as compared with the price of feed and the price of pork at all of the centralized markets in the country. They also criticize the system which allows the grower of poorly bred and poorly fed hogs to receive as much or nearly as much for his product as his neighbor can get for his hard-finished and well-bred animals.

These points are illustrated by prices received at other markets. For example, on October 2, the top prices at the different large markets were as follows: Kansas City, \$10.00; Denver, \$9.80; Omaha, \$9.75; Chicago, \$10.15; South St. Paul, \$9.60; Portland, \$10.00; San Francisco, \$8.75; Los Angeles, \$9.25. While high, the Eastern market is higher.

But price alone does not tell the complete story. In California the price quoted is f. o. b. destination without feed or water, whereas at other points the quotation is f. o. b. destination after feeding and watering. The difference in shrinkage in the two systems means somewhere near a half cent a pound to the producer, it is claimed.

Although there is a difference in California quotations between the good and the poor hog, farmers complain that the average small raiser does not get the advantage of this on account of the local buyer's method of buying.

It is claimed, and local buyers have admitted the practice to the writer, that the grower with less than a carload cannot secure any decided difference in price for his hard-finished 200-pound hog than his neighbor with undersized soft hogs. Farmers point out that this condition does not encourage better breeding and feeding, but tends toward the increased production of soft, undersized hogs.

Another complaint of growers is based on the relative price of pork and grain. They maintain that quotations on hogs in other sections of the country rise or lower as the price of feed goes up or down, whereas in California there is no sympathetic rise in the price of pork when feed is up as at present.

The Local Buyer.—Naturally, the middleman is between two fires: the farmer and the packer. He answers the farmer's criticism as to the spread in his price by the statements (1) that he dares not pay one farmer more than another for fear of losing the patronage of one, and (2) that to break even on the poor hogs he must cut on the good ones in order to buy at a satisfactory average.

He further strengthens this argument by the assertion that farmers sometimes misrepresent the hogs they are selling by claiming they have been grain fed continuously since weaning, whereas they have been fed grain for only a short period before marketing. Another fault he finds is that the farmer usually wants a bulk price on the lot he is selling. Sometimes these lots are of very uneven quality, comprising piggy sows, lightweights and only a few tops. On the two former kinds he is docked severely by the packer, whose only recourse is to put them in the feed lots after arrival till such time as they are fit for killing or reject them and compel the buyer to render this service.

The buyer contends that besides the losses above mentioned he is

compelled to stand shrinkage, freight, expense of collecting for shipment and in some cases loss from tubercular animals. His half-share of this latter loss amounts to about one and a half per cent of his total shipments taking the average for the State; but in some of the large dairy sections the loss is much heavier. With all of these losses and expenses he insists that he is conducting his end of the business at as small a cost as is possible under prevailing conditions.

The Packer.—Although there is but one true definition of the word "packer" there are two interpretations of the word in this State. Here every large butchering plant is called a packing plant whereas in reality many of those so called are not in the business of packing cured meats and should not be termed packers.

Between the two there is much difference in operations, requirements, and prices. The true packer desires a hard-finished, well-bred hog weighing around 200 pounds live weight. From such a hog he can get a larger percentage of ham, loins, and bacon, with a smaller loss in dressing than from the lighter hog; and his price is therefore usually highest on such an animal.

The concern that is in the butchering business, purely from a fresh meat standpoint, prefers on the other hand a lighter hog, one weighing 150 to 175 pounds, as the smaller cuts, hams, shoulders, etc., are most

in demand among fresh meat consumers. They also want well-bred and properly fed animals in order that the dressing percentage may be satisfactory. As their requirements are different from the pork packer they usually pay more for the hog above designated than the packer but less for the 200-pound animal.

At the recent meeting of the California Swine Breeders' Ass'n at Hanford, W. Hough, Frank Hauser, and H. L. Kelley spoke at length on the unsatisfactory system California farmers have of growing hogs for the packer, all three representing concerns which are in the packing business.

Largely their troubles are, they say, traceable to poor quality. Mr. Hauser pointed out that the large majority of the hogs arriving at his plant from California

points are poorly bred. This means that they usually have large, coarse head, neck, and shoulder, the parts which are in least demand for packing purposes and which sell at a lower price accordingly. Instead of having well-sprung ribs, thereby increasing the amount of side meat, an article in demand, they have a peaked back with no spring of rib and dressing out a smaller percentage of loin and bacon. In hams also they are deficient, this portion of their carcass starting high above the hock joint with a small diameter and continuing in like manner by the tail setting.

He showed by a comparison of a purebred barrow with a grade barrow where the purebred animal possesses all of these desirable qualities which are deficient in the mongrel; and gave it as his opinion that when California hog raisers improve the breeding of their hogs, the packer will gladly pay the additional price which their dressing percentage warrants.

Both he and the other packing house representatives present emphasized the importance of better feeding practices. They admitted that some growers are finishing their hogs in the proper manner; and Mr. Hough pointed out that for such hogs his concern paid accordingly, basing the price on the percentage the hogs dressed out, with a 10 cent premium for each point over 77 per cent.

But in the great majority of cases they find too few farmers feed grain as they should and as they do in the Middle West, where hog growing has become a permanent venture and where prices are better also.

(Continued on page 524.)

Purebreds like Mr. Bernstein's Possess the Qualifications Desired by the Packers. They Dress Out a Higher Percentage of Higher-Priced Cuts than the Mongrel.

EDITORIALS

AFTER THE ELECTION.

WE ARE writing on Election Day, and thinking of what will come afterward. Our very large circulation makes it impossible to wait for returns. We have to get ahead early in the week with the kind of printing this journal has to do, and therefore the country will know more than we now do of the incident of choice for the presidency, before this paper can reach the readers. But as we said last week, the country has a clear duty before it, for itself and for the world, and it will do it about in the same way, whether the high-cockalorum at Washington shall be Charley or Woody. The campaign justified that irreverence. We tried to say last week that we never saw a campaign "with so few issues and so many tissues" in it—but the printer would not have it that way. The next time we try for an epigram we shall furnish the printers a diagram. But it did not matter much. It made nonsense of our comment, and that, too, was quite characteristic of the claims of the campaign which has now happily ended—happily either way, say we.

But of course we do not mean to say that there are no issues pending. Everybody knew all the time there were great issues, and that practically all patriotic Americans will insist upon meeting them aright, but neither side in the recent controversy dared to credit the other with the patriotism he really had, and this forced both sides to go to spinning political tissues, the flimsiest the American people have ever been called to vote upon. All this will be immediately forgotten, for the American can see through it all clearly enough though it must have been films in the eyes of the world which, may be, is flattering itself that this republic is blinded by its own cataracts. Not so: the public eye of the United States has been scraped clean. Every one knows now, unless he is hopelessly hyphenated, that this country must protect itself against every kind of aggression from the rest of the world. We must have ample and ready force, for the world has shown its disrespect for everything else. We must have ample and just protection for our capital, our labor and our commerce. We must have more even justice and opportunity for our own people in their relations with each other. There was much in the foundation principles of this nation which must now be recalled and vivified. There was much in the unfair purposes and achievements of the last half-century which must be abandoned and forgotten. There is much now dawning in the realization of "life, liberty, and the pursuit of happiness," which must be developed and enforced in the governmental policies and attitudes of this country toward its own citizenship. These are the real issues of the day and every true American knows them and will work earnestly for efficiency-methods which lie in the course of their full attainment.

COLONIZATION IN CALIFORNIA.

IN A little local way there is a reflection of these great principles of fairness between man and man in the notable contribution to knowledge of land settlement in California which we present to

our readers in this and next week's issues. This week we have startling facts about land prices, as related to the earning capacity of lands, in our subdivision and settlement enterprises of the last decade. Next week we shall have a masterly interpretation of these facts and a suggestion of what should be done about them. Most people have known that our land settlement efforts were going wrong, but very few knew how far they were going wrong, or in what particular ways. Very few also knew that the fallacies and inflations of the last decade have practically put the State out of the game of organized settlement, and reduced us to the limited dimensions of individual search and purchase by home-seekers. This is a calamity for a large, new State, which ought to be growing and making rural millions happy and prosperous, as well as building up great cities. The facts of present stagnation in rural lands is all the more depressing when one remembers that there was a time when California took some of her best forward steps through colony subdivision and settlement. Anaheim, Riverside, Fresno, and other now famous developments began on the colony plan thirty or forty years ago, and most of those who were in at their beginnings advanced to the ends of their lives in the joy and prosperity with which well-grounded development rewards its leaders and pioneers. There were profits in promotion in those days, but as we remember they were small and reasonable as compared with the calculations of more recent exploiters. In a way the pioneer colonists had less done for them, and they had a struggle which made them strong. They did at least get the land at fairer price even if they did have to fight to get the water out of the hands of the speculators in some cases. But they enjoyed the unearned increment of the land which followed their improvements, and nearly all men and women who worked well and wisely realized their reward, and enrich their descendants who had sense for continuing their work. This is all quite in contrast with the facts visible on another page of this issue, which show that promoters, by multiplying overhead expenses out of all occasion, by unreasonable selling cost, by trying to appropriate to themselves all unearned increments, made increments of all kinds impossible, and broke down the machine. How these performances have brought our present settlement conditions to impossible competition with other parts of the country, and how they have made it impossible for a settler to exist on California land as now fussed-up and surcharged with expense, will appear more fully in next week's issue. It is a sad story for the chances of a man in this State; it is a sad story for the outlook of the State itself. It involves problems of what should be done about it, which every one who owns land, or wants to own land, should immediately bestir himself to solve. If we mistake not, the questions raised will constitute a line of earnest work by the next legislature. Of course, California is not alone in the misfortune of the present condition. It is quite possible that even worse things have been done in the same line in other States. If so, there is all the more reason that California, by virtue of her leadership of the newer States of the country, should point the way out. Every one should go to work at it.

WHAT ABOUT CEREALS?

WE HOPE that readers having land for wheat will not kick themselves so hard for not heeding our advice about growing wheat last year that they will be too lame to plow wheat land this year. For it keeps on looking better for the man who has wheat, and worse for the one who has not. And, as you know, all California is the man without wheat, and will pay a lot of millions to the men in other States who have it—for the which California ought to be horse-whipped. Think of it: thirty-odd years ago California, the first wheat State in the Union, and now buying wheat, and buying it at a higher price than most people can remember, too! Why, if California had had the wheat crop she had in the '80's—and she could have it too without taking away land from any other crop—the growers would have brought into the State this year more gold than there now is in this district's Reserve bank—probably, for we do not know exactly how much that is. In-

stead of doing that we are pinching money out of fruit, etc., to buy bread; pinching the millers to take the bran off and pinching bakers to put wind and water in, when we might be getting fat on our own bran, wind and water, and filling our pockets at the same time. And yet, people say this is a day of efficient and economic regulation of things!

The only thing which keeps us from utter disgrace in this line is that we are selling barley—maybe voting ourselves dry (though we do not know it at this moment) to keep Europe and St. Louis wet. This is the barley story which came last week from the Sacramento statisticians:

California again leads all the other States of the Union in the yield of barley, according to advance reports of the 1916 crop. California's 1916 yield is placed at 31,975,000 bushels, while Minnesota is second with 31,143,000 bushels. But the difference in favor of California is greater when it is noted that California's yield is based on an acreage of 1,279,000 as compared to 1,482,000 for Minnesota. North Dakota has the largest acreage, 1,650,000, but its output is less than 25,000,000 bushels. With both its acreage and production increasing yearly, there is little chance for California to lose its lead.

But what sense is there in selling barley to buy wheat when so large a State can sell both and still not drive the mosquitoes out of the rice fields?

OLD HUMUS GETS A SET-BACK.

66 "H, YES," we hear some reader say, "you are going to give us a sermon on humus: that humus is the stuff which will enable us to grow just as much grain as ever; therefore, get humus." Nothing of the sort. You might have guessed right that way a while ago, but now Old Humus has got a crick in his back! Professor Madson has just shown in University Bulletin 270 that this old apostle of reform has been tipped over by the demonstrations at the University Farm at Davis during the last few years, and that for unirrigated grain at least the strife to secure cover crops yields no more than the drive on Verdun. This is based on nine years' experiments on the same land, which show that "the use of cover crops, even if they be legumes, does not seem to increase the content of humus or of humus nitrogen in the soil to any appreciable extent; the favorable effects of cover crops that are frequently observed must, therefore, be attributed to other causes than an increase of the humus in the soil. The organic matter added to the soil by the cover crop appears to be practically lost by oxidation the following summer."

Well, then, since continuous cropping will reduce the yield, and efforts to add organic matter by cover crops yield nothing to prevent it, where are we at with all our preaching? Where do you think? We are right back to the old "bare fallow," which seemed to be the right practice for forty years before Old Humus butted in—a practice which has probably made more clean money for good farming than any other culture method ever devised for dry farming. And this is the present tribute to this old Bare Fallow against whom Old Humus made his chief drive about a decade ago; for Professor Madson concludes: "Under a system of continuous cropping to wheat the yield decreases very rapidly to a point below profitable production. The year of fallow is one of the most effective means of retaining the productive power of semi-arid soils. The use of green manure crops increases the productivity of the soil, but not to the same extent as does the bare fallow."

BARE FALLOW KNOCKS HIM OUT.

NOW the proof of the foregoing preachment is thus condensed:

The annual increase in yield of 6.29 bushels per acre, which was obtained from the fallow plots, is largely clear gain. To be economically a success, the fallow plots would have to produce only twice as large yields every alternate year as was produced by the continuous cropped plots annually, whereas the actual average production of the fallow plots every two years was 35.35 bushels per acre, as compared with 11.38 bushels per acre, which was the annual production of the plots cropped continuously. While the yields with green manuring were considerably larger than those obtained under continuous cropping, they were, on the whole, somewhat lower than the yield obtained on the fallow plots. Furthermore, the cost of producing and handling the green manure crop is at least 50 per cent greater than the cost of maintaining the

fallow, including the cost of putting in the cost of the seed and additional plowing in the spring, besides the same summer cultivation that is given to the fallow. On the whole, therefore, the actual economic returns attending the use of a green manure crop is but slightly greater than those obtained under a system of continuous cropping.

From this it appears that in this period of nine years the bare fallow actually produced more wheat than the land farmed for humus, and did it at half the cost. Also that when you count the cost of cover cropping the return from humus-fed crops is but little larger than if you grew wheat every year. Of course the reader must not conclude from these results that the soil does not need added nitrogen nor that rotation is irrational, but they must be provided for upon some other economic basis. There is also no arraignment of the value of cover crops when measured in other terms than those of a grain crop when the whole cost of cover-cropping is charged to it.

BARE FALLOW AND THE TRACTOR.

WHAT is the immediate lesson of it? Just this: get back to the bare fallow riding on a tractor. To get the benefit of a bare fallow it has to be bare, and it has to be well

made and maintained. Its first purpose is to put as much as you can of two years' rainfall in one year's crop, and you can only do this by reducing evaporation to a minimum by fine surface cultivation and by absolutely allowing no weeds to drink up moisture, except during the winter. Spring working must be undertaken as early and for practically the same purpose as spring working of fruit lands. This is to prevent early evaporation, and to put the land in condition to take fine summer cultivation—which must be given it or your bare fallow lacks efficiency. And does this need to be done with a tractor? Not at all. Teams can do it to the limit of their capacity, if the man knows what good tillage is and is willing to get it and keep it. But on larger areas the tractor has greater capacity and speed, and can do great work, in breadth and depth, at less cost. It is in the history of our wheat-growing that we stayed in at one time against low prices, because the combined harvester cheapened harvesting. Now the tractor comes in, not at this moment against low prices, for prices are all right, but to improve and cheapen tillage so that we can secure a really good bare fallow, which seems to be the essential to getting more wheat with a good profit in it.

plant. It is controlled by Bordeaux mixture applied when the new growth is about six inches high and repeated two or three times at intervals of about ten days. The worm you speak of needs an arsenical like arsenate of lead as soon as you see it at work.

Who Invented the Apple Box?

To the Editor: Kindly tell me where I can find an account of the first use of the box as a package for California apples. I understand that California is the home of the box apple, and that the Northwest has simply adopted the package which originated with us, refined it and brought it to their present high standard. If you can not tell, be so kind as to give me any historical points which you may have in mind in this connection.—W. P. Tufts, University Farm.

At the moment we cannot answer your question and print it to draw out superior wisdom from others who may have the facts. When we came to California in 1875 the apple box was universally used along the coast and had been for a long time. We suppose the box came into use at the very beginning of American fruit selling on this coast because any man who had boards and nails could make a box while to make a barrel is a much higher mechanical art. After that the box prevailed because it is more rational and portable. As apples came to California from Oregon before they were fruiting here, except on a few old mission trees, there would be a presumption that the first artist with boards and nails was in Oregon. Apple trees were planted in Oregon in the later '40s; in California in the early '50s. Now who has any record of the facts about the box? We can dig them up, we doubt not, but cannot stop to do it now.

Moving Olive Trees.

To the Editor: I have a number of olive trees which have been planted two years this winter. I wish to move them. When would be the best time to do so?—I. T., Stockton.

Olive and citrus trees are usually moved most successfully considerably later than deciduous trees. Wait until the air warms up and excess water goes out of the soil. This will depend upon the season somewhat. It may be in February or March, according to the season and the soil. With irrigation it can be done even a month or two later. Take up the trees carefully with a ball of earth, water-settle the soil around the ball and cut back the top considerably.

Killing a Poplar.

To the Editor: I have a poplar tree which brings up the new growth all over the yard. Kindly advise me how to destroy the tree without taking it out.—A. A., Los Gatos.

You can kill the tree by girdling—removing a ring of bark about a foot wide, clear down to the wood, near the base of the tree. You will have to grub out the suckers wherever you find them, going deep enough to get out the roots from which they start. Probably you can kill the tree by making a ring around it, in the ground at the base, and pouring in a gallon of gasoline so as to saturate the bark. But you will have also to chase the suckers and grub or gasoline them also.

Planting Almonds.

To the Editor: I have been told that the best way to start an almond orchard is to plant bitter almond nuts in the assigned places and after two years graft over to whatever kind you want. Is this a good plan?—J. D. N., Modesto.

It is not a good way. It will give you a mean, irregular lot of trees and a lot of vacancies, which will keep you busy trying to fill when you ought to be doing something else. Plant yearling budded trees from the nursery.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., November 7, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		To Date	Normal To Date	Max	Min
Eureka	1.14	3.45	1.89	61	38
Red Bluff	.26	3.62	2.95	70	38
Sacramento	.04	1.06	1.72	72	38
San Francisco	.74	2.78	1.91	68	46
San Jose	.32	1.95	1.48	74	34
Fresno	.26	1.84	1.08	78	42
Independence	.01	1.12	1.04	72	
San Luis Obispo	.38	4.10	2.03	84	40
Los Angeles	.08	3.12	.97	74	46
San Diego	.04	1.19	.66	66	46

By the Editor || QUERIES AND REPLIES ||

Inquirers Must Give Full Name and Address.

Which Prune?

To the Editor: Which prune do you consider most profitable? We have the French which yields well but in many orchards they grow rather small. I have been thinking of planting the Imperial. Are they a shy bearer or will they produce as many pounds as the French one year with another? Will the Imperial stand as much frost as the French? Will they ripen the same time? What distance apart should they be planted? Will they need as much pruning as the French?—M. S., Ukiah.

There are several types of Imperials with somewhat different behavior. It is our conviction that no one should plant Imperials except for trial unless he has evidence of its value in his locality. As a rule they bear less than the French, though some find their bearing good. They ripen about the same time as the French and being larger are harder to cure. They should in all cases be allowed to ripen fully on the tree. In places where fall rains are apt to come early, these large late prunes might be troublesome. The Sugar is earlier than French, larger, if well thinned, and an easy drier; to our notion, inferior in quality, but in valleys north of the bay is profitable so far. Size in the Imperial, as in other plums, is promoted by systematic pruning and it is rather more necessary than with the French, for the wood is less elastic. Twenty-four feet is a good planting distance; with twenty-eight feet more desirable where conditions favor free growth.

Sowing Johnson Grass.

To the Editor: Is it against the law to sow Johnson grass in Monterey county? And, if not, will it grow on high land unirrigated? If it can be sown, where can the seed be purchased?—R. D. M., Monterey.

We presume it is not against the law to sow Johnson grass anywhere, but it is against the law to grow it so that the seeds can fall into irrigation ditches or near the boundaries of others' property. If the Monterey supervisors have legislated against a man's sowing Johnson grass or anything else on his own property, they have surely put one over on the constitution of the United States. But you do not want Johnson grass, for the only place where it will not grow is on high, dry land, where it might be of some use. And if you did want it you could not buy the seed of any reputable seedsmen—he would not dare to keep it, even in the pages of his catalogue.

Treatment of Seed Potatoes.

To the Editor: I had cold storage potato seed for a part of my crop this year and they come very badly. Would you advise cold storage potato seed? I lost over \$100 worth of my storage seed this summer.—C., San Bernardino.

We do not advise any one to hunt for cold stor-

age seed: we would prefer seed kept under more normal conditions, but sometimes seed out of storage has to be used. In that case we should vitalize it by exposure to half sunlight for two weeks or more and see that it was minded to sprout before planting. This is a rational treatment for all potatoes which do not seem to be starting their eyes. In the fresh seed it promotes maturity; in stored seed it determines viability. Never mind if it greens the tuber—that is no objection, though of course one does not wish to blister or burn the skin by too much direct sunshine.

Killing Mustard and Turnip.

To the Editor: Is there any known way of destroying mustard and radish seed on land that is infested with them? I have sixty acres of bottom land covered with those nuisances.—I. H., Wallace.

We know no practicable way to get at the seed before sprouting. The common way to clean land for grain is to disk or cultivate two or three times, killing the weeds as they are started by the fall rains, before seeding to grain, and then hand-pull the stuff which starts with the grain before it ripens seeds. If you put on alfalfa after the fall cleaning, it will usually take care of such weeds by smothering, especially if helped by early mowing. If you do not want alfalfa and can use the land for beets this winter or for corn or other cultivated crop next summer, the cultivation will clean out these annuals.

Vine Pruning.

To the Editor: I have some six-year-old Malaga vines that have two trunks and have been advised by some to cut one out; what do you think about it? How long will it take to rot the next prunings if plowed under; also, would it be beneficial to the ground? I expect to cut it short and plow under.—F. B., Clovis.

If the two trunks are about the same size we should leave them alone. Large cuts are apt to introduce decay and give you a bad trunk. If one is much larger than the other remove the small one. It will have a good chance to heal over. The rotting of prunings depends largely upon the moisture of the soil in which they lie and how finely they are hashed up. In a retentive soil, fine-cut prunings ought to disintegrate in a year and add humus to the soil which is desirable if it does not cost too much.

Early Blight of Potatoes.

To the Editor: With what do you spray potatoes for early blight? Is there any remedy for it? In Yucaipa Valley the potatoes grow very rank and do fine except for the early blight. This year, however, there was a tiny worm that worked on the leaves of the potatoes.—E. E. C., Yucaipa.

What is usually called early blight is the work of the fungus (*Alternaria solani*) which causes dead spots to appear on the leaves of the young

The Currant Grapes in California.

[By Prof. Frederic T. Bioletti.]

The dried grapes imported from Greece under the name of "currants" or "Zante currants" are made from a variety of vine known as the Black Corinth. A few are made from a similar variety known as the White Corinth. These are somewhat larger, of lighter color, but are not quite equal in quality to the black. Both varieties have been grown in California for many years in various localities.

The White Corinth is growing in commercial quantities in the Sacramento Valley, but does not seem to be altogether satisfactory, partly because its grapes when dried are somewhat different from the imported currants and partly because the crops are not large, owing principally to unsuitable pruning. A few growers of White Corinth, however, are well pleased with their results and some people prefer their currants to those of the black variety.

The experience with the Black Corinth has been disappointing in practically every case. The vine has grown vigorously, but has borne little or nothing.

Two notable exceptions to this have been observed. In Lake county Mr. Fifield of Kelseyville has a Black Corinth growing on his house which is said to produce regularly very large crops. The vine grows around the house, having developed a stem about 200 feet long. The grapes, however, have to a large extent lost their most valuable character, that of seedlessness. Many bunches consist chiefly of large grapes with seeds which make them useless for drying. It seems probable then that by allowing the vine to develop to a large size over trellises it might be possible to obtain good crops from the Black Corinth, but if this method of training resulted in producing grapes with seeds it would be useless.

The other exception is the grafted vines growing in the experiment vineyards at Davis and Kearney. At Kearney, Black Corinth grafted on 41B, 3306, and Riparia gloira have yielded at the rate of 6.55 tons of fresh grapes per acre corresponding to 1.59 tons of dried currants. These vines are four years old. At Davis two rows of Black Corinth six years old on their own roots have produced almost nothing, while two rows grafted on 41B, 3306, and Rupestris St. George have produced heavy crops at four years.

Small quantities of currants—both black and white—were made by the California Experiment Station in 1914 and in 1915. The quality was good and all by whom they were examined considered them as good as those imported from Greece. This year a somewhat larger quantity has been made and they will be tested for their commercial value.

It appears certain that it will be possible to grow paying crops of both varieties if the price obtained is a little higher than that of Sultanas (Thompson). It will probably be necessary to use American roots, at least for the black, which will increase the cost of establishing a vineyard about \$30 or \$40 per acre.

One great advantage in growing Corinth grapes will be the lengthening of the raisin-making season. This is indicated by the following list of the dates at which the various varieties of raisin grapes were ready to harvest at the Kearney Experiment Vineyard this year.

Black Corinth (grafted), Aug. 15.
White Corinth (grafted), Aug. 26.
Sultanina (Thompson) (grafted), Aug. 30 to Sept. 16.
Muscat (grafted), Sept. 9 to Sept. 16.
Muscat (on own roots), Sept. 26.
University of California.

A Good Method of Curing Olives.

To the Editor: Please send me a recipe for curing olives.—Mrs. W. J. Y., Stockton.

We quote the following which appeared in our issue of Nov. 21, 1914, as the practice of P. H. Steude of Yolo county.

Olives should be cherry color for pickling. In this way they have a good flavor and are appetizing. I consider the Mission olive the best for home use. It is best to not mix the olives from different trees as some trees have more bitter ones than others. This accounts for having some bitter olives among the sweet.

When you pick olives, get them into clear water as soon as possible.

Never use ditch or dirty water, as olives absorb the mud and are easily spoiled. Olives picked into lug boxes will mold in 24 hours.

Dissolve one pound concentrated lye and 1 pound pure salt in 2½ to 3 gallons of water, and see that it is thoroughly dissolved, then skim. Then drain all the water from olives, and pour the preparation of salt and lye over them. Weight the olives down to keep them covered. In 12 to 48 hours, the bitter will be entirely removed from them. Draw off the preparation and fill in on top again about once or twice a day to find out if the bitter taste is all out of them. If you see milk on them,

by cutting them open you will find the bitter still. For further test, you can wash off a few olives and bite, being sure to keep your lips away from them. Spit out at once and rinse your mouth with clear water. As soon as the bitter taste is out, turn in clear water. The first few days, change 4 or 5 times a day, and 2 to 3 times a day for about 10 days or till the lye is all gone.

Should they get a little soft, put a strong salt brine over them for 24 hours and then wash in clear water afterwards. I usually have olives to eat in one week from the time they are picked, but there is still a little lye on them.

To keep the olives a long time, use 12 ounces of salt brine to a gallon. That will make a potato swim. Olives should be in a dark place and covered with brine or water. By keeping them a long time, a scum should rise to the top and should be skimmed off, and the olives rinsed in clear water and put in new brine. If olives are too salty, lay them in water for a few hours and they will be ready to eat.

This preparation is strong enough to take the color out of the dark olives. They will not look as well as the commercial, but are far superior in taste.

YELLOW ORANGE LEAVES.

To the Editor: Enclosed is an orange leaf yellowed except along the principal veins. My trees have many such. My land is part red and part heavy black. Trees seem about the same on both.—Subscriber, Woodlake.

We believe the trouble is due to lack of nutrition. This may be due to lack of fertility or lack of water to make fertility available or to too much water which is just as bad. Knots on the roots, disease of the trunks, or injury to roots or trunks are less likely causes.

Workmen are at work grading for the extension of the Santa Fe line to Porterville.

Nursery Stock that is Free from Disease and Insect Pests.

No tree will grow into an asset if the stock is not free from disease or insect pests. Every precaution is taken by us to produce nursery stock that we can guarantee to be absolutely sound, sturdy, and sure to produce the kind of crop that you desire.

When you invest in nursery stock, be sure that it is sound.

Know that Your Trees Will Bear

The time, money and effort that is required to start an orchard warrants you in exercising extreme care in selecting your trees. You can depend upon our advice, and the trees we offer you for our experience covers over a quarter of a century.

We have sold thousands of trees and have delivered satisfaction with every order that we have filled.

Everything in the Nursery Line.

We carry Citrus and Deciduous Fruit Trees, Ornamental Trees, Vines, Shrubbery and everything to be had at an up-to-date Nursery.

We fill orders promptly and correctly, and we can be depended upon to deliver satisfactorily, whether you order in person or whether you order by mail.

ETTERSBERG STRAWBERRIES BEAR.

[Written for Pacific Rural Press.]

Ettersburg strawberries remind J. W. Givens of Merced county of a hen with chickens all around and under her. They bear from late April until October. The roots go six or eight inches deep, while Brandywines go only three or four. They are watered every 7 to 10 days, the soil being a silty, bakey loam. In hot weather the wind sometimes blows the irrigation dry overnight, and blasts some of the blossoms. It is a mistake to plant this variety 15 inches apart according to Mr. Givens. They should be three feet apart in rows four feet apart. After the fruit is off, Mr. Givens cuts off enough leaves and runners so he can cultivate. Then in spring, just before they send out blossom shoots, he cuts off all the leaves. Possibly this pruning treatment is one secret of making Ettersburg berries bear.

Windsor Beans for Cover Crops.

[From Fair Oaks Citizen.]

In the Pacific Rural Press of August 19 appeared an article by W. M. Mertz on "The Latest in Cover Crops," in which he recommends "a trial of the Windsor bean" for a cover crop.

I raised a crop of these beans the past season and it occurred to me that it would be a fine green manure plant for Fair Oaks orchards. It is the hardest plant I ever saw and will grow when it is so cold that other plants are either killed or at a standstill. It has fully twice as many nitrogen nodules on the roots as I ever saw on any other legume. It is not a vine, but grows upright, its branches close to the ground. I have counted a dozen branches on some plants, but that is unusual. Four to ten is the average number.

I think it would make a heavier crop of "green stuff" to plow under in the spring than any legume that has been tried so far in Fair Oaks. Right here I wish to say that I have no seed to sell.

Mr. Mertz says: "Objections are that the seed is so large that it requires 100 to 150 pounds of beans to sow an acre thick enough for cover-cropping. The seed costs 4 or

5 cents a pound, which makes the cost of seed two or three times that of melilotus."

I think that 75 pounds of seed per acre would be enough. In West Sacramento, when planting for a crop, 45 to 50 pounds were used. I had to pay 5 cents for my seed last fall, but if an orchardist will arrange to get his seed direct from the grower he can be sure that he will rarely have to pay more than 3 cents a pound. There are no horse beans in the hands of the growers here now except what have been saved for seed.

I would think that the best way to plant these beans in an orchard would be to sow them broadcast and then disc and cross-disc. In West Sacramento they are planted in rows, a furrow is made with a plow and the beans are dropped, a foot apart, by hand, then two furrows are turned, and so on until the field is planted. There is little danger of planting too deep. I have seen them covered a foot deep and come up all right.

If they are planted thick there will be few branches to each plant and the growth will be tall and straight. If less seed is used, the bean branches more and does not grow so tall. I would prefer not to answer inquiries by mail.

Harry D. Williams.

West Sacramento.

NOVEMBER CROP REPORT.

Horticultural commissioners' reports compiled by Secretary E. J. Vosler of the State Horticultural Commission, as of Nov. 1, are as follows:

COUNTY	Grapefruit		Lemons		Olives		Oranges

PEACH FRUIT BUDS.

To the Editor: What can I do to make the Elberta peach produce fruits? I think most of the blossoms bring fruit, but it is a shy bloomer with me. The trees are doing well and have a fine growth.

—E. B., Santa Cruz.

If you prune this winter, do not cut back, but thin out where desirable. Then do your cutting back next June or July on non-productive limbs, and wherever else seems desirable. This treatment favors formation of more and stronger fruit buds.

Specialists of the Department of Agriculture say that a satisfactory quality of book paper can be made from hemp hurds, the waste stalk produced in preparing hemp fibre.

Bartlett Pear

On Blight-Resistant Roots

There never was a more favorable time for Pear planting, but be sure your trees are planted on Japanese Roots. We have given this root a thorough test for over five years, and discarded all others in its favor.

All our trees are propagated from trees selected for their bearing qualities and grown in the granite soil in the foothills of the Sierra Nevadas, assuring a fibrous root system second to none in California.

Write for catalogue and full list of trees.

TREE PROTECTORS FOR WINTER USE

Why let rabbits bark your trees at this season of the year when for about a penny a piece you can save every one of them. We also have a heavy fiber one that will absorb the frost and save your tree from moderate freezing. If it's squirrels, tell us your wants. We have protectors for every need that will save your tree.

COLLAPSIBLE PLANTING POTS. Are you going to raise some Olive Cuttings, of Eucalyptus, or Rose Cuttings? Why not grow them in these pots and have every plant a single root system, and be assured every one will grow?

Why not plant your early Cabbage, Chilis, Tomatoes, and have good healthy plants to set out that will not stop growing a single day, for you can plant both pot and plant?

These pots are the up-to-date method of plant growing. Don't take our word for it; try them yourself. Write for samples of pots or protectors. Tell us which you are interested in.

Colonization in California.

[Compiled for the Pacific Rural Press.]

FIRST PAPER.

Several months ago the Commonwealth Club of California demonstrated its patriotic attitude toward the State by appointing a large, representative committee to study the facts and tendencies of colonization efforts recently undertaken in this State and by the appropriation of \$1000 of its funds to bear the expense of original investigation. The work was undertaken in co-operation with the University of California, Stanford University and the State Commission on colonization and rural credits, through its members who are in the service of those institutions. The results of the investigation are beginning to be attained, and as they underlie true State development and the prosperity of those seeking homes in this State, we shall present them for the consideration of our readers with such detail as shall be compassable. The reader will hardly need to be told that the undertaking is unique and the facts never before disclosed. Our showing will occupy several issues. First we have a condensed summary of the leading facts secured by the investigation compiled from the report submitted by Frank Adams, Professor of Irrigation Investigations of the University of California.

Consent of the Investigated.—At the outset the committee felt that the value of the results to be obtained would depend quite largely on the co-operation received from those interested in land colonization: commercial bodies promoting settlement, selling organizations engaged in actual colonization, owners of

large estates, and settlers already on the land.

What Chambers of Commerce Say.—The investigating committee met with the executive committee of the California Development Board, of the Sacramento Valley Development Association, and of the chambers of commerce of San Jose, Stockton, Merced, Fresno, and Los Angeles.

The average cost of unimproved land given by these bodies was \$260 and the time for payment allowed varied from 3 to 8 years, with interest on deferred payments at an average rate of 6.73 per cent. Outside of mortgage loans up to 30 to 40 per cent of the value of the property, none of these bodies could suggest any source from which settlers can borrow money to complete improvements and equipment except from private individuals. The answers are exceedingly interesting as evidence of what intending settlers without sufficient capital to carry themselves through the period of development can expect from the communities inviting them to come to California.

Land Sellers are Quiet.—Questions were addressed to California land-selling agencies, it being assumed that they would feel some interest in a public inquiry of the nature undertaken. It is regretted that practically no response was received.

Statements of Settlers.—The principal field work of the investigating committee was obtaining statements from settlers. The projects were selected with a view to making them representative of the entire State. Not

counting several projects which were visited, but in which no systematic attempt was made to obtain statements of settlers, the projects or sections included numbered 25 and the settlers interviewed numbered 25 and the settlers interviewed numbered 991.

The chief questions asked were as follows: Occupation prior to settlement; number in family; area in farm; capital at time of purchase and price of land; cost of improvements made annually since purchase, and cost of all necessary improvements; cost of farm equipment, acreage and value of crops from the first to the fifth years after settlement; number and value of livestock on hand during 1915; and present indebtedness and rate of interest charged.

The answers show the average price of land charged settlers in all the projects or sections included to be \$187 per acre; the average time of payment allowed, 5.6 years; the average capital of settlers, \$4,813; the average cost of improving farms, \$2,368; the average indebtedness of those having bank or private loans or contracts on their land, \$2,931; the average rate of interest on bank loans, 8.05 per cent; and the average rate of interest on contracts, 6.92 per cent.

The average area of farms for all of the projects is 36.94 acres. The average capital of settlers per acre is \$130, and the average acreage cost of improvements, \$64.

Adding to the average cost of land the average cost of improvements necessary gives a total acreage cost of approximately \$250. This is the average amount that settlers must have to improve, but not to equip a California farm.

The average age at which settlers

have purchased their land shows that California lands are being settled, not by young men, but those whose average age is 43.6 years.

The return received by settlers from their land, exclusive of from live stock, during the first year after settlement, range from \$2.17 per acre to \$14.93 per acre, and with a mean of \$6.78. The average gross return per farm during the first year after settlement is approximately \$250, which is considerably less than the amount needed to keep the average farm family in only meagre circumstances during the first year.

Little Landers Unreasonable.—The reports on the Little Landers Colonies by Professors Wildeman and Adams presents a searching inquiry into results that have been obtained on 1-acre farms in several parts of the State. The conclusion on this type of colonization, based on results at the older colony at San Ysidro, is that it is unsound when viewed in the light of its commercial results. After about five years this colony has not succeeded as a commercial venture because one acre of land under the conditions found at San Ysidro is clearly demonstrated as insufficient to provide a living for a family. This aspect of the colonies does not, of course, affect such residential value as they may have to those financially independent of making their livelihood from their holdings.

Requirements of Settlers.—The report of Professor R. L. Adams seeks to determine for selected business what in California agriculture constitutes: (1) a living income; (2) a family business; (3) the capital required to equip and establish a family business; (4) the capital needed for running expenses; (5) the probable returns; and (6) what farming

Goes Under the Limbs

Goes in 7 foot Rows

New Model 12-20 Yuba

It is only 55 inches wide. It works in vineyards with 7-foot rows. It goes under the limbs and gets close to the trees in orchards. It is simple in design, light in weight and priced accordingly. Write us about the lower price.

It is built particularly for orchard, vineyard and side-hill work; but may be used in scores of other ways, and in any kind of soil.

Its three speeds give it unusual flexibility. It has few wearing parts, and low upkeep. Big operators need it for its particular purposes; smaller operators need it for all purposes.

Orders now being booked for future deliveries.

STUDY THESE SPECIFICATIONS

MOTOR: 4½ inch bore, 6¾ inch stroke. Side plates for the easy adjustment of bearings. Extra heavy crank shaft. Equipped with Ensign Carburetor and automatic priming tank. Fly wheel clutch.

TRACK: Tread shoes of cast steel—without bolts. Pins and bushings are renewable. The races are of manganese steel.

TRACK DRIVE: Through manganese pinion that meshes directly with the chain. This pinion is completely enclosed and protected from wear.

AIR CLEANER. Equipped with a Donaldson Air Cleaner, which is almost 100 per cent. efficient in removing harmful dust from air that enters the carburetor.

TRANSMISSION: Of the sliding gear with three speeds forward and one reverse. Direct drive on all three

speeds. Low speed 1½ miles per hour. Intermediate speed 2½ miles per hour. High speed 3½ miles per hour.

DIMENSIONS: Over-all width, 55 inches. Length, 12 feet, 3 inches. Height, 4 feet, 6 inches.

TRACK AREA: 935 square inches. Pressure per square inch less than 5 pounds.

WEIGHT: 6200 pounds.

should pay and whether the selected businesses fulfill their financial obligations. Professor Adams discusses the financial aspects of five different types of agriculture—grain-farming, deciduous fruit raising, poultry raising, dairying, and diversified farming. He finds the total cost of equipping these selected businesses (over and above the cost of the land) to range from \$3,260, for deciduous fruit growing (not counting the cost of setting out and establishing the orchard), to \$6,570 for a 20-cow dairy farm.

He finds that, in order to meet the cost of operating, including depreciation and living expenses of the family, the total sum the various types of business should pay annually varies from \$1,695 for a 20-cow dairy farm, to \$5,768 for a 2500-fowl poultry establishment.

Tenant Farms.—The report of Edwin E. Cox on Farm Tenantry reaches the conclusion that while California's tenants as a whole are faring better physically and financially than those of Eastern and Southern States, yet the prevailing debilitating conditions of land tenantry are by no means absent in California. He finds that aside from the rapidly growing Asiatic element that can not be assimilated, the white contingent of California's tenant class are generally living under conditions inimical to democratic citizenship. "The tenants' children can not make the desired progress in education as they are constantly moving from one school district to another; the parents, because of their transitory life, take little interest in the school. Neighborhood solidarity, so important to communities of home owners, is lacking.

In Southern California.—In his report on land settlement problems in Southern California, A. L. Cowell brings out the fact that, in general, farming in southern California must always be an expensive business because of the high cost of land and water, the constant necessity for experimentation because of the variation of soil and climate, and the long wait for returns from orchards. He finds that real estate men of Southern California have apparently generally given little consideration to the problem of the men with small results.

Mr. Cowell visited five different colonization enterprises and interviewed a number of land-selling agencies, but states that with two exceptions he found no colonization agency that seemed to feel responsibility for the success of its colonists or that had made special plans to help them succeed. This he considered to be due in part to the fact that the selling of land in Southern California, as it generally is elsewhere in the State, is usually independent of the ownership of the land sold. The net result of this he found to be selling costs ranging from 20 per cent to 40 per cent of the sale price, misrepresentation by salesmen in order to secure commissions, and an almost total disregard by the selling agencies of the adaptability of the prospective settler to the conditions to be met with. In closing his report Mr. Cowell suggests the need for a State bureau of information for the dissemination of authoritative data to prospective settlers.

NURSERYMEN'S ASSOCIATION DOINGS.

In our comments on the recent convention of California nurserymen in Santa Barbara, we have spoken chiefly of matters which seemed to have the widest popular interest. Other matters of particular importance to the craft are the following:

The report of the legislative committee consisting of George C. Roeding, M. McDonald and M. L. Germain was submitted by Mr. Germain. Among other things it advised that nursery stock or horticultural products bearing a label showing by whom and where grown is utterly immaterial to the State. But if it is deemed advisable to show

where grown, this requirement may be embodied in the law.

"That shipments from one county into another should have a duplicate invoice mailed to the county horticultural commissioner of the county of destination.

"That the State should be divided into districts of five to seven counties, the chairmen of boards of supervisors in each district to select some prominent fruit grower who will be one of a board to act as an advisor to the State horticultural commission. George C. Roeding, chairman of the legislative committee, was appointed to represent the association in proposed legislation revising our horticultural laws. The members of a special committee on seed legislation are M. L. Germain,

C. W. Ward, George C. Roeding, W. J. Pettingell and F. H. Wilson.

A committee which has important work laid out for it is that of standardization and values. It consists of J. J. Reeves, F. M. Warner, J. D. Meriwether, J. S. Armstrong, G. F. Otto.

A committee, new to the organization, is that on information and publicity. It consists of H. W. Kruckeberg, Charles W. Ward and George C. Roeding.

Officers elected for the coming year are: President, Leonard Coates, Morganhill; vice presidents, John Vallance, Edward H. Rust, Max J. Crow, Chas. Howard, Geo. F. Otto; secretary, H. W. Kruckeberg; executive committee, J. D. Meriwether, Frank H. Wilson, John Gill.

Why Plant Trees?

- They add value to the property
- They add beauty and comfort to the home - - - - -
- They cool the air in summer and radiate heat in winter
- They improve sanitary conditions

Successful Planters

—recognize the fact that they can't get good results from poor trees. This is true of fruit trees as well as ornamentals. It doesn't pay to take chances on inferior stock—even though you may "save" a few cents at the start. The cost of planting, pruning and bringing an orchard into bearing is no more for good trees than for poor ones.

Thousands of planters all over the coast know the real worth of Roeding's True Trees. Our stock is healthy, firm rooted, and presents an attractive appearance. Our fruit trees will bear fancy fruit—the kind that tops the market, and you know what that means in the way of profits.

We Grow Nearly Every Thing that Grows

—and can fill your orders complete. For this season we have a splendid stock of apples, pears, peaches, prunes, apricots, almonds, plums, nectarines, cherries, walnuts, pecans, olives, oranges, lemons, pomeles, etc.; also nearly every wanted variety of palms, evergreen shrubs, climbing and trailing vines, etc.

Get Roeding's Advice

—before ordering. Let us help you plan your grounds. Whether you buy of us or not we are always glad to help prospective planters in their selection of varieties, and this advice costs you nothing. Write us.

OUR NEW CATALOG WILL SOON BE READY

If you wish a copy please let us know now so we can send it as soon as it comes off the press. When writing send us your list for prices and suggestions.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

GRAIN SACKS TOO EXPENSIVE.

[Written for Pacific Rural Press.]

Barley sacks didn't cost anything last year for E. V. Givens of Merced county, though his brother had to pay 13 1/2 cents each for his. The former put up a 500-bushel temporary bin in the grain field, dug a pit beside it and installed a hopper into which he could dump his wagon-loads of bulk grain from the ground. To raise the grain from pit to bin he put in a cup-and-belt elevator run by a gas engine of 2 or 2 1/2 h.p.

One team and grain-tight wagon hauled grain from the hopper on the harvester to the bin; while two teams of 10 animals each hauled 6 or 7 miles to the grain elevator at Merced.

The wagons hauling to town were loaded direct from the belt-cup elevator by swinging it around away from the bin. If the field wagon were dumping at that time, the grain was handled only once. If not, a trap was opened to let grain from the bin into the hopper, whence it would be elevated into the wagons.

Bin for Hilly Land.—If the ground were hilly, the engine could be dispensed with. The bin would be built on a steep hillside. A road would be dug above it and another below it. Field wagons would drive above and dump into a chute that would carry grain into the bin. Hauling to town, the wagons would drive along the lower side of the bin and open a trap to load, also by gravity.

DUAL PURPOSE TRACTORS.

[Written for Pacific Rural Press.]

Whether a dual purpose tractor and automobile or auto truck is of more value than dual purpose livestock, is yet to be tested out. There are several attempts along this line recently put on the market or about to be.

One of them is the La Dow Combination Road and Farm Tractor which runs 7 miles an hour at normal speed on the road and 3 to 5 miles in the field. It has hauled 12 tons of hay on trailers at 8 miles an hour, though part of the road was freshly oiled.

It has a regular auto truck front and tractor wheels behind, is about 12 feet long, and is supposed to give 16 h.p. on the drawbar at 4 miles per hour.

The Barker Tractor is another dual purpose machine soon to be put on the market. Its feature is the drive from all four wheels, four speeds forward and two reverse, ranging from 1 1/2 to 12 miles per hour. It is four feet high and 12 feet long, develops 20 h.p. on the drawbar and is claimed capable of pulling 25 tons at 12 miles per hour on hard roads.

PLOWS AND SEEDS GRAIN IN ONE OPERATION.

[Written for Pacific Rural Press.]

About two weeks after early rains, C. T. Givens of Merced county starts plowing for grain. To start sooner would turn under a lot of weed seed which would hurt the grain. He hooks a Stockton gang plow of 7

ten-inch bottoms behind a 30 h.p. Best tractor. He fastens one end of a seeder to the rear of the plow and lets the other end run on a wheel. Behind the seeder are two harrows. Thus the whole operation of putting in the crop is done with one trip over the ground.

The advantage of narrow bottoms is in the smaller chunks turned over. The advantage of only one trip is that a second one would pack the ground noticeably. Another advantage of waiting till after the first rain is that the ground on top is somewhat mellowed and turns fewer clods under.

PUTTING DOWN A WELL.

[Written for Pacific Rural Press.]

Instead of using a divining rod or other hoax to find water when it was decided to sink wells for certain orchard land on North Whittier Heights, Los Angeles County, a test hole was sunk near the creek, at considerably less cost than for a well, which might not yield enough water. Their test hole was a well itself, being 12 inches in diameter, according to Dr. G. E. Wanberg who controls the water company. A 12-inch hole cost 4 cents a foot. Water prospects being found satisfactory, a 24-inch well was sunk 209 feet at a cost of \$2600.

Lots of Loose Sand was encountered. In the 24-inch hole an 18-inch casing with 600 perforations per foot was sunk. Three or four carloads of sand were pumped out as the work progressed, and this was replaced in the space outside the casing with 113 yards screened gravel to hold the rest from coming through and yet permit easy flow of water. A Layne and Bowler pump in the 14x10 pit 18 feet deep, forces 101 inches up hill through a 12-inch steel pipe line.

POWER NOTES.

Shipments of Samson Sieve Grip tractors have been going to France, Australia, New Zealand, Canada, and Mexico.

The Waterloo Boy tractor manufacturers have been making an average of 30 tractors a month for the past year for a European firm who sells them for farm use, according to Mr. Sells.

"Does it turn short enough to use in an orchard?" was the commonest question at the Puente Tractor Demonstration. "Doesn't it pack the ground?" was another, to which the usual reply was that the weight of the tractor is distributed over enough more square inches of ground so that the pressure per inch is less than that of a horse.

A "rice chisel" consisting of a frame in which are fixed five subsoiler standards about two feet long has been made by the Killefer Mfg. Co. for Lutz & Co. of Santa Ana. Rice fields are often too wet to plow decently, but the subsoiler opens and loosens the soil without slicking or packing it.

REDWOOD TANKS — SILOS.
Thirty-five years in this business in Stockton.—A 500-gallon tank, \$8.00. A tank 6 ft. x 2 1/2 ft., \$7.50. Other tanks equally cheap. I deal direct with the consumer, saving 10% to 25%. All sizes in stock. Clear, dry redwood direct from the mill. Write for price today. Latest improved machinery. Doors, Windows, Frames, Mouldings.
R. F. WILSON, STOCKTON, CAL.

TRACTOR FOR TEN ACRES.

(Written for Pacific Rural Press.)

F. P. Clark of Covina has had a 6-12 Samson tractor since two years ago this fall, for use on his 10 acres of oranges. He has used his team less than six days during that time, except in hauling fruit to the packing house. He plows, cultivates, and furrows with the machine, figuring \$1 per 9-hour day for fuel. He has also used the tractor to pump water into the tank for house use. He was well satisfied with it for the 10 acres of orchard, but for less than that, he thinks a tractor does not pay.

POWER NOTES.

Churchill county, Nev., has purchased a large Holt Caterpillar and is using it for road work at the present time.

Philip F. Rose, a Wisconsin machinery expert, says that more power is used on the farm than in manufacturing enterprises. Counting horses, mules, windmills, tractors, and gas engines, the total power developed on farms amounts to 28,000,000 horse power. Manufacturing enterprises use about eighteen and three-quarters million horse power.

Included in the machinery recently purchased by the Lindsay-Strathmore Irrigation District, Lindsay, California, were eighteen pumps to go in 16-inch wells. All these pumps were manufactured by the Layne and Bowler Corporation of Los Angeles.

The California and Hawaiian Sugar Refining Company has just contracted with the Layne and Bowler Corporation of Los Angeles to drill a test well and install an up-to-date pumping plant to supply water for its big refinery at Crockett, California.

CONCRETE FIREPLACE.

To the Editor: Is concrete fire-resistant enough to be used for back and sides of a fireplace instead of fire brick? If so, what proportions should be used and how thick should the walls be?—R. S. H., Napa.

[Yes, if mixed with clean sharp sand and pebbles or rock which do not crack when exposed to fierce heat. We would make the walls about 3 inches thick and not put wood or other inflammable material directly against them on the back side. A sack of cement, two cubic feet sand, and three or four cubic feet of pebbles or rock mixed thin enough to pack well around woven wire or rod reinforcement, will be good. Be sure if you lay wet cement against bricks, that the bricks are absolutely full of water first. We were once accused of using poor cement on bridge piers because a local resident had plastered his brick fireplace with some of it and the cement dried out before it could set. It should be kept moist for several days.]

The first farm loan association organized in the West is the Delano-McFarland National Farm Loan Assn., in which 24 farmers have taken membership, and will apply for \$66,800 loans, in sums ranging from \$500 to \$10,000.

The Farmers and Merchants' National Bank, an organization of the National Loan Ass'n, branch of the Federal Loan Bank, has been organized by farmers in the vicinity of Merced.

WHITE, The American Baptist Home Mission Society, Dept. O, 25 East 26th St., New York.**

The San Francisco restaurant men are preparing to enter the hog and poultry raising business, to save restaurant patrons of San Francisco from paying war prices for food, says a daily press report. They have bought a large tract of land near San Rafael, and will ship food refuse from their restaurants to the ranch for feed.

General Agricultural Review.

FIELD CROPS.

The late rains did not materially hurt the Lompoc Valley crops.

Manteca will experiment with the growing of cabbage as a winter product.

The bean losses of the Santa Ynez Valley were much less than first feared.

H. Eto, a Japanese at Lompoc, disposed of 16,000 barrels of mustard at ten cents.

The Pacific Rice Growers' Association claims to have an outlet for 500,000 sacks of rice as soon as it comes in.

State Housing Commissioner Brown says he found bad sanitary conditions in the rice fields, on a recent tour of inspection.

Joseph H. Stephens of Sacramento, president of the Pacific Rice Growers' Association, estimates California's production of rice this year at \$5,000,000.

George Cook of the Mount district, Ventura county, says from a portion of his ranch that last year he got 385 sacks of limas; this year he will thresh 933 sacks.

Reclamation of alkali lands through rice cultivation looks very promising, says Chas. E. Chambliss, in charge of the rice investigations of the U. S. Dept. of Agriculture.

The bean crop of Sutter county this season will be about three million dollars. The price is far above the average, the best varieties now selling at 8 to 9 cents per pound.

Sweet potato growers of the Atwood district are reaping a harvest of profits for this year's crop, the price, \$1.25 per hundred weight, being double last year's quotations.

Bean growers of Santa Barbara county report a banner crop of beans, and say the damage by the rains was not near so great as expected. Growers are said to be getting 9 to 9½¢ for whites, both large and small.

The high price of cotton and cotton seed, it is said, will stimulate the planting of cotton next year in the Imperial Valley. The acreage in the Valley this year was 100,000; next year it is thought that it will reach 140,000 acres.

Reports from the Whittier district say that the loss to the bean crop will not be as heavy as first reported. The threshing of blackeyes and Lady Washingtons is nearly completed, and the yield is turning out better than expected.

The estimated average yield of wheat per acre in Canada in 1916 is 10.5 bushels in Manitoba, 16 in Saskatchewan, and 24.25 in Alberta. The low yields are due largely to crop damage.

The combined harvester made especially by the Holt Manufacturing Company for cutting rice will reduce the cost of production at least one-third, it is said, and will practically revolutionize the rice-growing industry of the State.

The Sacramento canneries have shipped most of their produce and will be entirely cleaned out of canned goods, both fruit and vegetable, before next season arrives. Tomatoes are being shipped East at prices hitherto unheard of.

All Japanese engaged in rice-growing in California will become members of the Pacific Rice Growers' Association according to a pledge given the executive board of the Association at its meeting by M. Matsumoto, secretary of the Japanese Agricultural Association.

The pink boll worm, the most destructive pest known to the cotton-grower, has appeared for the first time in North America. Following a recent visit of a number of Federal Horticulturists to Calexico, the local custom house officials were notified by telegraph Nov. 4 that a

quarantine had been placed on all cotton from Mexico except Imperial Valley.

Ten thousand sacks of rice, grown in the vicinity of Madison, are daily being brought to Woodland by trucks which are operated day and night. The Globe Milling Company's warehouse, which has a capacity of 250,000 sacks, will not be able to accommodate the crops of the county.

H. C. Woody of Van Nuys says he has sold \$690 worth of potatoes from an acre of land this year. His first crop was 142 sacks, which he sold at \$1.60 per cwt., netting \$240. His second crop was planted July and was irrigated once. This planting made 150 sacks, which are worth at the present time \$3 per sack.

DECIDUOUS FRUITS.

The California Peach Growers have withdrawn prices on fancy Muirs. The supply is exhausted.

The State convention of the California Nurserymen's Association for 1917 will be held in San Jose, October 11, 12, and 13.

Interest and faith in the California Prune and Apricot Growers' Association is evidenced by a large number of Hollister ranch owners, who have signed up to take stock in the organization.

The United States Department of Agriculture says that reports from 352 storages show that 949,147 barrels and 1,062,564 boxes of apples had been stored in their rooms before the 15th of October, 1916.

The State Horticultural Commission has established a sub-laboratory at Pasadena, with E. J. Branigan in charge, for the purpose of breeding "paraleptmastic abnormis," a near relative of the common ladybug, a parasite from Sicily, to destroy the destructive mealy bug.

The new Yolo County Horticultural Commissioner to succeed G. H. Hecke, who was recently appointed State Horticultural Commissioner, is Wm. Gould of Woodland. Mr. Gould has proved most efficient as Deputy County Horticultural Commissioner, and is highly recommended by Mr. Hecke.

CITRUS, NUTS, SEMI-TROPICAL.
The Riverside orange crop this season totalled 3236 cars.

It is estimated that 900 to 1,000 tons of olives will be forwarded from Lindsay this year.

U. S. citrus experts have just visited Porterville to study grapefruit conditions.

Orange packing started in the Oroville district about the middle of this week.

Oranges in the Pomona Valley, it is said, are coloring nicely, and the crop there this year will be worth \$3,000,000.

Ventura county is moving in the interest of the standardization of oranges and lemons before the same are put on the market.

It is reported from Walnut that the Walnut Fruit Growers' Association has paid out \$68,000 for English walnuts, and the end is not yet.

The consumption of walnuts in the United States is increasing rapidly. The estimated consumption of the past year is 67,515,000 pounds.

The first car of oranges from the Lindsay district was shipped to San Francisco November 6. The fruit was of good color and tested over 8 to 1.

The packing-house of the Covina Heights Grove Assn. was totally destroyed by fire on the night of Oct. 27, with a loss of \$12,000, covered by insurance of \$10,000.

M. J. Rouse, local nurseryman of Visalia, has offered to donate 2,000 California black walnut trees to plant on each side of the State highway between Visalia and Goshen.

The first car of navel oranges to be shipped from California to the Eastern markets was sent November 2 from Woodlake. It tested 9½ to 1. The car was billed to Minneapolis.

A new record high price for Porterville lemons has just been made in New York, where a carload lot has just been sold for \$6 per box. The lemons were grown in the Farr & Shippey grove at Zante.

On petition of the Tulare County Protective members, packers and shippers, the newly-adopted orange standardization law has been amended so that funds to cover inspection work will be paid by the packing organizations.

At a meeting of 250 orange growers at Riverside last week it was voted unanimously to ask the Board of Supervisors to adopt an ordinance requiring that all oranges shipped

from Riverside county shall pass the eight to one test.

The California Associated Olive Growers, Inc., have just completed their plant at Fallbrook, San Diego county. They are also packing under contract at Porterville. They expect to put out 15,000 cases this season, all of which is already sold. They report that oil olive growers are "up against it."

The supervisors of Los Angeles county have been petitioned to pass an ordinance prohibiting the shipping of oranges that will not pass the 8 to 1 test. While the majority of growers favor the ordinance, some independent shippers object to it, and say they will fight such a measure. The matter is being taken under advisement by the supervisors.

Walnuts around Whittier have nearly all been harvested; only the work of gleaning is now to be done. Wallace Gregg, secretary of the Whittier Walnut Growers' Association, says that already 1,000 tons of walnuts have been delivered to the Los Nietos packing house, and about 50 tons more yet remain to go forward, making a total of 1050 tons.

GRAPES.

The Lodi wineries are taking Tokay strippings now, paying \$8 per ton for them.

California raisins are bringing the highest price in Chicago in the history of that city.

Sixty tons of Sultana seedless raisins were shipped last week from Woodland to Liverpool, Eng., via New York.

Between 25 and 30 per cent of the 1916 muscat crop was lost as a result of the early rains, entailing a loss of about \$2,000,000.

W. E. Lewis of Selma took 45 tons of green grapes from his five acres of three-year-old Thompson Seedless vineyard. These were sold at \$27.50 per ton to a private party, to be bleached.

The Sebastopol winery of the California Wine Association has begun crushing the second run of grapes. Thus far this season the winery has crushed 1200 tons of grapes, dispensing \$22,000 to the growers and \$1200 in labor.

MISCELLANEOUS.

San Luis Obispo Co. is after a Farm Adviser from the State University.

Libby, McNeill & Libby have purchased five acres of land adjoining their big plant in Selma.

Approximately \$4,000,000 is the estimated cost of the work necessary to reclaim Tulare Lake if an overflow district is formed.

Modesto has been chosen as the meeting place of the 1916 State Convention of the Farmers' Educational and Co-operative Union of America, to be held Dec. 18, 19, and 20.

NAPA PRUNE GROWERS ORGANIZE.

The prune growers of Napa Co. held a well-attended mass meeting at Napa last Saturday and decided to organize for mutual protection and to promote their common interests. The meeting was addressed by Hugh Hersman of Gilroy, who has done such effective work in Santa Clara Co. in the same line, and also by H. C. Dunlap of Napa, both of whom explained to the growers how they were exploited by the packers, and exhorted them to make an organized effort to bring about better conditions in conjunction with similar organizations springing up in the prominent prune-growing sections of the State. A committee was appointed to complete the organization. Four hundred acres were signed up. A similar meeting is to be held at Suisun today (Nov. 11).

THE CITRUS INSTITUTE AT RIVERSIDE.

The five-day program of the Citrus Institute under the auspices of the Citrus Experiment Station, University of California, to be held at Riverside, November 20-24th, in-

clusive, 1916, has been issued. In arranging this program great care has been exercised to present discussion of as many of the factors of orchard management as possible. The men who are scheduled to speak on the different subjects are highly qualified through experience and investigation. Discussion of those

phases of management upon which no definite suggestions from experimental data are at hand have been purposely omitted. The lectures will be held at the Polytechnic High School, Riverside, Calif. All who can possibly do so should attend these sessions. There is no charge of any sort for the course.

Alfalfa-Growers!

get the facts about Hairy Peruvian Alfalfa

Hairy Peruvian produces 2½ tons more per acre than the ordinary varieties of alfalfa, and one ton more per acre than the famous smooth Peruvian alfalfa.

HAIRY PERUVIAN is a thoroughly tested plant. It has been tried out and endorsed by the Arizona State Experiment Station, and by growers in both hot and cold countries. It produces heavily in all climates practically the year round. Does well at 5000 feet, or at sea level.

HAIRY PERUVIAN produces large leaves from the top to the crown of the plant, and as the leaves contain the greatest and best part of the food value, this is the most important reason why you should plant Hairy Peruvian.

Don't fail to plant Hairy Peruvian this season. Send for folder containing facts and testimonials.

Milo Better Hog Feed Than Barley.

University Test Shows Great Advantage of Ground Milo over Rolled Barley, in Rate of Gain, Cost per Pound of Grain, and Dressing Percentage of Carcass.

[Written for Pacific Rural Press.]

The 97-day hog-fattening test completed under direction of Prof. J. I. Thompson, at University Farm, Oct. 17, with eight pens of 12 hogs each, was described in a recent issue. The pigs averaged about 4 months old, weighing 102 pounds at the beginning. They averaged 220 pounds at the end, but each lot differed from any of the others.

The Western Meat Co. bought and butchered them, keeping records of their dressed percentages and paying accordingly.

Twenty cents per hog per month was charged for pasture, which is higher than is ordinarily used, but present prices of alfalfa seemed to warrant this. Eleven cents per 100

omy of production, anyhow.

Ground mlo, tankage, and alfalfa pasture produced gains at a cost of 6.6 cents a pound; while rolled barley, tankage, and alfalfa pasture made the gains cost 7.7 cents, and averaged 38.3 pounds less gain per hog in the same time. It took 10 per cent more barley than ground mlo to make one pound of gain when both were fed in self feeders with tankage and alfalfa pasture. The dressed percentage of the mlo-fed hogs was 83.1 as against 78.8 for those fed barley.

The figures for Lot 1 furnish conclusive evidence that \$32 barley can not be fed profitably to hogs in a dry lot, and according to Lot 5, there

RESULTS OF UNIVERSITY HOG FEEDING EXPERIMENTS.

lbs., or \$2.25 per ton, was charged for green alfalfa. Twenty-seven dollars was used as the average price of barley for the past five years and \$32.00 is the present price. Similar figures for tankage are \$41.00 and \$42.00; shorts, \$29.00 and \$33.00; coconut oil meal, \$24.00 and \$20.00; and mlo maize, \$27.00 and \$30.00.

The pigs in Lot 1 cost 5c per pound up to the time they were put into the experiment, and this figure is used for all lots. No labor costs are included, and this gives additional advantage to the self-feeder lots, all three of which lead in econ-

is little economy when cut green alfalfa is fed in addition. Lot 6 shows that when hogs are selling below 9 cents, shorts at \$29 and \$33 a ton are too expensive a supplement to rolled barley when alfalfa pasture is available. Lot 7 shows a saving of .7 to 1.1c per lb. in cost of production, when coconut meal at \$24.00 and \$20.00 is used instead of shorts at the above figures. Lot 1 was divided, the lighter hogs being separated out. The heavy ones dressed 77.7% and brought \$8.85; the others bringing just \$8.75. Lot VIII dressed the highest, 83.1%, and sold for \$9.35.

San Benito Berkshires.

[Written for Pacific Rural Press.]

Among other fruit growers who are establishing herds of purebred livestock on their farms is Dallas Basche of San Benito county, who has been growing hogs for the past four years in connection with the cultural work of raising a young orchard.

Mr. Basche has been growing purebred Berkshires for some time, but during the past summer has started to improve the quality of his herd by the purchase of some of Rival's Champion Best female stock, and one of the best sons of Grand Leader 2nd for his herd sire. With his four years' experience and the present high quality of his foundation herd,

Mr. Basche hopes to breed an outstanding line of Berkshires.

UNIVERSITY CO-OPERATION.

The University of California will co-operate with the Farm Loan Board in inaugurating in California the new rural credit plan. The Farm Advisers, maintained by the university and the United States Department of Agriculture in various counties, will take up with the Board of Directors of the Farm Bureau in each county the plan of appointing a farm loan committee to take charge of inaugurating the federal farm loan system. There are 175 such Farm Bureau Centers in California.

Livestock on Public Highways.

To the Editor: In a county like Lassen where there is no law against turning stock out on the roads, does not the owner of said stock turn them out at his own risk, or can he claim damages if stock is injured or killed by autos or teams?—H. A., Standish.

[Answered by T. C. Judkins, Jr., University Farm, author of our recent article on "Agricultural Fence Laws."]

Yes, it would be illegal to turn stock out upon the highways of any county in California. "Any person at any time finding any stray animals upon the highways adjacent to his property, may take up the same and have a lien upon them for all expenses incurred in keeping said animals" until the owner himself appears and claims them. Thus the State law implies clearly that no animals shall be turned out upon any public roads and should only be permitted thereupon when being driven from one farm or place to another (and must then be in care of a herdsman, etc.) Any cattle let

roam at-large upon public roads are there illegally and the owner will be liable for any damages they inflict. If stock is at large by mistake and is wilfully and maliciously run down by a passing vehicle, the conditions would be altered however, but this would be an exceptional case. It is also highly probable that the county of Lassen further supplements this State law by more definite and stringent local ordinances, which make it even harder upon such stockmen. The California Legislature has made an exception of the stock-ranging counties of Shasta, Trinity, Modoc, Del Norte, Siskiyou, and Lassen counties, however, in that cattle found upon the lands of another are not necessarily to be classed as strays. But this exception would have nothing to do with the State law covering estrays upon public roads and such turning out of stock is as unlawful, in our opinion, in Lassen county as in any other California county.

Are Rice Middlings Good Sow Feed?

[Written for Pacific Rural Press.]

Since the advent of rice mills in this State there has been more or less experimenting with rice by-products as a feed for farm animals and particularly has this been true with rice middlings as a hog feed. When fed in connection with other feeds to fatten market hogs rice middlings seems to be well thought of by all those who have tried it, but in at least two cases this has not held true with brood sows.

Two prominent breeders inform us that when rice middlings comprised one-fourth of the ration it seriously affected the young pigs in the litters, in both cases the middling fed sows farrowing pigs weak in constitution and lacking uniformity in size, one breeder stating that many of the pigs never got out of the sheath

and some were badly decayed, looking as though they had been dead a month. When this condition was found to be prevalent with all of the sows being fed the ration the middlings were discontinued and since then no like experience has been had.

For fattening hogs middlings seem to be entirely satisfactory, one of the before mentioned breeders relating how he had turned off five-month-old hogs weighing on the average 169 pounds and these had been fed on rice middlings, soaked milo, skim milk and molasses. While the gain was not unusual it indicates that the middlings had no harmful effects in this case. We should be glad to hear what others have found out about rice middlings as a feed for brood sows.

Benefit by State Dairy Cow Competition.

[Written for Pacific Rural Press.]

If you are not already a member of a local cow-testing association and expect to enter grade cows in the California Dairy Cow Competition it will pay you to join your local association at once.

Although it is not compulsory for a contestant in the State competition to belong to his local cow-testing association, such members will have decidedly lower cost of testing. The rules provide that weights and tests provided by an officially recognized cow-testing association shall be considered official if the testing is done every fourth month by a representative of the University of California.

It will be necessary to send a University tester only twice during the ten-month lactation period instead of 10 times as will be the case when the herd is not entered in a recognized local association. The regular charge for grade cows will be \$5 for each 15 cows or less each month, making a total of \$50 for the 10 months, but under the above ruling association members will only pay \$10 for 15 cows during the entire lactation period in addition to their regular association dues of \$1 to

\$1.50 per cow per year.

This will undoubtedly result in a large number of entries of grade herds already entered in cow-testing associations as it only means an additional charge of \$10 for each 15 head entered, and allows the member to compete for all of the grade cow prizes, which amount to many hundreds of dollars.

Where several neighbors wish to enter only a few cows each, they may be able to bring them together into a herd of fifteen ready for the tester; and share the expense.

Intending contestants should write at once to Prof. F. W. Woll, University Farm, Davis, Cal., for entry blanks and rules.

COWS EAT FENCES.

To the Editor: My cows are trying to eat up all the fences on the place—shakes, shingles, or any old redwood they can get.—A. B. K., Manchester.

ABSORBINE STOPS LAMENESS

from a Bone Spavin, Ring Bone, Splint, Curb, Side Bone, or similar trouble and gets horse going sound. It acts mildly but quickly and good results are lasting. Does not blister or remove the hair and horse can be worked. Page 17 in pamphlet with each bottle tells how. \$2.00 a bottle delivered. Horse Book 9 M free.

ABSORBINE, JR., the antiseptic liniment for mankind, reduces Painful Swellings, Enlarged Glands, Wens, Bruises, Varicose Veins; heals Sores. Allays Pain. Will tell you more if you write. \$1 and \$2 a bottle at dealers or delivered. Liberal trial bottle for 10c stamps. W. F. YOUNG, P.D.F., 86 Temple St., Springfield, Mass.

Purebred Registered HOLSTEIN CATTLE

The preliminary report of tests covering the period since 1909, and just published by the Iowa Agricultural Experiment Station, states that the average of records made by first generation heifers by a purebred Holstein sire, shows an increase of 71 per cent milk and 42 per cent fat, at an average age of 3½ years, over the record of their scrub dams at an average age of 6 years. These dependable reports show very plainly that the introduction of a purebred Holstein bull to a herd of common cows will materially increase production and profits. There's big money in the big "Black and White" Holsteins.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

Ralph Newman of Elk Grove, whose dairy has for a month been putting out certified milk, has recently returned from Fresno where he went to buy a purebred Holstein bull.

All the herds of cattle in the vicinity of Bodega are to be entered in a competition that is to be held under the auspices of the Bodega Cow Testing Association, a new association.

A. Niboli of Surf is milking 18 head of dairy stock, feeding 200 head of beef stock, and has over 100 acres of small white beans. He and two hired men do all the work except at threshing time.

Impressed with the quality of Kings Co.'s Holstein-Friesian cattle, Prof. A. L. Westover of the San Luis Obispo Polytechnic School selected a carload of fine young milk cows of the Holstein breed for two cattle buyers of his county.

The Le Baron Estate of Valley Ford, Sonoma county, has just purchased a carload of advanced registry Ayrshire cows in Wisconsin to add to their foundation herd of registered Ayrshires. They will start to do official testing shortly.

Creamcup Vogelschen Cornucopia, owned by K. W. Abbott, Moorland Farm, Milpitas, the oldest daughter of his herd bull Colantha Sir Pontiac Aaggie, has just made a 7-day record as a junior four-year-old of 28.005 lbs. butter from 529.6 lbs. milk.

Mr. D. H. Bitner, representing the Greeley Ranch of Bakersfield, has just purchased a two-year-old bull from Mr. A. A. Jenkins of Tulare. This bull is by Mr. Jenkins' herd bull, Gerties' Lad, and has been a consistent prize winner at the many county fairs this fall.

Dr. Chas. Keane, State Veterinarian, warns dairymen to beware of fake inspectors representing themselves to be operating under the provisions of the new milk law which became effective Oct. 1. Dairymen should require all persons claiming authority to show proper credentials. A number of impostors are at work throughout the State administering the tuberculin cure.

Relative to a news item appearing in these columns in the issue of Oct. 21, N. H. Locke writes: "Empress Lass made 11,314.4 pounds milk, 603.17 pounds fat, in 281 days, not 603.17 pounds butter. The Holstein breeder would figure one-fifth more butter or 723.8 pounds butter. She gave 34 pounds fat for last monthly test, and is due to freshen in ten days, having carried a calf during most of the test period, run in pasture day and night, and milked twice a day."

The Rural Press has received copies of the second edition of the De Laval Dairy Handbook, which is filled with good, practical information and advice to cow-owners from cover to cover. The book evidences care in its preparation; and while the various phases of dairying are discussed by the best and highest authorities, the book is not technical, but is written in plain, understandable language. The De Laval Separator Co., 165 Broadway, New York City, states that it will be glad to send this handbook free to any of our readers who write for it.

The following is the score of the recent test in the Gridley Cow Testing Association: Beauty, Holstein, owned by S. A. Mealey of Gridley—pounds of milk, 1814; per cent of fat, 3.8; pounds butterfat, 68.9. Gladys, Shorthorn, owned by C. Goetz, Tudor—1150; 4.9; 56.4. Darkey, Holstein, D. Beale, Gridley—1181; 3.8; 53.1. Maud, Holstein, J. H. Guill, Chico—1376; 3.8; 52.3. Sadie, Holstein, L. Kaiser, Biggs—

1395; 3.5; 48.8. Rone, Shorthorn, M. Shibig, Meridian—942; 5.0; 47.1. Gladys, Holstein, D. Beale, Gridley—1246; 3.7; 46.1. Brandal, Jersey, M. Shibig, Meridian—939; 4.9; 46.

BEEF CATTLE.

Vincent Brothers near Porterville have shipped two thoroughbred Hereford bulls to Waldon Lewis, near Madera, recently. The younger bull brought \$175.

A shipment of 650 range cattle was received in Visalia this week by Frank Brundage for the Brundage & Crowley Cross Creek Ranch, where they will be fattened for the market.

Several special freight trains unloaded 53 cars of Nevada cattle at the Newman stockyards Thursday, coming to California to escape the snow and cold of the ranges in that State.

The Rural Press is advised that Henry M. Elberg has leased the T. B. Gibson interests in the Rose Lawn Stock Farm estate, near Woodland, and taken over all the livestock. Mr. Elberg is the son-in-law of the late T. B. Gibson, and will continue the business, specializing on Shorthorns.

The Central Stockmen's Association held a most successful meeting at Coalinga, Nov. 4. The counties represented were San Luis Obispo, Monterey, Santa Barbara, Kern, Fresno, Tulare, and Kings. The meeting met in the interest of good road construction and to formulate a bill to be introduced into the next Legislature providing that all notes secured by chattel mortgages shall become negotiable instruments.

Other important business was transacted and a good time had.

SWINE.

John P. Walker of Visalia has ordered from the East an entire new strain of the finest pure-blood Duroc-Jersey hogs which he is importing to his ranch near Visalia for breeding and showing purposes. Mr. Walker is among the several new ranchers of the community who believe in having only the finest bred stock.

Donald H. Graham, Lancaster, writing under date Nov. 4 to one of our staff, says: "It may interest you to know that those purebred Duroc gilts of mine which you saw here during the summer have farrowed. Of the nine, in the picture I sent you, we are very proud and happy. None of them farrowed less than 7 pigs; they went as high as 12, with an average of 9 2-9. We lost all of one litter of 9 so that our average raised is but 6 8-9. We lost some in nearly every litter, but the average raised is not bad for gilts. A gilt I got from Elmer Lamb farrowed 10, the second litter."

SHEEP AND GOATS.

Kaupke Bros., Hampshire breeders of Yolo county, report the sale of a foundation flock of ewes to Dr. E. E. Brownell of San Francisco, who will run them on his ranch near Woodland.

A nation-wide alliance of sheep producers, wool manufacturers, railroads, mutton handlers, etc., is to be proposed at a big meeting in Chicago during the International Livestock Exposition Dec. 2-9.

It is reported from Redlands that Winthrop Howland of the Rancho el Chivar is making a cream cheese from goat's milk that is as good, according to the formula of the famous Neufchatel cheese that is imported from France.

The Frank Mecham Estate at Petaluma has recently shipped a carload of Merino ewes and rams to N. E. Curtiss of Lone Pine and a carload of Red Polled heifers to Wm. Rust of Ukiah. They have also recently received an order from Central

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. J. Ceder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all ages, reasonable prices. Some fine bred sows and gilts, and top quality young boars. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, E. H. Whitten, Route 5, Box 647, Los Angeles.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT CO., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Broadway, or San Francisco banks. Office 219 Underwood Building 625 Market St. San Francisco.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 531-537 Brannan St., San Francisco.

FOR SALE—Dairy Shorthorn Bulls. Also Alfalfa Meal. I. T. Grounds, Route K, Box 321, Fresno, Cal.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

America for two Red Polled heifers and a bull.

UNIVERSITY TO SHOW FAT STOCK AT INTERNATIONAL.

We are advised by Prof. Gordon H. True that the University of California will make an exhibit of fat steers at the International Livestock Exposition to be held at Chicago, December 2 to 9 inclusive.

Writing of their exhibit Prof. True says, "The two steers to be exhibited are a cross-bred Hereford-Shorthorn calf just past one year old, showing at a weight of something over 1100 pounds, and a two-year-old Aberdeen-Angus steer that was grand champion at the P. P. I. E. as a yearling last year. While this steer is better than he was a year ago and was counted at that time an exceedingly good one by Eastern judges he was defeated at the California State Fair by the calf referred to above, so I feel that we are going to be in a position to make a very creditable showing for our State."

Prof. True also states that he is endeavoring to get up a party of livestock breeders in California to attend the International this year, a number having already spoken enthusiastically of the plan to him. If a sufficient number seem interested, he has volunteered his services in making arrangements for the trip. It will be necessary to leave San Francisco not later than Thanksgiving Day in order to arrive in Chicago before judging is started.

AVOIDS ALFALFA BLOAT.

(Written for Pacific Rural Press.)

Although pasturing dairy cows on alfalfa has been considered poor policy owing to the loss by bloat, the waste of feed, and injury to the alfalfa, many dairymen believe that if moderation is used in pasturing, it is more economical than cutting and feeding it green. Among these is George Farmer of Kings county. Mr. Farmer has pastured for years and says he hasn't had a case of bloat for ten years, although his cows are on alfalfa pasture for a time every day.

It is heavy feeding of green alfalfa that causes bloat. According to Mr. Farmer, if you turn cows into a field where the growth is rank and when the cows are exceedingly hungry, you are sure to have bloat. In such cases he fills them up with dry hay or Bermuda grass before turning into the alfalfa. In either case the cattle do not eat so ravenously and as a consequence do not bloat.

DUROCS AND GUERNSEY BULL CALVES dits bred to 900-lb. boar. Ed. E. Johnson, Chico, Cal.

Drying Beet Pulp.

(Written for Pacific Rural Press.)

With the extensive use to which dried beet pulp is being put among livestock feeders, it may be interesting to our readers to describe the drying process at the American Beet Sugar Company's Oxnard plant where 3600 sacks of the dried product are turned out daily during the beet harvesting season.

Before reaching the pulp factory the beets have been sliced and run through various vats of water where practically all of the sugar is extracted by continuous washing.

The wet pulp is pumped with water to the drying plant where it flows into a heavy steel screened vat, the water passing through the holes in the screen and the pulp being conveyed to large cylindrical hydraulic presses.

These presses reduce the moisture content as much as possible by pressure alone, also breaking the long slices into much shorter ones.

Conveyed from these presses automatically, the pulp is then carried to immense hot-air drums, so equipped inside that two hours are required for the pulp to pass through them, which is also automatically performed. The hot air passing through this drum is kept at a temperature of 190 degrees, taking out

all but about 10 per cent of the moisture in the pulp.

From the outlet of the drum conveyors again take the pulp, now thoroughly dried, to automatic scales and sackers where it is packed in large burlap sacks, then being ready for immediate shipment or storage in the warehouse.

Some idea of the amount of wet pulp handled daily may be gained by the fact that a ton of wet pulp is required for each sack of the dried product.

The Complex Problem of Marketing Hogs

(Continued from 1st page.)

Unless a hog has been fed some grain continuously rather than spasmodically or for a few weeks before marketing, he is certain to dress out a low percentage; and each point lost by dressing out virtually means a pound of pork paid for that cannot be sold.

Tubercular hogs also cause a loss of some three per cent to the packers because of the practice of feeding raw milk from tubercular cows to the hogs. This three per cent loss is prorated back over all the hogs purchased by the packer, the good hogs standing their share of the loss and the producer's price being cut accordingly.

Possible Solutions. — That the problem is a complicated one, all must admit. Theoretically at least all three factions should be interested in seeing more hogs in California—the farmer because it means economical manufacture of cheap products into a finished form on the ranch; the buyer because more hogs mean larger business; and the packer more hogs because it means expansion of his business and cutting down of overhead expense.

Producers now in the hog business in California, but having previous experience in the Middle West, advise us that our marketing system is wrong and that with a centralized or union stock yard market the situation would immediately right itself. They say that on such a market a hog is sold on his merits and that the shrinkage in shipping, now charged up to the producer, is almost completely offset by a heavy fill of feed and water before weighing out to the buyer in the stock yards. A few shipments of soft or undersized hogs with a consequent difference in price between them and the hard 200-pound animal would, they contend, do more toward educating the producer to breed and feed right than any other one thing.

Lacking the facilities for such

marketing D. O. Lively recommended the organization of co-operative shipping associations among producers at the Hanford meeting.

These associations would be composed of hog raisers who would hire a competent man to assemble and market their hogs, doing the work now done by the local buyer to a certain extent; but going still further and following such shipments through the packing house, thus ascertaining what each lot of hogs in the shipment dressed out and paying the individual members for their hogs according to this dressing percentage. In this manner any and all losses through improper breeding, feeding, tuberculosis, piggy sows, etc., would revert back to the responsible party and not be prorated over the entire membership.

Both farmers and packers who were present at the meeting and who have been interviewed since, favor this idea—the former on the grounds that it will improve the price of good hogs and thereby insure a margin of profit on the well-bred, grain-fed hog. The packers present favored it because they believe it will give them organized bodies of men to deal with, rather than individuals as at present, and will result in a better understanding of the fundamental troubles of the industry.

From the writer's knowledge of the situation it seems certain to him that some radical change must come, and from the experience of other agricultural producers in California it would seem that even though the local shipping associations might not totally solve the problem they would at least be in a better position to lay bare the true facts of the case than growers are in their present unorganized condition. There are already several hundred such associations in the United States, and California could readily support a large number of them at this time.

Breeds Large, Heavy-Producing Cows.

(Written for Pacific Rural Press.)

C. G. McFarland of Tulare county has some very decided views about the breeding of Jersey cattle. Chief among these, is the necessity of breeding a big vigorous animal, capable of producing heavily at the milk pail under normal, rather than abnormal conditions, as is so often the case nowadays in the race for high-record cows.

Taken as a whole, Mr. McFarland's herd of 27 cows averages around 500 pounds of butter per year. These are official records, for he is a firm believer in official work with purebred dairy cattle.

It has taken a good many years to accomplish this remarkable average, and no single factor can be pointed out as more important than any other, unless it be the continual endeavor he has exercised to breed away from trim little Jersey show type and into a commercial dairy type.

Feeding has undoubtedly been an influencing factor, for while home-grown feeds such as alfalfa and corn silage have constituted most of the

ration, they have been fed liberally. The calves have also been well cared for, and everything done to develop them into large cows. Early breeding has never been practiced. In fact, Mr. McFarland prefers to have his heifers freshen with their first calves when about 27 months old, by which time they have had a chance to secure the major part of their growth.

And this careful rearing of the heifers is indicated in the older cows, an illustration being the cow Philadelphia's Glory Gertie which made a record of 592 pounds butter when 13 years old; and Philadelphia's Glory Zella which made 680 pounds of butter when 12 years old and 631 pounds the year before. These records, as well as all others made by Mr. McFarland, are accomplished with two milkings a day, which adds considerably to their significance.

The Bodega Cow Testing Ass'n resumed operations in October with 1092 cows entered.

When you buy Prince Albert you are getting quality!

Quick as that P. A. flavor strikes-in, you'll realize you've received all you paid for in *tobacco quality*—not coupons or premiums! State or national restrictions on coupons or premiums can in no way affect Prince Albert's sale. Quality has been the only inducement Prince Albert has ever offered smokers!

You've heard many an earful about the Prince Albert patented process that *cuts out* bite and parch and lets you smoke your fill without a come-back! *It proves out every hour of the day!*

PRINCE ALBERT

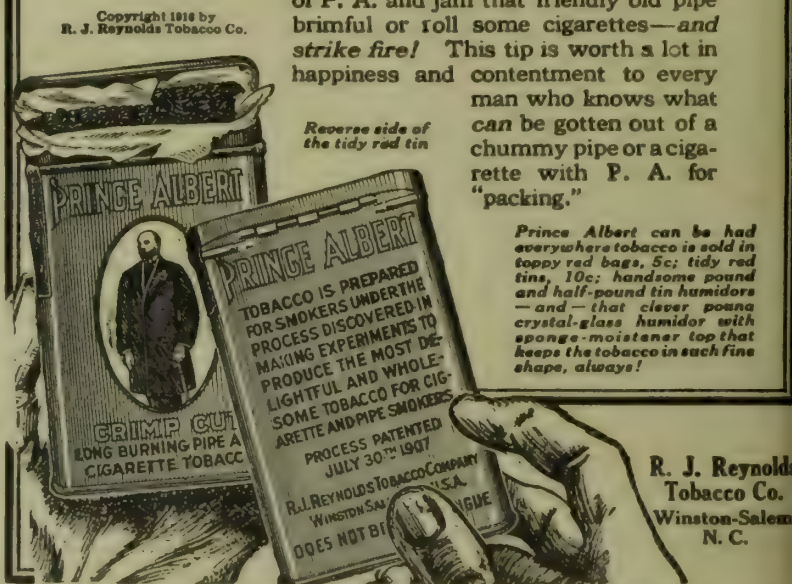

the national joy smoke

will open the doors wide for you to come in on a good time with a jimmy pipe or makin's cigarettes. You'll think the smoke-lid is off for fair, firing up as the smoke-spirit strikes you—without a regret!

All that delight can be yours soon as you lay in a stock of P. A. and jam that friendly old pipe brimful or roll some cigarettes—and *strike fire!* This tip is worth a lot in happiness and contentment to every man who knows what

can be gotten out of a chummy pipe or a cigarette with P. A. for "packing."

Prince Albert can be had everywhere tobacco is sold in tippy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidor — and — that clever pouce crystal-glass humidor with sponge-moistener top that keeps the tobacco in such fine shape, always!

DRYING MILK-COWS.

To the Editor: What is the best way to dry up milk-cows without injury to them?—F. A. R., Turlock.

[Gradually decrease the amount of milk taken at each milking.]

PIGS' FACES SCABBY.

To the Editor: Pigs one to six weeks old have a disease in which scabs or cracks form on the ears, nose, and around the eyes, and also on the tail, which finally drops off.—J. D. P., Biggs.

[Smear the affected parts with iodine ointment U. S. P., once a day.]

COW'S EYES WATER.

To the Editor: My cow's eye has been running for the last month. At the corner there is yellow matter and the eye is highly inflamed but not swollen.—B. M. B., Sonoma.

[Place a few drops of a 25 per cent solution argyrol in the eye three times a day.]

SHEEP COUGH AND DIE.

To the Editor: Lambs about 10 months old appear droopy; froth runs from the nose and mouth. Short hacking cough. There is a rattling sound in the throat or chest when the animal breathes. These symptoms usually increase until the animal dies in 12 to 36 hours. Every animal of mine which has been so affected has died. Every one had been in thrifty condition. The trouble always appears in the fall. Have recently changed the band to fresh pasture, but two have died. No dangerous weeds.—D. L. L., Atwater.

[This looks like verminous bronchitis. It would be advisable to call in the State Veterinarian's office.]

COW BLOATS EVERY DAY.

To the Editor: A cow bloats every day on all kinds of feed.—S. B. O., Fresno.

[This is chronic indigestion. Give one dram of each of the following twice a day: Fluid extract nuxvomica; fluid extract gentian; and fluid extract cascara.]

DOG HAS INTERMITTENT ITCH.

To the Editor: Our collie dog has a skin disease. For several years a spot on his back near the tail has occasionally itched so he would scratch a great raw place. An emulsion of olive oil and sulphur makes the trouble subside, and the hair comes back. He has fleas, lots of them, and of late he scratches all over. We feed him cooked scrap meat with bread and vegetables.—G. W. B., Highland.

[Bathe this dog once every eight days in hot lime-sulphur dip, scrubbing the solution in well. Withhold all meat from his diet and give Fowler's solution in 5-drop doses twice each day.]

UTERUS CLOSED.

To the Editor: Several cows come in heat rather irregularly, sometimes miss one or two periods, and they do not catch. I find the neck of the uterus closed too small to admit the small finger. It does not yield to any method of dilation that I use. I have never had any abortion.—W. W. C., Ontario.

[These cows have nymphomania. Call in your veterinarian and have him break down any cysts he may find in their ovaries per rectum or per vagina.]

GOAT FOOT ROT.

To the Editor: I am having some trouble each winter with foot rot in my band of 300 Angora goats. One of them has been in bad shape all summer and with the first rain this fall several began to limp. I have a 14-foot trough and intend to drive the band through it daily with a saturated solution of bluestone deep enough to cover the roofs. Would it be good to spread refuse burnt lime from an old lime kiln, in the shed?—M. W., Cool.

[It will be better to use a 2 per cent solution liquor cresolis compositis and hold them in this long enough to soak into all the cracks and crevices. Lime spread in their quarters will be very beneficial.]

Blackleg Keeps Out Purebred Stock.

[Written for Pacific Rural Press.]

We know of a beef-raising community along the Coast where there are no purebred beef bulls for fear of blackleg. One man recently commissioned a stock buyer to get 100 grade Hereford bulls in the East for use on his range herds. Despite climatic and feed possibilities worthy of the best stock in the world, and cheap land to run on, scrub stock is raised into inferior beef for inferior prices because when blackleg gets the calves, there is less loss if they are not purebreds.

We know one young man who has not lost a calf out of his small herd, presumably because he vaccinates them twice a year and uses reasonably fresh vaccine. He is now buying a purebred Shorthorn bull, and hopes eventually to have a purebred establishment on his 1100 acres, of which 300 are fine bottom land. He now raises and buys cattle to feed for market, being financed largely by bankers. His own profits on this feeding will go into purebreds, for the blackleg has no terrors for him.

To vaccinate, he corrals the calves, an assistant ropes one at a time and snubs the rope around a post, while the young stockman goes outside the corral to load his "gun." The vaccine pills are laid on a thin layer of clean cottolene in a saucer (vaseline would be just as good and more expensive). Each pill is picked up with the "gun," and held in its cavity by the grease until injected. Without the grease, the pill might easily be lost in whatever commotion is aroused, without his knowing it. Then if the calf should die he would say that vaccine didn't work. Likewise, if he didn't have a way of knowing all the calves are vaccinated, some which evaded it might die and discredit the vaccine.

A "squeezer" between two corrals would probably be handier than roping the calves, and would avoid possible failure to place the vaccine right due to the calf's uneasiness. The vaccine costs 10 cents a calf, and 100 calves a day is figured as a small job for two men.

HERE IS YOUR LAST CHANCE to order an IDEAL GREEN FEED SILO

and get it up in time to fill with the last crop of alfalfa, which can be fed out in time to again fill in the spring with the first cutting, which as hay is hardly worth handling, but which makes excellent silage.

YOU CAN THEN FEED SILAGE through the summer and have the silo empty in time to fill with corn next fall.

MANY DAIRYMEN TRIED THIS PLAN last year and saved enough to pay for their silo. You can do as well.

DON'T DELAY, BUT ORDER NOW.
If desired, terms can be arranged.

Most Wonderful Milking Machine Made To-Day

Most durable, most practical, most economical and most sanitary method for milking cows. Big success from the start 8 years ago. Pays 100 per cent on the investment the first year. Great labor saver. Nets more profit for your dairy. Increases the milk yield. Cuts milking time in two. This machine milks like the human hand. Perfect method of suction; suction gradually increases; cows like the soothing action, as there is no strain on teats or udder. The milker has no complicated mechanism; only two moving parts; no vacuum tanks or pipe lines; no metal pipes to freeze or become foul; no vacuum in pail; few wearing parts; easy to keep clean; simple in construction; boy or girl can operate; low cost of upkeep; little power needed to operate. Write for free catalogue which tells the whole story. Address C. F. DANIELS & SON, Prince and Bateman Streets, Berkeley, California.

Uni-Lectric
GASOLINE-ELECTRIC UNIT
LIGHTING SYSTEM

Electricity for Farm Homes

At one-third cost of juice from Power Company (this includes interest on cost of plant). It is the simplest and most economical plant on the market.

No Batteries - No Switchboard - No Rheostat.

Will operate 50 lights 7½ hours for 11c. Will also operate electric fans, irons, small motors, etc.

If your buildings are not wired, send us plans and we will give you full instructions so that you can wire them yourselves. Material furnished at lowest cost.

Raising Poultry for Profit

GETTING MORE OF CONSUMER'S EGG MONEY.

[Written for Pacific Rural Press.]

"Our business—to get the producer more of the consumer's money." Such is the cold-blooded declaration of the Tulare Co-operative Poultry Association, and the beauty of this motto is that they are getting it.

When this association was formed three years ago last May, there were 50 poultry raisers in the vicinity of Tulare who were willing to pay \$25 for a membership in this association whose avowed purpose was to market poultry and eggs and buy feed for its members at cost.

Inexperience in the egg-marketing business was largely responsible for a great deal of grief in those early days. Not only did the business of selling right have to be learned by experience, at the cost of the association, but financial difficulties were also encountered because, with a total capital of but \$1250, part of which had to be expended for equipment, it was difficult to conduct the business profitably to the association and to its members at the same time. This is accounted for by the fact that to cut down the selling cost per dozen of eggs you must do a large enough volume of business to cut down the overhead expense to the minimum, and without working capital in sufficient amount this seemed impossible.

When it became certain that lack of capital was retarding the welfare of the association, money was borrowed, and now, after three years, the debts have been paid off and the association is in a flourishing condition.

Early Conditions.—As to the actual accomplishments of the association it is necessary to relate conditions before the association was started. The egg market then as now for Tulare eggs was Los Angeles, and while it was better than the San Francisco market, it was at best a poor market for eggs from the valley towns.

To quote I. N. Foss, present secretary and manager of the association: "San Joaquin Valley eggs are in a class by themselves . . . it is not a good class, especially in the warm weather. So strong has become the prejudice against 'Valley Eggs' that Los Angeles has established a special low price on the valley's product, and it runs from two to four cents below the case count quotations on the day they arrive."

Tucopa Brand.—But this does not apply to "Tucopa" eggs, the brand under which the association markets its good eggs. It has taken three years for the association to convince dealers and consumers that there is a difference in the quality of valley eggs, but by careful grading and persistent hammering of members to keep their nests and laying houses clean, to swat the rooster and to gather their eggs twice daily, cooling them out promptly and keeping them cool until delivered, they have at last impressed egg buyers with the fact that "Tucopa" eggs are different. As proof of this we quote from a letter received from one of the largest handlers of eggs in Los

Angeles. It says: "Your Tucopa brand still looks very nice, and as long as they continue to be as good as they are now we are going to allow you one and a half cents over the San Joaquin Valley price." In another letter this same firm says: "We are going to allow you one cent over the Los Angeles market, on account of the size and quality being so extra fancy."

With this and other successful selling evidence, it does not require much imagination to answer the question, "How have they competed against the independent buyers?" They have done it, first, by getting more for their eggs, and, secondly, by adding this additional money to the price that they pay for eggs.

Benefits.—How this has worked out is shown by the quotations June 2 in Visalia, where eggs as they ran were 15½ cents. In Tulare they were 18 and 19 cents. On that same date the association was paying 21 and 18 cents. As Manager Foss points out, "It is not much to claim that the higher Tulare prices are due to the association."

The association does nothing but a cash business, 60 days being considered cash. Members are paid once a month, at which time a report is given each member, showing the number of firsts, seconds, and selects he has delivered each month. Non-members are paid cash on delivery, sufficient leeway being figured in such transactions to allow the association some profit.

But while the building of a reputation for Tucopa eggs has been the fundamental reason for success, other savings have also been made. In the matter of selling poultry, for instance, the association has found that San Francisco is a better market than Los Angeles, and for that reason they ship the bulk of that product north. Their feed business has also assumed great importance as members can purchase any feed at wholesale prices, plus the overhead charges of handling.

Save on Shipping.—In his July report of this year Manager Foss points out another of the accomplishments of the association. This is the saving of one thousand dollars during the first six months of the present year on shipping expense.

Formerly all the eggs were shipped by express. Both the rate and the breakage by this system were expensive. Now all the eggs are shipped by freight, in an iced car that leaves every day containing both butter and eggs. The old method cost \$.70 a case, including the return of empty cases, while by the new method the cases are delivered and returned for a trifle less than \$.40 a case and the eggs are delivered in far more satisfactory condition.

With success in marketing has come a larger volume of business, making the overhead and consequently the selling cost less. In fact, eggs are now graded, packed and landed in Los Angeles for three cents a dozen. The progress of the association is ably shown in the total average monthly business done during the three years.

The first year the average was \$4,000 a month, the second year it was \$5,000, and the third year a little over \$5,000. Judging by the present year to date, Manager Foss expects to do about \$7,000 worth of business monthly during 1916.

INCUBATOR-BROODER HOUSE

[Written for Pacific Rural Press.]

Now is none too soon to begin planning equipment for the spring hatches.

A healthful, safe, and convenient incubator and brooder house is that at the Magnolia Poultry Farm of Riverside county. The cement-floored-and-walled basement extends above ground just enough for windows, but not enough to permit any sudden change of temperature. In this are eleven incubators of 540 and 600 eggs capacity and four small ones. A 50-gallon oil tank outside the building for convenience and safety has a pipe to a stand in the basement where lamps are filled and cleaned without taking them outside.

The brooder house is above the incubators. It has a tight floor which prevents whatever dead air might come up from the lamps, but the heat tends to keep it from getting cold. It holds 1400 newly hatched chicks.

Ventilators at or above the floor admit fresh air, while chutes to the peak carry off hot air. The house is opened wide every morning to clean out the night's air quickly. Petaluma and Hunter stoves burn distillate whose flow is regulated automatically by a thermostat. The chickens never crowd when they are

Canadian Wheat

To Feed the World

The war's fearful devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and there is an unusual demand for Canadian wheat. Canada's invitation to every industrious American is therefore especially attractive. She wants farmers to make money and happy, prosperous homes for themselves while helping her to raise immense wheat crops.

You can get a Homestead of 160 acres FREE and

Other lands can be bought at remarkably low prices. Think of the money you can make with wheat at its present high prices, where for some time it is liable to continue. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 40 bushels to the acre. Wonderful crops also of Oats, Barley and Flax. Mixed farming is fully as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required either for beef or dairy purposes. Good schools, markets convenient, climate excellent. Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government this year is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Superintendent Immigration, Ottawa, Canada, or

Clean Cut Weeder and Mulcher

**KILLEFER
EFFICIENCY**

It is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigation on orchard, bean, beet, or grain land. It does twice the work with the same team of any other tool for this purpose, and as the knives overlap each other it is impossible to miss anything in their course. Our patented knives are formed with a straight throat so that they wear uniformly from heel to point and are all stamped with our quality trade-mark.

The orchardist will find this tool a valuable one for leveling down furrows and for preparing the ground for the cultivator. The large range of work makes it almost indispensable, and the extremely low price at which it is sold brings it within the reach of all.

KILLEFER MANUFACTURING COMPANY

2209-21 Santa Fe Avenue.

Los Angeles, Cal.

warm enough.

Roosts are of three different heights, the bigger chickens taking the highest. There are plenty of them, so that none of the chickens are crowded off onto the floor. Lots of people do not get their roosts low enough and the chicks do not learn to roost soon enough.

On the same floor is the feed room which will hold a large supply and avoids the necessity of running out in wet or cold weather for each feed.

Chicks run in a shaded yard when weather is good. In this is dry mash in troughs each with a strip nailed lengthwise above its center to prevent chicks getting in with their feet. Fresh water drips continually into a trough except when shut off automatically when full.

At about six weeks old, the chicks are taken from the brooder house into open-front tight-sided houses where they are kept until selections are made for trap nesting.

POULTRY QUERIES.

(Answered by Susan Swaysgood, Pomona.)

Brown Ticks.—What should I do for brown ticks that bury themselves in the chicken's body?—M. T.

The best way is to try to clean them out of the building, for that is where they are. Spray with black distillate and crude carbolic, one pint of the latter to a gallon of the oil, and get well into the cracks. You will have to do it more than once though, and the best time is early in the morning. Then mix one part turpentine, one part olive oil, and one part coal oil. Dip a piece of soft cloth in this mixture and just touch where the tick is buried. That will bring his head out, and as a preventive, I would rub vaseline very lightly on the skin, keeping it off the feathers as well as possible.

More Chicken Pox.—My hens and pullets have had the chicken pox and are nearly cured of it, but I notice their corn does not digest properly, feed curd, lots of greens, Egyptian corn and a good feed of dry bread soaked in sour milk about twice a week with Lambert's poultry tonic. Pullets are laying well but hens are molting. What is it they do not get and what is the reason of corn passing whole? They have shells and a big load of sand to pick from.—Mrs. J. J. Z.

The hens have indigestion, probably from being run down with the pox and molt combined. While your feed is good, it does not contain enough mineral matter. Get them some good sharp grit. Sand is good but it does not fill the bill. Then get them some bone. If you don't feed mash you can buy bone in a size as big as a small bean and put it in something where they can eat all they want. At first they won't eat much, but after awhile they will devour a lot; and the more they eat the better you will be paid. Feed them all they can eat of bone and good grit.

Poultry Disease Book.—Please recommend a standard book on poultry diseases and treatment therefor.—G. L. S.

There is no recognized standard book on diseases that I know of. California Poultry Practice" tells you all about the diseases of poultry and how to cure and prevent them, in a plain, simple language. By sending \$1.00 to the office with your inquiry you could have been treating your chickens now; but it is not any

too late. Send your order and the office force will see to it that you get a copy by return mail. One lady wrote me that this book had been a gold mine to her. It may prove to be so in your case.

Ducks Quit Laying.—I have two Indian Runner ducks that started to lay a month ago. They laid a few eggs then quit. I feed soaked barley and a mash of bran, alfalfa meal, and oil meal. They do not care for the mash and would rather eat barley or wheat. They have a big trough to bathe in.

Your ducks show good sense. If I had to choose between grain and a mash as coarse and poor as that, I believe I would be glad to take the grain. The ducks quit laying because you did not give them any material to make eggs with. Ducks must have good feed to lay on. They don't need any trough; just a drinking dish is enough. Make the mash palatable and I will warrant you they will eat it. Now here is a good mash for laying ducks: One part bran, one part middlings, one part corn meal, one part alfalfa meal, ten per cent of beef scrap, and two per cent grit and oyster shells. Feed all they will eat of this twice a day and plenty of water to drink; and you will get eggs.

POULTRY NOTES.

Turkey raisers in Merced Co. are anticipating good returns this year as the demand for birds is good.

The State Bureau of Food and Drugs has appealed to the housewives of California to aid the Bureau by immediately returning every bad egg. Director Lea points out that the Bureau is handicapped in its efforts to enforce egg standards by the reluctance of housewives to return bad eggs to dealers.

The Tri-State Breeders' Ass'n of Fresno has not absorbed the Fresno Poultry, Pigeon and Pet Stock Ass'n, as recently stated. The Tri-State Poultry Breeders' Ass'n was organized for educational purposes primarily. In time other advantages of co-operative organization may be considered. An amateur fancy and utility show for the San Joaquin Valley will be given by the latter association in Fresno Dec. 13 to 16 inclusive. Both classes will receive equal consideration.

Poultry Breeders' Directory.

TURKEYS, DUCKS AND GEESE.

THOROUGHbred FRENCH ROUEN Drakes, \$3 to \$5. All awards at San Jose. Every bird a winner. Eggs \$1.50 and \$2.50 a setting. Emma V. Miller, Farmington, Cal.

HART'S BRONZE TURKEYS AND EGGS. Large reduction in price of stock. Order now for fall delivery. Free Circulars. Albert M. Hart, Clements, Cal.

MAMMOTH BRONZE TURKEYS for breeding. Toms this month, \$5. No better stock on earth. S. C. Reed, Acampo.

CHICKENS, CHICKS, EGGS.

WANTED.—A number of hot water incubators, Jubilee preferred, 200 egg capacity or over. 220-egg type, Hoganized, S. C. White Orpingtons and Sicilian Buttercups, cockerels, hatching eggs and chicks. All information gladly furnished. M. S. Woodhams, San Mateo, Cal.

BABY CHICKS NOW READY.—Hatches every week. Write for special "Fall Chick" circular. See why Fall chicks pay. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Campbell Poultry Ranch, Campbell, Cal.

CROLEY'S DRY MIXED INFANT CHICK Feeds for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by Geo. H. Croley Co., Inc., Poultry Supplies, San Francisco.

Mrs. Best's Letter.

My dear Friends:

I wish that all of you who are interested in maternity dresses might have gone with me through that department in one of the big stores. It is possible now to buy garments that are both good-looking and serviceable, and that can be worn for any length of time. These dresses are made generally with a full-pleated or gathered skirt set on to an under-waist so that the weight hangs from the shoulders. There is an elastic band at the waist that regulates the waist line. The waists in quite a number of them were made like an artist's smock hanging full from a yoke to about eighteen inches below the waist and having a soft girdle or sash that could be tied loosely. The materials were soft finish serge, crepe and silk in dull shades of blue, brown and plum.

In this same department were most attractive negligees of rose and old blue corduroy, made very simply, with peasant sleeves and finished with either a hem or a satin binding.

Albatross is back in favor again for dressing jackets, etc., and these are trimmed in fringe or edged with lace with a little hand embroidery. They come in all the soft colors.

The white broadcloth collars that have been having such a vogue are shown now trimmed in rows of narrow velvet ribbon in pretty colors, or with inserts of crepe, or with a fancy chenille stitching.

Sweater sets of cap, scarf and sweater of Angora wool seem to be the fashionable knitted garment just now. Fibre silk has dropped into the background for the present.

Caps and scarfs for automobile use are shown of white corduroy, trimmed with a band of color. The caps are a modified Tam-o'-shanter in shape.

Gloves have been added to the long list of articles that have been advanced in price, and some kinds are practically impossible to procure.

Soutache braiding has been very popular on the suits and one-piece dresses, and now you find it on the crepe-de-chine blouses. Many of the plain white blouses are much higher than they were for the same quality silk.

Coats continue full and very generally fur-trimmed, and are shown in a bewildering array of solid colors. Mustard shade, trimmed with a dark fur and worn with a dark hat, makes a very modish combination. The prevailing style of looseness makes it quite possible to make one coat answer for both day and evening wear.

Hats are very generally one of two extremes—either they are very small, fitting the head close, or they are quite large, sailor in type, and having high crowns. The materials are velvet, plush, or silk beaver, and the preponderance of color is black.

Yours devotedly,

Rosabella Best.

Johnny, aged four, went into a near-by grocery and asked for a box of canary seed. "Is it for your mother?" asked the grocer. "No, of course not," replied the little fellow. "It's for the bird."

THE HOME CIRCLE

HOUSEHOLD HINTS.

Use ordinary adhesive plaster for mending a rent in an umbrella. If the umbrella is colored dye the adhesive tape.

Unsightly stitches may be prevented by sewing matting with raffia. It is very strong and can be purchased in almost any color.

As sheets begin to grow thin, they can be made to last much longer, by splitting down the middle and seaming the outside edges together. This brings the wear on another part of the article.

To clean leather couches or chairs, go over them with a cloth dipped in skimmed milk. This will clean and straighten out creases.

A home-made dustless mop can be made of old clean stocking legs or other soft material, dipped in a mixture of one quart coal oil and one-half pint boiled linseed oil. Hang up outside and when dry, it will answer the same purpose as the more expensive mop.

To keep mice from dresser or cabinet drawers, tack window screen over the bottom of the dresser or cabinet.

SAUCES.

A good sauce will do much to improve an ordinary dish, and the use of various sauces lends variety to the same dish. In general, sauces may be divided into two classes, white and brown. Flour is usually used for thickening and care should be taken that it is thoroughly cooked. In the case of the brown sauces, the flour should be browned first in butter. The liquid should be added gradually and for white sauce should be milk, cream, or white soup stock, and for brown sauce a brown soup stock.

A rich white sauce can be made with two tablespoons melted butter, two tablespoons flour, and one cup either chicken or veal stock that has been flavored with onion, celery and salt. This sauce can be used as the base for mushroom sauce, by adding one-half cup mushrooms cut in halves. Or for celery sauce by adding 1 cup of well-cooked celery.

BOILED CABBAGE.

Remove the outer leaves from the cabbage, cut into halves if small heads, into quarters if a large head and remove the tough stalk. Soak in cold water about 15 minutes before dropping into a vessel of boiling salted water to which has been added one-third teaspoon soda. Cabbage (in fact all strongly flavored vegetables such as turnips, onion and cauliflower) should be cooked in a large amount of water and uncovered. Cook about 35 minutes, or until tender. Remove from the water carefully, drain, season with salt, pepper and butter, or a white sauce may be poured over the cabbage. Serve hot on a hot dish.

CANNING OF SOUP.

Soup stock—Secure 25 pounds of beef hocks, joints and bones containing marrow. Strip off the fat and crack bones with a hatchet or cleaver. Put the broken bones in a thin cloth sack and place in a large kettle containing 5 gallons of cold water. Simmer (do not boil) for 6 or 7 hours. Skim off all fat. Salt when done cooking. Put while hot in glass jars, bottles or lacquered tin cans. Partially seal glass jars or seal tin cans, sterilize 40 minutes in a hot-water bath outfit. This stock can be used as a foundation for many vegetable soups that can be prepared in quantity, sealed and placed on the pantry shelf for use when a quick meal is necessary.

When canning on a small scale it is entirely possible to arrange to use home equipment such as a wash boiler with close-fitting cover for a home canner by making a false bottom with lifting handles.

A CONVENIENT LITTLE MOP.

A convenient little mop for cleaning bottles, tall vases and other dishes that the ordinary mop will not suffice for can be made as follows: Cut a deep groove one-fourth inch from the end of a slender stick—any desirable length and no larger round than a pencil. Place a bunch of string cut in two-inch lengths around the stick and tie them firmly in the groove with a strong thread. Next, turn the long ends of the string down and tie again just beyond the end of the stick.

CLEANING SPONGES.

For sponges that have become slimy, the following treatment makes them as good as new. Fill a basin with boiling water and a little washing soda and soak the sponge in this for several hours. Rinse in hot water and then again in cold, allowing the sponge to remain in the cold water for some time. This treatment can be given as often as necessary.

OLIVE OIL.

Olive oil has many virtues and among them is its use for softening the skin. After washing in warm water, take a little oil on the finger tips and rub it on gently; very little is required. It is free from the risk of growing hair, an evil tendency feared with vaseline and some animal fats. The free use of olive oil in the diet is beneficial to most people and is believed to improve the complexion.

Speaking with a young lady, a gentleman mentioned that he had failed to keep abreast of the scientific advance of the age. "For instance," he said, "I don't know at all how the incandescent electric light is produced." "Oh, it is very simple," said the lady. "You just press a button, and the light appears at once."

CANDIED SWEET POTATOES.

Wash and cook six medium-sized sweet potatoes in boiling salted water to cover. Drain, peel, cut in halves lengthwise, arrange in buttered baking dish, sprinkling each layer with sugar, using one cup in all. Pour over one-half cup melted butter. Cook in a slow oven two hours.

Floral Department.

[By Geo. N. Tyler.]

There is not much to be done in the garden during November, but a few things are in order. If you have not planted your bulbs do so at once. As soon as we have a severe frost, roses should be pruned—Cut them back heavy, back to one or two eyes of this season's growth and cut out all weak and blind wood.

Dahlias do much better if lifted now and dried off before putting away in the cellar or some cool, dry frost-proof place. Label every variety as you dig them and put them out in the sun for a short time to dry off. In storing them it is best to put them in dry sand, top side down, as the stalk where cut off gives off an acid that rots the tubers. This is one of the causes of decaying tubers. Your storage place must be absolutely dry and frost-proof. It does not do to keep them in a basement where there is a furnace. If you are in a warm belt, they can be left in the ground all winter, and be dug in early March, separated and replanted.

Chrysanthemums that have finished blooming should be cut off close to the ground, and be sure and label choice varieties so you will know what to propagate from in the spring.

Trees and Shrubs.—You can begin this month to transplant deciduous trees and shrubs if your soil is moist enough, for there is hardly any real dormancy in the warm belts, and the transplanted stock begins right away to establish itself by sending out rootlets and will make a good growth in the spring.

Roses.—You can purchase and plant your roses from now on, but do not plant any but small field grown plants, that is, plants that are one year old, and be sure and plant those on their own roots. You will get better results from them in the long run.

It is a little too late for seed planting, but sweet peas can still be planted, and a number of seeds of other varieties of plants, if you have a warm location.

NAMING THE FARM.

Perhaps a name for the farm is only a bit of sentiment, nevertheless it is becoming a custom that characterizes the owner as a man of pride. The community looks upon the name as a trade mark for this particular farm and the things for which it is noted.

The name should not be hastily chosen and should have a relation to some distinct feature of the farm or the line of farming pursued. After having made a decision in the matter, it should be used on stationery and should also be placed in an attractive manner at the gateway that all who pass may observe.

For the fall cleaning of closets and store rooms, the best thing to wash the walls and shelves with is a strong, hot solution of alum water. Use a brush, so as to reach every crack and crevice.

If soot is spilled on a carpet, sprinkle corn meal or bread crumbs on it before sweeping. A second application may be necessary to entirely remove the stain.

Good Health.

(By H. E. Pastor, M. D.)

A Few Words on Constipation.

This is a large subject and can be merely touched upon in this brief note. There is a vast literature on the subject, therefore many theories of its cause, and cures as numerous as there are theorists and quacks. Many of the latter have become immensely rich in foisting on the afflicted and gullible public their vari-

ous nostrums, whose continued use aggravate rather than relieve the condition they are recommended for.

More things than could possibly be enumerated here are causative of this condition, many of them due to social habits and conventional misconceptions. There is no doubt whatever that we in America eat beyond our physiological requirements and of the capacity of our digestive organs to assimilate, bringing on those instances of constipation where putrefaction of the ingested food and fermentation in the bowels are accompaniments of constipation. It is claimed by specialists who have delved deeply into this subject that man is not naturally a carnivorous animal, and in proof of this contention point to the well-known constipated habits of flesh-eating animals as contrasted with the easy defecation of grain-, grass- and fruit-eating animals; hence it is argued, with some semblance of truth, that meat should not be eaten at all, or only sparingly, by those afflicted with this commonest of all physical ills. Again, a sense of shame or lack of convenience often leads to the lengthened postponement of the bowel function, and the unexcreted matter becomes a source of local irritation, or is re-absorbed into the general circulation, whose current it pollutes.

From these few remarks one or two conclusions may be deduced: 1. Eat abstemiously, and avoid an excess of meat in the bill of fare. 2. Establish a habit of going to stool regularly, at least once a day. The mental impression is wonderfully effective in stimulating intestinal activity.

The Farm Woman's Preference.

Recently the Dean of the College of Agriculture in a sister State, with a view to getting a line on the relative value placed on sanitary and economic conveniences as gauged by the farm women, sent out inquiries over the State to that end. A summing up of the answers received showed the order of preference to be as follows: 1. Running water. 2. Sewage disposal. 3. Heat. 4. Light. Most of the housewives thought they ought to have all four conveniences, and those of us at all familiar with the laborious work incident to the average farm household in California think they richly deserve them.

Bad teeth are responsible for many serious and sometimes fatal diseases.

Don't carry a handkerchief too nice to use when you sneeze or cough.

California Garden Flowers, \$1.50, Postpaid, Pacific Rural Press.

SAN FRANCISCO.

San Francisco, Nov. 8, 1916.

WHEAT.

There has been a little reaction in the East, and with car shortage hampering the movement of northern grain, prices show little further advance. California club, however, seems to be cleaned up, as none is offered; and northern club is slightly higher. A large tonnage of wheat was sold at Wheatland recently at \$2.30.

[First-hand prices on strictly first-class grain, San Francisco.]
 Sonora wheat\$2.65@2.70
 Northern club2.50@2.55
 Calif. club, cti.None offered
 Northern Bluestem2.85@2.90
 Northern Red2.75@2.85

BARLEY.

The advancing movement in barley has halted for the moment, and buying locally is very quiet, though there is no prospect of lower prices.
 Shipping, cti.\$2.00@2.10
 Choice feed, cti.1.95@2.00

OATS.

Texas red seed is cleaned up, and the movement in other seed grades is less active. Feed oats are moving fairly well, but offerings so far are ample.
 Red feed\$1.80@1.85
 Red seed2.15@2.30
 White1.90@2.00
 Black seed3.00@3.25

CORN.

Eastern corn is scarce, and yellow is quoted at a sharp advance. No California yellow is coming in yet, and new Egyptian is higher for first-class grain. Most offerings, however, are not thoroughly cured, and move slowly at irregular prices. One sale made in this city two days ago was at \$2.20 per hundred. White Gyp Corn also brought \$2.30.

[First-hand prices on strictly first-class grain, San Francisco.]
 Eastern Yellow, cti.\$2.40@2.50
 Milo MaizeNominal
 Egyptian, new2.25@2.35

BEANS.

The bean market has not yet settled down to any definite basis, and there is a very feverish feeling in regard to prices, though so far the movement has been entirely upward. Large whites show no further change, and are pretty well out of growers' hands, so their position is better established. In other lines most of the crop is still in the country and threshing is not yet completed. Everything is very firmly held, and buyers seem anxious to get supplies; but the future is rather uncertain.

Bayos, per cti\$5.75@5.90

 Mexican Reds6.00@6.25
 Tepary beans4.25@4.50

HAY.

Local prices have been marked down rather sharply from the figures which have prevailed for the last few weeks, though an advance might sometimes be obtained in cases of momentary local shortage. The car situation is as bad as ever, and the limited arrivals are mostly by boat. Local consuming requirements, however, are very light, though there is some export business. Dealers assert that the difficulty of moving hay from the country at this season is likely to bring a weak market in the spring, when there will be efforts to clean up the holdings. The distributive movement in the country is also hampered by lack of cars, but the demand is rather strong.

[Wholesale prices per ton, carload lots, San Francisco.]

 Straw, per bale50@.70

FEEDSTUFFS.

Rolled oats and barley are \$2.50 per ton higher.

POTATOES, ONIONS, VEGETABLES.

The Delta celery season is now well under way, and several carloads are moving daily from Antioch, with prices satisfactory. Locally, Alameda stock is still steady, despite large offerings from the Delta. String and lima beans are scarce and higher. The Bay tomato crop is being cleaned up, and prices are easier, with heavy offerings of green stock. Potatoes remain very firm, but prices are about as before, with choice River stock sometimes bringing a premium. Sweet potatoes are firmer, with large Eastern demand. Onions show another sharp advance, with a heavy demand and all supplies here closely held. Oregon growers have withdrawn offerings from the market.

DECIDUOUS FRUITS.

The Newtown pippin crop is getting pretty well out of first hands, though the greatest difficulty is experienced in getting cars, and many sales have been held up on that account. Prices, however, hold firm and the outlook is encouraging. Bellflowers, etc., are moving on the street at the old figures. Local grape prices are unchanged, and the demand is active, with considerable good stock still offered. The shipping business is practically all over. Some lots of pomegranates are offered lower, while figs are higher, with few appearing. Casabas are up a little, with a large movement.

DRIED FRUITS.

Business is retarded considerably by lack of cars, leaving the Eastern markets very short of supplies; but the demand seems to be running ahead of the supply, regardless of that feature, and from most reports the bulk of the crop in all lines has already gone into distribution. One of the most sensational features is the continued heavy demand for raisins, which has delayed the issuance of the new list by the Associated; and another matter of interest is the activity in peaches, which has already absorbed the greater part of the crop. Apples are held at 7c, firm, with little stock left; and 15c is now the inside figure on cots. A few black figs may still be had, but the supply is rapidly moving off, and there is a great shortage in other varieties. Packers report not over 1,000 tons of prunes left in the Santa Clara Valley, and growers are holding for 6½ to 7c, though 6½ is the highest paid yet. Small sizes are practically all gone. Pears are firm in sympathy with other fruits.

HONEY.

The local honey market is beginning to stiffen up as the holidays approach, and shows the effects of the light production, as the general consuming demand is rapidly absorbing the stock on hand, without any export movement. Low-grade honey for manufacturing is in most demand, and dark extracted shows a slight advance.

HOPS.

The market continues inactive, probably owing mainly to the shutting of American hops from the British market. Buyers are taking little interest, and most of the growers are holding off in hope of an advance.

Sacramento10@11c
 Mendocino11@13c

HORSES.

Nothing of any interest has appeared here this week, as recent of-

ferings have been moved with difficulty and conditions do not seem favorable for further offerings at present. The city market, in fact, has been so quiet this season that sellers are giving more attention to country business, and more sales are being held at outside towns, with fair success. Values are held at about the old level, the continued demand for military uses tending to keep the market firm.

GROCERIES.

Flour shows a further advance, ranging from \$8.80 to \$9.20 per bbl. Prices have been withdrawn on some lines of soap, and everything in this line is much higher. Much higher prices on salt are predicted. A number of grocery specialties are out of the market. Hams, lard and oil are higher. Broom corn is said to be worth \$250 per ton, and brooms have advanced sharply.

LOS ANGELES.

Los Angeles, Nov. 7, 1916.

RUTTEL.

Receipts California by rail for week ending Tuesday, Nov. 7:

1916273,500 lbs.
 1915262,720 lbs.

There was a dropping off in the receipts the past week and a rather firm tone to the market. San Francisco was weaker, but this had no influence upon the market here. Chicago and New York were both stronger, which made holders here more independent, especially as the cold storage stocks are much lighter than a year ago. A very good local consumptive demand was had throughout the week, though there was no investment buying. The fact that prices now are 7c higher than a year ago caused traders on 'change to go slow.

Wed. Thu. Fri. Sat. Mon. Tu.

EGGS.

Receipts by rail as reported to the Produce Exchange for week ending Tuesday, Nov. 7:

1916710 cases
 1915734 cases

There was a little more life to the market the past week, though there was nothing doing on 'change. A dropping off in the receipts and the markets both in San Francisco and the East being higher encouraged the street trade to take hold more willingly and absorb the light receipts at good prices. It was a steady 45c market for fresh ranch case count up to Saturday. Monday in sympathy with stronger markets elsewhere prices were jumped on 'change to 48c. San Francisco was up 1½c and the receipts were very light for two days. Receipts for the week by rail were 710 cases and estimated receipts by truck 600 cases, total 1310 cases. The same time last year receipts by rail were 734 cases and estimated receipts by truck 600 cases, total 1334 cases. Fresh ranch, case count48c

POULTRY.

There was less life to the market the past week, at the same time the movement was fair. The sharp advance in all feedstuffs the past few weeks caused local poultry raisers to reduce their flocks, hence an increase in the supply both of hens and light stuff, and as the demand showed no improvement prices dropped 1c on all broilers, fryers, hens and young roosters. Ducks and geese in better demand and 1c higher. Turkeys steady. No eastern poultry in the local arrivals being sufficient to take care of the trade.

HAY.

There was a little firmer tone to the market the past week. Light receipts and a fair demand operated to maintain full last week's prices, though they were unable to establish an advance. We quote:

Special Citrus Market Report.

Los Angeles, Nov. 7, 1916.

Shipments of oranges from Southern California for the season from November 1, 1915, to October 31, 1916, were 31,757 cars against 33,317 cars the same time 1914 and 1915. Shipments of lemons the past season 6940 cars against 6843 cars the season of 1914-15. Total shipments of oranges the past season 38,697 cars against 40,160 the season of 1914-15. These figures show a falling off the past season in the shipments of oranges of 1560 cars, but a gain in the shipments of lemons of 97 cars.

The past week the market showed less life and was inclined to weakness. Offerings the tail-end of the Valencia crop and of less desirable quality had something to do with the market. Then, too, new navels will soon be on the market and will be had for less money, which doubtless is having its influence. Hence buyers inclined to go slow. Locally there was a little more doing in oranges and prices steady. Grapefruit also sold fairly well. Lemons continue dull. Local packers are paying for oranges 2½@3¼c in the grove and for grapefruit 2@3c per pound in the grove and lemons 1½@2c per pound in the grove.

Special Deciduous Market Report.

[By J. L. Nagle.]

Sacramento, Cal. Nov. 6, 1916.

Shipments of grapes are now very light, Malagas having been practically cleaned up, and what Tokays have not been damaged by the recent rain will all have been shipped within the next week or ten days.

The shipment of Drum Emperors will also be finished within the next week. Crate Emperors will be moving in light supply for the balance of the month.

The following prices have ruled for

FROM AUCTION SALES.

New York Nov. 3.—Nine cars of Valencias and two cars of lemons sold. Oranges steady on best grades, generally easier on poor and choice stock. Lemons steady. Weather fair. Valencias averaged \$3.10 to \$6.80. Lemons averaged \$3.95 to \$6.40.

Boston, Nov. 3.—Eight cars sold. Market easier on oranges—doing better on lemons. Valencias averaged \$3.85 to \$5.65. Lemons \$6.30 to \$7.65.

Philadelphia, Nov. 3.—Two cars sold. Market stronger. Valencias averaged \$4.15 to \$5.15.

New York, Nov. 6.—Sixteen cars of Valencias and five cars of lemons sold. Market is steady on oranges, but lower on lemons on account of increased offerings. Weather fair. Valencias averaged \$3.45 to \$6.50. Lemons \$3.50 to \$6.10.

Boston, Nov. 6.—Ten cars sold. Market lower on both oranges and lemons. Valencias averaged \$3.45 to \$5.25. Lemons averaged \$4.15 to \$6.25.

Philadelphia, Nov. 6.—Four cars sold. Market strong and higher both on oranges and lemons. Valencias averaged \$4.90 to \$5.35. Lemons averaged \$5.50 to \$6.75.

New York.—Tokay grapes averaged \$1.35; Cornichon, \$1.31; Emperor, \$1.50; Malaga, \$1.09; Pomegranates, \$1.50.
 Chicago.—Malaga grapes, \$1.20; Tokay, \$1.05; Emperor, \$1.38; Cornichon, \$1.49.

Boston.—Tokay grapes, \$1.67; Malaga, \$1.27; Cornichon, \$1.45; Emperor, \$1.75.
 Total shipments to Oct. 6, 17,097 cars; total shipments same date 1915, 15,885 cars.

WALNUTS.
The season with the association is over. The fair weather the past ten days enabled growers to gather the crop pretty freely and the Association reports the crop of its members all in and shipped, with the exception of a few tall ends. Secretary Thorp says the past week was a very active one with them and the season will be closed by November 13. The market is very

firm and no good walnuts are to be had now save at a premium over the association prices and they are 1c per pound higher than last year. With but few foreign walnuts on the market the trade absorbed the short crop at the advance without trouble and the season is said to have been a very successful one.
The Associated prices for this year and last are:
1916 1915
No. 1 \$15.50 \$13.60
No. 2 12.50 10.60
Budded 19.00 17.00
Jumbos 17.50 16.60
Orchard run 3c per pound less.

Special Livestock Market Report.

San Francisco, Nov. 8.

No changes are made in the livestock prices from last week. F. L. Washburn of the Western Meat Co. has recently returned from an extended trip in the East. He found practically no choice cattle coming into the markets there, those selling for top prices being few in number. The rest were selling very little higher than at San Francisco. Most farmers in the East seem planning to rough-feed their cattle through the winter on account of high price of feed. This is likely to create a scarcity after Jan. 1, and a corresponding liberal supply next summer. Hog prices are still held fairly high in the East, due to the high price of lard and all other fats, edible and inedible. Sheep in the East are higher than usual, the scarcity being due to the high price of wool.

CATTLE: Locally the steer market is strong and the demand for cows is steady.

HOGS are in steady supply, of good quality and desirable sizes, which, for the Western Meat Co. are about 3/4 light weights and 1/4 heavy weights. Large California hogs are usually older than in the East, having bigger frames and less lard. A four-car shipment was recently received from Lovelock, Nev., in which the hogs averaged 497 pounds and were nearly two years old. The folks had fed them nearly a year, holding for high prices. These were about the heaviest hogs that ever came to San Francisco in such a large shipment. They dressed out 83 per cent and drew premium prices; but at that, were probably a losing venture for the growers. Feeding such heavyweights would make most anybody go broke if long continued, according to Mr. Washburn.

DRESSED MEATS: The market for dressed meat is weak but is expected to rally within the next few weeks. All pork products are high, but fresh beef and sheep are reasonable. There are no exports from California.

SHEEP are scarce on account of high wool and previous prices; the few remaining lambs are well grown.

WOOL: Defective wool remains the same, but free wools are one to two cents a pound higher. Fall clips and last spring's wool are reported mostly out of growers' hands already. Boston markets have been very active.

North Portland, Ore., Nov. 6, 1916.

CATTLE: A very light run on today's market, about 600 head. There was a keen demand from both local and outside packers and butchers and prices were 15 to 35 cents higher on all cattle. The quality of today's run was very common, but a few loads of good cattle here, one load of good steers brought \$6.75, with a few other sales at \$6.60; the balance of the steers sold from \$3.50 to \$6.00. Good cows brought \$5.50 while ordinary kind brought \$4.75 to \$5.00. Bulls were in good demand at 25c higher prices; fair to good bulls brought \$4.00 to \$4.25. There were a number of loads of feeder stock here today, a few going at \$5.75.

HOGS: There was a liberal supply of good hogs today, one of the best runs for some time. One load of choice butchers brought \$9.80, with several other loads of prime stuff to packers going at \$9.75. The bulk of sales were made at \$9.60. There was a good demand from packers and butchers.

SHEEP: There is practically no change in the sheep trade. One load of choice East of the mountains lambs brought \$8.75 today with a number of loads of Valley lambs at \$8.50. Valley yearlings brought \$7.50; good mutton ewes at \$5.55. A very good demand continues for all kind of sheep.

Los Angeles, Nov. 7.

CATTLE: The market situation is unchanged from a week ago. A fair run of very good steers was had the past week both from California and Nevada and last week's prices were fully sustained. Killers were all in the market and made very fair purchasers.

Quotations f. o. b. Los Angeles:
Beef steers, prime 1000 to 1100 lbs. \$7.00@7.75

Stockers and feeders 5.50@6.50
Prime cows and heifers 6.25@6.50
Good cows and heifers 6.00@6.25

HOGS: California continues to furnish us a very good supply of hogs and of very good quality and they supplied most of the demand. The eastern markets being less bullish and the Idaho market not so strong, a few Idaho hogs were in during the week, the first for a long time. Killers all in the market and they made fair purchases at last week's prices.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs. \$8.50@9.00

Mixed, 200@250 9.25@9.50
Light, 175@200 9.25@9.50

SHEEP: A steady and rather firm market was had the past week. A very good supply of yearlings and lambs were had in from Utah and Nevada and they were in very good condition. Not many heavy sheep arriving, they still being hard to get. Killers all in the market and they bid up well for everything that suited them.

Per head f. o. b. Los Angeles:
Prime wethers \$7.00@7.25
Prime ewes 6.50@6.75
Yearlings 6.50@7.00
Lambs 6.50@7.00

You need a practical book to help you in the poultry yard. Mrs. Sways-goods "Poultry Practice" may be had at this office for \$1 per copy postpaid.

Next week's issue of the Rural Press will contain forty pages, if present plans mature. This will be the largest issue we have ever made and is caused by the demand for advertising space. We have several special articles already in hand, and taken altogether, we believe the paper next week will be notable.

Thanksgiving for the Agricultural Year.

The Year Has Brought Forth Good Crops, High Prices on Eager Markets, and Greater Co-operation among Producers. The Future Holds Promise of Better Markets and Capital for Increased Production.

[Written for Pacific Rural Press.]

TIS real Thanksgiving time; for not only have we avoided the loss of our best manhood and money by war, but we are prosperous to the point where luxuries seem necessities. That California is highly prosperous, is shown in a multitude of ways. The State Controller's figures on assessed valuation of real and personal property in this State, exclusive of railroads, are \$3,420,871,174, an increase over last year of \$116,378,376.

In the main, crops have been fine, weather good, and markets eager at prices almost unprecedented. The prices of various products, figured by averaging the weekly highest and lowest quotations in Pacific Rural Press market reports for the past three years, from January 1 to October 16 of each year, show gains on the following products among others, for the year 1916 over the averages of 1914 and 1915: Wheat, barley, alfalfa, potatoes, poultry broilers, eggs, butter, dried peaches, raisins, oranges, lemons, all meat livestock and wool, and fresh plums, peaches, pears, and grapes. Many other farm fruits and products were not averaged. In most farm products, the prices have continued to soar since this compilation was completed.

While the barley crop was less in total this year than last, all grades are far advanced, and the export continues. Other grains are proportionately higher and scarce.

In the bean sections, rains have injured a small part of the crops, but prices are sky-high. Beans are being sold as fast as they are threshed. Growers were recently receiving 9½ cents at Stockton for small whites. The total bean crop is estimated at 245,000,000 pounds.

Potatoes are about as high-priced as pianos, and they are being sold as fast as dug. The certified seed potato law has been in effect this year and the hundreds of acres of seed being grown subject to it promises well for the future of this industry.

The biggest trouble of poultry raisers is that they haven't enough laying stock; for even the present high-priced feed looks cheap when you are selling four-cent eggs.

Prunes and dried apricots, peaches, figs, and raisins are above what even the growers could have hoped for. Dried pears and apples are mostly out of growers' hands, having sold at happy prices—many pears at 10 cents f. o. b. ranch.

The 1916 pack of canned fruit and vegetables is practically all sold, and prices now are expected to diminish consumption. This may get people out of the habit of using canned goods, but it insures no carry-over to embarrass the marketing of next year's crop.

Citrus Exchange fruit, during the year just past, returned to California nearly \$28,000,000, or 33½ per cent more than in any preceding year. Quality was about the best ever, due to good weather and careful handling.

Deciduous fresh fruit shipments to November 4 were 16,972½ cars, or nearly 1,300 carloads more than to the same date in 1915, which had been the banner year of all. Prospects are that returns will be \$20,000,000, or \$2,000,000 more than last year. The season was a week or two earlier than last year, and weather made the quality first-class. Stoppage-in-transit privileges have been secured, and will aid materially next year in developing small Eastern markets into carload receivers.

The only exceptional and severe fruit troubles of the year, aside from a light crop of almonds and apricots, afflicted the grapes. Early in the season the crops in whole vineyards were wiped out by frosts. Late in the season, long-continued rains put many of the table grapes to the bad, but the total tonnage is expected to equal the banner crop of last year when nearly 1000 carloads more were shipped than ever before. Almeria grape imports from Spain are larger by far than last year, but have not injured the sale of those from California. The rains spoiled a considerable percentage of drying raisins, but advanced prices are helping to make up the loss so the crop is expected to yield \$10,000,000. The threat of prohibition of the wine-grape industry has passed; but the good prices paid this year do not make the growers forget the several losing years just past, and interplanting with fruit trees goes on apace.

Causes of Increased Values.—Among the influences affecting increased values of farm products the war has possibly been the greatest, largely due to increased prosperity in the East, and therefore to increased consumption of our Western products.

Legislation in California has standardized the quality of deciduous fruit to a remarkable degree, giving confidence to Eastern buyers and eliminating much of the fruit that would have reduced the demand for our products.

The 8 to 1 test on oranges, having been firmly enforced by the California Fruit Growers' Exchange for two years has led to such stability of markets that at least three counties have passed ordinances enforcing that test on all shipments from them.

State Market Director.—Early this year, State Market Director Harris Weinstein began consistently and actively to nurture the formation of growers' stock organizations; and some of them are now in working order.

Growers' Organizations.—The most remarkable new organization is that of the peach growers, completed this year; and its effect in trebling the price of dried peaches to the grower has been noted.

The raisin growers' organization has for the first time sold out a crop, the biggest ever grown, before the next one came in. The new crop will nearly equal last year's in spite of the rains.

The example of these organizations has encouraged many others. The olive growers are the first of these to get organized for business, and they will pack a small output this year. The rice growers have reorganized into a similar company, and engaged the California Fruit Distributors to market their crop. They have also forced the Oriental rice growers to join their marketing system in order to control the market for all. Poultry producers are organizing under the Market Director's influence. Lima bean growers have organized anew, with a controlling hand on the crop and prices. Prune and apricot growers are in a good way to be organized shortly after the end of the year; that movement having started definitely last spring.

The California Walnut Growers' Association is marketing 12,500 tons, one of its biggest crops, promptly, the quality being better than in recent years. No. 1's are selling at 15½ cents as against 13 2-5 cents last year.

The California Almonds Growers' Exchange, handling a light crop, set its own prices to secure prompt movement of the whole crop, and is succeeding remarkably in spite of more or less underhanded, unfair competition. The price of Nonpareils is 20½ cents as against 15 cents at the same time last year.

Rural Credit—the greatest cause of rejoicing—is treated elsewhere. All hail to the new agricultural year just beginning with joyous Thanksgiving for the one just past!

Head of the Herd—Palcines Ranch.

Are You One of the Losers?

Low Corn King
Low Cloverleaf

SOMETIMES Americans wonder why they get only about half the crop yields from an acre that are produced in other countries. Well, here's one reason—a large majority of the farmers in this country own no manure spreader. One corn belt state lost \$20,000,000 last year by the wasting and poor handling of manure. Are you one of the farmers who shared in this loss? If you are, you need an IHC manure spreader.

International Harvester spreaders, Low Corn King and Low Cloverleaf—besides being low, strong, durable, simple in beater and apron mechanism, with good traction, light draft, and plenty of clearance—have a really successful wide-spreading device.

Low Corn King and Low Cloverleaf spreaders are low for easy loading and narrow for easy handling in yard, stable or field. From a box 45 inches wide either of these spreaders covers an even strip of ground 8 feet wide, or better. It saves time and labor, and keeps wheels and horses well away from the slippery manure already spread.

See the IHC dealer about a Low Corn King or Low Cloverleaf made to stand by you for years. Write us for catalogue.

Farmers Organizing to Borrow Money.

Farmers All Over the State are Forming Temporary Organizations to be Ready to Make Loans for Productive Purposes under the Federal Farm Loan Act. This Tells How One Was Formed.

[Written for Pacific Rural Press.]

YOU can borrow money at 6 per cent or less interest under the Federal Farm Loan Act if you are a land-owning farmer; or if you want to use the money to finish paying for land in which you own 50 per cent interest, or on which its owner is willing to take part payment down and a second mortgage for the remainder.

As Dr. Elwood Mead says, wherever the use of additional money will increase production enough to pay the interest and a profit, the money should be borrowed. The merchant who does not borrow is soon out-distanced by his competitor—so it will be with the farmer. Borrowing for productive purposes is not a stigma; it is a sign of industry and up-to-date success.

But you can't borrow money now under the Rural Credits Law. The District Land Bank, from which you will borrow, will not be established until early in 1917; and probably will not do business until April 1. Nobody yet knows even in what States the twelve District Banks will be located. These will send blanks to groups of farmers for final organization, and will grant a charter to each group.

You can get ready for the bank, however, as has already been done in certain districts of San Joaquin, Kern, Glenn, Imperial, Madera, and San Bernardino counties, and probably others.

There, groups of at least 10 farmers each, wanting to borrow a total of at least \$20,000, have held meetings, elected temporary chairmen and secretary-treasurers, and told the latter how much money they want, for what purpose they intend to use it, what security they have, and what sized—equal annual or semi-annual—payments they want to make. These equal payments are so figured that the whole debt and interest will be paid off when the last one is made. It has been a suicidal policy in America for farmers to borrow money or contract to pay for farms when both the borrowers and lenders knew that the final payments could not be made on time, according to Dr. Mead.

The temporary organizations already formed are composed mainly of people who want to borrow from the Federal Land Bank to pay off such pre-existing debts and mortgages. In Imperial Valley, many have been paying 10 per cent interest. In San Joaquin county, they have been paying as much as 8 per cent. The Farm Loan Board investigations have shown that in the northern part of the United States, farmers have been paying as much as 5 per cent per month on first mortgages. It is the western and southern parts of the United States, however, that will benefit most.

Hearings have already been held by the Farm Loan Board in the North and West. They are now in the South. Wherever Farm Bureaus are in existence, they are organizing as far as will be possible until the final blanks shall be supplied by the District Land Bank.

First Organization.—The "North San Joaquin National Farm Loan Association" claims the distinction of being the first such temporary organization. S. A. Nesbit was the first man there to send to the Farm Loan Board at Washington for a copy of the Act and explanatory pamphlets. When he had studied them, he went about the country enthusing his neighbors. Then some of them advertised a meeting, October 16, at the Lavella schoolhouse. About 75 attended. Mr. Nesbit was elected temporary chairman and J. B. Jorz secretary. The pamphlets were read and discussed. A board of eight directors was elected—also a "loan board" of three men to appraise the security to be offered for loans. By-laws were not adopted because no formal suggestions for such have yet been made by the Federal Farm Loan Board. They adjourned to meet October 30. About 125 came this time, and the chairman called for information as to how many wanted to borrow money. They were backward about telling their business so publicly, so the secretary went down

among them quietly, and found folks that hoped to borrow \$115,000 total. Other applications for thousands of dollars have followed.

County or Local Organization?—Following the Farm Loan Board's suggestions for large local associations, Farm Adviser F. F. Lyons proposed the idea of a county unit. This was opposed by most of those present, on the ground that a county appraising committee could not be in close enough touch with local land values to give an intelligent appraisal unless they should spend all their time, especially at first, traveling about the county at great expense to the association.

It was also pointed out that the basis of this rural credits system is the personal acquaintance of members with each other in the local associations, for character will play a great part in determining the actual value of the security. And if a member defaults payment, his local association must help him over his hard luck or permit his property to be sold to repay the loan. If it doesn't bring that much, it will show lack of judgment in the appraising committee, for loans must not exceed half the value of land or one-fifth the value of insured buildings. Then the members of this association must contribute as much as necessary, not to exceed 10 per cent of what they have borrowed, to make up the loss which would otherwise have to be borne by the district bank.

The point was made at the meeting that a local association in the San Diego county valley, whose farms were washed away, would have to go bankrupt, because sale of the farms that were washed out probably would not satisfy the loans, even with the 10 per cent added from fellow-members. Then the bank would lose the balance. Yet, if all of San Diego county had been in the same association, the 10 per cent to be paid by solvent members would more than protect the bank. Therefore, the bank

could be more liberal in its loans to a large association than to a small one; and the bank appraiser could approve higher valuations of property, made by the local appraising committees.

This point lost its force in the North San Joaquin Valley, where such disaster is not considered possible. Probably the most potent objection to a county organization, rather than a number of locals, was that its headquarters would be at the county seat. Its members would go there to make payments, and would spend too much money while there, reducing the ability of home merchants to keep satisfactory stocks of goods. It was preferred to make the payments through a treasurer in a local town. This rather lost force, because a rural mail carrier will sell a money order to be mailed to Stockton at a cost of a few cents, and few people

would make a special trip there, taking a day's time and the cost of transportation, because their payments must be made there. It was also admitted that the local banks would be glad to receive the payments and transmit them free of charge to the county-organization treasurer at the county-seat. His location there would enable him to keep up-to-date information on the deeds involved in loans and the taxes, for he must see that taxes are paid, and that buildings used as security are kept insured. For the last named purpose, it is thought that most people would be glad to deposit their insurance policies with the treasurer, who would keep them in a fireproof safe, and be in better position to assure himself that premiums are paid up. The treasurers are expected to be paid. Half a dozen in a county would probably cost \$300 per month in salaries. An advantage of the county organization would be that one man would spend all of his time at it, and as Dr. Mead points out, there would be only one treasurer to educate to the multitude of details that must be mastered by every treasurer.

One Treasurer for All Locals in County.—However, since a single county-wide farm loan association seems improbable, this same unified service could be obtained for a large number of local organizations, as suggested by Mr. Jorz, by each of them electing as their treasurer the same man all the rest of them elect. A county organization could also hire a competent man to get abstracts of titles at a cost very much less than is now necessary, and as suggested by I. G. Brown, could arrange for their publication at a pro rata cost.

Details Yet to Be Decided.—There are a thousand questions of detail which only the Federal Loan Board can answer, and which they have not yet answered. Watch Pacific Rural Press for further news.

The Young Man and His Bride Can Now, Even with Limited Capital, Start Farming in a Comfortable Home, for He Can Borrow Money at Low Interest and Long Time, to Buy Livestock, Trees, Equipment, Etc.

Purebred Beef to the Front in California.

Beef growers are buying purebred bulls from outside the State; purebred livestock auctions and shows will shortly supplement the present constructive promotion of purebred beef-breeding in this State.

[Written for Pacific Rural Press.]

To those in a position to feel the pulse of the great livestock breeding industry, now in the making in California, it must be apparent that a silent but persistent tide of public approval has set in for the purebred beef animal.

Different in many respects from the rapid growth of some of our other livestock breeding endeavors of recent years, the business of breeding purebred beef animals has been in a smoldering stage. It is perhaps the one phase of livestock breeding in which we have been ultra conservative, inasmuch as it has not kept pace with the utility end of our meat-making industry. It is common knowledge that this situation is at the present writing reversed with some forms of animal breeding in the State. That of course is a separate matter; and yet it has a direct bearing on the revival of beef cattle breeding as it points to the errors of booms and boomsters.

Our Deficiency.—We have said that the business of breeding purebred beef cattle has not kept pace with the meat-making industry of the State. This statement may be proved to anyone's satisfaction by a survey of the supply and demand for bulls for range use in California.

Quoting from the latest figures of the U. S. Department of Agriculture and from the annual report of the California State Board of Agriculture, there were 1,554,000 head of cattle in California in 1915, other than dairy cattle. Of this number 576,909 were breeding cows; 218,480 were yearling heifers; 267,799 were heifer calves, and the balance were steers.

If the average number of cows served per bull be 30, the total number of bulls in annual service is over 19,000. Assuming that the average life of the range bull in service is three years, it would appear that our annual bull wants amount to about 6,500 head.

As against this demand, we are raising not to exceed 1500 purebred and registered bulls a year, of the two most popular breeds, Shorthorns and Herefords.

In view of the fact that it is quite generally thought among progressive cattle raisers and breeders that far too many scrub or grade bulls are used, the thought naturally occurs, "Does not the 1500 registered animals, or one-fourth to one-sixth of the total number used, supply the present demand?" Would not any renewed activity in breeding quickly flood the market with bulls?

These questions can best be answered by the records of State Veterinarian Chas. Keane, which take account of all animals brought into the State for breeding purposes and which show that for the year just ending, approximately 3000 beef bulls were shipped here from other States.

True, a great number of these imported bulls are unregistered and many of the registered ones would be more beneficial in the killing lot

than on the range. Also, the grades are bought at a lesser price than purebred breeders would care to sell for with present prices of foundation cattle. However, the material fact is, that 3000 range bulls are being brought into the State which should be grown here. It is this "out-of-State" buying which gives the greatest assurance of purebred breeding success at home, as it emphasizes the trend of range raisers toward better bulls. This is the fundamental reason for more breeding establishments.

Cattle Raisers Speak.—And lest this proof be not convincing, we have the more direct evidence, in the actual viewpoint of cattle raisers themselves, particularly those who are classed among the more progressive and successful.

The ideas of a few of these, re-

in the growing qualities of the higher priced calf, he finds, and for that reason he is an advocate and buyer of the best class of so-called purebred range bulls.

Take also the case of Mr. B., who has a reputation of being the most successful and prosperous cattle grower in his locality.

He also purchases both Herefords and Shorthorns and makes pilgrimages East for carload lots of registered bulls. His last shipments cost him \$200 per head plus expense of locating them. When pressed for his reason of such purchases he shows you the proof of the pudding in his steer weights which are uniformly higher than any other in the district and consequently more profitable.

Still another is Mr. C., who has imported two carloads of Shorthorn bulls in the past two seasons; the first being two-year-olds that averaged him over \$210 each landed; and the others, yearlings, which ranged close to \$150 besides their keep for a year previous to service age. In his own words, "never have our two-year-old steers weighed so

livestock show that incites most direct interest in and comment on purebred beef cattle. What we lack at present in this respect as much as the cattle, is a livestock show circuit, important enough in its scope to attract out-of-State herds as well as beef cattle interests generally. Such shows will undoubtedly be founded.

Purebred Auction Sales.—Next to shows, purebred auction sales are clearly favored among the breeding contingent as an avenue to create interest and enthusiasm. Here also, unless we sorely mistake the times after interviewing a great number of breeders, action will not be long delayed. In fact, it is not impossible that the sale plan may precede the enlarged show idea.

There are two reasons for this thought: (1) sales can be conducted without the mass of preliminary work required for show, and (2) present breeders do not wish to endorse boom methods of breed promotion, preferring to stabilize values through association or consignment sales, while they still have the power to do so.

Grand Champion Female Oregon State Fair, 1916, to be sold at Auction Dec. 7, 1916. Auction Sales and Shows Will Soon Be Demonstrating the Rising Tide of Sentiment for Purebred Beef.

cently given the writer, may be taken as an indication of the future; for they represent widely scattered territory.

The first, whom we shall call Mr. A., is a large buyer of bulls, having extensive cattle interests in the State. He uses purebred and registered Shorthorns and Herefords. Almost always, in recent years, he has been compelled to fill a large portion of his bull wants in the Middle West, despite the fact that he has purebred herds of his own. This year he has already purchased a carload in the East besides numerous purchases from California breeders. He informs us that all of his buying would have been done locally, had the supply been sufficient and more available.

The value of a bull, in his opinion, can be based solely on the calf crop and in no other way. By good management, he secures the service for 100 calves from each of his range bulls during their life time. If, as at present, he pays as high as \$250 for a registered bull his calves have cost him \$2.50 each for service fee. As compared with the calves from, say, a \$150 bull the former mentioned ones have cost him a dollar more than the latter. This difference in service fee is more than made up

heavy as since the infusion of the purebred blood; and our idea as to the relative value of purebred vs. grade has been materially strengthened in favor of the former." Numerous experiences of this kind might be related, all equally convincing, did space allow.

Promotion Probabilities.—It is characteristic of the livestock breeding industry that all great movements run in underground channels, long before they appear on the surface. And so it is with beef cattle breeding in California at this writing; there is a surging under-current of optimism and progressivism among breeders, which, as one man has said, "you can feel in the atmosphere, based on a dollar and cents standard."

As a result of this confident feeling, new herds are being founded; and to keep pace with the times, established breeders are taking a long pull on check books to strengthen their herds. If we mistake not, the result of this will bloom forth at the livestock shows in the very near future.

Livestock Shows.—The full significance of the present building-up process will not perhaps be clearly demonstrated till the show-ring era begins anew, for it is usually the

BEETS AND BEET PULP FOR DAIRY COWS.

To the Editor: We have just begun to feed some stock beets to cows, and wish to know how many pounds to feed each cow per day, "three times" with alfalfa hay; also the feeding value of pounds of beets as per pounds of hay.—W. C. McC., Lodi.

[Answered by Prof. F. W. Woll, Univ. Farm, Davis, Cal.]

Stock beets may be fed to dairy cows in very large quantities, say 100 pounds per head daily or even more, if desired. Many Eastern farmers are feeding beets that heavily to cows on official tests. Danish farmers have also fed large amounts of beets to dairy cows during late years. The cost of growing the beets in comparison with other farm crops and the quantities on hand, are the main factors that will decide how heavily to feed them. It is very likely that McC. will find that it will cost more to raise and feed a ton of dry matter in the form of beets than in crops like Indian corn or grain sorghums, which may be conveniently and profitably made into silage. Root crops have no special advantage over silage from standard field crops as feeds for dairy cows. Both are most excellent feeds for farm stock, especially for cattle and sheep.

By feeding a ration of about 20 pounds of hay and 50 pounds beets per head daily, the cows will receive a sufficient supply of nutrients for the production of a fair mess of milk, say 2½ to 3 gallons per day. In the case of heavier-producing cows, an allowance of grain will be advisable in addition to the beets and hay. One ton of alfalfa hay may be considered of similar value for feeding dairy cows as about six tons of stock beets.

The Imperial Valley Livestock Fair will be held in El Centro and continue for a period of five days, according to the announcement of its promoters, who are actively at work raising funds and perfecting details.

One of the State's largest silo manufacturers estimates that there have been fully 300 silos erected in California during the past year.

California Nurserymen of the First Decade

Sixteenth of a Series of Sketches in Which the Editor Presents Suggestions, Drawn from Long Experience, of What Californians Have Done and May Do for the Advancement of California Agriculture.

One of the notable things about the beginnings of American agriculture in California was the quick uprising and rapid development of what is now commonly called "the nursery business." The word "nursery" designates the space, with promising equipment and environment, for the upbringing of the young, either of plants or animals. The phrase "the nursery business" indicates an industry—the commercial growth and distribution of plants. It is interesting to note that California had both nurseries and nursery businesses from the very beginning: that even when nearly all who came in the gold-rush of 1849-50, either went to mining gravel or to digging into each other with various ventures, there were a few who devoted their time and money to the horticultural arts and found great achievement and satisfaction therein. The results which they attained soon attracted attention of others and within three or four years, the plant collections and establishments for plant propagation in California were, in size and number, such as no other American State has ever possessed in its youth. The reasons for this rapid development of appreciation and demand for plants are to be found in two directions, neither of which need be pursued beyond citation: first the welcoming climatic conditions which American enterprise never possessed before and was delighted to prove out by plant tests; second, the purchasing power of gold which was abundantly in nearly every one's hands in the beginning. There never was a young state with such forceful incentives to buy plants and so much money to buy with. Emotions and sentiments were also involved, of course, and the early Californians were more moved by them than the founders of some other states, perhaps, but it was the call of the climate and the gleam of the gold which impelled California horticulture to shoot from the starting-post so like a thoroughbred.

A State of Preparedness.—It is our purpose to present what seem to us unique and interesting facts about the men who ministered to this building in California of the superstructure of American horticulture upon the excellent foundation laid by our Spanish predecessors in the justly celebrated mission gardens of the Franciscan fathers. American horticultural builders could not possibly have achieved what they did in the first decade without such clear demonstrations of climatic capacity as the missions afforded. It is true that the padres had not large lists of exotics but every one they had spoke truly for the class of plants to which it belonged and therefore most of the American dreams of horticultural expansion based on mission achievements came true.

But there was also an American condition of preparedness which contributed grandly to California's quick start and wonderful early attainment. One of the moving forces in California's early development

both in fruit and ornamental lines was the nursery establishment of Ellwanger & Barry of Rochester, New York. Patrick Barry of that firm wrote a book in the '40s which was fundamental in suggesting the style of California fruit trees. Downing and Thomas also wrote books in that decade, but they seemed inclined largely to the laissez-faire method of training fruit trees, but Barry expounded the European systems of cultural training which early Californians adapted to large scale operations in this State by their own original modifications. But I wish to take from Barry not training systems but a personal observation of the expansion of eastern nursery industry during the decade preceding California's beginning.

In 1860 there was a course of lectures on agricultural science at Yale College and Mr. Barry was one of the speakers. He said that in 1840 two or three small nurseries near each of the larger eastern cities, occupying in all not more than 500 acres of land, and a few other nurseries occupying perhaps one acre each, supplied the plant and tree demand of the whole United States and Canada. Twenty years later there were over a thousand nurseries in the country, and in his county alone there were three or four thousand acres in nursery, selling annually half a million dollars' worth of plants and trees. It was this eastern development in the commercial handling of plants and trees which made a large contribution to California's start, for it gathered all the then known plants, the hardy in the open air, the tender under glass, and had them available for bulk movement to California and the California demand found the munitions ready.

Foreign countries contributed also, for plants came from everywhere—and men came also, chiefly young men trained abroad in plant handling, who soon saw that most of the plants grown under glass in wintry climates needed only sky-covering in California. The start in this State in 1850 was therefore deeply indebted to the world's awakening to desirability in new and better plants during the preceding decade.

How California Welcomed the Nurseryman.—The California pioneers had a high appreciation of the functions of the nurseryman and his relations to the upbuilding of the State in the making of beautiful homes and in the advancement of moral, esthetic and patriotic standards in the citizenship as well as in promoting industry.

Therefore the pioneers began in 1854, when the State Agricultural Society was organized by statute, to send out visiting committees to the nursery establishments to make public reports upon their conditions and contents and to award State premiums to the most worthy of them. It meant a great deal to California progress that such an attitude was assumed so early. It was an acknowledgment of obligation to plant introducers and propagators which

has not always been well remembered in recent years. It was surely encouraging and stimulating to industry in plant propagation and distribution.

From these official reports we learn that as early as 1856 there were nurseries of considerable size in San Francisco owned by H. A. Sontag & Co., James O'Donnell, W. C. Walker, and R. W. Washburn, which are credited with area, equipment, and plant collections equal if not superior to many similar establishments in the Eastern States or in Europe at that day. They all had good greenhouses and their sales of potted plants and cut flowers, the later for their weight in gold slugs probably, during the flush times of the metropolis, are now almost incredible. Away from San Francisco there were many nurseries in 1856-7 chiefly occupied in growing fruit trees to satisfy the first great passion for fruit planting. In Oakland James Hutchison had fruits and flowering plants and George Lee had "the largest variety and most luxuriant growth of tropical fruits in the State." At Alameda, Wilson Flint had 329,000 fruit trees of 150 varieties and received the first premium for the best nursery in the State. At Alameda also was A. H. Meyers with 50,000 trees and the first seedling peach to receive a name, which is now forgotten. At San Lorenzo, John Lewelling had 52,000 trees and at Mission San Jose as many more. Around San Jose there were many nurseries. L. Prevost had 72,000 fruit trees, and many ornamentals including 17,000 roses in 80 varieties; A. Delmas had 10,000 European grape vines in 80 varieties and 300 basket willows, and William Lent also had foreign grapes in variety. L. E. Gould and J. Morse had small nurseries. B. S. Fox had 42,000 fruit trees and took the first prize for nurseries in 1858. Smith & Winchell had 123,000 fruit trees and took the first prize in 1856. Capt. Aram also had a "well known nursery" near San Jose, and Sanderson, Lowe, Daniels, Pellier, Case and O'Donnell were other nurserymen in the San Jose district. At Sacramento were the "Smiths Gardens" of A. P. Smith, whose large operations will be mentioned presently. Near Marysville were the New England Nurseries of George H. Beach, who grew large stocks of fruits and ornamentals, including 95,000 fruit trees and grape vines, and near Napa S. & W. N. Thompson had 50,000 trees and grape vines, and near Napa Angeles, which then included most of the settled area of Southern California, there was much interest in fruit planting to secure the high prices prevailing in San Francisco and many undertook nursery work. William Wolfskill had in 1856, 9000 orange and 6000 lemon and lime trees. Dr. S. W. Halsee had 14,000 citrus trees, which received a diploma as "the best the committee had seen"; H. C. Cardwell had 15,000 trees and shrubs on the "best land the committee had seen for nursery purposes"; William Stockton (near San Gabriel) had 10,000 budded trees and W. B. Osborne had 20 rose bushes of 118 varieties. Dr. T. J. White had 300 vines of 47 varieties imported from France; also sapota, aguacate and mango brought from Nicaragua and 8,000 citrus trees in boxes. S. Harbison near

Sacramento had a "timber nursery" which received a premium in 1858 for shade and ornamental trees.

Thus within the first decade California had nearly forty nurseries of professional standing, with an unknown number who grew trees for their own planting and sold some—which resulted in the great sensation of the period.

First Nurserymen's Association.—The disposition of planters to grow their own trees and to sell "left-overs" to others has arisen whenever unusual interest in fruit planting has prevailed in California. "Everyman his own nurseryman" was a slogan against which the pioneer professionals had to contend, and war broke out in 1858 when the first recorded association of California nurserymen was formed. The convention was held in San Francisco in November of that year and its purpose was "to regulate prices and sale of trees." When duly organized the association made this declaration:

"For years a base imposition has been practiced upon purchasers of fruit trees by non-professional nurserymen who go about the country picking up small refuse stock here and there, and, after labeling the trees to suit supposed demand for certain varieties, load them into wagons and then for weeks trundle them over the country. No reliance can be placed upon trees thus hawked about—either on the chance of living or on the varieties secured."

Thus California nurserymen declared war upon "tree-peddlers" nearly 60 years ago. The way they proposed to protect the public was as follows:

"We propose to sell trees only from our nursery grounds, digging and packing no faster than ordered. We have assembled in convention to adopt such a reduced scale of prices as will enable all purchasers to obtain directly from long established nurseries, genuine and reliable trees and vines at less cost than they have hitherto been induced to pay for those of unknown and worthless character."

These declarations were signed by nine nursery firms engaged in the production of fruit trees, viz.: A. P. Smith, Sacramento; J. Aram & Co., San Jose; J. Lewelling, San Lorenzo; L. A. Gould, Santa Clara; China Smith and B. S. Fox & Co., San Jose; R. W. Washburn, San Francisco; G. H. Beach, Marysville; A. Lewelling & Co., Fruitvale.

The scale of prices which would knock out the tree peddlers is very interesting now, viz.: 1 yr. old apple trees 35 to 50c each, 2 yrs. old 62c to \$1; pear, nectarine, apricot and cherry trees, 1 yr. old .75 to \$1, 2 yrs. old \$1 to \$2; plum trees 1 yr. old .50 to \$1, 2 yrs. old \$1 to \$2; peach trees, 1 yr. old .37 to \$1, 2 yrs. old \$1 to \$1.50; almonds, seedling, .50 to \$1, grafted \$1 to \$2; figs, California \$1 to \$1.50, foreign \$2 to \$3; walnut 1 yr. old .50 to \$1, 2 yrs. old \$1 to \$1.50. It must be remembered that these are all prices for single trees: no prices by 100 or 1000 are quoted and there is no intimation of reduction in price for quantity orders. Apple and peach scions are \$10 per M; pear, plum and cherry scions, \$20 per M.

These are the prices which were (Continued on page 545.)

EDITORIALS

JOY WITH A REBATE.

WE ARE printing this week a forty-page issue, the largest paper ever undertaken during the forty-six years of continuous performance by the Pacific Rural Press. It is two and a half times as large as the normal size with which the journal began, and only rarely exceeded during its first forty years. During the last six years its size has averaged at least fifty per cent greater than this old normal, and it has made frequent spurts to one hundred per cent increase. This week's leap to one hundred and fifty per cent increase is our record, and we hope the reader may find interest and satisfaction in it.

We frankly confess that we lose much of the joy with which we attain this eminence when we reach out to enfold our offspring in fatherly embrace, for there keeps ringing in our ear Kipling's line—"An image made of mud, which they call the great god Budd." The paper, which the war and other wrongs, perhaps, force us to use, is a beam in our eyes and an iron in our journalistic souls. Readers are very patient about it, and we accept their content as a manifestation of sympathy—for we like it even less than they do. Perhaps we can claim to suffer more than they do, for they can turn from it, after a day or an evening or two, to sight of the sun and the green fields, which the war does not obscure, while we have to work day after day with the sad sight of our beloved offspring clad like a tramp and bleary-eyed as a sot, and can discern no chance of immediate reformation.

* * *

A PROBLEM IN ECONOMICS.

BUT, the reader may say, if you feel so badly about it, why do you not buy decent clothes for your bantling? Perhaps we ought to be frank in our answer. During the first decade of this journal, subscribers paid \$4 per year; during the next decade \$3; during the next two decades and more, \$2; during the last two years \$1 per year. It has been the ambition of all of our publishers to serve the farming public of California at the least possible cost to it, and the present publisher dared a figure below all his predecessors, even after the war, which now humiliates us, had begun. It was a popular stroke, for our circulation is now perhaps five times as great as five years ago and our publication proportionately advanced in general esteem and influence. All this, of course, is to the good, but it imposes limitations nevertheless. If we had our circulation of other days, with the rate per which then pertained, we might be printing on hand-finished India paper, from which the type would shine clear-cut as though from the chisel of Phidias, and slippery half-tones show forth the "atmosphere" of the old masters. But, alas! we have made our bed and must lie in it. It is ostensibly a "dollar bed," because that is what the subscriber now pays, but not enough of that dollar remains to us to pay for a perch in a hobo's roosting place. It is this way: For the subscriber's dollar we send him each year 69 cents worth of the paper we are now using, and we pay

11½ cents postage to get this paper delivered to him—which leaves us 9½ cents to pay for editing, printing, mailing, etc., for which it only pays a fraction of one of these items. If we should return to the paper formerly used it would cost \$1.15 for the paper and postage alone. And if we should do that we would be in the boat with the far-seeing merchant who conceived the idea that if he sold everything below cost he would soon make up for it by the increased business which would come to him!

But we are not trying to drag the reader into the gloom of the publisher's problem. If he sends in his dollar he still leaves us a little margin to go on—providing he does not delay and oblige us to use a few postage stamps in reminding him of his delinquency, for these would soon destroy the margin. And we are writing all this simply to explain to the reader why we are sending him the Pacific Rural Press as it now appears. We do not blame him for not liking it; we do not like it ourselves.

* * *

SHIFTY WEATHER PROPHETS.

WE MUST remind our press brethren of the daily habit that their special leased prophets are not playing the weather game according to Hoyle. They promised the winter would be warm, and we accepted that prophecy, knowing that if it was warm it would be wet, but now they are playing the cold cards, hoping to justify their dismal foreboding of drouth by discarding their temperature suit. These prophets certainly betray human traits, according to the poet who sings:

As a rule, man's a fool:
When it's dry he wants it not
When it's cold he wants it hot—
Never liking what he's got,
Always wanting what he's not.
As a rule, man's a fool.

But dry and cool it is: cool as never before in November; not only in California, but throughout the country. November records are so low that even now, a week after election, all do not agree which presidential candidate was worse frost-bitten.

As for the cold itself, we have to write too soon to note the end, though we have an idea that Tuesday morning held the worst of it, as shown by the adjacent summary by the Weather Bureau. Naturally, the mercury fell lowest where there was least to be hurt; orderly planting has for years had due regard for that. Naturally, too, the mercury fell least at points where the official conscience is somewhat soothed by steam-heated skyscrapers. As the great interior cold wave, which brought to the Rocky Mountain region as much below zero as it left our coldest places above it, has gone eastward after brushing us only with its feather edge, we may expect an indraft of something warmer and possibly wetter also. If wetter, it will be warmer, and both are desirable to enable all to go forward confidently into the good crop year which we have every reason to expect.

* * *

THE VOICE OF THE WEST.

IT WILL probably be for the good of the whole country to know that it can elect a president without the consent of the northeast corner of it. It will help the far-Easterner to realize that west of New York the country is not all provinces. It is true that the center of population is still in Indiana, and did not move far westward during the last census decade, but the self-consciousness and influence of the West is rising faster than the population-center moves toward it. The greater this rise and influence in the mind of the country, the better our financial condition will be. We shall count, as more "worth while," and this is the real basis of financial condition in a large way. In the face of such public recognition of worth and importance, less discrimination will be practiced against us. It is possible that this newer and better idea of the West will manifest itself more sharply in the interest rate than in any other way, and this will be the best way of all for the development of the West into still greater importance and influence. The discrimination against us in the cost of farm mortgages is shown by the

report of the Association of Life Insurance Presidents, covering the operations of 148 companies to the close of 1914. The following figures are given: The amount loaned on farm mortgages by these life insurance companies is, in New England, \$105,000, averaging 5 per cent; in the middle Atlantic States \$827,000, at 5.8 per cent; central northern States \$117,000,000, at 5.2 per cent; south Atlantic States \$20,000,000, at 6 per cent; gulf and Mississippi Valley States \$21,000,000, at 5.9 per cent; southwestern \$187,200,000, at 5.7 per cent; northwestern \$284,100,000, at 5.4 per cent; and Pacific States \$16,000,000, at an average of 7 per cent. Commenting on these figures, Orange Judd Farmer says:

The borrowing farmers, whose notes and mortgages to insurance companies net the lenders an average of 5½ per cent, also have to pay all commissions and other expenses. It is probable, therefore, that the vast amount of mortgages now held by life insurance companies represents a cost to borrowers equivalent to an average of 7 to 8 per cent per annum. Most of these mortgages run for only five years, when they must be paid, or renewed, with all the expenses incident to such renewal.

The Federal Farm Loan law, which the election of President Wilson makes sure of favoring administration, provides that the interest rate shall nowhere exceed six per cent, and there shall be no commission, fees, or expenses beyond the interest payments. What the actual interest rate will be in this district is not yet known, but it cannot be more than stated. On the basis of the insurance companies' loans in this district, as noted above, it must be a reduction of 25 per cent in interest cost, and may be more than that. If the law works well and buyers call for the bonds, much of this 8 per cent mortgage paper will be displaced—if the present lenders allow it to be done. This they will not do; they will be rather in competition with the federal loans, and will do what is necessary to hold their business. So will the bank and private lenders, who hold probably twice as much farm mortgage money as the insurance companies do. They will all be glad to renew much of their investments at a rate which will compete with rural credit rates. This is no prophecy; it is simply what these parties are trying to do already. This will have a tendency to equalize farm loan interest rates in all parts of the country, and it should be practically realized. As the discrimination has always increased westward, and as we have the worst westward of the whole country, it is greatly to our advantage to have all possible demonstrations that we are worth while.

* * *

STILL LOOK FOR SHARKS!

THINKING of rural credit development, there is still occasion to warn people against sharks. It seems hard for people to realize that movements toward organization for rural credit must not be accompanied by any money payments. Borrowers are required to take 5 per cent of their granted loan, in stock, but no one is authorized to collect that in advance; it will be taken out of the loan when made and not received beforehand. Absolutely all that borrowers can now do is to get together and get ready, and that should cost nothing but time and gasoline. There is provision that "joint stock land banks" may be organized under the federal farm loan act, but not one has been organized yet, nor can they be to any advantage until the federal loan board has adopted its system, under which in some regards all such banks must operate. It is in this line that sharks seem to have bitten hardest. In Alabama such a game was played, and \$30,000 was paid by subscribers for shares, nearly all of which went to the promoters. And now the "directors," which they chose from the subscribers, are probably liable to their shareholders for all the money which the sharpers got away with. Do not have anything to do with any joint stock land bank, unless you are a banker, and then you can look out for yourself and should know whether it is any advantage to you. Farmers wishing to borrow should deal only with a "farm loan association," which is not authorized to sell any stock or make any collections until advised by a district land bank, of which none are yet organized, nor can they be.

A LABOR PARADISE.

CALIFORNIA does surely possess the admirable feline attribute of always landing on her feet. Whether there be cataclysmic movements of the earth-crust or of the national political conscience, California quietly and quickly steadies and readjusts herself. For instance, California last week fell from the grace of big business by repudiating Hughes, but, by the same sign, rose to a labor-heaven by accepting Wilson. As we write on Tuesday there comes this, by telegraph from Baltimore:

"Oh, you California!" is the official yell of the annual convention of the American Federation of Labor, now in session. Every delegate, from President Samuel Gompers down to the rawest recruit in the ranks, gives California the credit for the re-election of Wilson. The official convention yell rocks the theater whenever a Californian takes the floor. There is nothing too good for the men and women from California. They are the whole thing in the convention. The most popular song in the United States today is "I Love You, California!" President Gompers and every speaker at the opening session of the convention handed choice bouquets to California for its support of President Wilson.

We can hardly tell what effect this new-born

popularity may have on our regular work of grafting on big business magnates, but we must admonish Mr. Gompers and his associates that, as they have started this kind of publicity, California will expect them to come through on the regular line. Labor magnates must park their special cars, motor to their castles, and subscribe to this journal to learn how to equip their country places. We must especially suggest to our great and good friend, President Gompers, whom we consider the foxiest big business magnate on this continent, that he must park his car at Santa Barbara, build his villa on the charming Riviera Heights, where from mountain-top sunrise to ocean-bed sunset his gleaming watch-seals may flash defiance through the plate-glass of President Ripley on the plain below. How California will respond to these new tokens of admiration we cannot surely tell, but we know this: she will not sit for courting in a hotel parlor. You must buy land and build mansions, keep a battery of motors, and all that. We trust you, Mr. Gompers, to see that the labor magnates play the game aright, and do not allow themselves to be outclassed. "The king is dead; long live the king!"

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address.

Weevils and Beans.

To the Editor: Kindly inform me as to what treatment to give beans to keep the weevil out of them? I have beans of my own raising, which I wish to keep over until next year, for seed.—J. B. K., Denair.

To the Editor: What can I do to keep the weevils out of our beans when they are gathered and sacked?—E. C., Yucaipa.

We have had several columns on this subject during the last year and we must suggest to readers the desirability of filing their papers and using the indexes which are printed at the end of each six-months' volume.

The weevil makes its first attack on the bean when it is green in the pod and there is therefore a chance that you may already have the weevils nicely sacked up in the beans. If this is the case, they can be killed by heating the beans up to 130 degrees with a good thermometer so as to be sure to get heat enough to kill the weevils and not enough to kill the beans. Or you can kill the pests by putting the beans in a barrel and placing on top of them a saucer half full of carbon bisulphide—covering the barrel and leaving the dose to vaporize. Do not go near it with a light or you will blow your whiskers off and may set fire to the house. If you have no weevils already in the beans you can protect them against later invasion by storing in a perfectly clean place where no beans or peas have been kept before. If you have to use an old store room, burn sulphur in it just as you would in a sulphur box in fruit drying and then whitewash thoroughly, filling all the cracks with the whitewash.

Sunburned Apricots.

To the Editor: I have some young apricot trees that are badly gummed—mostly on south side. I would like to know cause, cure and preventive.—G. R., Modesto.

You have probably neglected to protect the bark against sunburn on the south and southwest sides. If you find the bark brown or black down to the wood, remove such dead bark to a clean-cut live bark at the edges and cover the whole trunk with whitewash. If the bark around the gumming is not discolored underneath but shows life below, do not remove it but whitewash all over and let it go at that. All newly planted trees should be covered with tree protectors or strips of burlap wound around or whitewashed.

No Long-Pruned Peaches.

To the Editor: What varieties of peaches should be pruned long to get a crop, and which are the fruit buds?—E. M. L., Los Molinos.

We do not know which peaches universally require longer pruning than others. Probably all peaches may require less shortening in some localities. Look at the new wood of the bearing

peach tree and you will soon see the buds, usually three at a place—the bloom bud between two sharper leaf buds. Leaf buds are found singly on young trees and farther out on the new wood of bearing trees. Longer or shorter cutting of varieties begins with careful observation of the buds and afterward comes to be known as more or less of a rule in pruning varieties in localities, according to their local bearing habits.

Applying Superphosphate.

To the Editor: I notice in the issue of Oct. 28 an article on superphosphates for alfalfa. What is the cost of that fertilizer? I am planning to plant corn in the spring—can I sow the fertilizer onto the ground this winter and plow it under, or would it do as well or better to sow it in the spring at the time of the last plowing before planting?—E. H. S., Sisquoc.

To ascertain prices inquiry should be addressed to manufacturers advertising in our columns. Superphosphate is readily soluble and should be applied near the time when the plant is active to use it. If used for a winter-grower it should be applied in the late fall. For corn, which is a summer grower, application should be made in the spring while there are still likely to be showers enough to dissolve and distribute it. The last plowing which would do for that should not be delayed too late or the land will hardly be brought into good shape. Get the land in shape and then work lightly when the safe date for corn planting comes in your locality.

Pecans and Chestnuts.

To the Editor: I have a mountain ranch, altitude 2300 ft., average amount of frost, heavy black loam. Will pecans and chestnuts be good nuts to raise? Is there any profit in them?—E. G., San Jacinto.

If you have a moist bottom at that elevation it is possible pecans would succeed. Dry mountain land is not suited to them. Such land would be more likely to suit chestnuts, but nothing but actual trial would demonstrate their behavior. Both nuts would be profitable if you can get them.

Planting Hickory Nuts.

To the Editor: I have received from Maryland some hickory nuts, which I wish to plant as an experiment in my yard at San Mateo. Please give me information as to the best method of planting them, and anything else you think useful in making this experiment.—J. T. H., San Francisco.

Dig up the ground deeply in places where you wish the trees to grow, and put in about five nuts a few inches apart in a place—pressing the soil firmly around the base of each nut and covering with about an inch of fine soil above the points of the nuts, leaving this covering rather loose. Then cover each place with a litter of rotten straw or old leaves, an inch or two thick, to keep the ground

from sun-baking and rain-tamping. If you get several to start in a place, transplant all but one after the leaves fall at the close of the next year. The hickory is usually a poor, slow grower in this State. The pecan makes a much better tree, but does not ripen nuts in your section.

Peas and Oats for Forage.

To the Editor: Referring to the article in your issue of Oct. 28 by S. F. Bonner, will you kindly advise whether, in your opinion, it would be practical to follow his plan of sowing a mixture of red oats and Niles peas in November in this section where climatic conditions are probably different than in Butte county?—K. M., Willits.

Both peas and oats do exceptionally well in your part of the State, but satisfactory growth in the early winter is not as sure as in the interior valley. If the particular land you have in mind is subject to hard freezing or to be full of cold water during December and January, the peas will be very slow even if they keep at it. On warm land which is well drained and usually out of the heaviest freezing, you ought to get a large growth. It is a local question. If you are new to the locality ask some older resident how peas behave on land like yours during the heaviest part of the winter.

Botany of Buhac Plant.

To the Editor: Will you kindly state which is the correct name: "pyrethrum cinerariae folium," "chrysanthemum cinerariae folium," or "buhac"? Is this plant found in abundance in this State or anywhere in the United States? Is there any other use for it than making insecticide?—K. D., San Francisco.

Botanically the plant is a chrysanthemum. "Pyrethrum" is a name largely used by florists but is not botanically correct. "Buhac" is the trade name of the insect powder made from the plant and was invented by G. N. Milco of Stockton. Mr. Milco was a Dalmatian and he brought the plant from his native country to establish an industry here. The plant does not grow wild in California nor elsewhere in the United States, except as it may have escaped from cultivation. So far as we know, this species has no economic uses except as an insecticide.

Pruning Prunes.

To the Editor: Please advise me how to prune three-year-old prune trees. Would you advise topping or cutting back, and if so, about how much?—M. A. H., Slough House.

If the trees were properly cut back after planting and have been short-pruned for two winters and have now a good low head and enough main branches we would not shorten the leaders, but would remove excess branches, such as are crossing, going in wrong directions, etc. If the trees have not been properly shaped and not sufficiently branched from low points, we should cut back into the old wood if necessary to get such branching. This is supposing you have the French prune.

Imperial on Almond.

To the Editor: Kindly inform me if Imperial prunes will bear and make good trees if budded on almond root.—J. G., Guinda.

They are offered on almond root by commercial propagators and, so far as we now know, are held to be satisfactory.

Dahlias from Cuttings.

To the Editor: Can dahlias be grown from cuttings?—D., Conejo.

Yes, but it is not counted easy nor is it much practiced because division of tubers is so simple. Cuttings made of the new shoots from the tuber, taken off as soon as they have made a few leaves and put in sand, with proper moisture and heat, may be rooted quite successfully.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., November 14, 1916.

Growing Oranges for Pleasure and Profit.

[Written for Pacific Rural Press by A. H. Sanborn, C. E.]

Reared in the bleak environment of New England, and having read much of the allurements of California and its rich crops of oranges, lemons and other subtropical fruits, I early became intensely interested in the unique horticulture of this State, and resolved in time to try my hand.

It was not, however, until the spring of 1904, that I found any hope of realizing the romantic dreams of my boyhood. I had then obtained a foothold in San Francisco and accumulated a little surplus cash, and I began to seriously consider the experiment of starting my orange orchard and bringing it to fruition. In casting around for an eligible location, I considered carefully the factors of climate, soil, water, and transportation; also the questions of packing and of selling facilities. It was no easy task to find a location which combined all these desirable essentials. However, I finally decided on a 10-acre piece of land situated about four miles north of Lindsay, in Tulare county, just on the eastern edge of the San Joaquin valley, where the foothills of the Sierra Nevadas begin to rise abruptly from the flat floor of the valley.

Knowing little or nothing about the practical work of growing oranges when I began operations, I had it all to learn. Fortune favors the innocent sometimes in a most surprising way, and she smiled kindly when she led me to the location described. I put in a good part of the time that could be spared from a busy professional life in studying out the various details of citrus culture, and tackled the problem of realizing something more than the mere cost of production, for I was beginning to learn, among other things, that "all is not gold that glitters," even in the orange industry. When Horace Greeley wrote his celebrated book on "What I Know About Farming," he was raising cabbages, and it is said by his friendly critics that these cabbages cost him about \$1.00 a head. I had no desire to follow in Greeley's footsteps, and to duplicate his financial performances.

My guide in the beginnings of this work was Prof. Wickson's "California Fruits and How to Grow Them," which helped me much, though I by no means confined my study to this book. But with all my garnered wisdom and conservative calculation, the preliminaries of nursery-stock buying, planting, and subsequent items of irrigation, cultivation, pruning, fertilization, all cost me more than had been figured on. But the ordeal was weathered through and at the end of the fourth year I had my first crop of oranges to dispose of. I settled the marketing question by joining the Lindsay Fruit Association, a branch of the California Fruit Growers' Exchange.

The deeper I got into the enterprise, more and more was the fact forced upon me that the successful citriculturist requires a deal of experience to produce crops satisfactory in quality and profitable in quantity, and that the expense account keeps even pace with the crop increase. This year, the twelfth of

my experiment, I had for the first time to fumigate my trees with cyanide for scale. The fumigation of the 1,000 trees on the 10-acre tract cost me 30 cents apiece, or a total of \$300 for the entire work.

To get satisfactory results, water and fertilizer must be supplied very lavishly. Incidentally I may state that I have found the green manure crop more economical than the commercial fertilizer. If any one has the impression that growing oranges is an easy and inexpensive pastime, he will be quickly disillusionized if he undertakes the job in real earnest. I have observed that the orange

I am quite satisfied financially and otherwise. It has been educative, and created a new interest in life. By reference to the diagram which is published herewith, the reader will see that at the present time I have received in returns from the sale of my crops all the money that I have expended for the orchard, both the initial investment and the running expenditures; and when I have marketed this season's crop, I expect to be a little ahead and have my orchard clear.

The Diagram.—A careful study of the table will show the first cost of the land, with water ready to use and the trees set out. It also shows the annual cost of up-keep thereafter, the progressive income

grower on the ground works very hard for his money, and that only the wide-awake and active keep ahead of the game. Not being a resident of the county where my grove is located, I go back and forth about three times a year. In doing so I estimate that I have travelled about 18,000 miles since my orchard was first established. While I have not realized to the full all that I had hoped when I went into this venture,

end of the seventh year, the crops began to pay a net profit. For the past three years this profit has equaled the entire cost, so that at this writing I feel that I have a 12-year-old orange grove of 1,000 trees, worth at a low valuation \$7000, which has really cost me nothing but the interest on \$3,500 for 12 years, which at 6 per cent would be \$2,520, showing a profit of \$4,480 over and above the amount invested.

Amboy GYPSUM

Increases Crop Production

Chemists agree that California soils need Gypsum badly. Amboy Gypsum increases the fertility and lengthens the life of your soil. It converts inactive elements into productive and available forms. It improves the soil texture. It aids in the decomposition of vegetable matter and the formation of humus. It counteracts black alkali, turning such land into productive soil.

Invaluable for alfalfa and field crops, citrus orchards, lawns, etc. Gypsumed soil requires less irrigation.

Amboy Gypsum greatly increases the value of manure by retaining the essential elements of the manure which are usually lost in the form of gases. Eliminates flies and germs.

The State Fruit Growers' Convention.

[Notes and Extracts from Convention Addresses.]

Note: Our report of the State Fruit Growers' Convention at Napa Nov. 13-17 is not complete at time of going to press and will be given fully next week.

State Horticultural Commissioner.

In the opening address of the Convention, State Horticultural Commissioner G. H. Hecke, having been only five weeks in office, but having been a growing force in California horticulture since 1892, suggested some of the policies in which he hopes for the support of the State's fruit growing and marketing interests. After paying tribute to the U. S. Department of Agriculture and the University of California, he says, "I shall not fail to preserve all the advance moves inaugurated by Mr. Cooper, Mr. Jeffrey, and Dr. Cook . . . and to proceed with such additional constructive work as may meet your approval." In "the vital necessity of protecting the horticultural interests of California by quarantine," he hopes for funds adequate to protect our fruits from destruction by foreign pests, whatever the reasonable cost.

"Legislative changes are suggested by your committee to bring about closer co-operation between the State and County Horticultural Commissioners. . . . So long as there exist as many different systems as there are counties, results will be far from satisfactory.

"For the purpose of bringing about closer co-operation in county quarantine work, weed, and pest control, your State Commissioner will endeavor to strengthen the commission by adding field deputies, perhaps one for the South, another for the North.

"The encouragement necessary to the success of all co-operative organizations in the fruit business will be cheerfully given. Through such organizations it has been possible to place the industry on a higher plane, and the future will witness greater strides along this line."

Fresh Fruit Standardization.

The application of the Standardization Law to tree fruits, cantaloupes, and berries has received a year's test (two years on grapes). H. E. Butler of Penryn, Placer county, one of the prime movers in drawing up the law, described its workings, and F. B. McKevitt, of Sacramento called special attention to its weaknesses, giving suggestions for amendments.

Mr. Butler believes "it would spell disaster to the State to enact arbitrary and critical standards for packing or for maturity. Better and more practical to have no standard law at all than to make standards inconsistent with the profitable and natural pursuit of the industry.

Growers Supported Law.—"In the main tree-fruit districts (with one exception) the law has been effectively applied. Growers and shippers have supported its enforcement. I have never heard a complaint from a grower in our district that its requirements worked any particular hardship on him. Uniformity of size, quality, and maturity has seemed possible to obtain from all packers who are conscientious enough to make an effort to conform.

Shippers Refused Rejected Fruit.

"In practically all instances shippers have respected the law and refused to load rejected lots. The public inspectors have been available to act as disinterested referees, between receivers and growers. This arrangement enables a receiver to be more independent, knowing that the rejected fruit would not be received by competitors.

It is difficult or impossible to fix details by law fairly and equitably.

"Practically all of the tree fruit covered by this law is packed in the orchards by the growers themselves and seldom in central packing houses. Equipment varies from nil

to perfect, and packers from new settlers to experts. In a great many instances packers are the families of growers themselves.

"Conforming with the law requires grading for size, quality, and maturity. The method oftenest used is to stack the peaches, plums, pears, etc., on tables, and to pack from the accumulation, choosing uniform specimens for each box, and handling over and over to find the same. Grading tables, scientifically constructed, can be built, and padded with cloth, for \$1.50 each, on which the tenderest fruit may be graded by hand more economically and far better. Such reasonable equipment must be provided when the law's requirements of uniformity are more rigidly enforced."

Orchard packing is necessary but

not always expert because "orchards are often widely scattered, frequently miles from the shipping station; roads are rough, and fruit must be packed in the orchard to protect it in the hauling, in a great many cases. It is next to impossible to avail ourselves of a large central packing house. The crop is highly perishable, and must be handled quickly or lost. Expert packers are sometimes impossible to get. The grower's family, neighbors, and friends are often impressed to save a crop ripened by a sudden change of weather.

"Maturity standards have been, and always will be, difficult to establish. From first to last of the season, there is a very long list of varieties of each of the kinds of fruit regulated. Color varies at

DON'T envy the Fruit Grower. Be one yourself—even though you start on a small scale. An orchard of well selected and properly cared for fruit trees will be a source of profit for many years to come—but, note the emphasis on well selected. It pays to start with the right varieties—the kind that will be the most profitable when they come into bearing are not always the ones that are paying best now—and it pays to plant stock that you know will turn out the way you expect.

Get Roeding's Advice—FREE

We offer you without any obligation on your part the benefit of our thirty-three years' experience in California horticulture. We know the state and the coast from one end to the other and are always glad to advise with prospective planters as to varieties, etc. Tell us the nature of your soil and where it is located and what you think of setting out. Don't hesitate. Write us today.

Everything for the Planter

—A splendid stock of FRUIT as well as ORNAMENTAL trees, vines, shrubs and plants. No matter how large or small your order—write us for prices and suggestions. This bids fair to be a very large planting year, so to avoid disappointment get your order in early.

like maturity, in almost every variety of plum and peach particularly. California is a State of many climates and varied soils, and unequal moisture conditions. Intimate knowledge of the characteristics of each variety, and of its peculiarities under conditions in which produced, are required to determine its real state. Blackberries are red when they are green; some plums are green when they are ripe, while others are still green when red. (So much for the English language.) To fix maturity standards by color is impossible. Maturity, however, should, in all instances, be within reason. The practical application of any law can be to the extent of reason only.

"I believe the benefits that will be derived from the present law, if enforced, are very far from being understood as yet, and that any radical changes, thus early in the experiment, would turn the present favorable sentiment among growers to antagonism. This would defeat the end desired, which I believe to be an honest and dependable pack from all sections in California, uniform in size, quality, and maturity throughout the container, correctly marked as to contents, all for the protection of the buyer and consumer, and for the establishment of confidence in California fruit."

Mr. McKeivitt's suggestions, however, do not seem arbitrary or radical.

"It is a weakness in the present law," says he, "that domestic shipments are exempt from the provisions of the act. Experience, as well as justice, shows there should be no exemption. This defect will probably be remedied by the coming legislature."

"We will never secure the best of results from this or any other Standardization Law until there is a change in our horticultural laws which will give to some central authority complete control over the inspection of fruit instead of the loose method in use at the present time which permits each county to establish its own standard."

Besides these suggestions for better enforcement of the law, Mr. McKeivitt showed by plenty of facts and argument, that the weight of fruit in the ordinary packages should be limited by law to prevent the squeezing which bruises or crushes grapes, apples, and pears, especially, when packages are overfilled.

"A grape package intended to comfortably contain twenty-five pounds is made to carry twenty-eight to thirty pounds; and the fruit, instead of being carefully and lightly packed, is crowded into the baskets and the top jammed down upon them, resulting in broken and split berries, with the elements of decay beginning their work of destruction before the package is placed in the car."

"If all grape crates contained a maximum amount of say twenty-five pounds, the dealer would know exactly what he was getting for his money and would buy accordingly, knowing that his competitor was getting no more than he. The fruit is worth so much per pound and should be bought on that basis, which is the only way fair alike to grower and dealer."

"The situation is bad with apples

and pears. While acting as one of the Jury of Awards in the five-box apple contest for the sweepstake prize at the Panama-Pacific Exposition last year, as many as sixty per cent of the apples in some of the boxes examined had been mechanically bruised. These beautiful apples, probably the finest grown in the world, produced on the highest priced land, cultivated regardless of expense; pruned, sprayed, and fertilized with utmost care, the fruit picked with gloves, placed in the boxes as carefully as if they were eggs, were over one-half injured by over-crowding, and both their appearance and their keeping qualities greatly injured.

Eighteen per cent sugar for most table grapes, with 16 per cent for Emperors and Cornichons, would be better than the present 17 per cent required for all varieties except Emperors, for there was "much complaint in the Eastern markets this season because of immature Malagas. It is the poorest of business judgment to ship grapes that are unfit to eat. Nothing will more surely kill the demand for this fruit."

SHORT PRUNING IS NOT LOW PRUNING.

To the Editor: I have several acres of Gros Colman vines—two years old and very vigorous. They had fruit on this year, but an article by Prof. Bioletti in the Press, lately, stated this variety should be "short" pruned, while mine is "long" pruned. I would like to know if I could safely cut them back now and if so, how high should they be crowned from the ground. Also, should I use wax on the wound after cutting back?—R. G. M., Sanger.

[Answered by Prof. Bioletti.]
Your correspondent has misunder-

stood my remarks about the Gros Colman grape vine. When I said the vine should be short pruned I was not referring to the height of the stem, but to the length of the spurs, which should be left very short in the annual pruning. A strong vigorous vine, like the Gros Colman, should be given a high head like a Malaga, but as it bears well with short spurs there is no need to leave

long ones, as short pruning is much simpler than long pruning. The words short and long in vine pruning refer to the length of the wood which is left each year. For the height of the vine we use the words high and low.

Articles of incorporation were filed for the Madera County Fair and Livestock Association to hold annual fairs at Chowchilla.

Surgery on Decayed Orchard Trees.

[Written for Pacific Rural Press by John J. Fox, Napa.]

The recent demonstrations in tree surgery in Napa county by A. G. Haskell of St. Helena drew a large number of interested growers who watched the work with keen interest. They took notes on the tools and paraphernalia required and most of them will go right to work on their orchards whenever time will allow. Mr. Haskell placed his services at the disposal of the orchardists for an entire week free of charge, as he is not looking for work in this line, but confines his work to old ornamental trees.

The worst orchard trees were picked out and worked on. Spongy,

torch and afterwards coated with boiling asphaltum.

Where there is a real hollow, cement and sand are used as a filling. This mixture—about 2½ to 1—is not really wet but contains just enough moisture to make it stick together. When mixed it looks still loose and powdery. The consistency of this pure fine sand and cement is most important and it is tamped firmly into the cavity, using one hand on the outside as a support if necessary. It may be built out on the outside and "slicked" up with a small founder's trowel (into the shape of a trunk) until a little moisture shows on the face of the filling. The filling is then cut round the entire edge with a deep channel so as to be quite free from cambium or inner bark which has previously been trimmed square in with a sharp knife. This is important, for if the bark is overlaid with cement its growth may force out the filling instead of covering it.

If the cavity is flat and open, the inside should be studded thickly with 6d. nails before filling, as cement will not adhere here to the wood and it might get displaced.

The tools necessary are a set of ship chandler's gouges and chisels, a small gasoline hand torch, a three-pound mallet, a founder's flat trowel and a sharp knife to dress the edge of the wound in live bark.

The Cavity Is Cleaned Out and Charred with a Torch to Kill All Spores of Decay, Then Filled with Cement.

fungus-infested hearts were cut out to sound wood and traced to their origin. Some infection originated in old large cuts, others from sunburn or where they had been scarred by the plow and still others at a graft cut. The cavities are dug out with chisels and gouges until sound wood is reached. After being thoroughly cleaned with the tool, the inside is burnt out with a plumber's hand

which have become infected can be cut and burned out and if not too deep may be just asphalted over and not filled.

The cost (including labor which could be done by any one with judgment) was estimated at \$1.00 for the worst tree done. The average cost, if labor had been paid for, was 70c a tree, 15c of which was for material.

PREPARES ORANGES FOR FROST.

[Written for Pacific Rural Press.]

"We picked the oranges clean from the outside rows, especially along the eastern side of the orchard first, because our cold winds come from the east and it is harder to fight frost on the outsides," says Fred Arth of Redlands. Fruit among the leaves is best protected. A neighbor had ice all over the oranges on top of a pile of picking boxes one morning though that on the trees was uninjured.

Mr. Arth has two galvanized iron oil storage tanks holding 5 and 1½ cars respectively, which are kept well supplied for emergency (such as 1913 when people couldn't get oil on 24 hours' notice as usual).

He has had frost pots two years, 800 pots per 900 trees on 10 acres. These raised the temperature in the center of the orchard to 40 degrees in an hour one night when the outside temperature was 25 degrees.

Makes Wood Dormant.—But the principal protection for the trees aside from fire is in making the wood dormant. This is done by stopping cultivation and irrigation early so the trees will harden their wood. Old trees go dormant naturally quite regularly, but young trees may not; and the former practice of autumn cultivation has been discontinued. Suckers should be left in the fall to help deaden the fruit wood by monopolizing sap flow.

Temperatures beside some Valencia trees dropped to 22 degrees

once and to 24 degrees twice last winter with no damage at all, on account of maturity of wood, according to Mr. Arth.

Young trees whose bodies were

wrapped in cornstalks had no damage to their dormant tops when temperature went down from 20 degrees at 7 p. m. to 13 degrees before morning in a former year.

Take Advantage of This Good Weather Spray NOW!

For a big crop of good fruit—clean up your trees. Scaley, moss-covered trees can't produce like trees that are clean and healthy. For prunes, apricots, apples, and pears, use

BEAN'S BUG-GO

A PERFECT CRUDE OIL EMULSION

It's the cleanest, most convenient, most effective clean-up spray known.

Mixes readily with cold water.

Penetrates through the moss, killing both moss and scale.

Do the work NOW—while the weather is good and the ground firm.

BEAN SPRAY PUMP CO.

Malagas Pruned for Fruit.

[Written for Pacific Rural Press.]

F. H. Booth's adversity was his prosperity. He couldn't hire enough help on his vineyard and orchard near Kerman, Fresno county, so he was always late getting his work done, especially his pruning and plowing. Why his crops were so good he didn't know, but now he thinks it was because of the lateness of his operations. His place is an ash loam averaging four or five feet deep, but with hardpan pretty close in places.

He has 12 acres of 7-year Malagas which when seen last spring had the fattest, longest spurs that we had seen on Malagas in a 150-mile Fresno county trip. He had already observed that in pruning he ought to save "the wood that has already worked for us."

The big canes had been cut off and the weaker ones left short and scarce, by pruners in the spring of 1915; and notwithstanding that, the crop was 31 tons. This year it averaged over 7 tons per acre as figured when the crop was one-third picked, Oct. 5.

Instead of leaving 2 or 3 buds each on 3 to 5 slim spurs, 5 buds were left on each of 5 to 11 fat spurs of canes which had borne

fruit. Longer spurs were not desired on account of cultivation damage, so more of them were left, on the vines and arms which had shown most vigor the preceding season. This was to take all the sap sent up by each vine, and prevent breaking out of watersprouts, which would waste the vines' energy. If too many spurs were left, they would suffer for enough food to go around, so the relative vigor of the preceding season was used as a reliable index. "If possible, you should always cut canes that have borne fruit, for next year's fruit spurs."

Renewal Spurs.—Since continual use of fruit wood for spurs might build the vine up too big and high, putting the fruit too far from its source of root sap, an equal number on one-eye renewal spurs are left, keeping them, so far as possible, low down on the arms and trunks to shorten the arms rather than make them longer. About 90 per cent of these bear fruit also, next season, under the Henry system of grape culture which Mr. Booth followed closely this past season. These many renewal spurs are desired "so I may have plenty of fruit wood to work with the following year."

FRUIT TREES ON DITCH BANKS USE WASTE LAND.

[Written for Pacific Rural Press.]

When land is high priced and you could be getting interest on the money invested, it pays to waste none of it. Irrigation ditches are usually waste land. The seepage from them is usually wasted water.

G. R. Fox of San Joaquin county couldn't at first see the philosophy of his son and wife who wanted to set fruit trees on the ditch banks of his alfalfa and bean ranch. But he finally bought about 600 trees for the mile of ditches on the place and planted them two years ago last March. They are about 16 feet apart on top of both banks of the ditches, being staggered to admit more light. About 500 of them are cherries of four varieties, with a lot of Bartletts along the lower ends of the three cross ditches. Some peaches and apricots were set on the corner near the house. A Muscat grape vine was planted in each space between trees, with a few of other varieties. Few if any losses have occurred, no attention has been paid to the trees for irrigation, they get no cultivation because alfalfa runs

up to them on one side. The trunks were whitewashed to prevent sunburn. Some nice fruit was picked this year and Mr. Fox is well pleased with the system. The trees have grown well, for they have plenty of light, air, soil, and water.

GENTLE LEMON PRUNING.

Two lemon orchards near Fillmore are four years old and nearly the same acreage. One bears considerable fruit, the other does not. The latter is cut back heavily every year, leaving about a foot of new growth and producing a lot of useless shoots around each cut.

The other is not pruned, but where limbs grow too tall, their end buds are pinched off; and where the limbs grow too thick, they are pulled out before they get a good hold on the wood. These trees bear fruit.

But some folks say they don't want such young trees to bear fruit. Considering that wood growth requires much more soil plant food than fruit, why should not a crop of fruit be easier on the tree and more profitable than a crop of wood shoots that must be cut away at extra expense?

GUAVA PLANTING.

To the Editor: I would like to plant a guava jelly plant, if this is the time of the year and if it will bear next year.—G. W., Stockton.

[Answered by C. P. Taft, Orange.]

The guavas grown in California are mainly the Strawberry (red or yellow); the Lemon, of which there are various sorts, all quite tender and easily frostbitten; and that recent introduction, the Feijoa or "Paraguay" guava. All are used for jelly. This is not the best time to plant, but any one of these guavas would probably live if planted now. They all have considerable inherent vitality. If a large bush already in bearing were taken up with plenty of earth, it might bear next season.

CALIFORNIA NURSERYMEN OF THE FIRST DECADE.

(Continued from page 537.)

held to be low enough to knock out tree-peddlers. It is not indicated what these prices are reduced from, but it is otherwise known that fruit trees had been sold in previous years at \$3 to \$5 each. Probably planters often fail to realize how much more easily they can now provide for planting than the pioneers could, through the organization and efficiency of modern nursery operations. Planting more closely, as the pioneers did, even at the reduced prices noted above, it must have cost, on the average, from \$100 to \$150 to get the trees for an acre of land.

Looking backward for notes of the speed with which pioneer nurserymen advanced it is very significant to remember that in 1858 nine of them alluded to their "long established nurseries" when only one of them had been in business more than five years and most of them less than that. It was quite characteristic of the times. Things grew old very fast.

Experiences of Two Pioneer Nurserymen.—Perhaps we can get a more realizing sense of conditions in the first California decade by contrasting the experiences of two pioneer nurserymen which we glean from various contemporary records.

A. P. Smith of Sacramento was apparently the first commercial nurseryman of California, for he started in 1848, on 65 acres of land three miles from the city on the American river which he purchased from Capt. Sutter, whose old fort, somewhat restored, now stands in the center of the capital city. Mr. Smith evidently entered the nursery business by the market garden route and was ready not only with vegetables for the inrushing '49ers, but for the first start both with fruit trees and ornamentals. F. A. Miller, himself a pioneer whom many of us remember, wrote in 1904 as follows: "Mr. Smith cultivated a very meritorious collection of ornamental and fruit-bearing trees, shrubs and vines which would be considered a credit to his State at the present time." The early records justify Mr. Miller's tribute to the first of all the nursery pioneers. In 1856 it was officially reported:

In the extent of plantings, the number and variety of plants, the hedges of escallonia and osage orange, the firm walks and perfect cultivation, it would be difficult to find the equal of the gardens and nurseries of A. P. Smith. The grounds are irrigated with water from the American river raised by a 10 h.p. steam pump, capable of throwing 10,000 gallons an hour into a reservoir from which it is carried by 6000 ft. of 12-inch earthen pipe under ground to 20 hydrants from which it is distributed through 4500 ft. of canvas hose, here and there as desired.

In 1857 Mr. Smith had in nursery 194,000 trees and plants of 1109 different varieties. In that year he grew and sold 4,000 lbs. of garden seeds. He had three greenhouses, each over 100 ft. long, which took State premiums in 1857 and '58. During three years, from 1856 to '58, Mr. Smith sold products to the value of over \$150,000 and his expenses during the same years were \$110,000.

He was doing a good business, but soon after, the demand failed to keep pace with such expansion and the establishment was broken up a few years later after a hard struggle. It was too great for the time and the competition which surrounded it.

Quite in contrast with this pioneer nursery tragedy was the upbuilding of another pioneer concern by B. S. Fox of San Jose, remembrance of whom, in his latter days, a number of us probably share. He was a quaint Irish bachelor gentleman, well trained in handling plants, with a fine thrift, a hunger for hard work and an acuteness in trade. His chief recreation was seedling pears, some of which still stand in honor on American fruit lists. He was perhaps the closest link between California and the distinguished Eastern pomologists of fifty years ago. He was the opposite of his predecessor Smith in everything but the plant-love which both of them possessed. He built up his business, which endured until his death, in the early '80s, with less money probably than Smith unconsciously threw away. Surely the modern science of efficiency has nothing on Fox in economy of production. We have his word for it, as follows:

"In 1857, I planted ten acres of stocks, afterwards grafted, budded and cultivated the same all the rest of the year, making and caring for 63,000 budded trees for a cash outlay of \$1,423. In 1858 I planted out, and budded later, 100,000 trees and kept them growing with an outlay of \$1,828."

How Mr. Fox could produce budded nursery trees for less than 2 cents each would be hard to understand if we did not fortunately have his own explanation. In his report, he ingeniously says: "We do all our own budding and grafting and of course make no charge nor credit for our own labor, not knowing its value." He also wrote: "Time pressed so hard that we had to graft

day and night." With this sidelight we can understand how Mr. Fox could figure cost of trees so low, but even this left him in some economic doubt, for he wrote that he "questioned whether trees would pay a fair return upon the capital sunk at the present price of labor. I am afraid that they will not, but our operations for the coming season will be on an extended scale, considering the age of the State." But while he still had doubts whether returns would justify the capital sunk in paying one man and a boy the sum mentioned above per 100,000 trees, still he kept bravely on. His timid expansion secured for him the first prize for the best fruit tree nursery in the State and he maintained a leading position in the California nursery business for a quarter of a century after his doubts began.

Dry-farmed or Irrigated Trees?—Early in the '50s, the tap-root controversy was hot in California as it was at the East, and the prejudice created against transplanting was somewhat troublesome to the nurseryman. The answer is, of course, then as now, that not one in a million of successful fruit trees ever grew from a seed planted in place—which is a complete demonstration that its original tap root is of no importance to a tree. If it wants one, or several, it will make them after transplanting. And so the tap-root issue of the first decade came to naught as that issue always will. Closely related was the controversy, which also arose in the '50s, as to whether nursery trees should be irrigated or not. George H. Beach, the pioneer nurseryman of Marysville, met that issue squarely in 1858 with this declaration:

"About half my nursery trees and vines are grown with and one-half without irrigation. I think those which were irrigated start more thriftily when set in orchard, having softer wood and bark, freer sap vessels and roots better fibered, always continue to do better with the same treatment than those grown without

irrigation. The latter tend to a tap root, while those grown with irrigation send out a multiplicity of roots and fibres and I find the top partakes very much of the style of the roots."

It must be admitted that some of these claims were then, and are still, unsupported by demonstration, but as theories they are quite as good as those which have been constructed against properly irrigated trees.

The Pioneer Landscapist.—Now that California nurserymen are acting upon the conviction that it is a part of their business to offer planters advice about arrangement and handling of plants as well as fill their orders for them, it is interesting to note that at least one pioneer nurseryman laid out his business that way. J. R. Lowe, educated in England, established a nursery and offered to do landscape work, in San Jose early in the fifties. Of him the early official reports says that he was the most prominent landscape gardener and that he laid out handsome grounds, not only in the Santa Clara valley, but in remote places. The report of 1857 speaks of Lowe and of his work as follows:

"Landscape gardening is beginning to be quite fashionable. The careless, irregular, but graceful curves and winding of the carriage drives bordered with flowering hedges, lawns, groups of rare and well-shaped trees, surrounded and mingled, forest-like, with shrubs and running vines, please the admirer of nature more than the old geometric style, with its stiff-set, mechanical forms."

Now that the so-called natural system prevails so widely in California and the formal system is usually restricted to its proper elements and surroundings, it is interesting to remember that next to Nature itself, the natural system was first practiced professionally by J. R. Lowe, as a part of his regular nursery business, early in the first decade.

Colonization in California.

[Compiled for the Pacific Rural Press].

SECOND PAPER.

[The following is a discussion of the significance of the facts about methods of colonization recently produced in California based on the facts presented in the last issue of this journal from the report of the Commonwealth Club. What follows is compiled from the summary of the report prepared by Dr. Elwood Mead of the University of California. —Eds.]

Settlers Who Made Good.—Ten years ago California presented unusually attractive opportunities for settlers with small capital. There was still some fertile public land. The great wheat and stock ranches were being sold at low prices—from \$10 to \$50 an acre.

Farmers with very little capital could buy farms and meet their payments from crops. This attracted a large number of settlers from other sections of the country who have generally succeeded and done much to develop and demonstrate the possibilities of intensive agriculture in the State.

Coming of the Speculator.—Unfortunately, these conditions also made the State an attractive field for land speculators. In localities where wheat land could be bought for \$25 an acre, orange groves and vineyards were selling for \$100 to \$300 an acre and paying interest on these prices. In no other part of the country was there so great a difference between the prices of land before and after subdivision. A great business developed in the purchase, subdivision, and colonization of farm lands. Real estate operators and land salesmen from the over-done and less profitable fields of the Middle West flocked here, not to develop agriculture, but to exploit it. Land to them was merchandise, to be bought at the lowest possible price and sold at all the colonists could be induced to pay. Land purchased at \$10 to \$40 an acre was after subdivision raised to \$75 and \$150 an acre. In one instance a tract of land bought originally at \$5 an acre was sold for \$15 an acre, then subdivided and sold to colonists at \$125 an acre.

How Their Victims Fared.—The real farmer who came here from other sections of the country looking for a home, who had no intention of speculating and could not afford to do so, found himself in an atmosphere which often swept him off his feet. When he was told that if he would make the first payment, the land would do the rest, he accepted this as reliable advice, invested nearly all his capital in this first payment, and the land did the rest, which too often was to turn him adrift with the loss of his money and the gain of some useless and disagreeable experience.

Instances of Exploitation.—This rise in land prices was arbitrary and artificial. It was not the result of profits of cultivation. It was not due to a demand for land, because these colonization enterprises were spending huge sums of money in lurid advertising and personal solicitation to induce people to come here. Commissions on sales rose from 5 per cent, which had hitherto

been the rule, to 20 per cent and even 30 per cent of the selling price. The price that our settlers have paid for the privilege of buying small farms is so far beyond the value of the services rendered by the colonization enterprises as to require a change in methods even if there were no other reasons for such change.

For example, in the Orland colony land before subdivision sold at \$10 to \$40 an acre. All that the colonizer did was to subdivide and sell it. The average selling price was \$136 an acre. The settler paid \$100 an acre to secure a chance to develop the country. At Willows land bought by the colonization company at an average price of \$37 an acre was sold to colonists for an average price of \$130 an acre. Here the settler paid his captor \$90 an acre. In the Oakdale district wheat farms were bought in large tracts by colonizers at \$10 to \$40 an acre. They sold them to settlers at \$75 to \$300 an acre. These examples are typical of what took place all over the State.

It is reported that the syndicate which bought and resold the Haggin Grant to another body of speculators, made a million dollars' profit. An Eastern banker took away a quarter of a million dollars, the profit from buying and subdividing a comparatively small area.

It may be thought that the public has no interest in how much the speculator makes or how much the settler pays. We once thought that the public had no interest in the amount of watered stock sold by corporations. Now we know it is a public question of first importance and the sale of land at prices above its productive value is as detrimental to the public welfare as the sale of watered stock.

Our Land Prices Unreasonable.—One of the reasons why so few settlers are coming here is that they can buy land elsewhere for less money. The average price of unimproved land from Maine to Pennsylvania is \$37 an acre, in the South Atlantic States \$24 an acre, in the country north of the Ohio and east of the Mississippi \$75 an acre, in the States west of the Mississippi \$60 an acre, in the South Central States \$24 an acre and in California \$110 an acre. In other words, the man with small capital can buy three acres of unimproved land in States like New York and Pennsylvania for what it will cost him to buy one acre here. He can buy four acres in the Southern States for the price of one acre here. He can buy two acres in States like Iowa and Kansas for a little more than he would pay for one acre here.

Need Longer Time in Paying for Land.—The people who planned colonization schemes in this State had apparently very little knowledge of what it costs to improve a farm or what can be made out of it. Either that is true or all they cared for was the first payment; because the time of payment was altogether too short and the interest rate too high to give the average settler any reasonable chance to survive.

Generally speaking colonization companies ten years ago gave set-

tlers four or five years' time in which to complete the payments for their land. Those beginning within the last two years make the time ten years; those that are planning to begin in the future are considering twenty years.

The other countries of the world where land settlement has been made a State policy and the profits of agriculture carefully worked out, the time for payment runs from thirty-five to seventy-five years. How, then, can our settlers, buying the highest priced land in the world, pay out in the time allowed in this State? The answer to that is that those who expect to earn the greater part of the cost of the land and improvements out of the soil cannot do so and have not done so.

How Settlers Have Been Helped.—At the Van Nuys colony the settlers of small capital were in trouble as soon as the first deferred payment became due. They could not meet it. The success of this colony, for it is a success, was achieved by those interested in the company lending large sums of money to settlers with which to make improvements. This included \$60,000 with which to establish poultry farming, and large sums for the erection of canning factories, and for extending the time of payments.

The four years' time given in contracts at Shafter does not mean anything, because the management of the colony is willing to give any settler who is industrious and who makes improvements ample time, and those who are behind this enterprise have ample capital to continue this policy.

At Fairmead the management of the colony is assisting the settlers to obtain loans. The most success-

ful colonies in the Oakdale district are managed by a local banker who is in himself a rural credit system. The settlers of limited capital at Patterson, Kerman, Wilton, Carmichael and other colonies have only been able to retain their homes because compliance with the contract is not insisted upon. Los Molinos is prospering because the company was able to forego payments and furnished a large sum to finance improvements. At Orland many of the settlers have paid neither principal nor interest since they took their farms, although the entire contract period has elapsed. At Willows the Sacramento Valley Irrigation Company, one of the largest enterprises in the State, has voluntarily remitted all unpaid interest and given its settlers new and longer time contracts.

Irresponsible Promotion.—But there are other colonies where the company selling the land owed money and had no financial resources. They depended on the payments of settlers to meet their own obligations and when these were not forthcoming they were in no position to either extend time or give assistance. In such instances a great many settlers have lost their all because of having undertaken to pay for land under plans which are financially impossible.

In a number of colonies only two or three settlers remain out of scores, and this is not always because the land is not good but because the settlers did not have sufficient capital to begin with or were not given time to earn it from the land. It would seem, therefore, that some supervision or regulation of these matters by competent authorities would be in the interests of all concerned.

Alfalfa-Growers!

get the facts about Hairy Peruvian Alfalfa

Hairy Peruvian produces 2½ tons more per acre than the ordinary varieties of alfalfa, and one ton more per acre than the famous smooth Peruvian alfalfa.

HAIRY PERUVIAN is a thoroughly tested plant. It has been tried out and endorsed by the Arizona State Experiment Station, and by growers in both hot and cold countries. It produces heavily in all climates practically the year round. Does well at 6000 feet, or at sea level.

HAIRY PERUVIAN produces large leaves from the top to the crown of the plant, and as the leaves contain the greatest and best part of the food value, this is the most important reason why you should plant Hairy Peruvian.

Don't fail to plant Hairy Peruvian this season. Send for folder containing facts and testimonials.

Germain
SEED & PLANT CO.

328-328-330 So. Main St.,
Los Angeles, Calif.

Produces 2½ tons more to the acre than common alfalfa

It is impossible for the settler who comes here, especially the settler from a humid section, to be able to determine whether the water supply is adequate, whether the land is troubled with alkali or whether it needs drainage, and he is in danger of being misled. Even the Native Son cannot always protect himself. To take an extreme case, our committee found some settlers on a dry area who had been sold land on the guarantee that it had an undisputed water right and an inexhaustible supply. This was all true enough, but the supply was 300 feet below the surface and it would cost many times as much as it was worth to spread it on the land and the right to it was undisputable because no one cared to contest it.

Character of Settlers.—The first settlers of California were a superior body of men and women, enterprising, intelligent, and patriotic. They represented all that was best in American life and American character; and it is owing to this fact that California has become a great State—a leader among States in its social and political institutions. It would be a calamity if that leadership should be lost by impairment in the quality of rural communities. In a few instances this matter has had consideration, but in too many cases the only question asked about a settler was the amount of money available for the first payment on land, and a welter of races, industries, and inexperience has been gathered together in these new settlements. This is not mentioned to urge the exclusion of any one, but to show their need for public oversight and guidance to help them enter on the most highly specialized forms of agriculture or horticulture and to bring about a friendly and harmonious social and political life in rural districts.

Need for More Young People.—Another menace to our rural life is the movement of farmers' sons and daughters to the cities.

High prices for land and hard conditions of payment make it so difficult for them to purchase farms that settlement is quite largely restricted to those who have lived long enough to accumulate considerable money. The average age of settlers in the colonies studied was 43 years. Too many have reached an age when they should be leaving the farm rather than beginning its development.

Growing Menace of Tenant Farming.—Tenant farming has always had an important place in the agriculture of California, but with the rise in land prices and the adoption of intensive cultivation it has taken on a new and less desirable aspect. In the earlier history of California the tenant farmer was an integral part of the community. He was, as a rule, an American with an interest in political and local affairs, and as ready as the land owner to work for the up-building of the neighborhood.

In recent years, however, tenant communities have been growing up in California made up largely of Asiatics or peasants from those portions of Europe where life is sordid and standards of living are low. These tenants have little or no interest in community affairs. They maintain their racial indifference and aloofness. They are not a contribution to our political or social

strength. Their willingness and ability to pay high rents does not come so much from better methods of farming, though as a rule they are good farmers, but because they live more frugally than the American or the immigrant from Northern Europe.

It is undoubtedly true that many land owners can obtain a higher return from their land by renting it than in any other way, and it is also probably true that the class of people who form the bulk of the tenantry are living better than ever before; but that does not mean the kind of community life which is being created is desirable or that this sort of development can become permanent without lowering the standard of the State's civilization. In other words we are creating tenant slums on the great landed estates.

A New Era in Colonization.—With the bursting of the speculative colonization bubble a new spirit has been born in land settlement. Those interested are beginning to study the question from the standpoint of the settlers' needs. This is planning colonization in accordance with the Golden Rule in which the seller shares the risk with the buyer. It is in accordance with the spirit of fairness which has been prominent in California in the past. It will, I am certain, dominate this development in the future.

The manifestation of this spirit does not, however, render less necessary and desirable the placing of colonization under public supervision and control. This question needs to be studied from the standpoint of public welfare and the larger State interests. We need to protect

the settler and the honest colonizer from the encroachment of the unscrupulous. Regulation, however, is not enough. The time is near at hand when California will have to take this up as a constructive matter. The best that we can possibly hope to accomplish does not equal what is being accomplished in Ireland, Germany, Denmark, Australia, and South America.

FRUITS ON QUINCE ROOT.

To the Editor: What kinds of fruit can be grafted onto quince root?—J. C. S., Ontario.

[Answered by Leonard Coates, Morganhill.]

[All pomaceous fruits, such as pear, apple, hawthorn, loquat, medlar, etc., may be grafted, with varying success, on the quince.]

For Every Orchard

Orchard Brand Lime Sulphur Solution controls San Jose Scale, Peach Blight, and Shot-hole Fungus.
Orchard Brand Bordeaux Mixture Paste controls various fungous diseases on apple and stone fruits.
Universal Brand Crude Oil Emulsion controls Scale insects and kills Aphis eggs.

Alfalfa Seed From Cultivated Rows.

[Written for Pacific Rural Press by J. M. Bomberger, Modesto.]

The Pacific Rural Press asked me for a report on my experiment on growing alfalfa seed in cultivated rows.

I will first explain my reason for trying to grow seed in cultivated rows.

In 1910 I bought what was supposed to be common alfalfa seed grown in Nevada. The alfalfa produced from this seed was remarkably different from other alfalfa that I was growing. The yield was heavier and it grows very early and late in the season so that I feed it as a soiling crop from March 10 until after Christmas. I was so well pleased with this variety that since then I have always bought my alfalfa seed from the same seed house and always asked specifically for Nevada seed; but I have never succeeded in getting the same variety again; so now I have been trying for several years to grow my own seed from a part of the tract which I sowed in 1910.

First I tried to grow seed from it as it is usually grown in this vicinity, by letting the third crop stand for seed; but it was a flat failure with this variety; because the alfalfa kept growing right along even though it was not irrigated. When it blossomed, the plant sent out new growth and the blossoms did not go to seed at all. The result was only a very heavy crop of hay.

Because of this failure, I decided to try growing the seed in cultivated rows, so as to get as much sunshine among the plants as possible, and to keep the plants from shading one another.

I plowed up a portion of the 1910 tract so that the plants were left in rows four feet apart. The result is that this season I secured 300 pounds of seed per acre, which is really a

small yield; but I consider it a great success because I have secured the seed I so much wanted. I would gladly have paid 50c per pound, or more, to secure this kind of seed.

Even with the rows four feet apart, the growth of the plants covered the space between the rows almost completely. Next year I expect to improve the yield of seed by having the rows still farther apart.

In my system of crop rotation I use 150 pounds of alfalfa seed per year. This year I will have some seed to sell and help partially pay for the expense of growing it.

Heavy Seeding Not Wanted.

When Mr. Honeywell of the Pacific Rural Press was at my ranch looking over the seed patch in rows and noticing the rather scanty setting of seed, he suggested that I select seed from the plants which seed most heavily and in that way secure a better seeding variety; but I at once explained to him that that is exactly what I do not want. I want a variety of alfalfa that will grow the largest possible amount of hay; a variety that will have a great tendency toward growing leaves and green parts rather than vigorous blossoms and seed. I feel reasonably certain now that I can grow the seed by planting it in cultivated rows far enough apart.

My only object in cultivating between the rows is to keep down the weeds and keep the seed absolutely clean. I do not know that there is any advantage in growing ordinary alfalfa in cultivated rows for seed except to keep it clean of weed seeds; as some of my neighbors on the same kind of soil with ordinary alfalfa grow much larger crops of seed per acre by letting the third crop go to seed than I have grown in rows.

Winter Pasture for Wet Land.

To the Editor: I would like to have your advice on planting Sudan grass now. Also, red top clover. I have been told that now is a good time to plant. My land sometimes overflows. I want something for green feed during the winter months. —C. F. C., Santa Cruz.

[Answered by Prof. F. B. Kennedy, University of California.]

It would not be advisable to plant Sudan grass at this season of the year in Santa Cruz. It is a heat-loving plant, and the seed would be sure to rot with our cold rains. It is also very sensitive to even light frosts. The time to plant it in the vicinity of Santa Cruz, provided one is far enough back not to be influenced by the fogs, would be about the first of March, or whatever would be considered in that vicinity as good corn-planting time. The plant likes abundant heat with moisture, and the yield procured depends very largely on these two factors, the character of the soil being a secondary consideration, except that it must be well drained.

Your correspondent could not do better than plant his bottom lands to Italian and perennial rye grasses, sowing now at the rate of about 35 pounds per acre broadcast, and harrowing lightly.

I do not know exactly what is

meant by "red top clover." The common red clover of course has a blossom with a red top, but there are two distinct forage plants, one of which is recognized as Red Top, a grass, and the other, the common clover, or red clover, a legume. The red clover, however, would not do well on land unless it is well drained. If the land is only flooded for a short period, and the water drains off readily, it would not perhaps do very much harm, but it would certainly be killed out where the water is allowed to remain on it for any length of time. The red top, which is the grass, would not need, however, to have drained land, and when established would even grow up through the water.

If you want to plant a clover, the one that would more nearly answer your purpose would be the Alsike clover.

Thousands of acres of the great "pocket" lying between the Modesto Irrigation District and the San Joaquin River, are being put in shape for rice cultivation, six miles west of Modesto this season. The services of an expert rice grower have been secured for the management of the new venture.

"LEAKY" POTATOES CAUSED BY FUNGUS.

To the Editor: What causes
"leaky" potatoes and how can we
avoid them?—Subscriber.

[Answered by W. V. Shear, Stockton.]

"Leak" of potatoes has recently
been determined definitely as due to
a fungus—*Pythium debaryanum*. It
annually causes enormous losses to
potato growers in the delta section of
California and sometimes in other
sections. Potatoes affected with this
disease decay very rapidly; and be-
cause the decay appears as a watery
dissolution of the tuber, the term
"leak" has been given to it. This
trouble occurs almost entirely dur-
ing warm weather before heavy
frosts occur in the fall. The infec-
tion is almost always caused by
inoculating the tubers by fork punc-
ture or other wounds during the dig-
ging of the potatoes. The fungus
is present in the soil and finds an
entrance into the tuber usually
through some abrasion of the skin.
Occasionally it may obtain an en-
trance through the minute breathing
pores of the skin. After a tuber is
inoculated, the fungus develops very
rapidly if the temperature is favor-
able—85 to 95 degrees. If the
wounds are sufficiently exposed to
the air so that the surface of the
wound is dried quickly, no infection
is likely to take place. The only
remedy so far known for this dis-
ease is to prevent the wounding of
the tuber if they must be harvested
during warm weather. The imple-
ment ordinarily used for digging
potatoes in California is a sharp,
round-tined fork. This makes an
ideal inoculating instrument when
it enters the tubers; and if condi-
tions for development of the fungus
are favorable, the great majority of
these punctures produce "leaky"
potatoes. A heavy frost, especially
if followed by a rain, seems to de-
stroy this fungus, or at least to ren-
der it incapable of infecting the po-
tatoes, as after a severe frost occurs
very little trouble is experienced
from this disease.

GERMAN MILLET.

[Written for Pacific Rural Press by
D. L. Schrader.]

In the first prize Kerman booth
at the Fresno Fair last fall was a
notable display of German millet
grown by G. P. Guernsey. It is a
very profitable forage crop and
chicken feed, says Mr. Guernsey.
Stock clean up the forage and do
well on it. The seed are fed with
good results not only to chickens,
but also to hogs which fatten fast
on this feed.

The seed is planted as soon as
danger of frost is over. The growth
is cut two or three times for green
feed before allowing it to mature for
harvesting.

HOT-HOUSE CUCUMBERS.

To the Editor: What variety of
cucumbers is used by hot-house men
for this locality, and where can I get
seed?—H. E. R., Santa Cruz.

[Answered by C. C. Morse & Co.]

The "hot-house" cucumbers are a
special variety and entirely distinct
from those grown for general pur-
poses. These cucumbers have very
small seed carriages, grow long and
straight. One of the best varieties is
the Telegraph and this we can sup-
ply in small packets for 25c each.
Packets contain about 20 seeds.]

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

15 Draw Bar H. P.—35 Belt H. P.

The Tractor Question Solved

THE SANDUSKY TRACTOR is adapted to a wide range of service.
Convenient in lining up; belt clutch control. Pulley is direct con-
nected to crank shaft of motor, which is set crosswise to frame,
eliminating all gearing. In this character of work, power ranges
economically from one hundred fifty revolutions per minute to stand-
ard belt speed for heavy farm machinery. Ideal for individual or
small community requirements.

THE SANDUSKY TRACTOR is a four-cylinder, three speed, all-
steel machine. The wide drive wheels and scientific distribution of
the weight of machine, create a pressure per square inch on the
ground, far less than man or animal and absolutely will not inju-
riously pack any ground it works upon.

OUR GUARANTEE

We guarantee THE SANDUSKY TRACTOR to be 15 H. P. at the
Draw Bar and 35 H. P. on the Belt; to handle four 14-inch mold-
board Plows, eight inches deep where a big team can pull one 12-
inch Plow six inches deep, to run Belt Machinery up to a 32-inch
Separator; to have one-third reserve over its Draw Bar rating and
for one year against defective workmanship and material.

Try it before you buy

We give you a 3-day free trial on your own farm, demonstrating its
ability to fulfill our guarantee. A handsome 40-page booklet fully
describes the design, construction and ability of "The Little Fellow
with the big Pull." Sent on request.

**160 ACRE
FARMS IN
WESTERN
CANADA
FREE**

Canadian Farmers Profit From Wheat

The war's devastation of European
crops has caused an unusual demand
for grain from the American Con-
tinent. The people of the world must be
fed and wheat near \$2 a bushel offers great
profits to the farmer. Canada's invitation
is therefore especially attractive. She
wants settlers to make money and happy,
prosperous homes for themselves by
helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE

and other lands at remarkably low prices. During many
years Canadian wheat fields have averaged 20 bushels to
the acre—many yields as high as 45 bushels to acre.

Wonderful crops also of Oats, Barley and Flax.
Mixed farming as profitable an industry as grain rais-
ing. The excellent grasses full of nutrition are the only
food required for beef or dairy purposes. Good schools,
churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there
is an extra demand for farm labor to replace the many young
men who have volunteered for the war. The Government is
urging farmers to put extra acreage into grain. Write for litera-
ture and particulars as to reduced railway rates to Supt. of Im-
migration, Ottawa, Canada, or

Gilbert Roche, Canadian Government
Exhibit, San Diego, Cal. Canadian Gov't Agt.

FIELD CROPS.

Another week of fair weather will take all the rice out of Butte Co. fields.

It is estimated that the Sutter Co. bean crop this year will bring close to \$3,000,000.

Seven thousand acres have been signed up for beets by the Corcoran Sugar Company for the coming season.

The crop of the bean growers in Sutter county this year will bring in more than \$3,000,000 with big prices prevailing.

The San Joaquin Valley Stockmen's Association are working for the establishment of a slaughter house at Fresno.

A cannery is being built for the Alpaugh Co-operative Cannery Company who plan to can meat, vegetables and fruit on a large scale next season.

Tulare has one of the largest corn crops that they have had in years. Rain has done very little damage. Most of the crop has been contracted for at about \$35 a ton.

This year's bean crop in Merced county is now sold. It totaled 4,830,250 pounds. High prices prevailed due partly to the failure of the white bean crop in Michigan.

It is reported that hemp will be planted on a large scale next year in the delta of San Joaquin. The war in Europe has made prices of this production rise to double those paid in normal times.

The potato crop is to be more than 50 per cent short. There is a demand in Eastern States and the probability of higher prices before the end of the winter is the present state of the potato market.

One of the large land owners of Yuba Co. has announced that he will immediately plant 40 acres of his land south of Marysville to cabbage. He expects to supply the markets in Seattle, Denver, and San Francisco.

The newly installed equipment at the plant of the Pacific Coast Company at Santa Monica gives facilities for the handling of 4000 sacks of re-cleaned beans daily. The enlargement was compelled by the number of rush orders.

On account of the ravages of water grass rice farmers in the Gridley-Biggs district are planning rotation of crops in the hope of killing the pest. It is believed it can be killed in two or three years. It is proposed to try sugar beets.

The Pacific Rice Growers' Association has failed to sign up 75 per cent of the California rice crop, and so that organization will not handle the crop for 1916. The Japanese could not see their way clear to come in on such notice, but say they will consider the matter favorably.

Donald H. Graham of Lancaster, Cal., writes under date of Nov. 11: "I have just finished my sixth cutting of alfalfa. Just got it cut before several nights of hard frosts. I am irrigating now for alfalfa pasture during winter for my hogs. Expect pasture to last until Jan. 1 to 15. I will irrigate again in February for early spring cutting."

There promises to be a big increase in bean acreage in Southern California this coming season. Estimates in the vicinity of Oceanside make the bean crop this year over 70,000 sacks, the larger portion of which will be limas. About 20,000 sacks will come from the territory south of Oceanside and the remainder from the Santa Margarita ranch.

The Lemona ranch in the Riverside section, above the Gage canal and adjoining the new citrus experiment station tract on the north, will plant about 40 acres of winter tomatoes between the rows of young citrus trees and ship in carload lots during the winter months to the

hungry and appreciative eastern markets. The plan is experimental.

Owing to the refusal of the Asiatic rice growers in Southern California to join the California Rice Growers' Association until 1917, that association will not handle the 1916 crop. J. H. Stephens, president of the association, states that he expects to have 90 or 95 per cent of the California rice crop signed up for 1917, when the marketing will be done through co-operative action.

DECIDUOUS FRUITS.

An effort will be made to bring the 1917 season of the California Fruit Growers' Association to Modesto.

Successful meetings of prune and apricot growers in Solano county are held. Organizations will probably be effected soon.

It is estimated that the peach growers of California will receive about \$3,000,000 for their 1916 crop, \$2,000,000 of which has already been paid.

The California Peach Growers' organization indorses the work that is being done to organize the prune and apricot growers into a marketing organization.

A week's series of vine and tree-pruning demonstrations is now being arranged by Farm Adviser Charles M. Conner for December 4 to 9 at the University of California's Kearney Farm in Fresno county.

The California Peach Growers have again advanced the price of standard and choice yellow dried peaches. This time the prices on standard were increased from .06 1/2 to .06 3/4; choice from .06 3/4 to .06 1/2.

Notwithstanding the unusually low temperatures that have prevailed throughout the current week, and fruit and vegetables were nipped by the heavy frost here and there, it is thought by growers and vineyardists that the damage will be trifling, as they had ample warning and had made preparations accordingly.

S. F. Price, who owns a 16-acre apple orchard near Cloverdale, sold 23 1/2 tons of dried apples from it this year, for which he received \$2,800. Mr. Price says that about 175 tons of dried apples were shipped out of Anderson Valley this year, some bringing as high as 6 1/2 cents a pound—\$130 a ton!

CITRUS, NUTS, SEMI-TROPICAL.

The orange pack is on in full swing in Oroville.

It is estimated that the Lindsay orange crop this year will approximate 2,400 cars.

Los Angeles county refused to pass the 8 to 1 ordinance asked by the Calif. Fruit Growers' Exchange.

Foggy weather and rain have delayed the closing of the Goleta and Carpinteria walnut packing house several weeks.

Washington navel oranges from the Kern mesa are arriving at Bakersfield. It was estimated that the crop will be 35 to 40 carloads.

Orange picking began in Fresno and Tulare counties this week. The bulk of the crop is still quite green, but a small quantity was ripe enough for the Thanksgiving trade.

The oldest orange grove in Lindsay, now owned by Lewis Larson, is so loaded with fruit that Mr. Larsen has been obliged to prop every tree. He expects to receive for his crop about \$11,000.

State Sealer of Weights and Measures Johnson has ruled that "olives in brine should be marked with a statement of the net weight of the olives, exclusive of the weight of the brine."

Apple packers from Washington and Oregon have invaded Oroville and are awaiting the opening of the

Reliable!

The BEAN is reliable—dependable! It represents over 30 years of study and experience. It will stand up to the hardest work day in and day out—week in and week out—and that's the kind of a sprayer you want. BEAN reliability is a feature of all

BEAN Power Sprayers

from the sturdy little one-man, one-horse Eureka to the big Bean Giant Triplex, which fairly eats up the work. The BEAN is reliable because every part and detail is reliable:

—BEAN AUTOMATIC PRESSURE REGULATOR holds the pressure at exactly the desired point. It never fails.

—BEAN THREADLESS BALL VALVES never stick or corrode tight—and they can be opened up in a few seconds without stopping the engine;

—BEAN PORCELAIN-LINED CYLINDERS will outlast the pump;

—BEAN ECCENTRICS are much more durable than cranks;

—THE STURDY NOVO ENGINE AND THE BEAN PUMP (the only pump without a stuffing-box) require practically no attention.

Spray now! See your nearest Bean dealer—or mail the coupon to us—at once.

orange packing season here. The prevailing chilly weather will hasten the coloring of the fruit.

With the co-operation of the Navelencia-Orange Cove district as exhibitors at the seventh annual Tulare County Citrus Fair, Dec. 6 to 13, in Visalia, the entire central California orange district is assured.

Much of the olive crop about Fresno and Madera will not be available for picking, because of the heavy frosts prevailing nightly throughout the past week. The olives can be used for producing oil however.

The southern citrus counties have rejected the plans for the adoption of an orange maturity law. The fruit is coloring rapidly and many of the growers demand the right to ship fruit in its tree-ripened condition regardless of the chemical content.

Orange County, in the heart of the Southern California Citrus belt, has refused to adopt the 8 to 1 test for the county. With the similar action of Los Angeles county recently it is evident that Southern California will now oppose the 8 to 1 standard for determining when oranges are ripe.

Officials of the Tulare County Protective Association, under whose direction orange standardization laws are to be enforced, have been notified by the railroads that they will not handle oranges this year unless the bills of lading for the fruit are accompanied with a certificate that the fruit meets legal requirements.

Boydston Brothers, owners of the Boydston Heights orange groves in the Worth district, Tulare county, have purchased a tract of 160 acres of lime rock, about four miles east of the Worth school. Ground limestone has been found valuable in the treatment of heavy adobe orchard soils, and heretofore all this material has been imported from Southern California.

Unusual efforts are being made by traffic officials of the Southern Pacific to bring into the district sufficient refrigerator cars to handle the early orange crop. Trains of empty cars are being rushed to Calif. from as far east as N. Y. City; and to bring in box shooks from the north empty cars are being forwarded to the mills in Oregon and Washington.

GRAPES.

Nearly 150 tons of raisins were stemmed by the Live Oak Stemming Assn. this season.

The price of California grapes has been brought down in New York by the heavy arrivals of Almeria grapes from Spain.

Several Kings Co. ranchers have installed raisin driers and will dry their second crops instead of sending them to the wineries.

The Tokay grapes shipped from the Lodi district total about 2,500 cars. About 30 cars a day are being shipped from Lodi, Woodbridge, and Victor.

The winery on the Guglielmetti ranch in Chileno, west of Petaluma with the entire contents, including 80,000 gallons of wine, was destroyed by fire on the morning of Nov. 14th. The loss will be in the neighborhood of \$20,000, partly covered by insurance.

The Stewart Fruit Company of Selma is packing some fine grapes of the Flame Tokay variety. They are placed in drums, surrounded by sawdust made from redwood, and kiln dried. Thirty pounds of the grapes are placed in each drum. They are so well protected they will keep for several months.

Consul Frost at Genoa, Italy, reports that Italy's grape crop and wine production this season will not permit the exportation of any considerable quantity of wine, as last season's shortage depleted the country's stock so that the vintage of the present season will be needed to refill Italian cellars.

George C. Husmann, pomologist

in charge of viticulture in the United States department of agriculture, is in Fresno for the purpose of selecting several pieces of land of different soil type on which to test out currant stocks for commercial purposes. Good crops have been taken from a Fresno vineyard and also from an Oakville farm.

Investigations of vineyards in Tulare county, by County Horticultural Commissioner Fred P. Roulard, show that the leaves of infected vines recently stricken with an obscure disease, turn yellow and drop off, and in about four weeks small leaves come out that show the effects of a choked plant. On examination the roots are found to be black.

In four days last week telegraph, cable and long distance telephone orders from nine American cities and three foreign countries reached the Calif. Associated Raisin Co. which disposed of \$4,000,000 worth of raisins, the largest sale of Calif. fruit of any kind for that period of time. It is believed the crop this year can be sold for a grand total of \$10,000,000.

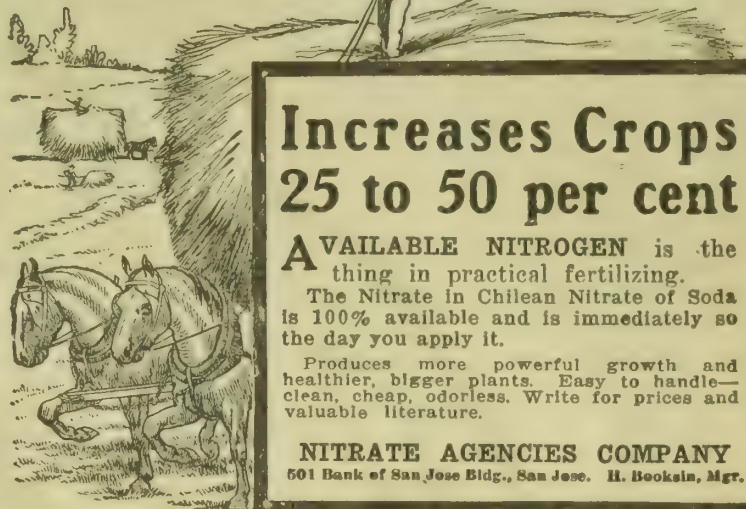

MISCELLANEOUS.

Imperial Valley is being invaded by English sparrows. They are said to be so numerous and pugnacious that they are running away more peaceable and more desirable birds.

The burnt ruins of the old mill at Merced have been rebuilt into a bulk grain elevator by Hulls and Boyden, old millers of the early days, who bought and shipped some of the last crop, even before the elevator was finished.

The Nicholls-Loomis Co., the well-known hay and grain dealers of Los Angeles, have bought three acres of ground in the heart of the industrial district, and have erected a commodious brick structure for the transaction of their business.

Horsepower

630000 IN USE

The Model 75 and 75 B Series of Overlands has shattered all selling records.

Already there are 63,000 in use.

The whole country is buying this Overland.

The demand is huge and steady.

Such smashing value was of course bound to make this the fastest selling complete automobile ever offered.

The motor is a wonder—full 31½ horsepower.

But though unusually powerful it is wonderfully economical—20 to 25 miles on a gallon of gasoline is the usual report.

It holds the road better, and rides more comfortably at all speeds than any other car of its size.

It has cantilever rear springs, four inch tires and an exceptionally long wheelbase for a car of its price.

No need to hesitate about buying a car with such a selling record and so many advantages.

See the Overland dealer today, get your \$635 Overland now and have it for some of the finest driving weather of the year,—while you've time to use it. Put up the side curtains this winter and go anywhere, anytime and in comfort regardless of the weather.

Catalog on Request. Please Address Dept. 583.

The Willys-Overland Company, Toledo, Ohio

"Made in U. S. A."

casings will be in water-bearing strata and solid casings everywhere else.

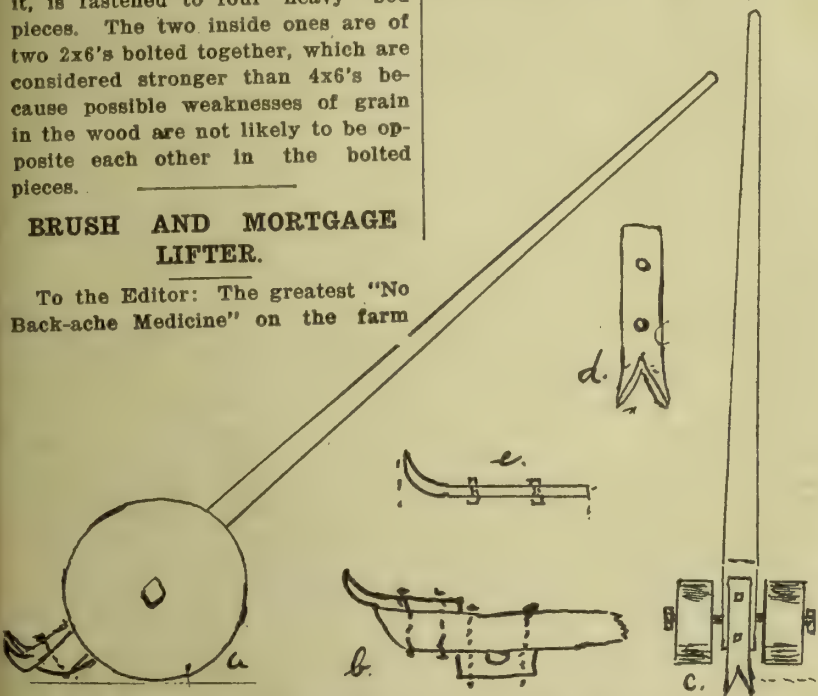

Concrete Casing Near Top.—A new city well for Woodland, bored last month by Mr. Krotser, had a 16-inch casing 60 feet down and a 12-inch casing inside of that, but extending 118 feet further. The space between casings above the 60-foot level was filled with cement to keep out surface water if the casing should ever rust out.

Cost of Operating Engine.—The engine has been in use for three years, and the only repairs up to date, according to Mr. Krotser, were for natural wear on the ignition point; and that cost just 20 cents. The distillate used is 9 gallons per week of 8-hour days, boring steadily.

Solid Engine Bed.—If anything strains an engine and causes wear, it is a wobbly foundation. This engine, being mounted on a long wagon with well-boring gear at the end of it, is fastened to four heavy bed pieces. The two inside ones are of two 2x6's bolted together, which are considered stronger than 4x6's because possible weaknesses of grain in the wood are not likely to be opposite each other in the bolted pieces.

BRUSH AND MORTGAGE LIFTER.

To the Editor: The greatest "No Back-ache Medicine" on the farm

Handy Brush Puller—Better than Team and Chain.
(a) Wheel Cut from Log 4 Inches Thick, 10 Inches Diameter; (b) Block for Axle Bolt, 3x4½x8 inches; (c) Oak Handle 7½ Feet Long and 4½ Inches Square at Base; Axle 8 Inches from Jaw Pull; (d) Jaws Beveled like Hammer to Sharp Pulling Edge; (e) Side View of Jaw, Half-Inch Steel 3x10 inches.

for pulling brush, etc., is not patented nor will it be. I join your paper in making a present to farmers. With it one man can pull and burn ¼ to ¾ acre of brush per day much easier than two men with team and chains.

The cost of construction is \$0.80, for the two half-inch bolts four

Clean Up! Turn bush-land into cornfield, disk your roadsides and kill the chinchbugs. The **Cutaway** (CLARK) **Bush and Bog Plow**

does away with the bushknife, grubhoe and shovel—it's better, quicker and cheaper. The **forged sharp Cutaway** disks penetrate deep, cutting roots, turf and trash and pulverizing the soil. Splendid for deep tillage, a horse and 4 horse. Reversible. If your dealer has not the **genuine Cutaway** write to us direct. Be sure to write us for our new book, "The Soil and Its Tillage." Livestock Facts and Fancies---VII.

[By the Editor.]

We have been talking a good deal about the ideal forms and characters of purebred animals of all kinds as they dawned in the mind of man and arose to realization in his breeding processes. We have also noted the influence of these purebred, selected and prepotent animals in transformation of nature's picturesque forms and capabilities to man's productive or achieving forms. We have glanced at landscapes of California communities, and of the State itself, in which these improved animals may predominate, driving from sight the inferior animals which may be masterpieces of nature's wisdom or man's folly, as the case may be. We anticipate the time when scrub forms will wholly disappear from farming landscapes, just as wild forms have from populated regions, for scrubs are as out of place in intelligent farming as lions and tigers would be in the shrubbery of Golden Gate Park. The scrub does not perform aright: it lacks efficiency and so, failing by this most modern test of value, the scrub must take its blue envelope and go, with other hoboes, to lurk in outer darkness.

And now we drop this line of exhortation and attack another which is fundamental and indispensable and which calls for incisive and insistent action. Although it is hard to find a man now-a-days who will deny that purebreds and high grades will make, as a rule, more meat in less time, more milk from the feed, more draft per pound of weight, more speed in less time, etc., etc., than the scrub, there is often ground for an argument that they do not yield money in proportion to the investment in money, care and the feeding which they need to do their best work. We will not argue this question from a world point of view, for that would rule out the objector's claim so conclusively that there could be no argument. If we take purebreds and their high grades everywhere, there is no doubt whatever that they are in every way more profitable than scrubs of their kind. Still it is true that in some places the grower does not get as much more money from their growth and products as he should. This state of things has existed here and there, in this country and abroad, from time to time, and world-wide testimony is that growers have helped themselves out of it. It has been demonstrated that there is no fallacy in the theory of the superiority of purebreds and their high-grade offspring and there is no room for doubt that when intelligently handled they will produce the value for which they are endowed, but will the grower get that value? That depends not upon what fine animals do for him but upon what the grower does for himself.

It is our conviction that, at the present time, California is a place where there is ground for the claim that the grower of fine stock does not get all that properly belongs to him, and that is not the fault of the growing but of the commercial handling of the product. Our methods of marketing are non-competitive and therefore they conceal and do

not disclose the relative values of good and poor animals. Therefore buyers do not bid upon the intrinsic values of the offerings of different growers. They are glad enough to get the best, but their chief thought is not of the best but of the poorest as well and they worship the "deadly average." They dare not pay just what each lot is worth for it might make the average too high to give the producer of good stuff what he deserves. They dare not offer the producer of bad stuff what he deserves, for they would incur his lasting hatred and free-speaking enmity. And so they go around squeezing the good toward the bad and the bad toward the good, and there is no such discrimination according to quality as there should be, and the man who buys purebred sires and puts lots of money and time in the equipment and supplies for first-class animal husbandry, looks at his check from the buyer and wonders whether he isn't an ass to conceive of and pursue high ideals.

Of course this is not all that there is wrong in the California situation as we see it, but it is a simple fundamental thing and good foundation for an exhortation. It is an old trouble and is not at all confined to animal products. It has discouraged all who have tried to make particularly good products of anything, but it has never been proven in any of them that a good product is not better and more profitable than a bad one. The problem is to get the difference for the good goods, and that is no fault of the goods themselves but in the handling of them. Our fruit producers have come nearer than any other class of California farmers to getting this difference recognized and handed over to them. They have done it by organization, by finding out what is the matter, by grading and standardization, by fixing prices in some cases and by establishing competitive buying in others and so on. In this way the producer of good goods gets what belongs to him and the producer of bad goods gets bounced until he reforms. It is easy enough when you know how. In Europe and in animal product lines it is the glory of Denmark, the greatest agricultural triumph of organization in England, and the economic hope of Ireland. The continental countries of Europe are largely indebted to it for the wonderful endurance in war which they have manifested. It is one of the surest things on earth!

We have said it is easy when you know how, but it is not easy to know how. One of our associates has given considerable time to a quiet inquiry into California conditions, chiefly, as they appear to those inside the present going of the meat business—a part of which was offered to the reader in last week's issue. We propose to keep digging away, hoping to disclose something which will be really helpful in understanding our present commercial meat handling in California and in improving it. But how can the conditions and situations be improved?

There is only one way. The pro-

ducers must help themselves here, as they have everywhere else, by organization which enables them to pursue authoritative inquiry into facts and causes and, having learned these, they will probably have strength and wisdom to do the next thing. Is San Francisco the lowest stock-selling market in the country? If so, why? Are the growers getting what belongs to them, or is someone else getting it? If growers do not, why? If they do not, what has to be done to get it? These are questions which only an inquiry in the interest of growers can answer. If they organize for it they can get expert help. If they appeal to the Division of Markets of the U. S. Department of Agriculture they can probably get an inquiry without fear or favor, and that is what they need. The government is doing this sort of thing in all parts of the country in the interests of producers and consumers, but the government is not going to do much for a lot of people who do not show they care what they get except as they go off in fence corners and bellow and squeal over it.

It is really too bad that we have no general stock-growers' association in this State which has the collect-

ive strength and readiness of the mass of plain stock people. Efforts at organization hitherto have interested chiefly the big interests. Their purposes have been too exclusive and their costs of membership too high. Some day we shall have, we hope, a really popular organization in which all can participate. But we do not need to wait for that. We have a California Swine Breeders' Association which is popular and reasonable in its purposes and requirements. Next January it will hold a convention in Los Angeles. If it should lay out its program for that meeting so that the chief addresses and discussions would uncover marketing situations and conditions in this State, and get the great hog handlers and the growers together in frank conference, the chances are that things very important and significant would be better understood, and the Swine Breeders could then make their declarations and lead all other stock-growers into organization which would have power and wisdom to do the things which need to be done. There is only one way to do things, and that is to do them. The Swine Breeders have a chance to lead toward the doing.

How Good is Your Grade Cow?

[Written for Pacific Rural Press.]

Do good dairy cows just happen or can you depend on getting them by intelligent breeding, selection, and feeding? It was to show by practical illustrations in California

with a test of 3.4 per cent fat; also a seven-day record of 550 pounds of milk containing 18.5 pounds of butterfat.

Writing of this cow's work Messrs.

Her Third Pair of Twins in 22 Months, Sired by a Registered Bull.

that breeding, selection, and proper feeding are essential to the dairyman's welfare that this journal suggested in 1915, the holding of a State dairy cow competition under the auspices of the University of California, and later donated a liberal monthly prize for contestants.

As we have previously written, it seems certain that good breeding will play an important part if past experiences are any criterion. In this connection we are reproducing a photograph of a grade cow and her calves owned by Leedom and Son of Merced county, which has given as much as 75 pounds of milk a day

Leedom say: "This is a picture of one of our cows and her twin calves, the third set she has dropped in 22 months. She is not a registered cow, in fact our whole herd of 22 head are only high-grade Holsteins, although we always keep a registered bull."

If owners of such cows will enter them in the coming competition they will not only receive financial benefit themselves but will do a great good for the dairy industry of the State as well. Application blanks and full information about the contest may be secured by writing to F. W. Woll, University Farm, Davis, Cal.

UNIRRIGATED SUMMER FEED.

Few dairymen in San Luis Obispo county make a year-round job of milking because of the scarcity of wild pasture in the late summer and early fall months.

An exception to this rule is found on the dairy of Forest W. Wood, who has a steady demand for milk among his retail trade that necessitates a different system of management than pasturing alone.

Alfalfa hay is purchased in quan-

ties; but its expense warrants the substitution of as much home-grown feed as possible and this is amply supplied by silage.

With the exception of about six weeks in the year, silage constitutes a part of the daily ration of the cows, a 100-ton silo answering this purpose admirably. It is more than filled from the 15 acres of bottom land planted each year to corn. As the silage usually lasts till late summer, green feed is provided the balance of the time with green corn.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

N. H. Locke has taken a show herd of his registered Jersey cattle to the Arizona State Fair which is held at Phoenix.

Alexander and Kellogg of Suisun report a heavy demand for Milking Shorthorn bulls of serviceable age. They have eight head of cows on official test at this time.

The Sacramento spring sale of registered Holsteins, under management of the Calif. Breeders' Sales and Pedigree Co., will be held at State Fair Grounds May 25 and 26 next.

Irving D. Ewart of the Success district, whose ranch is particularly adapted to dairying, has just purchased from F. D. Helm of Fresno 25 head of very choice registered Holstein-Friesian cows.

J. W. Benoit of Modesto, a Holstein breeder, says his herd averages 70 pounds of milk daily. He attributes his high average to a ration composed of crude molasses, alfalfa meal, rolled barley and oil meal.

The Modesto Milk Products Corporation of Delaware is installing a milk supply station at Crows Landing to receive the product of more than 1000 cows from that section. This will increase its present output.

Lester A. Driver of Nicolaus purchased a fine young herd bull at the Sacramento Holstein sale on Oct. 26 and 27. His sire is from Aralia de Kol, who was the first cow in the world to produce 28,000 pounds of milk in one year.

Jas. McGilvarey of Sacramento county has recently purchased a large ranch near Galt and announces that he will start development work on it at once with the idea of making it the future home of his large herd of registered Holstein cattle.

The Jersey cow Gertrude, owned by A. J. Morey, leads the list for the best butterfat producer in the Orland cow-testing association for the month of October. David Brown's Durham is second on the list. The predominating breed of cow is Jersey, fully 60 per cent of those tested being of that class.

F. Stenzel reports recent bull sales to the following: Herman Berg Marysville; Braun Bros., Rio Vista; W. B. Knight, Vallejo; D. McIsaacs, Tocoloma; J. T. Martin, Arizona, and Howard Shaffer Estate, Rio Vista. The last named firm secured Aggie Grace Pontiac Creamelle, a brother to the California champion 2-year-old and out of a 23-lb. cow.

Among others who are taking advantage of the winter months to do official testing with their purebred cattle is the Henderson Co. of Sacramento county who have several head on weekly and 30-day tests at this time and who expect to test everything that freshens during the next few months. Superintendent Jay Dutler has the cattle in good physical condition and expects some very creditable records.

Permanent organization of the Sacramento Valley Milk Producers' Association was effected at a meeting of the promotion committee of the organization, held in the Travelers Hotel Nov. 11. J. M. Henderson, Jr., was elected president and J. H. Guill, Jr., of Chico, Secretary. President Henderson appointed a committee consisting of F. H. Harvey of Galt, John Watson of Dixon and F. L. Morris of Woodland to draw up tentative articles of incorporation, to be presented for ratification at the next meeting of the committee.

BEEF CATTLE.

W. Bemmerly of Yolo county has just purchased a new herd sire in the East for his herd of registered Herefords.

The 1916 annual convention of the California Cattlemen's Protec-

tive Association will be held at the Palace Hotel, San Francisco, Nov. 25.

The decision of the Cutler Bros., near Visalia, to build up their herds with blooded Herefords, is taken among cattlemen to be a decided forward step. Dairy herds are even now being built up rapidly, but the range cattle still roam at will.

C. A. Noyes and Son of Sutter City have recently purchased a registered Hereford of Prime Lad breeding from the University of California. She is bred to Cal. Prime Lad and will be added to Messrs. Noyes' foundation herd of good Herefords.

Oakdale shipped a car of calves to Los Angeles over the Santa Fe last week. This is the first shipment made from Oakdale to Los Angeles, as practically all of the livestock grown in this section has always gone to the San Francisco and Seattle or Portland markets.

The California Protective Cattlemen's Ass'n will hold their regular annual meeting of the Palace hotel, San Francisco, November 25. An interesting program has been planned and matters of general interest to the cattle interests of the State will be discussed.

D. J. Stollery, business manager for the Howard Cattle Co. advises us that he closed a deal last week whereby all of the cattle on the Howard ranches are sold and the ranches themselves leased for a term of 10 years. The herd of registered Shorthorns formerly maintained by this company were sold to the Palacios Ranch Co. last year.

SWINE.

Members of the Modesto Farmers' Union recently shipped their second pool car of hogs to San Francisco and the stock proved to be of such quality that the price secured was over a cent per pound above the market.

C. A. Noyes and Son of Sutter City have recently sold registered Poland China boars to the following parties: Louis Clarke, Henrick Heinsen and Mrs. E. Robinson. All of these boars were sired by their herd sire Sutter King, a son of Chief Picture and out of Candy King, grand champion sow at Sacramento in 1914.

C. H. Woodward of Tulare has about 100 head of old and young pigs. He has been able to hook a grinder onto his pump motor and is feeding them a ration of ground gyp and alfalfa. He runs the head of the gyp right through the grinder without the bother of threshing. He soaks the alfalfa and corn in water.

It is very gratifying to see the number of silos being put up in Tulare and Kings counties. The reasaw silo is the most popular, though we saw quite a number of DeLaval, Remco, and other makes of silos that had been put up in the last year. Milo maize and field corn are most generally used to fill them.

The pig-feeding contest between the Chino and Ontario grammar schools, just finished, was spoiled by the high price of feed. Earl Remington, a prominent Chino ranchman, furnished the sucking pigs to the children and offered suitable cash prizes to those that grew the fattest pig within a given time. There were thirteen pigs in the contest. The other day they were gathered up and taken to the San Antonio Meat Market at Pomona, where they were pronounced too poor for market. The children's excuse was that they could not pay the high price for feed necessary to make them fat.

SHEEP.

Bishop brothers of San Ramon have sold 15 head of registered Shropshire ewes to C. A. Noyes and Son of Sutter City, for foundation purposes.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/2c per word.

POLAND-CHINAS—Prize-winners. Money-makers. W. Bernstein, Hanford, Cal.

Berkshires.

GRAPEWILD FARM BERKSHIRES—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion, but the sire of Champions. At the 1916 California State Fair his daughters won first in all of the senior sow classes, including the Grand Champion Sow. At the 1916 Oregon State Fair a Grand Leader sow was Junior Champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for Fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

ABOUT BERKSHIRES—You know Frost? He publishes the "Berkshire World." He says of one of our herd boars—Mayhew Leader 6th—"A grand hog—one of the very best to be found in America. This boar is a son of the World's Fair Grand Champion Grand Leader 2nd, owned by the great breeder, A. B. Humphrey." We shall be pleased to book a few orders for the get of this splendid boar out of some of our leading sows. Write to Butte City Ranch, Home of Good Berkshires, Box P, Butte City, Cal.

WINONA LAUREL 5th—a junior yearling show daughter of the famous Laurel Champion in pig for Dec. 24th farrow to the grand champion Big Four Winona Ranch, R. 1, A-Rox 105 Grants Pass, Ore.

REGISTERED BERKSHIRES—Progeny of Improver B. Young stock now ready for sale. Start your herd with breed and strain of established reputation for California conditions. Geo. G. Meckfessel, Berlin, Cal.

CHOICE REGISTERED BERKSHIRES—Line bred Rival's Champion's Best and Masterpiece pigs, \$15 each, prior \$40. Service boars, bred sows, and gilts at reasonable prices. W. H. Waugh, Riverside, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

BARGAINS IN BERKSHIRES—Write today for our Special List of high-class boars and open gilts. Both the offerings and prices will please you. Silver Birch Farms, Box P. P., Newnort, Wash.

HOPLAND STOCK FARM—Registered Berkshires. Prices on application. Hopland, Cal.

REGISTERED BERKSHIRES—Weanling pigs, \$10 each. G. A. Casey, E. 7, San Jose.

SPECIAL—Six good service boars and a few sows in pig to Premier Leader due to farrow in October. Geo. M. York & Son, Berkshire breeders, Modesto, Cal.

REGISTERED BERKSHIRES—For sale, bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Novato, Cal.

REGISTERED BERKSHIRES of prize-winning blood. Write for description and photos. Imperial Stock Farm, Morgan Hill, Cal.

ROSE CREST BERKSHIRES—Rivals Champion best blood. Open and bred gilts. Service boars. F. L. Hall, Fortia, Cal.

30 REGISTERED BERKSHIRES—Boars and gilts for sale. J. H. Benedict, Lemoore, Kings county.

BERKSHIRES—Carruthers Farms, Mayfield, Cal. Second annual sale, August 2, 1917.

REGISTERED BERKSHIRES—Young stock for sale. F. W. White, Elk Grove, Cal.

CHAS. GOODMAN—Breeder of high-class Berkshire Swine. Williams, Cal.

Duroc-Jerseys.

DUROC JERSEYS—My hogs won highest honors at State Fair, taking first prize herd, first prize sow, second prize boar. Were the largest of their age exhibited. Stock all ages for sale. Prices reasonable. Breeding and satisfaction guaranteed. Haden Smith, Route 1, Box 84D, Woodland.

DUROCS from River Bend Farm, St. Helena, Cal., are large type, smooth, rangy, with fine backs and deep cherry color. We sell only those we like to keep in our herd. Don't write us if you want cheap stock.

RANCHO RUBIUS DUROCS—A few choice gilts bred for October farrowing; also good service boars, tried sow and weanling pigs, priced right. Elmer Lamb, Ceres, Cal.

REGISTERED DUROC-JERSEYS—Service boars from prize-winning stock are money-makers. They grow faster. New England California Corporation, Ripon, Cal.

DUROC JERSEYS—Herd boars. E. M. N. Colonel and Tulare Boy. Sweepstakes winner at Fresno, 1915. Choice breeding stock. J. P. Walker, Visalia.

REGISTERED DUROC-JERSEY SWINE—Both sexes. Big-boned type. B. F. Kendall, Hardwick.

REGISTERED DUROCS of guaranteed breeding. All ages. Weanling pigs \$10. H. B. Boudier & Son, Napa.

REGISTERED DUROCS—Crimson Wonder stock. Young stock, both sexes. L. D. Collins, Denair, Cal.

WINTON DUROC-JERSEY FARM, Winton, Cal.—High-class pure-bred hogs, both sexes, any age.

CURTIS DUROCS of either sex at all times. E. C. Curtis, Napa, Cal.

REGISTERED DUROCS—All ages. Either sex. W. A. Pack, Hollister, Cal.

FOR SALE—Registered Percheron Stallion. Address E. I. P. Horse Ass'n, R. 5, Box 32, San Jose.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office 219 Underwood Building 525 Market St. San Francisco.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for pig hogs. Geo. H. Croley Co., Inc., 531-537 Brannan St. San Francisco.

FOR SALE—Dairy Shorthorn Bulls. Also Halfa Meal. I. T. Grounds, Route E, Box 21 Fresno, Cal.

D. O. LIVELY, 218 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES bred to 900-lb. boar. Ed. H. Johnson, Ukiah, Cal.

Manuel Moneese, who ranged his sheep in the Mocho district, near Livermore, last winter and spring, sold out his holdings, about 1,000 head, last week, at a uniform price of \$10 a head.

TILLY ALCARTRA IS MAKING HIGH FIVE-YEAR RECORD.

[Written for Pacific Rural Press.]

A. W. Morris and Sons report that they expect Tilly Alcartra to complete her fifth year in milk with a total of 125,000 pounds for the five years. She is now in the sixth month of her lactation period and is producing, under official test, about 84 pounds of milk a day. The daughter of this great cow, Tilly Alcartra De Kol Burke, has freshened with her first calf and is reported to be doing about the same as her dam did at the same age.

One of the most promising cows in this herd at the present time is Aaggie Acme of Riverside 2nd. She already has a semi-official record of 1095 pounds of butter in 365 days and since freshening last week has been milking 80 pounds milk a day. Her average test during previous lactation periods was 4.47 per cent. A half interest in her son, Sir Aaggie De Kol Acme, was recently sold to F. Kiesel and Messrs. Morris and Kiesel intend pushing his heifers to the front.

Another cow in the herd that is doing well is Ignaro Creamcup, a half sister to Aralia De Kol and one of the last daughters of Ignaro De Kol. Since freshening July 1, she has been milking an average of 95 pounds of milk a day. This indicates that she will beat her previous record of 22,000 pounds of milk in a year, made as a five-year-old.

A new test barn has just been completed on the Morris ranch with a capacity of 16 cows and during the coming month a large number of cows, just freshening, will be put on test.

SHORTHORN BREEDERS TO ORGANIZE.

For several months there has been more or less talk of forming a California Shorthorn Breeders' Ass'n in order that breeders of purebred cattle might more easily co-operate in promotion work for the breed.

The continued agitation has at last found expression in a joint letter sent out by Mr. Chas. Hawkins of Hollister and Mr. David J. Stollery of San Francisco, to all purebred breeders in the State, calling a meeting at the Palace Hotel, San Francisco, December 11 at 2 p. m.

It is proposed to discuss the various angles of the Shorthorn situation at this meeting and decide upon definite objects toward breed promotion. It is also probable that selection of officers will be made at that time and steps taken toward immediate action on several matters that seem of unusual importance.

All breeders are invited and from the expressions heard from prominent breeders so far it seems certain that the meeting will be well attended.

BEEF CATTLE.

SCOTCH AND SCOTCH-TOPPED SHORTHORNS—We have the largest herd of straight Scotch cows in California. Foundation stock of both sexes for sale; also a choice lot of range bulls. Barco Ranch, Hollister, Cal.

FAIR OAKS RANCH Willits, Cal.—Young registered Shorthorn bulls for sale. Sired by Landseer 379318, grandson of Imported Villager 295884.

DOGS.

THOROUGHLY BRED SCOTCH COLLIES—All bred from our noted prize-winners. Have a few 3 months old puppies—very choice. Write us what you want. Brownale Kennels, Redwood City, Cal.

Breed for Butterfat

Beryl Clothilde Hengerveld, Champion in Butter-fat Contest, Sacramento, 5-day record, 21.11 pounds, test 4.7 per cent.

The quickest and surest way to make your Holstein herd more profitable in spite of high cost of feed is to introduce blood from high-testing ancestry.

My herd has a larger percentage of high-testing cows than any other herd in the State.

My young herd bull, **DUTCHLAND SIR PIETERTJE CREAMELLE**, has high-test breeding, and is transmitting this breeding to his sons and daughters. Your tested daughters have records averaging 21 pounds, all testing better than 4%. One of these, Clothilde Pontiac Creamelle, is California Champion 2-year-old, with a record of 22.52 pounds at 2 years 1 month; test 4.72%.

Have a few fine young bulls that will soon be ready for service.

WRITE OR CALL AND SEE THEM.

F. STENZEL

Breeder of High-Test Holsteins.

SAN LORENZO,

CALIFORNIA

Do You Need a Herd Bull?

THIS IS YOUR OPPORTUNITY.

We Offer King Spofford Mead at \$250.

In our judgment there has never been a better one offered for the money. We base our opinion on the following facts:

His sire is **KING MEAD OF RIVERSIDE**, whose first five two-year-old daughters average in yearly test 14,325 pounds milk and 720 pounds butter, average test 4%. Two of these made over 21 pounds in 7 days, and with second calf four have made 26.17 to 28.46 pounds butter. The only one with second calf that has been tested for the year made, running out with the herd, 1,095 pounds butter and 19,577 pounds milk, averaging 4.47% fat.

His dam, **LINDEN SPOFFORD PROMISE DE KOL**, made in official test 26.72 pounds butter in 7 days, 103.5 pounds in 30 days and 842.85 pounds butter from 18,177.8 pounds milk in one year, average test 3.7. With her first calf she made 625.48 pounds butter. She is a large light-colored cow, a consistent performer year after year, and carries a well-balanced udder.

KING SPOFFORD MEAD was born February 13, 1916, is beautifully marked, perfectly straight back line, in fact his conformation would be difficult to fault.

If you want exceptional value for your money, don't delay, but secure this bull. Write, or wire today.

A. W. MORRIS & SONS

Woodland,

California

PERFECTION

IN PRODUCTION, FORM AND COLOR.

We breed for uniformity, both in form and color and production at the pail.

One of our herd sires is **Supreme Gilsta Pietje**, whose 15 nearest female relatives average more than 31 pounds of butter in 7 days.

His dam is the famous **Gilsta Eglantine**, who made 32 pounds in 7 days, and who twice has made better than 128 pounds in 30 days, with a full sister and a dam who both have made better than 32 pounds.

His dam and granddam not only are 32 pound cows, but **Ybma Spofford 6th**, his grandire, holds the world's record for transmitting power, 87.5% of his daughters making better than 31 pounds in 7 days.

He is just as strong on his sire's side, he being **Woodcrest Pietje Ormsby**, grandson of **Pietje 22**, world's record-holder for 6 months.

We have a few choice sons of this full for sale.

Soil Building With Legumes and Cows.

The success achieved by a "tenderfoot" farmer on a wornout soil; and why he progressed from a buyer of condensed milk to the breeding of purebred Holsteins.

[Written for Pacific Rural Press.]

When R. F. Fischer purchased his present ranch of 150 acres in Humboldt county he was decidedly a "tenderfoot farmer." For a great many years he had been division superintendent for a large railroad company in the Philippine Islands with no direct or indirect interest in agriculture.

In view of his past occupation and the further fact that he did not go to Humboldt county to purchase land, but to take a much-needed vacation, it is not surprising that a very enterprising real estate dealer was able to sell him one of the worst run-down farms in the community.

That was four years ago, and since then some surprising things have occurred on Riverview Farm, as the ranch is now called: things which nobody in the neighborhood suspected would ever be accomplished on the ranch and particularly by a "tenderfoot." But it took this ex-division superintendent a whole year to find out the run-down condition of the ranch.

Oats and barley hay had been the favorite crops grown on the place for years before; and were relied on by the new owner. But the first year's crop from the rolling hills and the few pieces of high bench lands that had been planted the fall before, convinced even the Fischer household that something had to be done for the soil and done quickly, too.

Normally the district's chief occupation was dairying, but that had been one of the things the Fischers had struck from their list of possibilities. For the first year they even bought condensed milk in preference to milking a family cow.

But that first hay crop changed many a preconceived idea about what they would grow and how they would dispose of it. Their soil lacked two things, nitrogen and humus. These two essentials could be secured easiest under their conditions by growing leguminous crops and spreading manure. They learned that the two went well together, as the legume crops supplied feed rich in protein, which, when fed to dairy cattle and supplemented with other feeds, rich in carbohydrates, would bring cash returns and supply the manure needed to make bigger crops.

And so after more than a year, a definite policy of improving the soil was mapped out. A few cows were purchased to consume the surplus hay on hand; and late in the fall 50 pounds of common vetch seed was sown to the acre together with 125 pounds of oats.

But the oats smothered the vetch, instead of cutting a heavy crop of hay rich in protein another ton to the acre crop of oat hay was harvested the next spring.

Things at that time certainly didn't look promising for the building up of that hill soil with legumes. But the other end of the combination, dairy cows, was running true to form. There was a continual supply of manure from the dairy and by spreading this over the land with

a manure spreader as soon as practicable and immediately plowing it under, a noticeable change was apparent in the small acreage covered.

Dairy Became Interesting.—The queerest part of that dairy herd though, was the change it made in the Fischers' way of thinking. They were learning more things about farming than they ever supposed existed and not the least of these was the fun in getting on intimate terms with a dairy cow. They found that they could do a lot of regulating with those cows by proper feeding and breeding, and this was made still more of a game by taking out a membership in the local cow testing association. Now they learned which cows they were keeping and which cows were helping to keep the family.

So enthusiastic did they become over this aspect of farming that they went to the central part of the State and greatly enlarged their herd. True enough, they weren't growing feed enough to warrant an enlargement of the herd; but more cows would mean more manure and more manure meant more feed. So while they would have to conserve their limited supplies of oats, rye, grass, clover and alfalfa by soiling and even buy beet pulp and other concentrates, they deemed it more profitable to buy feed than fertilizers; and they still do.

Success with Vetch.—Although their first experience with vetch had been a dismal failure, it grew on other land in the county and should, theoretically, grow on the hill land of Riverview Farm also.

Accordingly the next fall another 50 pounds of high-priced vetch seed was sown with oats on the land that had been seeded the year previous. This time the vetch grew so rank and so thick that it and the oats together yielded three tons to the acre.

Leguminous crops depend on bacteria that grow on the roots for a large part of their nitrogen; and in soil where these bacteria are scarce or not present, the plant does not live up to its possibilities because it has a struggle to get nitrogen like other plants do. That was what happened to his vetch the first year, though bacteria were multiplying on its roots so that the second year the plants put out a normal growth.

"Theory," you may say, but this man Fischer has tried vetch on other land since, even on land that had been well manured, and always it has been the same story; no crop the first year but good ones afterward. Probably artificial inoculation of the seed would be quicker and more profitable, but he has never tried it.

Purebred Herd Purchased.—Since that first crop of vetch and oat hay many things have happened on Riverview Farm, not the least of which was the purchase of a foundation herd of purebred Holsteins a year ago last winter.

Soil Improved.—Surprising though it may seem, this cow-hating rail-roader and his wife have become more enthusiastic over their cows

than over anything else they possess. To them, cows are more than a mere milk-making machine, they are land builders as well. Unlike some, they haven't been completely swept off from their feet by the high records their cows have made, although that of course has been gratifying and will be continued. It is when they tell you of the 25 acres of land that were covered with manure last year and plowed under before it had a chance to wash off, that they point with most pride to the growing herd of cows, because that means soil building and larger crops.

Feed is still bought in preference to commercial fertilizer; but this will not always be necessary, for rotation of crops has been introduced.

Among them is corn which doesn't ripen, but makes good silage in the silo that has been erected. And vetch and oats planted on the corn land produce immense crops the next year.

Naturally, there is still land to be built up on Riverview Farm; but the dairy herd continues to increase, insuring more manure, for more humus and nitrogen, for more feed, for more cows etc.

REDWOOD TANKS — SILOS.
Thirty-five years in this business in Stockton.—A 500-gallon tank, \$8.00. A tank 6 ft. x 2 1/2 ft., \$7.50. Other tanks equally cheap. I deal direct with the consumer, saving 10% to 25%. All sizes in stock. Clear, dry redwood direct from the mill. Write for price today. Latest improved machinery. Doors, Windows, Frames, Mouldings.

TREWHITT'S BIG TYPE POLAND CHINAS

The blood lines of the herd are unexcelled, the foundation stock having been secured from the Topnotch Herds of the Middle West. Sows of fine quality, yet big and roomy. The sort that have large litters of vigorous pigs.

Offering for sale a choice selection of gilts, boars and bred sows.

W. D. TREWHITT,

HANFORD, CAL.

**SHEEP OR GOATS FOR WASTE
WEEDS AND GRASS.**

What the exact cost was in feeding and caring for them is not known, but in view of the fact that most of the feed they consumed would otherwise have been wasted, Mr. Trewhitt believes them to have been profitable. Without the feed cutter, however, the story might have been different, as it made poor feed into a much more palatable form. Well-bred Shorthorns or Herefords would be selected again, even at a higher first cost instead of wasting good feed and much labor on a mixed lot.

To the Editor: Kale stalks remaining after poultry have eaten all the leaves seem to be relished by horses and cows. We run them through a feed cutter, cutting them into ½-inch lengths, mix with an equal quantity of corn stalks similarly cut, and feed to stock. Horses and cows will eat this mixture and call for more. Even the so-called Egyptian wheat is relished fed to horses in this way, whereas if fed uncut and alone they waste over half of it.

Sanitary Handling of Milk on a Big Dairy

[Written for Pacific Rural Press.]

In their first published report as to the score of the various dairies supplying retail milk the Los Angeles Board of Health gave the highest scoring in the pasteurized class to the dairy belonging to the Crescent Creamery, located at Artesia and managed by S. A. W. Carver.

As this scoring was based on flavor and odor, visible dirt, fat, solids not fat, acidity, bottle and cap as well as on bacteria content and was extended over a period of four months' time it is safe to assume that the milk was produced under exceedingly favorable conditions.

Favorable conditions, however, vary according to one's viewpoint, and it is evident to the visitor of this dairy that while sanitary buildings and equipment are essential it is by no means necessary that they be of an expensive nature.

To house the 265 head of milking cows it is natural that the milking barn should cost money, and so it has in this case, but only in so far as a large amount of cement floor and shingled roof would ordinarily demand, for with the exception of a partially boarded and partially screened side wall around the structure nothing of an expensive nature has been indulged in. Concrete mangers are used because they last longer and are easily cleaned, and the same thing applies to the home-constructed iron stanchions, made from heavy pipe.

Milking and Feeding.—As the barn is built in units, the silos which are being constructed are located at one end of two units, simplifying the work of feeding thereby. Besides alfalfa hay and green cut alfalfa the cows are fed a concentrated ration of 10 pounds molasses beet pulp, 2½ pounds ground oats, 2½ pounds of cotton seed meal and 2½ pounds of alfalfa meal. Whole cottonseed meal has proven very satisfactory, but the present price is prohibitive.

For the past six months all of the young cows in the herd have been milked with Hinman milking machines, the reduction of labor being fully one-half, as is evidenced by the fact that where formerly a hand milker milked 25 to 30 cows the same man can now milk 60 cows by operating three units. In neither case, however, does this allow for the labor of carrying the milk from cow to milk room, which task is performed by another man.

Just here it is pertinent to point out that even with milking machines the ordinary laborer has to be watched when pure milk is a consideration. In this case the foreman is continually on the lookout for careless methods as is also the man who carries the milk from stable to milk room.

An instance of where this policy paid is told of one of the foreign milkers who allowed a cow to put her foot into a bucket of milk. This was set on the floor in readiness for the carrier, but fortunately the incident was seen by the foreman, who supervised its disposal to the calf pens instead of over the cooler.

Drainage, being a factor in all sanitation, has been cared for by running the liquids from the milk-

ing barn to a point some distance from the barn where it is pumped into the underground cement irrigation pipes that are extended to the various fields.

The solids are dumped into manure spreaders and spread evenly over the fields in fair weather and taken care of for short intervals in rainy weather by a concrete platform, round in shape and draining to the liquid manure pit nearby.

Hauled from the barn with a litter carrier the solids are dumped on this platform which is 35 feet in diameter, where it may be left till such time as hauling out is feasible. While it is large enough to accommodate several days' disposal it is also easily loaded from, into the spreader, as space is left all around for the spreader and the furthest distance to load from is a little over 17 feet.

From the milking barn the milk is taken through a screen-enclosed and concrete-floored passageway and dumped into a cloth-covered vat through which it runs over a large encased cooler that cools it to a temperature of 40 degrees. From the cooler it is drawn into cans and delivered in those containers by auto truck, direct to the distributing center in Los Angeles, the trip being made in less than two hours.

Milk Room and Utensils.—While sanitation is of utmost importance in the milk room and with utensils, it is accomplished here with many home-made but practicable devices.

The first of these is seen in the milk-cooling system. Often milk is not cooled sufficiently to stand transportation well because of the expense of a brine-cooling system. Here the same results are achieved by the use of an ice box made of tongue-and-grooved lumber outside and lined with galvanized iron inside, a space of three inches separating the two walls and being filled with ground cork.

At the extreme bottom of one end of this box a two-inch pipe extends from the inside to the outside, connecting with a one-inch centrifugal pump, electrically driven and having a discharge pipe that connects with the milk cooler in another room. A discharge pipe from the cooler extends back to the inside top of the box where it is perforated with small holes.

As seen in operation, the ice is cracked into fairly large sizes and covered with salt. The pump is then started drawing the water from the melted ice from the bottom of the box and forcing it through the cooler on out to the discharge pipe which again empties into the box, the returning water passing over the salt and ice before again reaching the pump or the cooler.

For efficient cooling the same results are accomplished as would be with a brine-cooling system. The only advantage is the lack of investment in the brine-cooling plant as the cost of ice is equal to the cost of operating a brine-making plant.

In sterilizing vats expensive equipment has also been done away with, those in use being constructed of galvanized iron which though not perfectly air tight allow of steaming to a temperature of 250 degrees,

with a minimum loss of steam. A vat similar to these has been built around the cooler so that it may be thoroughly sterilized while in position, thus simplifying the labor of handling such a large piece of equipment more than necessary.

Concrete walls and floors, screened

doors and windows, together with the fact that but one man ever enters the milk room at milking time, preclude all possibilities of heat, flies or filth, which accounts in a large measure for the perfect condition in which the milk from this dairy reaches the ultimate consumer.

How to Breed Hogs for Pork.

[From Address at the Western Berkshire Congress by F. R. Steel.]

The time when any old kind of hog, fed any kind of feed, in nearly any sort of way would return a profit on the investment has passed. Today to carry on the hog industry successfully we must have efficient hogs, rightly fed, rightly cared for, and rightly sold.

The management of a breeding herd divides itself quite naturally into four sections: (1) breeding, (2) feed, (3) care, and (4) selling. In selecting animals to reserve for your own herd, as well as, of course, in making additions to the herd, the choice should be based chiefly upon individual and ancestral size, early maturity, conformation, and prolificacy.

Size is one of the most important factors, and a thing that we as breeders of Berkshires must continually strive to maintain and increase in the breed. In making pork, the profits depend largely upon our ability to get a large number of pounds of pork at a certain early age of the pig—usually seven to nine months. To get large size at this age it is necessary to breed from large parent animals whose ancestors for generations have carried plenty of scale. The farmer trade—and it is upon this trade that the purebred Berkshire industry as a whole must stand or fall—demands size even more than good build. You let the average farmer who wants a purebred boar to use on a grade herd for pork go into your breeding lots and pick out a boar, and nine times out of ten he will pick out an outstandingly big pig of fair build over an excellently built pig of medium size. The chances are that he will simply pick out the biggest pig in the lot. Most purebred breeders, on the other hand, will pick the excellently built pig of medium size every time. Possibly both are right for their own purposes; but this trend of difference between the two standards of judgment must be carefully guarded so that there does not develop a chasm of difference in standards between the purebred breeder and the pork producer. Any great or fundamental difference in standards between these two would prove fatal to the purebred industry. Do not make the mistake of thinking that the pork producers are going to come over to any standard of the purebred breeder that differs very much from their own. They

will not do so; and it is up to the breeders of Berkshires in this Western country to see that our standards of breeding conform closely to the needs of the pork producer in this section. In this regard size is of paramount importance.

It is rather hard to find in literature upon swine any actual average weights of pigs gotten for full herds under ordinary conditions on the farm. Because we wanted such a table of weights that we could rely upon we have this spring at Winona weighed each litter of pigs each week; and from these figures compiled a table of average weight per pig of all the litters at each weekly and monthly age, taking every pig raised on the ranch, biggest and littlest alike, and all litters including those from first farrow gilts. The average weight per pig at each age by months is as follows:

One month	—15.9 lbs.
Two months	—37.8 "
Three "	—64.1 "
Four "	—93.6 "

These figures are for pigs in strong growing condition. From our experience so far I should say that 80 pounds at four months would be a good minimum or culling weight, i. e., a pig that weighs less than 80 pounds at four months would be a cull for lack of size. In all cases in picking your reserves or new stock select the largest size you can get without serious faults in other lines.

Early Maturity.—The modern tendency in the pork business is to market pigs at a much younger age than used to be the case. Our market now pays the highest price for a 200 to 225 lb. pig—not a hog, just a small pig. It is a good thing for the pork producers that this is so, because a pig up to about 200 lbs. puts on gains much more economically than is the case for heavier weights. It is necessary therefore to select your reserve stuff from early maturing individuals and families.

Conformation.—In picking reserves and additions it is well to select pigs with long bodies, strong slightly arched backs, short straight pasterns, wide hams, and smooth, even, deep sides.

Prolificacy is a point of tremendous importance. It is one of the main points of superiority of the Berkshire breed over one of our two chief competing breeds in the West; and we must keep it so, at least as

far as our breed is concerned. No matter how large, or how well built, nor how early maturing the average hog of any breed may be, the practical producer of pork does not want that hog unless it is also prolific. No money can be made from hogs except by the pigs they produce; and, except for the time a brood sow is nursing her litter, it costs just as much to feed and care for a sow that produces four pigs as for one that produces ten. This point largely determines the cost per pig at birth, which is one of the important factors in pork production; and because it is so farmers are going to breed in the future only a kind of hog that is dependably prolific. Therefore, in picking your reserves and new stuff insist upon prolificacy in the individual and its ancestry. You do not want gilts that farrow less than six pigs at the first litter, seven at the second, or eight later on.

Mating to Nick.—The skill and ability of a breeder of purebred stock are nowhere more vitally tested than in the matings of his brood animals. This is often the deciding factor tending to the production of outstanding or of mediocre animals. Be careful not to mate animals that carry the same important fault. If a boar has a slight drop back of the shoulders do not mate him with a sow that has the same defect, for if you do this defect will almost certainly be magnified in the offspring. If a sow has weak pasterns do not mate her with a boar not very good at this point. This is a feature that seldom breeds better and usually breeds worse. The same thing applies to a low back. These two points—back and pasterns—are probably the two hardest points of build to breed as we wish them; therefore they are of especial importance in matings. Size and prolificacy should be considered in direct matings just as much as points of build, all three characteristics be-

ing transmitted with equal regularity in the long run. In determining a proper mating one should not depend solely upon the size, build, and prolificacy of the individual animals used, but should know these points in regard to the ancestry of the two parents. The immediate parents of a litter of pigs determine only one-half of the characteristics on the average of the pigs, the grandparent generation determines one-quarter, the great grandparent generation one-eighth, etc., on back. The pedigree of an animal, together with a knowledge of the characteristics of the animals in this pedigree, enable a breeder to select the proper blood lines to mate together, a point equally important as mating proper individualities together. The question of whether you wish to line breed or not also enters the mating problem. Personally we believe in line breeding, using, however, only animals that have no important coincident defects. In this matter we try to follow Prof. Curtiss's definition of proper line breeding as "the judicious concentration of good blood."

FREQUENT URINATION.

To the Editor: A horse has to urinate every 15 or 20 minutes. Gave him green cut clover for a while, then changed to grain hay and gave him Hess' Condition Powder for a month, then gave several doses of turpentine, but with no effect. He has a good appetite and is apparently all right otherwise.—S. S. F., Santa Rosa.

[This trouble will require local as well as general treatment. Take the animal to Dr. Summerfield of your town.]

SPECIAL SALE LIST OF HIGH-CLASS BERKSHIRES.

Mature boars, Fall boars, Spring boars, some choice open Spring gilts, Weanling pigs, are all listed, described and priced in our new list just off the press. Write for it today. Some great bargains in high class stock from the West's greatest Berkshire breeding establishment.

Raising Poultry for Profit

FEED PLENTY TO GET EGGS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

If you have pullets that are maturing, hens that are molting or turkeys that are fattening, or ducks that are laying, in each and every case feed liberally. In warm summer weather, the flock will do very nicely on fair feeding, but as the days and nights get colder they all require more feed to do the same work. Young stock requires more feed to make the same growth, ducks require generous feeding and plenty of animal food to enable them to lay. Turkeys require more to fatten because the system requires more to keep the heat up, and nature always looks after the bird's system first before providing for anything else.

If you realize this you will know that a molting hen must have as much good, nourishing food as the hen that is laying heavily. I believe that molting is just about twice the strain on a hen as heavy laying; and yet many people that will feed a flock of laying hens quite generously, cut off nearly all feed from a flock that is molting. Many times this is done for lack of knowledge, but that does not make it any easier on the hens, neither does it put any money in the owner's pocket.

To get a flock of molting hens into laying condition, feed them all they will eat and digest. This can be ascertained by noting the droppings. If the droppings are round and tipped with white the food is being digested and no stinting need be done on that account; but if they are soft, of varying colors, and no white tip, unless this is the result of some laxative food, the digestion is at fault. In that case it will pay to feed a little light for a few days.

In feeding for eggs it never pays, no matter how high the price of grain may be, to stint hens in cold weather. The hen's own requirements, her bodily needs, are almost twice what they are in summer; and unless she is supplied with the surplus there will be no eggs. When a flock of hens look well and have gotten their new feathers and sing but don't lay, this is nearly always the reason. What they need to turn the song into a cackle is just a little more surplus energy, and it takes fuel, or feed.

When feed is high, it is a great temptation to feed light, but there is not any profit in it, because if we have to feed any high-priced feed it certainly pays to feed a little more and get the returns. Ducks are especially sensitive to a shortage in the animal food during the winter laying; they often stop short and do not lay again until spring when the food does not contain what they need.

QUESTIONS ANSWERED.

Yellow Specks on Skin.—My chickens, both old and young, have a yellow substance between the flesh and skin, and it is spreading. I feed wheat, green feed, and they have range.—Mrs. E. K.

It is chicken pox. I have known

cases when it never appeared on the head at all. Your feed is hardly strong enough to drive the pox away. The birds need good food, rich in protein. Better buy a few sacks of some good commercial mash food because it will be better balanced than you could mix yourself. Rub vaseline on the skin where yellow spots are and give the chickens ten drops of "tincture of iron" to a quart of water and see that they get a little of it every day until they improve. They will get well without any fuss if you improve the feed, but unless that is attended to you may lose some; or you might vaccinate. See October issue for instructions.

Broody Hen Has Sore Breast.—One of my hens, a Barred Rock, developed a red spot on her breast just at the keel, while she was setting. Now it has turned to a sore as large as a pullet egg, of a dark sort of hardness and there are more red spots on her breast. She looks healthy. Do you think it is a tumor?—Mrs. J. H.

No; that is no tumor. The hen has a tender skin and the dark skin that is hard will turn to a hard callous like a corn. I have seen old broody hens that had a callous from keel to vent. She will be all right. Don't fuss with it at all, unless to put a little vaseline on the place.

Electric Light Eggs.—Eastern poultrymen are favoring the use of electric lights in poultry houses to make longer hours eating in the cold winter months and claim many eggs. Have California poultrymen tried it, and with what results?—R. H. D.

Electric lights have been tried in California. I think we do not need them. They only give the hen a light to find the feed which a wise poultryman scatters in the litter in the house after the hens have gone to roost. In the morning they can commence the day by eating and scratching. The scratching starts the blood going; and as the birds increase the activity perhaps one or two hours before you would naturally get around to feed them, there is a big gain.

Rest the Cockerels.—What is the reason that two-year-old hens bred to cockerels produce fertile eggs in December and January and chicks are strong, while same eggs in March and April are infertile and chicks weak?—R. H. D.

The reason for infertile eggs and weak chicks in March and April is that the fire burns low in cockerels after two or three months' work, especially in the small breeds like Leghorns. One month is long enough for cockerels to be in breeding yards at one time. Give them a rest and have fresh ones to take the place.

Pullets Underdeveloped.—If late hatched pullets are slow in developing and do not lay until eight months old are they worth keeping over? Can the molt of these pullets be prevented?—R. H. D.

It depends on how the pullets have been raised as to whether they are worth holding over. If they have grown steadily, even though growth was slow, they are all right; but if they have been stunted at any stage of their life then they are not worth holding over. The molt can surely

be prevented if fed right from babyhood to henhood, but hardly after the feed has been changed several times. It is changing feed so many times that causes the molt. You can start a molt in anything in feathers by cutting down the quantity and quality of feed. It is not, as many think, rich food that starts the molt, but the lack of it; but the bird's skin being short of fat the feathers do not loosen and fall. Just the same, they are dead, and so as soon as the oil is supplied the feathers fall out. The best way is to feed pullets well all the time and increase the animal food necessary for laying by degrees; then the system uses it to build up instead of making feathers.

Fleas.—Could you suggest something to rid a chicken house of fleas and take them from around the eyes of young chickens that roost in the house?—R. A.

Spray the house with crude oil or distillate, and put a little of the following ointment around the eyes of the chickens: Melt a piece of beeswax the size of a walnut, a piece of lard same size, two tablespoonfuls coal oil, and one tablespoonful of creolin to be added after the wax and lard are melted; stir all together until cold, and one application will keep the fleas away for a month, during which time your house should be well rid of them.

Turkey Breeds.—Will you advise me as to the Bourbon Red Turkey? Do they grow as large as the Bronze and are they any harder to raise, and are they a good market bird? Please refer me to some one who has them if you think they would be suitable. If not mention some other breed. Thanking you for the many helpful hints you have given me.—Mrs. C. H. W.

Bourbon Reds are good turkeys, so far as I know. I hardly think they attain quite the size of the Bronze, but they are much quieter and more domesticated if kept close. The only objection is the price. Being scarce they command a better price than the Bronze for breeding purposes, in fact they are at present more in the Fancy. I don't see why they should not make even a better market bird than the Bronze, being such a nice white skin and clean

SHIPPING TURKEY EGGS.

[Written for Pacific Rural Press by Geo. H. Croley.]

Within the last three or four months several readers have reported exceedingly poor hatching results from turkey eggs that have been shipped to them by express. In packing for shipment, some of the breeders used sawdust, others used bran, while in other cases patent shipping boxes were used. Turkey eggs travel very poorly; they are easily damaged for hatching purposes. They should be packed each surrounded with a layer of excelsior one inch thick and packed in light baskets that are lined with a two-inch layer of excelsior. The eggs, after being placed in the basket, should also be covered with a pad of excelsior about three inches deep, over which a cloth should be stretched and securely fastened.

looking legs. One of our advertisers whose ad. has dropped out quite recently keeps them, but at present they cannot have any for sale or their ad. would be in the paper. It's against the rules to advertise those who fail to advertise themselves, because if they have the goods to sell, we suppose they will let it be known.

Rabbit Troubles.—Is there any cheaper way of feeding rabbits than this: I am feeding rolled barley and alfalfa hay. What causes them to eat wood when there is feed in front of them? Do rabbits need salt?—J. A. F.

Yes, sir, rabbits do need salt; so does every animal that is domesticated and kept away from its natural haunts. Put a little before them and they will soon satisfy you that they need it and are gnawing wood to get it. I think some good ground or even whole oats would be much cheaper, because better feed for your rabbits. Barley at present prices is about as dear as any grain we can feed. I am much in favor of oats in place of barley unless the latter is real cheap. You will notice a big improvement in the health and flesh of your rabbits when fed on good fat oats.

Pendulous Crops.—Please give me a remedy for the following trouble among turkeys: Craw much distended and pendulous; contains liquid and gas. They seem feverish and break out on skin of craw, not on any other part. Birds eat.—S. E.

This is indigestion, probably from overfeeding, though there is nothing said in regard to feed served. In most cases of that kind, a little charcoal and baking soda will make things right, but when it has gone so far as to break out on the skin, it requires more stringent measures. Give them a dose of epsom salts in just a little mash at night: say a teaspoonful to every turk; or to every quart of feed mixed put one tablespoonful of the salts. Next day and until better put one-eighth of a grain of strychnine to every quart of water and let them have no other. Feed very sparingly until better. If readers would give particulars as to feeding it would help me to answer them with more chance of success.

Col. Harris Weinstock, State market director, was in Los Angeles recently trying to organize the poultry men of Southern California into a co-operative market association for the purpose of marketing their eggs and chickens through the State Market Bureau. At a very well-attended meeting the poultrymen gave him a respectful hearing, but did not take very kindly to his plan. His proposition was that each member of the Association subscribe to one share of stock, to cost \$10, for every 1000 hens. When the stock sales reach \$4,000 the corporation will meet and elect officers. The corporation, however, will not be organized, unless by Feb. 1, 1917, there are 400,000 hens represented in the association.

Poultry Adviser

Personal advice on all poultry matters. I guarantee to increase the egg yield, the health and vigor of the flock, shorten the molt and prevent disease if you follow the advice. \$1.00 for advice and formulas.

SAN FRANCISCO.

San Francisco, Nov. 15, 1916.

WHEAT.

The Eastern market is seesawing, with foreign buyers holding off; but the general tendency still seems to be upward, and offerings here are unusually light. Northern red is cleaned up here at present, and northern club is a little higher.

[First-hand prices on strictly first-class grain, San Francisco.]
 Sonora wheat\$2.65@2.70
 Northern club\$2.60@2.70
 Calif. club, ctl.None offered
 Northern Bluestem2.85@2.90
 Northern RedNone offered

BARLEY.

Barley is very closely held in the local market, with an active speculative demand. The spot movement is not exceptionally heavy, but this is due rather to the firm views of holders than to lack of demand and both grades are higher.
 Shipping, ctl.\$2.15@2.20
 Choice feed, ctl.2.10@2.15

OATS.

Red seed has advanced quite sharply, with hardly anything on hand that will meet the requirements; though there is a lot of inferior stuff that does not sell readily even at the full feed price, desirable lots being quite firm. White oats also show a slight advance.
 Red feed\$1.80@1.85
 Red seed2.55@2.60
 White2.10@2.15
 Black seed3.00@3.25

CORN.

A little easier feeling is reported East, but yellow corn is practically cleaned up on the spot here, and California yellow is not yet in condition to ship. Egyptian is in good demand, but is very firmly held; and while buyers are unwilling to pay the quoted figures except for choice grain, it is hard to get anything for much less.

[First-hand prices on strictly first-class grain, San Francisco.]
 Eastern Yellow, ctl.\$2.40@2.50
 Milo MalzeNominal
 Egyptian, new2.25@2.35

BEANS.

The market is still rather nervous, with quite a heavy buying movement under way, though prices show comparatively few changes this week. The tendency is still upward in all lines, except for damaged stock; the extreme range quoted on small whites being due to the lower figure offered for beans injured by rain. Limas and red kidneys have taken quite a jump, and everything else is very firm.
 (On wharf, San Francisco.)

 Tepary beans4.25@4.50

HAY.

The local dealers have revised their prices upward again, which appears to be justified by the extremely small arrivals, which are hardly up to current needs. It seems impossible to get cars in the country, the situation being about the worst on record in that regard, and practically all hay is coming by boat. It is believed by the local trade that present prices could not be maintained if cars could be had. There is a fair movement on Government orders, but otherwise sea shipments are limited by lack of vessels.

POTATOES, ONIONS, VEGETABLES.

The cool weather is affecting the garden truck situation, as many lots of string beans are frost-bitten and sell at concessions, and tomatoes are lower with efforts to clean up the crop. Some lines are beginning to come in from the south. A good many onions are now arriving from Oregon, but have been bought at high prices in the northern market, and local onions in storage are very firmly held. Potatoes also remain strong, while sweets are higher.

DRIED FRUITS.

Gowers are about sold out in all lines, and the packers apparently have very little on hand, while the market situation in the East is steadily growing stronger. Sales of raisins have been unprecedented, and orders have lately been taken subject to ability to deliver. Peaches also have been active, and the stock is getting into narrow compass. Apples have again been marked up a little, and evaporators are well cleaned out, with little more available. Apricots are very firm at the recent advance, and few growers have any left, while figs are exceptionally scarce. Prunes show no further advance, but most of the crop has been distributed to the trade and the demand is still strong. Fancy Lake county pears are bringing as high as 10c in the country, but pears in other localities are not in the same class and are unchanged.

GROCERIES.

Flour continues very firm at the re-

cent advance. Pickles are higher, and Pacific codfish is up 1/4c. Several brands of canned salmon and meats have again advanced, as well as Cotto-lene and some lines of condensed milk.

LOS ANGELES.

Los Angeles, Nov. 14, 1916.

BUTTER.

Receipts California by rail for week ending Tuesday, Nov. 14:

1916309,605 lbs.
 1915225,620 lbs.

A steady and firm market was had the past week. The receipts were a little better than the week before but not oppressive. There was a further firming up of the market east which had a sympathetic influence upon the market here. Extra in Chicago is now 36 1/2c and in New York 38c. San Francisco is also up 1c for the week. Here the market remained steady and firm at 33c for extras under a good consumptive demand. Monday on 'change several small lots of extras sold at 33 1/2@34c, but the closing price was 33c. Tuesday there was no trading on call, but the tone of the market was firm.

EGGS.

Receipts by rail as reported to the Produce Exchange for week ending Tuesday, Nov. 14:

1916813 cases
 1915547 cases

A firm and fairly active market was had the past week for what few coming in. The street trade took what fresh ranch eggs arriving at last week's advance and storage stocks had to be drawn on to piece out with. On 'change there was nothing doing as receivers found a ready market for what coming in from their regular customers. San Francisco made an advance of 1c up to Tuesday, when fresh extra sold

Special Livestock Market Report.

Los Angeles, Nov. 14, 1916.

CATTLE: While there is no quotable change to note in this market the past week it is hardly so firm. A fair supply of steers continues to come forward from California and Arizona, but quality hardly so good. They show the affect of the high price of feed. Killers all in the market and they made fair purchases of fat cows and heifers.

Quotations f. o. b. Los Angeles:
 Beef steers, prime 1000 to 1100 lbs.\$7.00@7.75

Stockers and feeders5.50@6.00
 Prime cows and heifers6.25@6.50
 Good cows and heifers6.00@6.25

HOGS: A firm market and fair demand was had the past week at last week's figures. While California gave us a fair supply of hogs there were enough home grown in to supply the demand. A number of shipments were received from Idaho during the week, but they were not as good as previous seasons, many of them being young, and less finished than previous years owing to the high price of feed. Killers all in the market and wanted supplies.

Per cwt. f. o. b. Los Angeles:
 Heavy, averaging 250@300 lbs.\$8.50@9.00
 Mixed, 200@2509.25@9.50
 Light, 175@2009.25@9.50

SHEEP: A steady and firm market was had the past week both for sheep and lambs. Utah and Idaho both gave us a fair number and quality of the receipts very good. Lambs, in sympathy with strong markets east, were firmer, without being higher. Killers all in the market and wanted supplies and more sheep and lambs could have been sold than coming in.

Per head f. o. b. Los Angeles:
 Prime wethers\$7.00@7.25
 Prime ewes6.50@6.75
 Yearlings6.50@7.00
 Lambs6.50@7.00

CALVES: Not many coming in and market steady and firm. Selling at \$8.50 to \$9.50 per cwt.

San Francisco, November 15.

CATTLE are marked up for the first time in several weeks and there is a strong feeling for the immediate future. It now begins to appear that there are not the usual number being fed and that most of those that will be available are already in slaughterers hands. There is a distinct falling off in numbers in Nevada feed lots.

SHEEP remain about the same, as there are few if any still held by growers. Contracts for future delivery might be closed at a more attractive figure.

HOGS of desired weights are somewhat scarce, but there has been a heavy run of lightweights all week. In some instances these have been turned down because of lack of outlet. Heavy hogs have been marked up half a cent in sympathy with lard prices.

WOOL market continues to show activity although practically all of the fall clip is now reported to be out of growers' hands. The wool held by Chas. Kimball of Kings county amounting to about 400 bales was sold the past week. The market is active in Boston, also higher. London sales for the past week are about 10 per cent higher. Long staple values at \$90 to \$95.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

North Portland, Ore., Nov. 13, 1916.

CATTLE: One of the largest runs of the season greeted the trade again today, after several light Monday runs, receipts totaled well over 1600 head. Feeders were in good demand with a large supply, best fleshy feeders brought \$5.50 to 6.00, with very good kind around \$5.00, common stuff sold down to \$3.00.

BEEF STEERS: There was a large supply of beef steers available for packers today which met a keen demand, several loads of prime steers brought 7.10. There was a large proportion of prime steers which sold from \$6.70 to 7.00; good steers sold 6.25 to 6.65.

COWS AND HEIFERS: The supply of butcher stuff was limited. Demand was good both from packers and butchers. Prime cows sold at an advance of 25 cents, bringing \$5.75, while strictly good cows brought 5.25 to 6.60; heifer tops for today was 5.75. Fair and ordinary cows sold on a steady basis, sales ranging from 4.00 to 4.50.

BULLS AND STAGS: Demand for bulls still continues much larger than the supply. Packers are bidding up to 4.50 for prime heavy ones with good bulls going from 4.00 to 4.25.

HOGS: Prices in the hog market continued its upward trend today. The market opened with a keen call from all packers. A good supply of 1500 head did not near meet the demand. The top is \$9.75. Quality of the offering is holding up very good. Figs were sold usually one cent under tops.

SHEEP: There was but a light run on the market today. Prices ruling strong. There was one load of east of the mountains lambs that brought \$8.85, which was 35 cents higher than anything offered for some time. Valley lambs were unchanged, top bringing 8.50; there were several loads of prime yearling wethers which brought 7.75 at the close of last week. Mutton ewes are in good demand, prices ranging from 5.50 to 6.00.

at 50½c. Chicago is 1½c higher on first and New York is up 1c on first, which are selling there at 40c. This helped to create a firmer feeling here and Tuesday fresh ranch case count closed on 'change at 49c, an advance of 1c.

Receipts by rail for the week were 313 cases and estimated receipts by truck 600 cases, total 1413 cases. The same time last year the receipts by rail were 547 cases and estimated receipts by truck 600 cases, total 1147 cases.

BEANS.

The market continues firm and demand good both for limas and whites.

The latter are higher. The lima bean crop is now pretty well gathered but growers are marketing them slowly. Blackeyes are quiet but steady. We quote from growers:

Limas\$6.75@7.00
Large white9.00@9.50
Small white9.25@10.00
Pinks7.00@7.50
Blackeyes5.00@5.50

WALNUTS.

The California Walnut Growers Association says the season with them is practically closed. The crop as far as they are concerned has been marketed. They report the market very firm and demand good. No No. 1 walnuts are now to be had save at an advance of ½c over the Association price and but few at that.

The Associated prices for this year and last are:

	1916	1915
No. 1	\$15.50	\$13.60
No. 2	12.50	10.60
Budded	19.00	17.00
Jumbos	17.50	16.60

Orchard run 3c per lb less.

HAY.

There was a further falling off in the receipts the past week, arrivals only 30 cars. Under light offerings and a fair demand prices ruled higher all round. Barley and oat hay were advanced \$2.00 per ton and alfalfa sold up \$1.00 per ton and the market closed the week steady at this improvement.

[F. o. b. Los Angeles.]

Barley hay	\$16.00@18.00
Oat	18.00@20.00
Alfalfa, Northern	15.00@16.00
Alfalfa, local	17.00@18.00
Straw	7.50@8.00

Special Citrus Market Report.

Los Angeles, Nov. 14, 1916.

Shipments of oranges from Southern California from November 1 to November 8 were 166 cars and lemons 156 cars. The same time last year the shipments were 232 cars of oranges and 86 cars of lemons. From Central California the shipments from November 1 to November 7 were 22 cars of oranges and 28 cars of lemons. The same time last year the shipments were 5 cars oranges and 6 cars lemons.

A more quiet tone pervaded the market the past week at all the leading cities. The near approach of the new crop making buyers both backward and bearish. Hence a slight decline was reported for the week both in oranges and lemons. Still prices were very good for all desirable offerings. Locally the market remains unchanged from a week ago. All desirable Valencias met with a very fair demand at steady prices. Grapefruit

also sold very well. Some new crop navels are expected here the latter part of the week from Tulare county. Local packers are bidding 2@3c per pound for new navels in the grove. Valencias are still 3@3½c in the grove and grapefruit 2@3c in the grove. Lemons are still dull at 1½@2c per pound in the grove.

FROM AUCTION SALES.

New York, Nov. 13.—Fifteen cars Valencias and 6 cars lemons sold. Market easier and lower on oranges and lemons. Weather cloudy. Valencias averaged \$3.40@6.45. Lemons averaged \$3.50@5.05.

Boston, Nov. 13.—Ten cars sold. Market easier on both oranges and lemons. Valencias averaged \$2.50@4.55. Lemons averaged \$3.75@4.40.

Philadelphia, Nov. 13.—Seven cars sold. Market lower. Valencias averaged \$3.00@4.55; lemons averaged \$2.95@4.35.

Special Deciduous Market Report.

[By J. L. Nagle.]

On account of the frost of Sunday night, which killed what grapes there were remaining on the vines, the season may be considered practically closed, though possibly fifty cars of pinks, Cornichons and Emperors will be shipped within the next two or three days, these grapes having been picked before the frost and in the packing houses in lug boxes.

On the whole the season has been an exceptional one, in fact prices have ruled higher than for several years. The crop though light in some districts on certain varieties, was heavy on other varieties and this condition, together with increased acreage, has produced a heavier crop than last season.

Competition from Eastern fruits was not felt until late in the season and confined to certain markets. This is the final report of the season. The following prices have ruled for the week:

New York.—Emperor grapes aver-

aged: crate, \$1.15; drum, \$3.25; Malaga, \$1.06; Tokay, \$1.10; Cornichon, \$1.27; Persimmons, \$1.32; Pomegranates, \$1.25.

Boston.—Tokay grapes, \$1.63; Malaga, \$1.10; Emperor, \$1.45; Cornichon, \$1.40; Pomegranates, \$1.78.

Chicago.—Malaga grapes, \$1.18; Emperor, \$1.14; Cornichon, \$1.25; Tokay, \$1.17.

Total shipments to Nov. 13, 17,633 cars; total shipments same date, 1915, 16,376 cars.

Publisher's Department.

DELIGHTED WITH RETURNS.

Every business we have ever heard has its drawbacks. In the publishing of a paper one trouble is that if the advertiser gets good results and is out he stops his ad, and on the contrary, if he does not get results he keeps just the same. In either case the paper loses the business. Here is a case in point—of course we are pleased that the Rural Press "made good" and trust we will have business in the advertiser another season.

Kindly withdraw my ads in your classified columns. I am more than delighted with the returns. I am sold on seed potatoes as close as I dare look until grading and sorting is completed. I did not advertise in any other paper this season and believe your publication goes into the hands of the planters and growers in California. Sincerely,
H. A. Hyde,
Watsonville, Nov. 11, 1916.

In issuing a forty page edition of the Rural Press we had anticipated giving display space in advertising our books, but other advertising has crowded it out. However, we have a few books in stock awaiting your order. If you contemplate getting a copy of "California Vegetables" we would suggest that you hurry, as the edition is nearly exhausted.

We solicit your confidence and patronage. **SYMON BROS., LARGEST WRECKERS,** 1501 to 1527 Market St., S. F. 21st and San Pablo, Oakland.

A Schmeiser Giant Leveler Will Work Wonders on Your Farm

SCHMEISER POWER LAND LEVELERS, the great time and labor savers, are the only logical machines for leveling large tracts of land, not only because of the immense amount of dirt they move daily, but also because their giant strength enables them to work on ground too hard and rough and full of tough roots, etc., for a Fresno and horses to touch, thereby making it possible for the farmer to make ready for cultivation land which heretofore he had considered untillable.

Three Sizes, "Giant," "Junior," "Midget"

SCHMEISER "GIANT" LEVELER—Bucket 11 feet wide, 3 feet high, 4 feet sides; capacity of 35 cubic yards. With 2 men and tractor does the work of 9 men and 36 horses with Fresno. Price, f. o. b. Davis, Calif.,\$3900

SCHMEISER "JUNIOR" LEVELER—Bucket, 8 ft. wide, 3 ft. high, 3½ ft. sides; capacity 2 4/3 yds. Price, f. o. b. Davis, Calif.,\$650
"MIDGET"—Bucket, 8 ft. x 7½ x 2½ ft. Capacity 1 4/5 yds. Price.....\$350

SEND TODAY FOR FULL INFORMATION.

Schmeiser Manufacturing Co., 12 MECHANIC ST., DAVIS, CALIFORNIA

Mrs. Best's Letter.

My dear Friends: One has only to walk along the streets and gaze at the windows of crockery shops to know that an important event for the dining room is soon to take place. In many store windows, you find dining tables, fully set with all the silver, glassware and china necessary for a big dinner on display.

The new styles in silver tend to simplicity in pattern, and now that the good plated ware is made in exactly the same patterns as the solid, it takes an expert to distinguish the difference and brings good looking silver within the reach of almost all households.

The china, as a whole, is quiet in design, especially in dinner sets. The more striking patterns are mostly used for breakfast or tea. One needs to be careful about purchasing dishes of too striking a pattern for fear of wearying of them.

The carving sets are displayed in many patterns, either bone, celluloid or composition and come in varying sizes with rather plain handles and with the end of silver for an initial.

These exhibition tables have the new colored glass dishes for flowers; and the flower used is a pleasing contrast to the bowl—for example, a bright blue bowl will contain flowers of a pink hue. Cut glass is waning in popularity for vases, yet it certainly is pretty resting on a flat mirror that reflects the flowers.

Another favorite receptacle for flowers is the enameled basket with raised flowers on the sides. These come with high handles to which a bow of tulle may be tied. Combinations in flowers are very fashionable—as violets and red roses, or coreopsis and Shasta daisies or heliotrope with Cecil Bruner roses.

The newest candlesticks are of white china with stripes of black and bright colored flowers, but they are not the only ones seen. The crystal candlestick is always good on a dining table and the hand carved wood ones in bronze tints are good style also.

The attractiveness of these tables is largely due to care used in setting them and the snowy linen, glistening silver and sparkling glass used.

I wonder if any of you who have big family dinners have an extra size top you can place on your table. They can be purchased in the stores, but they can also be made at home by any one at all handy with tools. For ease in handling they should be made in sections and hinged together. This permits of their being stored away conveniently. The boards do not need to be well planed, for a heavy pad is necessary on any table to make a cloth look well.

I hope all my readers are to have the happiness of a family reunion and much good cheer.

Rosabella Best.

Cranberry jelly when strained and sealed in jelly glasses keeps like any other jelly and is always available at a moment's notice.

Red apples, russet pears, bananas and purple grapes make a beautiful combination for a fruit basket.

A large pumpkin hollowed out makes a fine centerpiece to hold fruit and from which to drape autumn leaves.

THE HOME CIRCLE

THE THANKSGIVING DINNER.

Thanksgiving day being a day of feasting, the greatest interest centers in the dinner. It is most distinctly a day for family re-unions and hospitality to those friends who are not so fortunately situated.

By common consent, either chicken, turkey or goose seems to be the choice for the main meat course. In some sections of the country, a turkey is always flanked with chicken pie, but food experts frown upon two dishes of exactly the same food value. Oysters in some form are an addition to the meal used either as a cocktail for the first course, or for a soup, or scalloped and served with the meat course.

soups, or the bouillon could be ready for reheating.

In many households, these two courses will be eliminated and the meal will begin with the meat course, which naturally must be more generous under those circumstances. With the chicken or turkey should be served either mashed or baked Irish potatoes and candied sweet potatoes as well as some substantial vegetables such as Hubbard squash, boiled onions or scalloped corn.

The turkey may be served with a simple but well seasoned bread stuffing and a gravy made of the giblets and drippings in the roasting pan, or if variety is wished, either oysters or chestnuts may be added to the stuffing or mushrooms can be sau-

THE SMILING COUNTRY.

Partridges a-callin',
Hick'ry nuts a-fallin',
Country jest a-smilin' all around;
Cattle-bells a-tinklin'—
Frost'll soon be sprinklin'
Spicy like, an' sweet'nin' all the ground!

Halleluja season—
Every prospect pleasin';
Fields, they hint of silver an' of gold;
Don't you hear the holler
Of the eagle on the dollar,
An' you'll soon have all your arms kin
hold!

Thank the Lord we're livin';
An' Providence, forgivin',
Is doin' jest the best that it kin do;
We're dancin' down our troubles—
We blow 'em off like bubbles,—
Three cheers fer life, an' halleluja, too!

—Frank L. Stanton.

If desired as a cocktail, use the small California oyster and serve in small glasses, well covered with the tomato mixture, which can be purchased ready for use. In restaurants these glasses are surrounded with chipped ice, but if both the oysters and mixture are cold, that is unnecessary. With this should be served small crackers.

Following this could come a cream of tomato soup, or if preferred a clear bouillon. In either case, have your materials ready the day before. The tomato should be cooked, strained and seasoned and set aside all ready to be added to the cream sauce, which is the basis of all cream

teed, rolled in chopped parsley and used as a garnish. If two meats are desired, serve small balls of sausage baked and used as a garnish for the turkey.

For relishes, all New Englanders will vote for pickled peaches and these can be supplemented by olives and celery or other home-made pickles.

No Thanksgiving would be complete without cranberries and they may be served in the old-fashioned sauce or strained and poured into individual molds.

For a heavy dinner, a salad should be simple but attractive and appetizing and the tastes of the family

should be considered. Hearts of lettuce with French dressing or a combination salad of asparagus tips, string beans, peas and sliced tomato would be nice to serve and could be placed on the table if desired with the main body of the meal.

For dessert, many people feel the meal is incomplete without the old-time dishes, plum pudding and mince and pumpkin pie. Pumpkin pie is very much better and daintier if baked in individual tins and served with whipped cream; and mince pie is attractive baked in individual tins, with strips of pastry across the top instead of a solid crust.

After this come mints, nuts, and raisins with black coffee and it is very fashionable to serve this course in the living room, but that depends upon whether it is easy to do it or not. Comfort and convenience count for a great deal more than style in family dinners.

THE DINNER TABLE.

A well arranged and decorated dinner table can make the simplest meal attractive, and the foundation of course is spotless table linen and shining silver.

For a center-piece many things suggest themselves, one of them being a basket or dish of selected fruit or a fern or whatever flowers the garden affords. If something different is desired, a large papier mache turkey surrounded by a rail fence made of long sticks of candy is unique and bound to please the little folks, especially if at the close of the meal they are permitted to demolish the fence.

Another attractive feature is individual baskets for salted nuts. The small inside case can be purchased very inexpensively and they can be covered with crepe paper and a handle of wire joined on. This handle should be covered with paper also and have tied to it a small bow of baby ribbon or flower made of tissue paper. The color used should be harmonious with the other decorations. This work could be done by any clever twelve-year-old child and is a great addition to the appearance of the table.

The shops have a wealth of inexpensive articles suitable for place-cards, such as large cut-out turkeys, and small gummed cut-outs of pumpkins, stalks of corn and the like, that could be added to a plain white card, bearing the name.

The food itself helps to decorate the table, the brown fowl is in pleasing contrast to the red of the cranberry sauce and the baked potato with two slashes to hold butter and a little parsley assumes a quite patrician air.

A well-planned and served meal is a feast to the eye as well as the palate and a large part of the pleasure is in the accessories.

NEW ENGLAND PLUM PUDDING.

Scald four cups of milk and pour over 1½ cups rolled crackers. Add ½ cup molasses, ¾ cup brown sugar, 1-3 cup melted butter, 4 eggs, teaspoon salt, ½ grated nutmeg, 1 teaspoon cinnamon, 1 teaspoon cloves. Cook 1 cup raisins in boiling water until soft, seed and add to mixture. Turn in buttered bread pan, put in pan of hot water, cover and bake in slow oven.

Floral Department.

[By Geo. N. Tyler.]

Lilies.—The ground should be spaded or trenched very deep and abundance of well-rotted manure worked in. But under no consideration use green manure on lily beds or bulbs of any description. If lilies are to be grown in beds let them be about three feet wide and as long as desired. Put the bulbs in deep; from eight to twelve inches is none too deep to plant them. *Lilium Auratum* should be planted twelve inches, and a mulch of straw or clippings from the lawn should be kept over them for the first year.

Big Ben

A
Westclox
Alarm

THREE-FIFTEEN—the Call Boy comes, to wake the Railroad man. Big Ben was on the job first. He started the day at three. He is right on the minute when there's an early run.

The Railroad boys all like Big Ben. He helps them make the grade.

Big Ben will run your day on schedule time—he'll sidetrack the Sandman whenever you say.

He's seven inches tall, spunky, neighborly—down-right good.

At your jeweler's, \$2.50 in the States, \$3.50 in Canada. Sent prepaid on receipt of price if your jeweler doesn't stock him.

Western Clock Co.

La Salle, Ill., U. S. A. Makers of Westclox

Whenever possible to do so, lily bulbs should be procured and planted as early as possible. After once planting it will not be necessary to move them. In fact it would be better not to do so for three or four years. But in moving them be very careful not to break or bruise the roots at the base of the bulb; if these are injured it may cause the bulb to decay or not to bloom for the following season. In planting put one inch of the clean sand or fine gravel at the bottom of the hole and pour more sand on and around them. This is important and one of the secrets of success.

To grow hyacinths and other bulbs in glasses, select only dark-colored glasses, blue or red, for instance, and those of a long, narrow or Belgian pattern, in preference to the more elaborate styles. The hyacinth makes long white roots and to make them quickly and before it starts into leaf growth, the bulb after being put in the glasses should be put away in the dark for six weeks, the same as in potting. Always use rainwater. Fill the glasses so that the water will barely touch the bottom of the bulb. The water should be changed as often as once in three weeks, using pure rain water, at the same temperature as you took them out of. A piece of charcoal in the water will cause it to keep sweet longer and a few drops of ammonia dissolved in the water will give the flowers a much brighter color.

When hyacinths are coming into bloom, and they are not tall enough to suit, you can draw them up by slipping a paper cone over them with a small opening in the top.

When all bulbous plants are through blooming in pots, glasses or sand they should be planted out in a shady place in sandy loam or leaf-mould and watered as long as the leaves are green. When the leaves turn yellow take up the bulbs and put them where they can get a good deal of sun, and after they have ripened pack them in boxes of dry soil and put away till planting time.

HOW TO CARVE CORRECTLY.

In carving, there is a right and a wrong way, and it is really worth while that one should be able to carve well. Be particular to have a very sharp carving knife and a platter considerably larger than the fowl.

The chicken or turkey should be placed on the platter, breast uppermost. Place a fork in the breast and sever the wings first and then the legs without turning the bird around. Next, slice the white meat on either side and remove the second joint from the legs and wings. If the turkey is large, cut only one side, as the other half can be re-warmed to much better advantage if left whole.

HINTS FOR THE DINNER.

To make shells for individual pies, turn cup cake pans upside down and fit the pie crust smoothly over the outside of each cup. It is much more successful than shaping it on the inside.

Unroasted peanuts, blanched and browned in the oven with butter and then salted make a pleasing addition to the dinner and are much cheaper than almonds. They should be ready days before the dinner.

GEO. N. TYLER, Brookdale Nursery, Los Gatos, Cal.

IN NOVEMBER.

The elm and the maple, the ash and the oak,
Gave a grand party to all their young folk.
The guests were dressed gayly, each girl wore a gown
Of yellow and red, and the boys came in brown.
They gathered in groups in the shade of the trees
Or whirled in the waltz with the frolicsome breeze;
And, when dancing was done, at the set of the sun,
They went to a bonfire and ended their fun.

—Anna M. Pratt.

LEARNING HOW.

November was drawing to its close, and Trinette was wondering whether this Thanksgiving Day would find her feeling more Thank-you (as she called it) than last year, when she had been but six and a half years and entirely untouched by the inner significance of the day.

"But, mother, I don't feel Thank-you at all; really and truly I don't," she had declared, and had repeated the statement over and again until all the family—all, that is, but mother—had grown very tired of it.

"What! not for all that turkey and pumpkin-pie," Uncle Dick had marvelled, "nor for this morning's long auto-ride, nor for all those brand-new Victrola records this afternoon? Well," as Trinette solemnly shook her curly pate, "you are an ungrateful atom!"

"She's a most dreadfully spoiled child," had been stern Aunt Sophia's verdict.

"What a very odd child!" Cousin Natalie had sighed, gazing at Trinette through her long-stemmed eyeglasses until that little lass squirmed in her seat.

"Queer, did you say, Natalie?" father had cried with his hearty laugh. "She's a dear, that's what—father's dear, aren't you, Trinkette?"

But mother had drawn her little daughter to her lap and had murmured, "She'll know better and feel as thankful as anybody next year when she's seven, won't you, honey?"

Now it had become "next year" and Trinette was quite seven and over, knowing less than ever about the real Thanksgiving.

On Monday afternoon, while Trinette was playing paper-dolls by the window, Uncle Dick and Cousin Natalie were taking tea with mother.

"Really Millicent [that was mother], you and Frank [and that was father] make me quite weary!

To think of declining an invitation like this one just because you cannot take Trinette! Why, it's absurd. The child will be perfectly safe here at home with her nurse and the other maids."

"And she doesn't believe in Thanksgiving, anyway," laughed Uncle Dick, "do you, Trinette? I'll wager she doesn't know a bit more about that Thank-you feeling this year than last year, do you, Trinette?" Above the giggling that followed Trinette's sober "No, sir," father was heard to disclaim any intention of leaving his small daughter to a solitary holiday.

"No, indeed!" he continued. "Millicent and I will drop her at mother's, at Hopedale, on our way to Lenox. You'd like that, honey-girl? Wouldn't you just love to spend your Thanksgiving at grandma's on the farm?"

This was why, on that Wednesday evening, after helping grandma clear away supper and wipe dishes, and following that busy woman round generally below stairs, Trinette, while being made ready for bed upstairs, was telling grandma all about it.

"You don't say!" exclaimed grandma, deeply interested. "They couldn't teach you how to feel Thank-you in kindergarten?" Trinette shook her head.

Nor in dancing-class?" Trinette shook it again.

"Nor even in Sunday-school? I declare!" cried grandma, with a wondering shake of her head. "Well, then, you'll just have to take a few lessons from us farm-folk. We'll have to look sharp, too, so's you'll know enough to feel thankful on Thanksgiving Day."

All grandma's pets had their breakfasts before grandma herself sat down to hers, and it was while fetching milk for the kitten and water for bird and window-plants that Trinette had her first lesson.

"Now watch Muffins," suggested grandma, when that small pussy, after a hearty meal, first washing both front paws and then his pink nose, rolled himself into a furry ball and loudly purred his satisfaction. "That's the way Muffins shows his Thank-yous."

"Look at Twitters," said grandma, with a smile, when the elderly canary-bird, after a dozen dips into feed and water mugs, fluttered to his perch and trilled and tremoloed in shrill delight. "That's his way of showing it. And here's my bonny cyclamen," grandma concluded, carefully watering her favorite plant. "Just stick your small nose right in here among the pink and white blossoms and take a long, long sniff. Smells good, doesn't it? Well that's the way my posies breathe their Thank-yous."

After breakfast, in jacket and tam, Trinette went with grandma to see the chickens.

"Each one," explained grandma, "after drinking puts back its head and looks up at the sky. That's my hens' Thank-you."

In the barn Dan and Dobbin turned away from their overflowing manger to look at grandma and give her a happy whinny by way of showing how they felt, and outside Rover bounded about and barked, and wildly wagged his heartiest Thanksgiving feelings.

"All of them," declared grandma, quite seriously, "feel, show, and say, each in his own peculiar way, that they know how to feel Thank-you. Now let's go in and get ready for our company."

All morning long Trinette helped manfully, fetching and carrying for grandma and saving that busy woman "some seventy thousand steps," as she called it. The company consisted of four very elderly ladies from the Town Home, who greatly appreciated grandma's turkey and "go-witherums," and waxed enthusiastic over the luscious pumpkin-pies. After dinner the six celebrators gathered before the open fire, while Trinette, at grandma's urgent request, spoke some kinder- on her own particular hassock at garten "pieces" and even danced the dew-drop for the guests. Then, in the early twilight, the little girl sat grandma's knee while the five old ladies told of former 'way-back Thanksgiving days.

Somehow, whatever the beginning and the end of each story, and whatever lay in between, the sum and substance of each old-wife's tale was one, big, cordial, really truly Thank-you, until Trinette felt this same warm Thanksgiving spirit enfold her little heart like velvet.

Suddenly there were steps and a knock at the front door, and, when grandma opened, there—just fancy!—stood father and mother come to spend the evening and the night with their little daughter at grandma's!

"Come in, dearies," said grandma. "Come in. How glad and thankful I am you've come to help us keep Thanksgiving!"

But Trinette hurled herself upon her parents. "Oh, mother, mother!" she cried. "I've learned how to feel Thank-you, mother! I learned it this morning, father, just in time for Thanksgiving, from everything on grandma's farm!" —Christian Register.

Good Health.

[By H. E. Pastor, M. D.]

A Rural Remedy For Whooping Cough.

A medical friend called the writer's attention to the following item with the remark: "It's a good item for your department in the Rural Press." It is here printed for what it is worth and we presume it is worth something, as it is clipped from the New York Medical Journal, which in turn reprinted it from the British Medical Journal:

It is, the Journal declares, a rural remedy for whooping cough which appears to be not known generally to the profession. It consists of peeling the cloves of garlic, as the segments of the bulb are called, cutting them into thin slices, and wearing them under the soles of the feet between two pairs of socks, for if placed next to the skin the pressure produced by walking is apt to cause irritation. The garlic can usually be smelt on the breath within half an hour after the slices have begun to be worn, and the whoop and spasm usually disappear within forty-eight hours. The garlic should be worn for a week or ten days or longer, according to the severity of the case. Among the French Canadian habitants, we know that onions are used in exactly the same way. Garlic may also be administered by eating it as a form of bread sauce, made by chopping up the cloves when peeled, boiling them in milk, and mixing them with bread-crumbs.

Treatment of Poison Oak.

The poisonous principle of this plant is a volatile acid resin, its volatile quality explaining the ease with which it is carried on the wind, and its acid quality showing that treatment with an alkali is theoretically correct. One of the most efficacious remedies for this troublesome ailment therefore, is a saturated solution of bi-carbonate of soda—that is to say, an application of water containing all the soda that can be dissolved in it. Applications of the water are also good, but the application of both combined—that is to say, a saturated solution of bicarbonate of soda in ice water—are better than either alone. Make these applications to the infected part and relief will be promptly felt and a complete cure may be effected in 2 or 15 hours except in very refractory cases. Crystallized alum dipped in water and applied to the surface is a favorite remedy for poison oak in the South.

Keep Your Hands Clean.

We are handling disease-infecting matter more or less constantly, and ever and anon carry the hand to the mouth. If the hand has been in contact with infectious matter, it is not unlikely that disease germs may be conveyed into the body by way of the mouth. Many people wet their fingertips with saliva as a preliminary to turning the pages of a book, counting sheets of paper, and other numberless little every-day acts. Then the process is reversed, and other fingers that handle these objects are carried to the mouth and thus the infection spreads. Having

these facts in mind the U. S. Health Service has issued the following simple rules of personal hygiene: "Wash the hands immediately before eating, before handling, preparing, or serving food, after using the toilet, after attending the sick, and after handling anything dirty."

Pasteurization Temperature of Milk.

There is grave doubt in the minds of some medical authorities as to the propriety of raising the temperature of cow's milk above 140 deg. when the milk so treated is to be used for babies or invalids. It has

been suggested by those who have given this matter special attention that milk subjected to a temperature of 165 deg., a common practice, or to any other temperature exceeding 140 or 145 deg., loses in some way some of its nourishing properties, though the milk's constituents themselves remain unchanged. This loss of nourishing power in milk so treated is not readily explained on chemical grounds, though it is nevertheless real. The fact here pointed out is not an important matter in cases where milk forms but a small portion of the daily bill of fare, but

becomes serious where milk constitutes the exclusive diet, or nearly so, of the bottle-fed infant or of others restricted for any cause to a milk diet.

Nature's Provision Sufficient.

Don't be too ready to dose the new-born child with a laxative, as is very commonly proposed. Give Nature a chance. The first milk of the mother provides for just such a contingency. The drug-taking habit is a vicious one at best, and it is hardly fair to force a bad habit on a helpless child.

HUDSON SUPER-SIX
Excels All in Endurance
Save \$175 Before December 1st

Things the Super-Six does are less important than the way it does them. In breaking world's records it has hardly shown an effort. And after 7000 record-breaking miles, a Super-Six motor showed no evidence of wear in any part or bearing.

The Hudson Super-Six, in most cities, has broken all local records. Most of you have seen them broken.

It has elsewhere broken all worth-while records which have any bearing on stock cars. But all these wondrous things are done without a sign of effort.

Most stock motors go to pieces in attempting speedway tests. Also in hill-climbing feats. They never arrive at all.

But most of our stock-car records were won with a single Super-Six. It made a speed record exceeding 102 miles per hour. It broke all touring car speed records up to 100 miles. It ran 1819 miles in 24 hours, exceeding the record by 52 per cent.

Yet that Super-Six motor, after 3800 miles of that terrific strain, showed no wear whatever. The motor's condition was to experts almost unbelievable.

Another Super-Six broke the ocean-to-ocean record, solely because of endurance. It ran from San Francisco to New York in 5 days, 3 hours and 31 minutes. Then the same 7-passenger Super-Six turned around and went back to San Francisco. The round trip was made in 10 days, 21 hours, 3 minutes. It was the first car to ever finish in a coast to coast and return trip against time.

Last spring the best one-way time made by a famous 8 was 7 days, 11 hours, 52 minutes. In 2½ days more the Super-Six made the round trip. No test of endurance ever equaled that.

That's What You Want

That's why men buy the Super-Six—men wise in motor cars. Not for excessive speed or power. But to render every-day performance without vibration, wear or effort.

The Super-Six at half capacity can match another car's supreme exertion. That means a long-lived motor, low upkeep, small repairs.

The great fact is that the Super-Six has almost ended vibration. It has reduced motor friction to almost nil.

Made Hudson Supreme

The Super-Six has made the Hudson undisputed king. It now outsells any other fine car with a price above \$1100. In six months we have quadrupled our output, but 3500 cars per month still fail to meet demands.

Yet this is the first season of the Super-Six. Last spring it entered the market a stranger, with all a stranger's uncertainties. And men have only begun to realize what this new-type motor means.

The end of the season will find 25,000 running. It finds the Super-Six in possession of all the worth-while records. It finds a car so perfect that not one change is necessary for the coming year.

Then every motorist must concede the Super-Six supremacy. And men who have bought cars with a lesser motor will realize their mistake.

The Super-Six is not one of the passing sensations. Ours is not one of those claims to motor supremacy which yields in a year or two to another. Mark what these records mean. There is plenty of evidence now to convince you that it cannot be superseded.

You Can Save
\$175 Now

By buying now you can save \$175. The price will be advanced December 1st. The models will not be changed. You get the same Super-Six motor, the same wonderful chassis, and the same beautiful body. Your car you get now will be identical with those we shall sell after December 1st.

On that date we start a second production of the Super-Six. Material costs have increased enormously. That forces this raise in price.

Are you one of those who, just because you can't get a Reo on the minute, are thinking of accepting as a substitute a car that is your "second choice"?

Or are you one of those who think perhaps you can get as good value in some automobile of lesser reputation?

If you are in doubt on any point, let us just say this:

Take a Reo, and have it made in any other factory—and it wouldn't be a Reo.

It isn't design alone—there are no radical features of design in Reo cars.

Nor is it factory equipment—all automobile factories have about the same machines. Reo, being a leader, is always a few months ahead of most—but machine tools are practically standard.

Nor could one say that Reo mechanics are all more skilled—others can hire good mechanics too.

That's why we say that if you took Reo design and Reo specifications and had the car made up in some other plant, still it would not be a Reo.

It's the Reo spirit—that indefinable but still tangible thing that pervades the whole Reo organization from General Manager down to the Last Man in the Shops, that gives to this product the quality that has come to be known as Reo.

We like to call it good intent—for after all that is the determining factor.

It is the desire of the Reo Folk to make the best automobiles it is possible to make.

Not the most, but the best. Not quantity, but quality, is the Reo goal.

And every Reo man—from the Chief Engineer to the Final Inspector—is imbued with that spirit, is actuated by that desire to make good, dependable automobiles. Better than others.

Visit the Reo plant. You will be welcome—the doors are always open. Reo Folk, proud of their work, are glad to show you through. Note the atmosphere of the place. Watch the workers—listen to the remarks you'll hear.

No one asks—"How many did we make yesterday?" as you hear in so many factories nowadays.

For that isn't the thought uppermost in the minds of Reo workmen.

It's how many parts were discarded, turned back by the inspectors—because of some error so slight it would "pass" in most plants.

There's no secret—no necromancy—about Reo quality or how it gets into the product.

It's the result of that fervent desire of the Reo Folk to make Reo cars excel—and the eternal vigilance that results from that desire—that is responsible for Reo quality, Reo stability, Reo low cost of upkeep, and finally, Reo preference—Reo demand.

Is it any wonder that Reo cars are known as "The Gold Standard of Values"?

SAN FRANCISCO

NOVEMBER 25, 1916.

LOS ANGELES

State Fruit Growers' Convention.

Fair weather, big crowds, tractor demonstrations, machinery exhibits, recommendations for amendments to our horticultural laws, marketing problems, with intense interest in all, made the convention a record-breaker.

[Written for Pacific Rural Press.]

THOUGH the weather was cool, it was a "sizzling afternoon" that Thursday at the California Fruit Growers' Convention held at Napa Nov. 15-17, but you will find that story in other columns. "It's the biggest crowd and the keenest interest we've had

in a fruit growers' convention since the one at Davis. It seems like old times," said a veteran horticulturist while it was in session. Napa could not have chosen more perfect weather; Napa people could not be excelled for hospitality; and the floor discussions could not have been more pointed and enlightening. Napa Horticultural Commissioner John J. Fox and the people who worked with him in making the visitors so happy and the convention so successful, are to be richly congratulated.

Fruit growers who did not attend, missed something that would have made them richer through the year to come, in happiness and prosperity. They cannot get the spirit of the convention, the personal conversation, the broadened viewpoint, the new ideas, the enthusiasm for their calling, from a written report of the convention; but these joys were for those who were there.

Tractor Demonstration.—This convention added a feature of vital interest to every fruit grower, which had not before been attempted, by staging an orchard tractor demonstration and machinery exhibit. Its success is noted in other columns.

Legislative Recommendations.—The most important feature of the convention, perhaps, was the suggestion of amendments to our horticultural State laws.

These were recommended to the convention by the Horticultural Legislation Committee of 35 men leading in the fruit interests of the State. This committee had been appointed by the committee of three originated at the Visalia convention for the purpose of revising our horticultural laws. Only their executive committee was retained to push the recommendations of the Convention in the Legislature, but about eight other representatives of allied interests were added to those retained. A fund of \$400 was guaranteed in the committee meeting to put the proposed amendments as printed in our other columns, into legal form.

There was not so much of detail in the program concerning the practices and methods of fruit growing, as there was of marketing and

co-operation, these subjects being of greatest interest just at this time.

Of bugs there were none on the regular program, except in the proposed laws; and the man who did most to exclude bugs from the program and also from California had the only "bug" paper on the program, the recommendations for more efficiency in bug exclusion.

Efficiency in fruit marketing was the great theme of the Convention; and it was treated from many angles.

The State's opportunity and limitations in helping the fruit producer to get most of what the consumer pays, was presented by State Market Director Weinstock. State laws for control of fresh fruit packing to insure better marketing occupied much attention; and "standardization" was about the commonest word at the Convention.

The efficiency and opportunity of co-operative organizations was debated pro and con with special reference to prune and apricot growers, raisin growers, peach growers, and deciduous fresh fruit growers.

Disposition of lower grade fruits occupied attention in several papers and discussions. The recommendations of F. T. Swett that the University be requested by the convention to provide a thoroughly equipped laboratory to investigate and standardize fruit drying and preserving methods and to test out the results of such investigations, received unanimous approval and were embodied in the resolutions later endorsed by the Convention.

Parcels post marketing was described from actual experience in Sacramento not long ago.

Consideration of the problems of nurserymen in improving their root stocks, selecting bud-wood, and watching orchards for improvements in type; also in arranging satisfactory and uniform inspection of trees shipped from one county to another developed some interesting clashes of opinion.

Dean Thos. F. Hunt told more about California farmers than had been suspected by most of the visitors, and he made it plain that farming in California is not overdone.

Modesto, Sacramento, San Francisco, and Eureka asked for the next convention. Modesto offered \$600 cash to pay the expenses of the convention if held there. Sacramento exhibited peti-

titions signed by hundreds, Eureka suggested scenery and an unknown country, San Francisco offered plenty of hotel accommodations and opportunity to investigate the local marketing problems. The choice will be made later by the new State Horticultural Commissioner G. H. Hecke.

The County Horticultural Commissioners' meetings Nov. 13 and 14 were full of interest to those who must fight insects and diseases, but they were especially for the commissioners, and did not have a large attendance of growers.

G. H. Hecke of Yolo County, California, State Commissioner of Horticulture, Who Presided at the Napa Fruit Growers' Convention and Now Enters upon His Career as Official Leader of California Fruit-Growing Industries.

Fruit Growers Convention Discussions.

PROPOSED HORTICULTURAL LAW AMENDMENTS.

A number of propositions for amended laws were discussed in committee, which were not recommended to the convention, for various reasons.

Standardization Laws.—To the fresh fruit standardization law, the most important change proposed is to strike out the words "interstate and foreign commerce" thus making it apply to shipments within the State. Heretofore, fruit caught in the act of being bad according to the law, has been sold locally, but Californians object to eating the refuse, and a better local market is to be encouraged for the growers' benefit. No maturity test was added because nobody yet can determine practically when fruits from different climates, soils, seasons, and varieties are at proper maturity for shipment, to unpredictable markets, through unknown weather. The University and U. S. Department of Agriculture are working on this problem. The only change in maturity requirements was that for Cornichon grapes, inadvertently placed with Emperors at 16 per cent sugar. A strong attempt was made to raise all but Emperors and Cornichons to 18 per cent. The grape maturity test was shown to be unsatisfactory. The only change in packing requirements was the detail which allows only 10 per cent variation in size of fruit packed in baskets. This has been impossible to enforce. A 10 per cent variation in size of fruits in each layer is the proposed amendment.

It was agreed that a definition of "packing" or "packed fruit" is needed in the law.

A new section was proposed, providing that all citrus fruits must be mature when marketed, except when sold on the trees. Definition of maturity was left to the ingenuity of a board consisting of the head of the State Laboratory, the State Market Director, and the State Horticultural Commissioner.

El Dorado county is supposed to have been exempt from this law because standards are higher than those required by law for fruit shipped by the Standardized Fruit Alliance of that county. Since other shippers outside this organization should come under the law, both private and State inspection had to be enforced. Their exemption was struck out, against their vigorous protest based solely on the expense of the double inspection.

Cantaloupe shipments under the present law permit only four sizes. At request of Imperial County other sizes will be permitted if the legislature agrees.

Quarantine Laws.—"Whereas injurious insects are being brought into the State under circumstances beyond the present quarantine laws, the situation is of sufficient importance to justify an amendment to cover the situation." A man has recently been caught importing new and dangerous insects from Florida on citrus twigs and leaves which might also have brought citrus canker.

A clause is inserted providing for

appointment of a county horticultural commissioner on petition of 25 resident fruit growers, even when supervisors neglect to do so. Offices, equipment, and office help must be provided horticultural commissioners if these amendments pass. Horticultural commissioners and their deputies having served in a county at least two years immediately preceding the end of a term or other vacancy, will be eligible to the office of county horticultural commissioner in that county without further examination. Such commissioner may be disqualified on petition by 25 resident freeholding fruit growers, nurserymen, and greenhouse owners after due hearing. Commissioners on authorized service outside their counties are to be paid for time and traveling expenses, either \$1800 a year or \$6 per day for their time.

Under another proposed amendment, a lien due to county eradication of serious pests where owners do not, takes precedence over all other encumbrances previously placed on the property.

County horticultural commissioners may require a license of fumigators and sprayers doing public work.

Every person bringing into any county any nursery, fruit, or seed material, etc., for propagation, must notify the county horticultural commissioner on its arrival and hold it for inspection if the latter deems it likely to harbor pests. Each package shall be marked with a statement of growers and where grown, its contents and the shipper's address, and a manifest shall be sent to the commissioner when shipment is made. All nurserymen and their agents must pay \$1 per year license and registration fee and the State shall assign to each a number which must be attached to all shipments. Shipments infected with pests unknown in orchards, etc., at destination, may be returned, as a whole, to the shipper.

The State Horticultural Commissioner is directed to publish names and descriptions of injurious insects and diseases from time to time and to prescribe proper treatment.

A separate statute designed to prevent spread of weeds, was OK'd by the committee but not presented to the Convention at the same time as the others.

Unification of the Horticultural Commissioner System under control of a representative State Horticultural Board of seven members chosen from as many districts to include the whole State was vigorously defended and opposed in committee. Under such a law, the State would pay county horticultural commissioners, removing them from politics, giving some of them more work, standardizing the work of all of them, combining several mountain counties under one commissioner, and allowing help for those where fruit is the leading industry. The contention for local self-government, and the probable difficulty of getting a sufficient appropriation from the legislature blocked this proposition temporarily. It was suggested that the industry rather than the State should bear the expense, in which

case the greatest objection would be overcome. Under such a system the friction and loss due to widely varying requirements of the various horticultural commissioners in standardized fruit inspection would be eliminated. Other work would be given to keep the commissioners busy the year around and thus increase their loyalty and efficiency.

That inspection of nursery stock at point of shipment is more or less of a farce was admitted, but the tags certifying such inspection are demanded by the carriers. A State law to make them mean something or nothing was proposed but not recommended.

SCIENTIFIC FRUIT DISTRIBUTION.

The air was sizzling with expectancy all Thursday morning at the Fruit Growers' Convention in Napa. State Market Director Weinstock was scheduled to speak on "The Scientific Distribution of Fruit." There were many in Napa who remembered Mr. Weinstock's proposal at the San Bernardino convention that all shippers of citrus fruits should get together daily as the cantaloupe shippers of Imperial Valley do, having previously told a secretary the number of cars of each kind of fruit they each proposed to get into each Eastern market that day. The secretary would list the totals for each market and present them at the daily morning meeting. If too many cars should be scheduled for one market and too few for another, the shippers who were willing would transfer to the other markets and thus equalize the distribution and avoid the glutted markets which reduce prices.

This plan was later proposed for deciduous fruit shippers. In both cases the purely-growers' organizations believed themselves in position to continue more profitably to themselves, as they have been. In both cases, the Market Director has circularized the members of the Exchanges to override the decision of their management, but with no apparent effect except resentment.

It was expected that Mr. Weinstock would urge his proposition at Napa, and he did not disappoint the deciduous growers.

The deciduous Exchange controls 15 to 17 per cent of the shipments from California. Shippers of the other 83 to 85 per cent had been willing to adopt the Weinstock system—indeed in some cases they were very anxious to do so. The Exchange's non-participation blocked the whole game, much to the Market Director's disappointment. The Exchange management claimed to be distributing their fruit scientifically and getting satisfactory prices. They believed that the way to get all the science of distribution there is, would be for all growers to join their organization. This Exchange uses the internationally famed marketing system of the California Fruit Growers' Exchange, during the months that citrus fruits are not moving most heavily. They have no liabilities and they do have assets. They invite all fruit growers

of the State to join them on equal terms and thus control their shipments to the finest degree.

Some of them argue that under Mr. Weinstock's system, the opening and development of markets would be checked. "If I open up a new market for California fruit and develop it at great expense, as there are many in the East to be developed, will I feel kindly when compelled to share that market with one who has been fighting me while I was building it up? If I am thus discouraged, will anyone else be encouraged to develop new markets? Yet if they are not developed, who can sell the tremendously increasing production?"

"Cantaloupe people say Chicago can absorb so many cars of cantaloupes today. No more may be shipped. Who will spend money to make Chicago absorb more? No one shipper, for he would probably have to share the increase with others who did not help bear the expense."

But Mr. Weinstock was there with more than argument this day. He showed two charts indicating the shipments of pears to New York auctions in the week beginning July 24. An average of \$2.04 was received for the 27,202 boxes put on that market that day. On the other four days on which sales were held, an average of 14,189 boxes averaged \$2.43, getting higher toward the end of the week. The apparent loss of the 39 cents difference per box on Monday on one commodity on one market, equalled \$10,608. Mr. Weinstock maintained that with even distribution through the week it would have been saved to fruit growers. He called that unscientific distribution and things looked bad for the Exchange. The chart showed that over 50 per cent of their offerings on the New York auction that week had been on Monday.

Manager J. L. Nagle, however, pointed to the facts that California fruit is shipped every day in the week, but sold at New York on only five days. There is necessarily an accumulation over Saturday and Sunday. On this particular Monday, independent shippers and others had accumulated 140 cars at New York, of which only 78 were sent to the auction Monday. The Exchange fruit, comprising only 1/3 of the total this day, sold slightly higher than the average, having the right to be sold first on Mondays. The Exchange would not have had so large an amount had not the growers of 2/3 the amount of their fruit sold insisted on its being sold that day. Knowing that other shippers were to rush the New York auction the rest of the week, the greater portion of Exchange fruit was not sent to New York but sold at outside points on the basis of the daily higher auction prices without paying the auction percentage for selling the fruit. That is why the rest of the week's Exchange sales on New York auction did not equal those of Monday. Mr. Nagle showed a statement signed by the presidents of local organizations of the Exchange representing 1,700 growers, expressing confidence in the management of their fruit sales. He agreed that outside growers had lost heavily by the heavy

shipments of Monday, but that was their fault, not the fault of the Exchange.

Other speakers argued pro and con, but the decision is not yet announced, for the discussions among fruit growers after the meeting still seemed to show equally divergent opinions. Perhaps the only verdict can be the final judgment of Exchange members as to their confidence in their management.

PEAR DRYING SCIENCE.

Lake County Horticultural Commissioner Fred G. Stokes gave detailed methods for the drying of such luscious jumbo pears as had never been seen by many in the convention until he showed their translucence before an electric light and passed a sackful through the crowd. We hope to publish this at about the time people are preparing for pear drying, since if published now it might be laid aside and directions lost. They dry as little as 4 to 1 in some cases; and the jumbos sell now at 11 to 14 cents. Fruit from one orchard recently sold for 11½ cents f. o. b. ranch. The fruit was 20 per cent jumbos, 60 per cent extra fancy, and 20 per cent fancy. More of this next summer.

Contra Costa County Horticultural Commissioner F. T. Swett followed with a pointed paper interjecting questions to learn the extent of dried pear consumption among those in the audience. Four people out of 200 or 300 signified that they had eaten dried pears three or four times in a year. "Who knows how to cook them?" but thereby hangs a tale in our Home Department.

About 1500 tons of dried pears are marketed per year, used mostly by Northern Europeans or immigrants from those countries. But we are selling less than we used to, largely because American housewives do not know the best ways of preparing dried fruits of all kinds. Growers' organizations have been helping at this, but we need better technique, better methods of preparation as well as cooking. There is a wide field for trained scientific investigation in the preparation of our minor fruit products and by-products, jellies, marmalades, chutnies, fruit pastes, and material for bakers and confectioners. At the laboratories of the University at Berkeley, investigations of utmost value are being carried on this line.

"I want to make a definite suggestion, which I trust may result in some action. Let's talk it over with Dean Hunt and President Wheeler and the Regents, and see if it is not possible to establish an adequate Fruit Products Laboratory. And if it seems advisable, let us urge that at least a part of the establishment consist of a small but practical working plant at Davis.

"Such a plant should be equipped with evaporators, with dry trays, with sulphur houses, with a small canning plant, with appliances for processing, and should be adequate to test and demonstrate the working theories evolved in the scientific laboratories." This plan is working now in the University creamery.

We need standardized methods of bleaching fruits and nuts. The market demands a light colored product. But the bleaching often results in a sulphurous smell that repels the

consumer.

E. B. Anderson of Contra Costa county called attention to the fact that where freight rates permit fresh pears to be shipped, it is not economical to dry them, so only the windfalls, and some years the second grades, are dried. That is why Lake County Dried Pears are in a class by themselves.

Frank Henry of Fresno county suggested exploitation of the peeled dried pear product which in former years won World's Fair prizes for his county. The peeling was done by slipping the skin off with the fingers after sulphuring.

FUTURE OF WINE GRAPES.

E. M. Sheehan, speaking for himself and not for the Viticultural Commission, etc., said in part: "It is unfortunate for the wine grape interests of California that the industry is linked, not from choice, but, rather, by the influence of its enemies, with all other elements of the liquor business, and it has had to stand or fall under this alliance. To date it has been able to weather the load; and taking its enforced position in the front of the battle line, it has saved itself and its weaker allies.

"The issue has not been a fair one and it never will be until such time as the wine grape interests propose their own alliances and proceed to initiate constructive legislation looking toward placing the distribution of wines on a plane that may not excite adverse comment.

"Aside from the menace of prohibition, the wine grape industry of California has, in my judgment, an excellent future. The very recent Federal legislation has given California an advantage, if availed of, that will operate beneficially in two directions. The recent act of Congress reducing the internal revenue tax on wines will probably not be interfered with successfully for a long time."

Missouri and Ohio secured the privilege, to a limited extent, of adding water and sugar to their wines. This is not necessary in California; and the advertising possibilities of this feature will probably be used greatly to our advantage. Movement of wine grapes East the past season may become greater in the future, though transportation is too high at present.

Mr. Sheehan estimates that this season 220,000 tons of grapes will have been used for sweet wines, 140,000 tons for dry wines, and 40,000 tons for brandy. About \$1,000,000 will have been paid for table grape and raisin culls. He takes "the position of an optimist in relation to the future of the wine industry in California" and does not believe it will be destroyed.

PRUNE AND APRICOT GROWERS' ORGANIZATION.

G. E. Merrill read a paper scheduled to be prepared by J. H. Bone, making the point that past failures are the stepping stones to success—that facts discovered through previously unsuccessful organizations have led to the formation of a plan which follows that of the successful raisin growers who in turn had previously experienced disastrous failures. Details of the present system have been published and may be ob-

tained by writing the gentlemen named at San Jose, so we do not reproduce them here.

"In addition to the many indirect benefits that will result from the formation of the Association, it will eliminate speculation; it will make possible the standardization of the pack; and it will result in a general raising of the price level for both prunes and apricots through the development of an improved form of package and popularization of that package through national advertising.

What of the Future?—"Next year we shall have more prunes and apricots in bearing than ever before and our orchards will be better cared for than ever. What of the more distant future, which after all is only a few years ahead, when California will have 150,000 acres of prunes in bearing and 60,000 acres of apricots?"

Mr. Merrill has every expectation of organizing in permanent form before Christmas.

Harris Weinstock suggested that we do not wait until we are dead to insure our lives, nor until our houses are burned before we insure them. He emphasized the time of prosperity as the time to insure the future prosperity of prune and apricot growers, by getting control of their product in their own hands.

E. B. Anderson of Walnut Creek recalled vividly the loss of \$1600 and the mortgage on his orchard which followed collapse of the Cured Fruit Ass'n of Santa Clara Valley, but said he was from Missouri and very friendly.

Harry Dunlap of Napa pointed out that all undesirable features of present marketing are due to one element—speculation. Eliminate that by growers' control of their crop, and Eastern dealers would push its sale to consumers, knowing they could depend on uniform grades and supply.

SAN FRANCISCO PRODUCE MERCHANTS.

San Francisco County Horticultural Commissioner Dudley Moulton showed that produce merchants can do better with a uniformly standardized and inspected product; and that they know best of all how fruit and produce should be packed.

Since they will be very directly affected by the proposed amendment to the Standardization Law making it apply to shipments within the State, they are entitled to a voice in making that law.

San Francisco receives not only the best of all kinds of fruit, but she also receives culls that are dumped onto the commission merchants but should never have been marketed at all. Mr. Moulton has returned some of such fruit to growers, especially if insect-infected. In one case three men together bought Southern cull oranges infested with scales, wrapped them in stolen or used Sunkist wrappers, put them in Sunkist boxes, were caught and stopped; but repeated the offense. The commissioner has notified apple growers in several districts that not more than 3 per cent of worms will be permitted.

Inspection of trees for use of growers is no more fair than inspection of fruit and produce for use of consumers; but the later also produces more stable markets and larger profits for the growers.

TABLE GRAPE STANDARDIZATION.

That a sugar test for table grape maturity is unsatisfactory, was developed in the questions and answers during one of the most interesting sessions of the convention. F. B. McKeivitt called attention to the numerous complaints from Eastern markets, of sour Malagas this season. As chairman of the Committee on Legislation, he recommended an 18 per cent test on all but Emperors and Cornichons. Horticultural Commissioner F. P. Roullard of Fresno county admitted that 17 per cent grapes this season were sour, while last season 17 per cent grapes were sweet. The inspection work in his county where most of the Malagas are grown, has been systematized and standardized to such an extent that there was very small possibility that mistakes in testing had been made.

Horticultural Commissioner H. H. Ladd of San Joaquin county called attention to the growers' sentiment that 17 per cent Tokays are sweet enough and that no change is desired. Another speaker suggested that raising the Malaga test 1 per cent would put that variety back 2 weeks and throw them seriously in competition with Tokays.

Chas F. Collins, Horticultural Commissioner of Tulare county, wrote a letter stating that there would probably be little objection there against a raise of 1 per cent on the earlier varieties, but that Emperors should stay at 16 per cent on account of frost danger.

Imperial County Horticultural Commissioner F. W. Waite asserted that all the shippers in his Valley held their Malagas last season until they tested 18 per cent; and no hardship resulted.

No one suggested an acid-sugar-ratio test for grapes, so we inquired from all the authorities available for the reason. They uniformly did not know why such a test should not be worked out as with oranges; but perhaps the University will enlighten us in a future issue.

The abuse of packing as much as 28 pounds of grapes into crates of four baskets, each intended to hold 5 pounds, was discussed; and a maximum legal limit recommended to the convention not only for table grapes, but also for apples and pears.

It has been the practice to clean the crates to make room for more grapes until nearly two inches were added above the baskets, which are four inches deep; and then so much fruit put in, that the top had to be bowed with considerable pressure. This crushed and bruised the berries, making them mold quickly. It also gave a cut-throat advantage to shippers who advertised these heavy crates, and compelled the rest to pack likewise. It was pointed out that the originators of that system, having brought the rest to their level, are not reaping the advantages now, and are willing to return to sane packages. Thus, no legal weight limit would be needed, were not other people likely to start the same procedure periodically.

(Continued on page 580)

The late cold snap, instead of hurting the crop, has improved the color of the oranges in the State.

THE WEATHER WE ARE GETTING.

THE relentless high barometer, which is circling somewhere overhead, keeps along with its hateful work, making it impossible to bring up relief forces from our gentle ocean, and dropping frost-bombs every morning. These frosts, although we are obscuring the whereabouts of our most tender things with copious smudgings, are certainly inflicting some losses—reducing olives to oil-grades, pinching the juice out of citrus fruits, shortening the alfalfa grazing-season, etc., and chilling the Thanksgiving in some hearts, no doubt. But even with such unusual visitations, November is not a dismal month, as it is pictured by humid-region poets. The days are clear and bright, the sun is warm, and for the tourist, whose sunrise comes in the middle of the forenoon, this weather must be counted "heavenly," but to the one whose livelihood comes from growing things, it should be warmer and wetter—as indeed it may soon be.

Probably the height of futurist wisdom about the California seasonal rainfall is that you "can not almost always tell." Any one can study the records of the last sixty-five years, and bring out what suits his temperament, and still be forced to admit that it may come just the other way—which is death to prophecy, except of the Delphic type, and that may, after all, be the highest wisdom in the end. Our meteorological friend, L. E. Blochman of Berkeley, favors us with this memorandum:

To some of my friends in Santa Maria, after their heavy September and early October rains, I predicted that they would have lots of time to thresh the beans that went through the rains; that both October and November would be very dry and probably only light rains in December. I am still willing, regretfully, to reiterate the unfulfilled part of my forecast. Invariably heavy September rains are followed by a long period before the regular rain season starts in. They are also, as a rule, though not invariably, followed by seasons of light precipitation. In September, 1904, we had five inches of rain a few days earlier than this year; some corresponding rains in October; a long, dry spell till sometime in December (one inch rain only between), but after January 1st the rains came practically normal. In 1851, 1911, and 1912 we had very early September rains, though less of them than this year, and we had practically dry seasons. The weather map of this year shows the movement of the storm centers to be quite far to the north, a sign that outside of possible showers the rainy season proper is still in the future.

The comfort for the hopeful man is then that we have had only freak rains so far, and the prevailing northers have largely blown them away. When the elements get down to their regular system, the probability is that we shall get enough, with chances for both too much and too little. The brave man takes these chances and goes ahead with his regular work. It is the only way, for a fair chance is the best a man gets in this world. All the world prefers a dead-game sport to a sure-thing artist, for the former is always ready; the latter, seldom. In farming, as in righteousness, it is the virgin with gasoline in her tank, who goes to the wedding.

THE WORLD IN BONDAGE.

IF THINGS really go on as they seem to be trying to go, we shall have the world so cluttered with entanglements that all plain persons, who simply wish to pick fruit, milk cows, hoe corn, and pay taxes, will have to get off from it—if they can. The Kaiser's plan to get Paris in three weeks, Petrograd in three more, the Suez canal and Egypt in three more, has, of course, gone glimmering, but now the Allies proclaim that they are not going to be content with driving the Kaiser into his own corner, but will hog-tie him. That is not much of our affair, so we let it go at that. But some other things which are being planned more nearly affect us. There is that Paris pact of last year, by which the Allies propose that all those who have been trying to mind their own business during the war will be excluded from the world's markets by discriminations, so that the menu, over as much of the world as they jointly control, shall consist of Russian kaviar, British roast beef, Italian fruits, and French wines, and nothing Danish, Hollandise, Scandinavian, Spanish, nor American shall enter into the lives of Allied peoples. We have little fear of such a policy lasting long, if it is ever put into operation. The people will expect to emerge from present distress into broader and fairer humanity and greater freedom to enjoy individual rights; and to trade as each finds most advantageous is one of such rights, which cannot be long withheld. If it is more advantageous to trade with vanquished enemies than with victorious friends, they will soon be doing it, and all pacts to force other action will dissolve.

A LABOR PACT PROPOSED.

ANOTHER pact, originating not within the ranks of sympathetic belligerents, and aiming to determine not national but class action, is now proposed by the American Federation of Labor, now in session in Baltimore. If such world-pact should be undertaken by organized labor with the idea of joint action to secure for itself undue advantage as against proprietary producing interests in which other classes are engaged, it would be as hateful and inimical to the rights of humanity as is the Allies' trade-pact to which allusion has been made, and we must hope it would ultimately accomplish as little. But when organized labor rises to a high patriotic and humane motive, it is entitled to respect and support. This seems to be the present purpose, and we accept it as such until otherwise demonstrated. As against oligarchical aggression and appropriation of human rights and privileges, organized labor, properly actuated and controlled, should be fundamentally opposed. The Baltimore convention is therefore justified in its declaration:

"Collective action by a League of Nations," can properly prevent the use of armed force for national aggrandizement and for exploitation of the small countries. Establishing methods and agencies which render display of military and naval power no longer effective is the practical and direct method to abolish rivalry between nations in standing armies and naval equipment. The labor movements of all countries have contributed much to the will for peace and justice, and must do their part in the development of the agencies by which their will can be expressed."

And this influence it proposes to exert by a world assembly and federation of labor organizations as soon as the war is ended. This will probably be convoked as soon as the period of negotiation for permanent peace begins.

WHAT WILL AGRICULTURE DO?

IT IS probable that all organizations—industrial, scientific, and philosophical—in different countries will seek world assemblies during this negotiation-period, which may be prolonged. It is not likely that the world, after this shaking-up, will be content to leave the new questions of national relations to settlement by a bunch of nobles, diplomats, statesmen, and military heroes, such as have patched up peace hitherto. If we are not mistaken, the adjustment will be undertaken, or influenced, by the people at large in all nations as never before. And everybody seems ready to have a hand in it. An appeal to the bar of the United States, a great neutral nation, to aid in defining international law and right in such terms that world peace might be maintained, was made by Sir Rob-

ert Laird Borden, Premier of Canada, in an address at the Lawyers' Club in New York last week. He appealed to the lawyers to recognize the field that was open to define international law and right in such terms that by them and abiding peace of the world might be maintained.

As the labor organizers and the lawyers have thus, in a way, declared their humanity and patriotism, so it is to be expected commercial and manufacturing organizations will also rise to their opportunities and duties, and present their views as to ways in which the world can be made better to live and do business in. All these and many more lines of thought and effort are more or less organized in all civilized countries, and ready to make their influence felt in world conferences, which will have much to do with determining the future courses of international law and action. Is agriculture ready to do anything?

WHY IS THE UNITED STATES UNREADY?

AS CONDITIONS now are, the United States is unready for participation in a world conference of agriculture, because we have no really national organization to be recognized as such. We have several organizations of large membership and wide influence, but none to which all of these recognize themselves to be tributary. Several of them have recently affiliated temporarily, or rather have acted jointly, in several matters, but there is none to which they all grant superior jurisdiction—each considers itself national with the result that no one of them truly is. On the other hand, European countries do have properly co-ordinated national organizations. We will not take space to name them, but we personally came into contact with them, and saw their working in Italy, Austria, Germany, France, Denmark, and Great Britain; and no doubt other countries, beyond our touch in 1813, had and now have them also. They are national because of their recognition and functioning as such. They are, in a sense, of the governments of the countries, but not in the governments; that is, they are not departments or bureaus. Such organizations are at work also, and are recognized as integral parts of the governments—just as our own Department of Agriculture at Washington is. But the highest national agricultural organizations in other countries than ours are constituted by the governments, but not regulated by them. In certain matters pertaining to agricultural industry, they are higher than bureaus and then the governments themselves, for they are advisory thereto, and neither administrative nor legislative branches often or seriously depart from their decisions on natural agricultural interest and policy. The United States has the greatest agricultural interests in the world, and it has agricultural organization abundantly in education, commercial, scientific, financial, and geographical phases, but in the way of an organization which can authoritatively speak the agricultural word for the nation, the United States has none.

NATIONAL CHAMBER OF AGRICULTURE.

THERE is now before Congress a bill providing for the organization of a National Chamber of Agriculture which, if enacted, would provide for the handling of all important agricultural problems and policies in a national way. The chief purpose and function of the proposed organization, according to its title, are "for the purpose of promoting the equitable distribution of farm products," which may be interpreted to mean that it is to have cognizance of farm products as soon as they leave the lands of the producers, and thence forward. Or it may have a broader aspect, and include the relations of farmers to labor, to capital and to whatever other national concerns, which influence the ability to produce anything to leave his lands as well as to affect it afterwards. It surely has a wide scope as befits a truly national institution. The Chamber is to consist at first of nine citizens (at least six of whom shall be practical farmers), appointed by the President of the United States, who shall proceed to organize in such a way that later the chamber shall consist of one delegate elected by the farmers of each State, which shall secure the local organization prescribed in the law to qualify a State to make such election.

Thus the chamber will begin as an appointive, and grow into an elective membership. The idea is that the government shall create and incorporate the chamber, which shall, as soon as possible, pass beyond government influence or dictation and become autonomous. This is, of course, essential to its future because it is not intended to evolve an executive or congressional bureau or commission, but a body chosen by organized farmers and answerable only to such a constituency. This would be a truly national body, and would overlie all nominally national organizations which it could harmonize and collocate while it encouraged and promoted them. It would not displace any if their aims and methods were worthy, but would advance all subsidiary organization which conditions required. If the creation of such a Chamber of Agriculture shall commend itself to Congress, and that is still to be seen, it would qualify the United States to do international agriculture as opportunities may arise. If we had such a body now, it could call all national chambers, which other countries have under various names, to an

international conference, after the fighting ceases, which would speak the world's word in support of permanent peace and humanity, of which agriculture, through all the world's history, has been a conservator, to the limit of its power and influence. Agriculture now has in all civilized countries outspoken appreciation and esteem never before accorded to it among the callings of men. The United States as the leading agricultural nation, could summon agriculturists of all nations to conference about world purposes and policies, and the decisions of such a conference would have great weight in reconstruction of international relations upon a just and enduring basis. If Congress acts promptly it can qualify this country to extend such an invitation to the nations. But to thus qualify, we must have a body which is not a part of the government but of the people, for the invitation will not be extended to agricultural officialdom, but to farmers in all countries who are organized in their own rights and names and beyond government control in thought and policy, and who are therefore capable of acting independently and spontaneously.

nuts are apt to give various seedlings. But you do not say whether your trees have borne nuts or not, and therefore you do not know what you already have. Some of them may be as fine as silk, and if so you may have little to gain from grafting. We should let the trees bear, and graft those which are inferior, taking scions from the best, if you have any. If not, graft over the whole lot with scions from other growers who have good types. Top grafting in the common way works well with the pecan—working in the branches above the forking. Graft rather late in the dormant season.

The Hyacinth Bean.

To the Editor: A dealer gave me two beans, like those I am sending you, last spring. I planted them here in my garden in the Delta. The vines ran up a 10-foot pole, slopped over the top, and then went at work—making beans. I have already shelled out half a peck from the two vines, and they promise to keep at it until frost. My Japanese farmer, who is an intelligent botanist, does not know them. The Chinese refuse to be responsible for them. The dealer does not know where he got them, and there you are! What is it?—J. P. I., Las Vegas.

It is a hyacinth bean (*Dolichos lablab*). Your Oriental cabinet does not recognize it because it came the other way round—reaching this country from Egypt as early as 1818. It is grown in this country and England exclusively as an annual ornamental vine for covering arbors and trellises, and its flowers are very showy. In the south of France and in some tropical countries the beans are eaten. California seedsmen carry it as an ornamental.

Dying Apricot Trees.

To the Editor: The leaves of some of my five-year-old apricot trees turn yellow and the trees soon die. The inside of the bark of the infected trees is white. What is it, what is its cure, if any, and if not, what other trees will thrive? The soil is a light, sandy loam with some gravel in spots.—A. A., Mt. View.

You do not give symptoms enough for confident diagnosis. If the roots are partly decayed, and the white under the bark is a felted layer under the bark near the ground, it is likely that the casualty is due to decaying roots of oak trees in the soil. There is no cure for a dying tree. Dig it out—making a large hole and carefully removing all roots encountered. Fill with fresh surface soil from a distance, and plant a new tree. Apples and pears are more resistant than stone fruits.

Dipping Seed Grain for Smut.

To the Editor: When using formaldehyde in solution for grain, how long should the grain be allowed to soak, and if it is allowed to soak for a half-hour will there be danger of injury to the crop?—H. W., Angels.

Probably not; for 30 minutes was at first prescribed for the soaking, but it was later shown to be a waste of time as ten minutes would allow the solution to penetrate the grain mass. It is only necessary to fully wet every grain; the virtue is not in the soaking, but in getting every grain wet. There are machines which work well, and they keep the grain moving through the liquid and do not soak at all.

Large White Beans.

To the Editor: Do you think that the large white bean would do well in this locality? I see that they are quoted as high as any bean. Blackeye and Tepary are the kind most raised around here.—E. L., Winton.

Large white beans are chiefly grown on moist river lands. They do not like to rough it in heat and drouth, as the pinks and those you mention are willing to.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m. November 21, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	00	3.53	7.31	60	32
Red Bluff	00	3.63	4.37	70	34
Sacramento	00	1.08	2.77	61	32
San Francisco	00	2.78	3.09	63	46
San Jose	00	1.99	2.38	70	28
Fresno	00	1.88	1.70	68	36
Independence	00	1.13	1.57	62	32
San Luis Obispo	00	4.14	2.85	78	32

and Address

Pruning Fruit Trees.

To the Editor: I have a small orange and lemon grove. The trees will be two years old this coming March. Will you tell me the best way and the best time to prune them, and also about pruning cherry trees and when to prune them?—M. R. K., Arbuckle.

We cannot expound pruning in a paragraph. It is an operation which a fruit-grower can practice and study to the end of his life, and still have something to learn. In our book, "California Fruits," a whole chapter is given to the general subject, and special suggestions on pruning are given in each chapter devoted to each different fruit. In the Pacific Rural Press there is something given nearly every week about pruning, and there probably always will be; for, though Adam began pruning when the Lord set him to tend the trees in the Garden of Eden, no universal method of pruning has yet been agreed upon, and in the nature of things there never can be.

Do not cut your citrus trees now. Let them carry all their leaves, for in case of a light frost they may act as a cover to protect lower growth. Prune citrus trees in the spring and summer as they begin to make new growth. Prune cherries and other deciduous trees now and during the next two months, while they are bare of leaves. Young citrus trees need little pruning except to shorten branches which are running away with the shape of the tree, and to remove suckers which may put the branches you wish to use, out of commission. Get into your head a good idea of the shape of the orange and lemon trees you ought to have, and cut away what is destroying that shape. If your cherry trees have gone two years without pruning, get a good tree man to help you get them into shape, and then by careful reading and by studying the trees of successful growers, try to get wise about treating them in the future.

Sharpe's Number 1 Prune.

To the Editor: Your correspondent, "M. S.," of Ukiah asks what prune to plant? Tell him by all means to plant the "No. 1," of which I. O. Scarlett says, "It is the most profitable prune I grow." He sold the 1916 crop of French at 5 1/2 c and the "No. 1" at 11 1/2 c. At Napa Farm Bureau Fair "No. 1" took first prize, and ran 19 to the pound again French 33 and Imperial 23. I am sending you sample and desire your opinion of quality.—Frank Owen, Napa.

The prune looks the record you give of size. It has fine grained, close-textured flesh, and a smooth, thin pit, relatively small. The specimens sent are monstrous. We had them cooked and judge them high quality, but incapable of being mouthed as a stewed prune, unless one has the mouth of a hippopotamus. Of course, to be processed and eaten out of hand by successive bites, size is an advantage, but few prunes are eaten that way in this county. We apprehend the time will come when outside sizes of prunes will be discounted, as or-

anges are, but people will probably not worry about that so long as they sell well. Still a medium-sized prune is the only rational thing for stewing.

Citrus Trees and Frosts.

To the Editor: Please tell me the best way to protect young orange and lemon trees from frost. We have, as a rule, not very heavy frost. I have been told, if there has been a heavy frost, to sprinkle water on the leaves before sunrise. Would that be a good way to keep the trees from frost-bite?—M. R. K., Arbuckle.

Good ways to protect young citrus trees from frost are to drive stakes around them and hood them over with burlap, or to bundle them with corn stalks, placing the stalks around them loosely, but still completely, and tying the bundle with wire or cord around it. Sprinkling cold water, as you indicate, may keep a light frost from doing injury because it thaws out the frosted foliage slowly. If the sun comes quickly on such foliage it is more apt to thaw it so rapidly that the cells are ruptured and the tissue destroyed. It does not prevent frost, but it may help the leaves to recover from frost. It is only useful and effective when the injury is very slight indeed, and cannot be depended upon either as a preventive or cure.

Insects on Fig Roots.

To the Editor: I have white Adriatic fig trees 25 years old, among which there are several smaller trees, of which the leaves turn yellow and drop during the summer. These trees do not mature their fruit well. I have heard that this is due to an insect working on the roots. This condition spreads to more trees every year. I have heard that the use of lime was good to overcome this. Is the use of lime beneficial in such a case?—A. N., Fresno.

We know no parasite affecting the roots of fig trees, excepting microscopic worms called "nematodes," and they are not common. If they are present you can determine it by digging up some of the small, fibrous roots and see if they have swellings on them. There is no cure for them. Lime would not affect them, unless you applied enough to kill the trees.

Are you sure that your land is not spotted with alkali? If it is, it would cause the trees to act as you describe, and the only cure is to tile the land and wash out the alkali with free use of fresh water irrigation to soak and carry away the alkali through the tiles. If you have alkali, the use of lime would make it worse, though gypsum might be of some use.

Grafting Pecans.

To the Editor: I have seedling pecan trees seven years old. Is it desirable to bud or graft to soft shells? They average about 16 feet high and three inches in diameter at the ground. Would it be better to bud or to graft, and at what time and the best method?—W. J., Hardwick.

You can only be sure of getting the largest, best type of pecans by grafting, as even the best seed

The Shipping-Plum Outlook.

To the Editor: Will you tell me something of the market value of plums,—which are considered the best shipping varieties, surest bearers, also best, on what kind of roots? My soil is No. 1 prune ground. All varieties of fruit in 3-year family orchard are doing finely, especially plums and peaches.—A. B., Visalia.

[Answered by F. B. McKevitt, Sacramento.]

Since the soil is number one prune land, do not fail to urge him to make his entire planting to prunes, of which he probably would find the best two to be the French and Robe de Sergeant.

The plum business is likely to be overdone. There are thousands of acres of plums in Solano and Placer counties. Old peach and apricot orchards have been grafted over, and more are being grafted over, to shipping plums, since peaches and apricots are too uncertain in profits.

The best shipping and bearing varieties are as follows: Beauty, Climax, Formosa, Tragedy, Santa Rosa, Grand Duke, Diamond, Hungarian, Giant, Wickson and possibly the Sugar and Standard Prune. All these plums should be on the Myrobalan root.

In regard to prices, it is hard

to give a fair idea. For example, this year plums netted in the neighborhood of \$100 per ton. Last year they netted between 40 and 50c per crate, which shows that the fruit did not pay to the grower \$20 per ton. Shortage of fruit in the East, and money plentiful, accounts for the high prices prevailing this year, which exceed anything the writer has ever known, taking it throughout the season.

In my opinion there is great danger of the shipping plum business being overdone in the near future. I do not anticipate the same condition in the French prune business, as the demand is strong and has been so for several years past; I consider that the French prune orchards of the Santa Clara Valley were so badly injured by the drouth two and three years ago that they will never recover their heavy bearing ability.

I am personally interested in growing both plums and prunes in Tulare county and from my experience and knowledge of both the business and the country, I would unhesitatingly recommend the planting of prunes for drying purposes.

ing oranges in the box. The clip-pers used are so made that it is very seldom that they scrape the skin, though it is the easiest thing to cut

ORANGES PICKED CAREFULLY.

[Written for Pacific Rural Press.]

As careful picking is vital to oranges, most of the packing houses have gangs of trained pickers working under a general superintendent. Such a superintendent is Fred Arth for the Crown Jewel packing house near Redlands.

Each gang has a foreman selected for known reliability and paid more than the rest, to have general supervision of the gang's work while Mr. Arth is visiting other gangs. This foreman picks oranges with the rest, but keeps records for all.

The current record of each gang shows whose orchard is picked each day, when the picking started, the number of boxes for each picker, when quit work. They work 9 hour days at \$2. According to Mr. Arth, 9 boxes per hour is fine picking. But carefulness is always emphasized above quantity. The superintendent visits all gangs and inspects one by one the oranges in at least one box for each picker each day.

Every man chalks his number on a painted space on each box in order to get credit for that box. This places responsibility also (until the picking box is emptied) for every carelessly picked orange handled by the packing house. The numbers are erased after the boxes are emptied and the fruit inspected at the packing house. This system has an advantage over the usual custom of putting tickets into the boxes, in that the distinguishing mark does not get misplaced or lost.

Picking boxes are not filled level full because in handling, especially in unloading from wagons, the upper boxes are likely to be dragged over the others with a corner lowered enough to bruise the fruit. It is the inspector's business to see that fruit is not pulled off the tree but is clipped clean. Pulling often leaves stiff slivers on the "button," which are likely to injure neighbor-

the stem off close to the button.

"An orange cut off right can usually be rubbed across another orange without scratching."

Bartlett Pear

On Blight-Resistant Roots

There never was a more favorable time for Pear planting, but be sure your trees are planted on Japanese Roots. We have given this root a thorough test for over five years, and discarded all others in its favor.

All our trees are propagated from trees selected for their bearing qualities and grown in the granite soil in the foothills of the Sierra Nevada, assuring a fibrous root system second to none in California.

Resistant Fruit Tree Stocks.

[From Address by A. L. Wisker, at Cal. Fruit Growers' Convention, Napa.]

Of great importance in the improvement of fruit growing are the many experiments dealing with improvements in root stocks, to meet every condition of soil-moisture and the underground attacks of insects and plant diseases. Naturally such experiments must usually be carried on for a considerable period before wholly conclusive results are accomplished. One of these experiments that has been in progress long enough to permit definite conclusions is that of the Southern Oregon Experiment Station, where Professor Reimer has been working for some years with many species of pears to find a stock that would be free from the disadvantages of the French seedling.

Pear Stocks.—As is well known to most orchardists, the French root is subject to great injury from attacks of the pear root aphid and is particularly susceptible to pear blight. As it suckers readily and these suckers often carry blight to the underground parts of the tree, the use of the French root not only adds to any system of blight control the heavy expense of eradicating blight from the root, but it at the same time constitutes an added and needless menace to the life of the tree.

Reimer's work has been most systematic and has demonstrated that great improvement in nursery stock will result from discarding the French seedling and substituting the Japanese or Chinese seedling, sometimes called the Sand Pear. For years this was known to botanists as "Pyrus sinensis," but Rohder, of the Arnold Arboretum, has recently determined that "Pyrus serotina" is the correct name of the species generally used by nurserymen under the names "Japan Seedling" or "Chinese Seedling." This species is quite resistant to attacks of the pear woolly aphid and remarkably resistant to blight. Reimer repeatedly inoculated the roots of this species with blight without producing a single case of the disease. At the same time he made similar inoculations with the same culture in the roots of French seedlings in adjoining rows, killing 100 per cent with blight.

This species produces a tree of great vigor when used as a stock for our commercial varieties and makes a perfect union. Although in satisfactory use in the Eastern and Southern States for over 50 years, its use on the Pacific Coast dates back less than ten, but its desirable qualities are now so generally recognized here that it appears destined to supplant the French root.

Apple Stocks.—Harry Nicholson, a Tennessee nurseryman, is now using the Japan root in an experimental way as a stock for apples, to obtain a root that will not be injured by the woolly apple aphid—a pest that makes apple growing impractical in some nurseries. Nurserymen will welcome the discovery of a stock for apples that is aphid proof and which will avoid the cumbersome method, now practiced to a slight degree, of double-working on Northern Spy, a variety somewhat resistant to aphid.

Plum Stocks.—Plum growers realize that there is much room for improvement in the stocks now in use for this fruit. Myrobalan, the stock usually used for moist soils, is very susceptible to crown gall. The same is true of the peach root, which is generally used in dry soils. Peach root has the further disadvantage of making a most unsatisfactory union with many plums, among them being Diamond, Grand Duke, Yellow Egg, Robe de Sargent, and Sugar. A stock for plums that will give as good results on dry soils as the peach, that will make as good a union with all varieties as Myrobalan, and that will be as free from

crown gall as the Damson, without its tendency to sucker, would be of greatest advantage to plum growers. Leonard Coates has been experimenting with several new plum stocks, and as he is already responsible for the introduction of a number of valuable varieties of different fruits, and for the selection and propagation of certain desirable strains of other varieties already known, it will only be in keeping with his past achievements if he should score another improvement in this direction.

Peach Roots for Stone Fruits.—A seedling peach from China, now the subject of an experiment by the Bureau of Plant Industry at the Chico station, promises a stock that is remarkably resistant to alkali. If present expectations are realized, it

is probable that peaches, apricots, nectarines, plums, and almonds can be worked on this root and grown on soils now wholly unsuited to their culture.

WATERMELON BLIGHT.

To the Editor: What can be done to kill watermelon blight? We have had watermelons on three acres for three consecutive years and they blight.—J. C. S., Ontario.

[The fungus lives over in the soil and any treatment to be effective would be too expensive. Try a crop of different nature on this three acres for two years. That will probably starve the fungus.]

The Clovis Chamber of Commerce saved a large amount of the raisin crop by use of a lumber company kiln.

What Trees Shall We Plant ?

This problem confronts the man who is just starting as well as the old settler who wants to set out another acre or a few more acres to the farmer's most profitable crop—fruit.

—and it IS a problem. To look ahead several years so that the trees you plant now will produce PROFITABLE crops when they come into bearing, requires careful study and a knowledge of more than local conditions.

"Ask Roeding for his Advice"

—that's what thousands of growers have been telling each other for years. They know Geo. C. Roeding KNOWS and that the planters who follow his advice are the ones that seldom complain about poor crops or low prices. For 33 years "Roeding's advice" has been sought—and it is just as freely offered to you today. Don't be guided entirely by present high or low prices or by rumor. Tell us what you think of setting out—your soil and local conditions—and let us advise with you freely. It won't cost you a cent—whether you buy of us or not.

Roeding's True Trees—of course

—give the best satisfaction. They are started right—grown right—and sold right. They might truly be termed "pedigreed" for they are the kind you can depend upon—the kind that produce fancy fruit.

It makes no difference how large or small your requirements—your order will be promptly and carefully handled if sent to us. Our exceptionally large and complete stocks of FRUIT and ORNAMENTAL TREES, VINES, SHRUBS and PLANTS comprise nearly everything that grows.

Ask for prices and suggestions.

New Catalog Nearly Ready

If you haven't already sent for it—drop us a line. It is completely illustrated—lists and prices over 2000 varieties—and will be sent as soon as it comes off the press. Write us today.

Fruit Growers Convention Discussions.

(Continued from page 575.)

FRUIT BELOW STANDARD QUALITY.

Bearing in mind the possible results if the Fresh Fruit Standardization Law is amended to apply to all shipments within the State, H. C. Rowley of the California Fruit News leads up to the following paragraph:

"I accordingly plead for the establishment of a high standard to be marked as such. Then allow all other produce, which is not deleterious to health or definitely injurious to the neighborhood into which it comes, to be sold for what it is worth: if the owner and consumer agree that it is worth sufficient to pay the cost of its handling and sale, always, however, with the understanding that it must be plain to the consumer just what he is getting. If it is made impossible to deceive or mislead a consumer through offering an inferior or unfit product for better than it is, the balance of the problem will take care of itself."

He emphasizes the advantage which will encourage production of best fruit by giving it an advertising value; but he would not permit destruction of valuable food products in this day of high cost of living just because they are not in the "extra fancy" grade.

There are many consumers who cannot buy the finest grades and would have to do without any fruit, unless lower grades are marketed. There are many producers who have not means to produce extra fancy grades only, yet they should have the right to supply the people who want their fruit.

Not everyone cares to pay for fancy packages. Those who wish, should be allowed to buy fruit in packages considered by the producers most economical for safe handling. Such economy might depend on uniformity of packages; but in this, as in case of lower grades of fruit, the reward of increased prices for superior articles will be sufficient to encourage the production of goods and use of packages of a standard higher than the average.

APPLE STANDARDIZATION LAW.

Praising the Apple Standardization Law as it worked in Pajaro Valley the season of 1915-16, F. S. Jerome, President of the Watsonville Apple Distributors, called attention to the harm done this season by packers who worked up a reputation under the Act last year and put out defective packs this year. One order for 100 cars has recently been turned down for this reason.

Opposition to standardized packing naturally comes from those who have inferior fruit which they want to sell at high prices.

"It is quite apparent," said he, "that we need two grades of standardized fruit. The lower grade should include fruit of less regular sizes, and with slight defects such as do not seriously damage the value of the fruit." But rotten apples, and those with worms or other infectious insects or diseases should be kept out of both.

Strict culling raises prices of marketed fruit both by reducing the quantity marketed, and by improving its quality. "If fruit is not well grown, however, no amount of standardization will enable it to do well on the market." This point was also emphasized by Mr. McKevitt, president of the Cal. Fruit Distributors.

FUTURE OF RAISIN GRAPES.

Reviewing the past success of the Cal. Associated Raisin Co. James Madison sounded a note of warning not to expect the present abnormal conditions to continue. Of the recently picked crop he estimated 90,000 tons of Muscat raisins, 22,000 tons of Thompsons, 6,000 tons Sultanas. Recent large plantings have been mostly Thompsons, but the minute the war is over, our market will be flooded with Greek and Smyrna raisins at half the present price of our Thompsons. Within three years, the new plantings already in will produce as many additional Thompson raisins as were produced this year when the crop is 20 to 25 per cent heavier than last in spite of the rain. He recommends Muscats and Sultanas if planting must be done; especially the latter where conditions are favorable.

SORE-FOOTED HOGS FROM CONCRETE.

[Written for Pacific Rural Press.]

Concrete undoubtedly has a place on the modern hog ranch; but its use as a flooring for all parts of the house or fattening pen seems doubtful in view of practical experience of those who have tried it.

An instance of this kind was recently seen where a large number of hogs are swill-fed and because of the need for sanitation the entire floor was made of concrete. As a result practically all of the hogs were sore footed and moved about with great difficulty.

In adjacent pens where brood sows were kept, this difficulty was overcome by leaving an earth floor in half of the pen on which the hogs spent most of their time except at feeding time, when they ran on concrete.

The "Losse" Cot

FINEST COT ON THE MARKET TODAY.

The Losse is unsurpassed for size, uniformity, color, quality, and all-round merit. It is absolutely the best cot for hand-eating or canning. When you plant a cot orchard—plant the best trees you can buy. It pays.

You can buy the Genuine Losse Strain Only from this Nursery. Write to us at once.

Kern County Organized for Rural Credits.

To the Editor: Replying to your letter of the 25th inst., which refers to activities in this county in connection with the Farm Loan Act, we have already organized the Delano-McFarland National Farm Loan Association with a membership of twenty-six farmers, borrowing in the aggregate \$70,000. Each farm center, of which we have twelve, is taking an active interest in rural credits. We have lined up something like 150 farmers throughout this county who will require between six and seven hundred fifty thousand dollars, and further applications are coming into this office from time to time. We will probably organize four associations during November and December.

It is not surprising that eighty per cent of the applications received are for the purpose of relieving farmers of mortgages at high rates of interest, but it is surprising that more of our farmers do not take advantage of this Act to borrow money for developmental purposes. There seems to be a feeling among those who are out of debt that it is advisable for them to keep so and thus relieve themselves of worry of which they have a vivid recollection from past experience. When this Act is thoroughly understood and farmers are convinced that borrowing money over a long term of years at a low rate of interest to make their farms more productive, and thus more profitable, I think then a great many will borrow for developmental work. It would not surprise me to find this county borrowing over a million dollars within the next twelve months, as great areas here are soils of fine quality capable of great production and on the whole are selling at a fair value. It is, however, necessary to provide water, which is generally done by pumping, the cost of which plants vary from \$1200 to \$2000, making it difficult for a young man with little means to make a start; but with the assistance of this Act, we feel that many people who have been unable to take advantage of their strength and industry through lack of capital will now take up these lands and add to the agricultural production of this county.

We have found a number of cases where land has been sold by local parties in which a small deposit was paid by the purchaser, the balance being repayable over a term of years secured by a first mortgage, and the sympathetic seller is willing to furnish the borrower with a clear title in order that he may have cheap money through the Act to develop his property. The seller will take

INCLUDES CHATTELS.

The Congress of Peru is considering a law to provide for agricultural loans on security other than land. Under the provisions of the proposed law, farmers could borrow money on their machinery, implements, livestock, lumber, timber or growing crops. Under the present rural-credits law, farmers may obtain loans on their land only, and the proposed law is intended to extend credit to the large number of farmers who do not own the land they cultivate.

a second mortgage in place of the first mortgage he now holds. This system helps men who do not have sufficient equity in the property, namely, fifty per cent, to come within the Act and at the same time give the Government the security that it asks.

G. C. Kreutzer.

Kern County Farm Adviser.
Oct. 26.

FIGS TO PLANT.

To the Editor: When is the best time to plant fig trees and what is the best kind to plant?—Subscriber.

[Plant any time while they are dormant. Do not let the roots dry out and put on protectors against sunburn. Set 40 feet apart and plant short-lived intercrops. Calimyrnas are highest priced but usually bear lightest because of the necessity and difficulty of pollination by insects from caprifigs. The fruit

is of best quality and largest size. White Adriatics do not require pollination by insects, are easy to grow, and prolific but likely to sunburn in hot districts. Black figs are easiest to handle, and there is a ready market for the well dried, graded, and unprocessed fruit. They require probably less care than the Adriatics. There is now a scarcity of dried figs.]

Another tomato cannery for Manteca is contemplated.

And Up They Go

No man who owns uncleared land need be stumped by the stump question. Formerly the clearing of land covered by stumps was a long, hard, expensive job. Often the cost seemed more than the land would justify.

During the last few years, however, the situation has changed. Thousands of land owners, those who follow modern methods, have saved time, labor and money—and rid themselves of the stumps—by using

HERCULES DYNAMITE

Stumping with Hercules Dynamite is as simple as A, B, C. In comparison with former methods it takes no time at all to run the holes under a whole field of stumps, insert the charges, fire them. Up go the stumps. Broken into firewood size and ready to be carted off.

If you have never used Hercules Dynamite on your farm it is high time you did—not only for land clearing—possibly your land is all

cleared—but also for subsoiling, tree planting, drainage and irrigation work, etc.

In a book, "Progressive Cultivation", the different ways in which Hercules Dynamite will save you time and money and give you better crops are clearly told. The methods to be followed in its use are explained.

California Farming is Not Overdone.

[Extracts from Address by Dean Thos. F. Hunt, University College of Agriculture, Berkeley.]

The farmer himself is to blame for the fact that his farm earns only a small interest on the investment plus wages. If he buys a farm at \$50 per acre, and it nets him wages and 6 per cent in addition, he immediately asks \$150 an acre for it, and would not sell it for less than \$100, after which he may complain that farming no longer pays. The high price of land is an indication that farming does pay. But too high a capitalization may prevent land from being put to a productive use.

In 1910 the total number of persons in California over ten years of age engaged in gainful occupations, was 1,107,668. There were 225,070 persons engaged in agriculture, forestry, and animal husbandry. There were approximately 1200 architects, 2000 dentists, 3000 clergymen, 5000 lawyers, 5000 physicians, and 10,000 real estate agents. In the United States as a whole, about one-third of the persons over ten years of age engaged in gainful occupations were engaged in agriculture, while in California only one-fifth of the workers were so occupied.

So far as the number of persons are concerned, therefore, farming is not overdone in California. Relatively speaking, it is not a crowded occupation.

It is estimated that one-half of the 100 million acres in California are suited to some agricultural purpose, and that it is possible to till thirty million acres, although only five million acres are now actually being tilled. If the tilled area was in the same proportion to the area which it is possible to till, as it is in the North Atlantic States, twice the area would be under cultivation, or if the same relation existed between the possible and actual tilled area as in the three corn states, three times the present area would be under cultivation.

The value of all crops and the value of all animals owned on farms according to the census of 1910 was greatest in the corn states and least in California. For the United States as a whole the crop return in 1909 was a little more than 13 per cent of the capital invested; while for California it was less than 10 per cent. However, the return per farmer was much greater in California, since the capital invested per farm was nearly three times as great.

Crop Specialization.—Not only is there a segregation by racial, social and religious instincts, but there is a segregation of interest due to crop specialization, which is carried to a greater degree in California than in any other part of the United States—perhaps in any other part of the world. In California a farmer raises poultry, and has a Ford; he raises grapes and keeps a Dodge, or he raises prunes and has an Overland, oranges and a Cadillac, or lemons and a Franklin. He gets his income from the one and gives his care and attention to the other.

Size of Farms.—Speaking in general terms, $\frac{1}{4}$ of the farms of California were less than 20 acres in area, $\frac{1}{4}$ between 20 and 49 acres, $\frac{1}{4}$ between 50 and 174 acres, while the remainder were 175 acres or more

in extent in 1910. The latter $\frac{1}{4}$ occupied $\frac{1}{4}$ of the total area in farms. The average size of a farm was 317 acres, with an average value for land and buildings of \$16,447. The average value of livestock per farm was \$1447, and that of implements and machinery was \$414.

Tenantry.—Of the 88,000 farms in California, 66,000, or almost exactly $\frac{3}{4}$, were operated by the owners, 18,000 by tenants, and between 3000 and 4000 by managers. In the past 30 years there had been no material change in the proportion of tenants to farm owners.

Livestock Necessary.—There are those who believe that the United States will in the immediate future following the close of the war come into a period of still higher prices for livestock. I hope it will, since nothing can be of more benefit to the general agricultural development and welfare than an increase in animal husbandry. This is particularly true of California. The fruit grower should welcome the development of livestock. The stockman makes a good market for his fruit and his orchards need the fertilizer that the livestock produces. It will help to make California a greater fruit State than ever before. Animal husbandry is not overdone in California and probably never will be. It requires capital and ability. Animals and fruit are the products that California should produce because they either sell for more than five cents per pound or they contain a considerable proportion of water. If the farmers finished product does not fall into one or the other of these classes, he is apt to find eventually either economic difficulties or soil depletion.

SUDAN AND BARLEY HAY SAME SEASON.

[Written for Pacific Rural Press.]

A crop of barley hay and three cuttings of Sudan grass from the same land the past year was the result secured by J. W. Benoit, Holstein breeder of Stanislaus county.

Last December Mr. Benoit planted a portion of his old alfalfa land to barley, cutting it for hay late in May. After irrigating the land and again getting it in shape for seeding he planted Sudan grass in June.

Up to the middle of September he had cut the latter crop three times for hay and had a lot of good pasture left for his cows. He states that there is no danger to the cattle when pastured on it and that his cows did as well on the Sudan hay as they do on alfalfa hay. Chickens, he says, are crazy for the seed.

The Sacramento Valley Sugar Company has received two carloads of beet seed and is expecting more in the near future. The seed will be planted in territory which will make possible the opening of the sugar factory in Hamilton City.

It has been estimated that the total rice yield in the Sacramento Valley this year will be 2,500,000 sacks, valued at approximately \$5,000,000. This is the largest yield yet harvested in the valley.

MORE MONEY FOR ALFALFA GROWERS

WITH

Hairy Peruvian Alfalfa

Hairy Peruvian produces the greatest alfalfa tonnage known—and does it under all climatic conditions.

Hairy Peruvian has been thoroughly tried out and tested by the Arizona State Experimental Station, and by growers in both hot and cold countries.

Hairy Peruvian produces a great mass of leaves from the top to the crown of the plant, and as the leaves contain the greatest amount of food value, this type of alfalfa gives the farmer the maximum yield from his land.

Don't fail to plant Hairy Peruvian alfalfa this season. Our illustrated folder upon request.

CHILDREN INTERESTED IN WEEDS.

[From Address by J. B. Hickman, Aromas, at State Fruit Growers Convention, Napa.]

It is rarely necessary to arouse the interest of children in plant life; and very little tactful and well-directed effort is necessary to establish ideals of great value to themselves and their communities. The agricultural features now developing in our school courses can be made doubly valuable by incorporation of such work in plant life as may be found in every school district. The roadside to and from school may easily become a highway to more than knowledge—a developed observation, correlating most valuable features of environment.

I also recall a hard-trodden city schoolyard where, when the sprouting seeds of malva and alfalfa pushed flakes of soil upward to reach the light, the pupils were requested to investigate; then to make simple

drawings of the plantlets as they developed; then design for drawing was suggested, and written description of their work. The study included the plant's life from heart-shaped leaves through changes of leaf, bud, blossom, and fruit to the final lunate carpels ready for another season's start.

Aside from any utilitarian results, if any one seeing the thousands of beautiful designs produced by these pupils from youngest to oldest, and reading their clear, definite statements as well as imagination-ventures, can suggest a broader, truer, fuller culture, I would be glad to listen.

It is worth while for the children to know our weed seedlings, to watch them develop true leaves, to watch the building and blossoming, the fruits and seeds as they form, how the seeds of their special plants are carried abroad, and how they are harmful.

This cure for rural blindness in the young, before it hopelessly sets in, will reveal a vision to them of a man with the hoe inspired to use it intelligently and therefore with joy and pride that springs from all intelligent labor.

NURSERY STOCK JUMPS.

Because of the fact that there are many new vineyards being planted in Yuba county the demand for grape vines for planting this season there is greater than for many years, and the price has jumped from \$15 to \$18 and \$20 per thousand. Quite a number of tracts of land have been purchased with the view of planting and many who have grain land unimproved will plant at least a portion of the same. The demand is practically all for Thompson seedless vines. In the tree line the planting will be mostly to prunes and orders have made this stock rare.

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her FREE Homestead lands of 160 acres each or secure some of the low priced lands in Manitoba, Saskatchewan and Alberta. This year wheat is higher but Canadian land just as cheap, so the opportunity is more attractive than ever. Canada wants you to help feed the world by tilling some of her fertile soil—land similar to that which during many years has averaged 20 to 45 bushels of wheat to the acre. Think of the money you can make with wheat around \$2 a bushel and land so easy to get. Wonderful yields also of Oats, Barley and Flax. Mixed farming in Western Canada is as profitable an industry as grain growing.

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

GILBERT ROCHE, Canadian Government Exhibit, San Diego, Cal.
Canadian Government Agent.

"I bought five boxes

of Eureka Stumping Powder and now I want to sell a lot of other powder that I have," writes Rudolph Stadel, Silvertown, Ore. "The other powder makes me terribly sick when I try to use it, but Eureka does not give me the least headache."

Eureka Stumping Powder is one of the two

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

Eureka goes farthest and costs least in blasting stumps in dry ground. Giant Stumping Powder saves work and money in blasting in wet soils.

Both of these Giant Farm Powders are made especially to meet Western farm and orchard conditions, by a Pacific Coast company, with 50 years' experience—the company that originated all "giant powders." Your dealer can supply you; if he does not, write us and we will see that you get the genuine, which has the Giant brand on every box.

Save Money on Stump Blasting

Our valuable illustrated book, "Better Stump Removing," shows you how to do it. Mark and mail the coupon—or send a post card—and we will give you this book and any of the four others that you care to have. Write now—before you lay this aside.

Dependence!

—The Big Thought When Buying Nursery Stock.

When you invest money in Trees, Vines and Shrubbery; when you give a lot of time and labor to putting them in the ground—you want to know beforehand that you are sure that they will grow sturdy and that they will produce generously.

This is your assurance if you order from us, for our extensive experience of over a quarter of a century is a guarantee against the possibility of your being disappointed.

The greatest care is exercised by us in selecting only the best buds that the best orchards produce, and we know how to care for these buds and to nurse them into plantings that do not fail to develop into satisfactory trees, trees.

General Agricultural Review.

FIELD CROPS.

Butte Co's hop crop this season is estimated at 7,600 bales worth \$170,000.

Thos. P. Redmayne is the recently appointed Horticultural Commissioner of Marin county.

Market prices on Merced sweet potatoes are double last year's quotations and the harvest is large.

Practically no damage to the sweet potato crop of the Atwater-Livingston vicinity resulted from the recent frosts.

Bales of cotton compressed at the gin arrive at their destination in better condition than do other compressed bales.

A Chinese company has purchased several hundred acres of land near Pacheco, which it is said will be sown to potatoes and garlic.

Congress has appropriated money for experiments looking to the increase of production of sugar-beet seed in the United States.

San Joaquin Delta farmers have this year had bumper crops with liberal prices. The average yields have figured better than \$80 an acre gross.

Care should be taken to handle alfalfa hay so as not to lose leaves, as these contain considerably more than 50 per cent of the feeding value of the hay.

A party of Russians have secured a tract of land comprising 3,000 acres in the vicinity of Kerman. It is the intention of the new settlers to grow rice.

The formation of ice on the surface of fields is fatal to alfalfa. This condition is most apt to occur on fields that are level or that contain pockets.

The carlot shipments of white potatoes for California as reported by railroads to the United States Department of Agriculture, up to Nov. 7, 1916, was 3,659.

Pumpkins by the carload are being shipped from the vicinity of Bogue to the canneries of Sacramento. The growers receive \$3.50 per ton, which averages from \$40 to \$50 per acre.

The Libby, McNeill & Libby cannery of Selma, is canning pumpkin day and night at their plant there. They are running two 12-hour shifts. They have contracted 600 tons at \$3 per ton.

A cotton seed oil mill at Calipatria large enough to handle the output of a large part of the Imperial Valley is being planned by Balfour-Guthrie Co., who have been active in the development of the cotton industry in the northern part of the valley.

Reports from Santa Ana say that the bean crop of Orange county has been harvested and threshed. The yield was good. The output was 250,000 sacks of limas and they sold at \$5 per cwt., and 90,000 sacks of blackeyes, that sold at \$3.50 per cwt. The total crop is said to have realized \$1,700,000.

Agricultural and horticultural interests in the vicinity of Winters are getting behind the efforts of the State Commission of Horticulture to secure the passage of an effective law at the next session of the Legislature. The yellow star thistle and the pests of the rice fields are to be given special consideration.

If ginning practices which permit the mixing of seed from different loads of cotton are allowed to continue, and if the common custom of planting different varieties indiscriminately in the same locality is not restricted, it is only a question of time until all varieties, no matter how well selected, will descend to one mongrel type. Farmers of each community should determine by experiments the particular variety of cotton which is best suited

to their section and should agree to plant this variety only.

DECIDUOUS FRUITS.

Fruit shipments from Placerville, El Dorado Co., for this season total 200 cars.

A carload of "Extra Special" peaches, valued at \$7,000, was shipped recently from Selma.

Tulare Co. this season harvested 5,000 tons of dried fruits, the tonnage from 2,650 acres.

As the outcome of a meeting of the prune growers of Sutter Co. held recently they decided to join the prune and apricot association which has been organized at San Jose.

Leonard Hess, near Tudor, made some profits this season which would convince a Missourian. From 10 acres he delivered 58½ tons of dried prunes to the Rosenberg Bros.' packing house, netting him about \$450 per acre.

The Cal. Fruit Exchange has handled almost \$3,000,000 worth of fruit this year, has returned to its members about \$350,000 in railway claims, and distributed about \$500,000 dividends, according to Manager John Nagle.

Based on reports from all apple districts of the Northwest, the aggregate losses to the apple industry by the cold wave which prevailed all last week is \$1,500,000. The frost, it is said, has made unfit for ship-

ment approximately 1,750,000 boxes of apples in the four States of Oregon, Washington, Idaho, and Montana.

About 65 carloads of apples will have been shipped from Inyo county this season; about 22,000 boxes from the district around Bishop. They are mostly Winesaps, with many Grimes Golden. The new plantings of Inyo county are mostly Rome Beauties, Baldwins, Winesaps, and Jonathans, according to Horticultural Commissioner Nordyke.

Before the war quantities of dried apples from California were shipped each year to the Siberian market through Hamburg houses. It is thought it might now be possible to re-establish this trade direct. The Russians are very fond of fruit and the consumption of apples in the chief centers of Siberia is large. Most of the supply for this market comes from Turkestan; but as this fruit is not always of good quality the well-to-do Russians are willing to pay a higher price for apples and other fruits of a higher grade.

The fruit-growing and fruit-canning industries are in a very crude state in Argentina, according to an official trade report just received by the Rural Press. Quality is not standardized; moreover, there is no fixed price for fruit, and not even a fixed measure of quantity. Thirty to 45 pound baskets of peaches are sold for 25c to \$1.70 U. S. currency. There being no uniformity about the fruit as in the United States, it is picked just as it happens to come, and is sold without sorting or grading. In canning it is said to be impossible to put a certain number of fruit of a certain size in a can, as is done in the United States. They merely

The Dependable Hired Man

If you had a hired man available at any hour of the day or night—ready for all kinds of work, in the house, in the barn or out in the field—your greatest trouble would be over.

G-E Motors
can do all this and more

fill up the can with large and small fruit.

CITRUS, NUTS, SEMI-TROPICAL.

Reports from Glendora say that the orange crop in that district will be the biggest and best ever raised.

The first unit of the campus at the new Citrus Experiment Station and School of Tropical Agriculture at Riverside is progressing rapidly.

L. E. Stums of San Dimas has sold his five-acre orange grove near Lone Hill station for \$9,000. This is an old navel grove of twenty-five years.

The Monrovia navel oranges will ripen this year earlier than any season during the past fifteen years. Shipments will begin there about Nov. 25.

Citrus canker threatens the destruction of Florida's great orange and grape fruit groves. The State has appropriated \$750,000 toward its eradication.

The temperature on the ground during the cold snap last week varied from 22 to 24 degrees in the vicinity of Fresno. The official temperature was 30 degrees, however.

Payments on the first pool of walnuts made by the State California Walnut Association, of which the Goleta and Carpinteria organizations are members, is expected about Nov. 25.

Reports from various districts on the effects of the low temperatures that prevailed last week indicate that olives have suffered severely, while oranges have almost wholly escaped.

A heavy frost was had last week throughout the Pomona Valley, but it did no damage to the orange crop. Oranges are coming on nicely and coloring and the crop promises to be a big one.

The Central Lemon Association of So. Calif. shipped 135 cars of lemons during the season. A good price was averaged, the net returns to the grower being over two cents per pound.

Riverside reports one of the worst windstorms last week that it had experienced in years. Riverside

district estimates that 20 per cent of the orange crop was whipped off the trees.

The production of walnuts in California this year, expressed in percentages of a full average crop, is 82; of lemons, 94, according to the United States Department of Agriculture bulletin dated Nov. 8.

The Tulare County Horticultural Commissioner has established a testing office in Lindsay and has employed ten men in the work of testing oranges for shipment which under the new county ordinance must come up to the 8-to-1 test.

San Bernardino, it is said, will produce a normal crop of oranges the first time in four years—since the freeze. It is estimated that the production of the groves will be 16,000 carloads, which will be worth about \$15,000,000.

L. M. Banks, a fruit broker of Monrovia, says the coming crop of navel oranges will ripen this year earlier than at any time within the past fifteen years. Shipments are expected to commence from there the last of this month. The crop is said to be 20 per cent larger than last year.

What is said to be the highest price ever paid for Tulare county Valencias was obtained by the Lindsay-Merryman Exchange last week in New York. Fancy brought \$4.90 and choice \$4.40 per box. This price it is said netted the grower \$3.20 per box for orchard run.

At a late meeting of the Board of Supervisors of San Diego county, an ordinance was passed making it mandatory for shippers to observe the maturity of 8-to-1 acid test in all shipments of oranges. This action is in line with that of Tulare, Fresno and San Bernardino counties, writes H. M. Armitage.

MISCELLANEOUS.

A course in agriculture has just been instituted at the rural Union High School at Fair Oaks.

Railroad officials are hopeful that some way out of the car shortage difficulty in the Sacramento Valley will present itself.

J. S. Strauss, entomological artist of the U. S. Dept. of Agriculture, recently visited Imperial Valley to study its insect pests.

Farm Adviser C. M. Connor will begin a series of pruning demonstrations throughout Stanislaus Co. Dec. 4, continuing to Dec. 9.

The Southern Pacific Company has reported for the three months ended September 30, an increase in railway operating income of \$2,533,290. Gross earnings are running at the rate of \$175,000,000 for the year.

Modesto expects by March 1 to have an ice plant representing an investment of \$135,000, with capacity to supply the entire demand of the district in re-icing refrigerating cars for shipment of perishable products to Eastern markets.

The average yield in California for 1916 of all crops combined compared with average yields for recent years, is 101.7. The price index of all crops on Nov. 1 was 43.7 per cent higher than a year ago, and 40.2 higher than the average of the preceding five years.

R. W. Wood of Bend, Tehama Co., under date of Nov. 13, writes the Pacific Rural Press: "In your Nov. 11th issue you give credit to Delano-McFarland National Farm Loan Association as being the first to organize in the West. The Tehama N. F. L. A., located at Bend, Tehama Co., claims that distinction. We organized in July. Will you please have this settled?"

Sacramento has been selected as the seat of the new Federal Farm Loan Bank, to be established in this section by the Federal Government, under the act of Congress creating the Department of the National Service. The selection of the State capital was decided by its geographical position. It is a convenient point for the two great valleys of the Sacramento and the San Joaquin.

NAPA TRACTOR DEMONSTRATION.

[Written for Pacific Rural Press.]

"The woods was full of 'em." The ten-acre prune-apple-pear orchard in the edge of Napa Nov. 16 was full of tractors of many makes and sizes. It was crowded with people; and the roads on both sides of it were lined with automobiles and horse vehicles.

The orchard plowing was worthy the occasion. The machines must have startled the old trees, for such a motley herd of animals making similar noises had never before invaded those "woods" and their effect on the orchard's root systems could not be foretold. However, the label "Caterpillar" on one of them must have inspired terror in the hearts of the trees on that peaceful day; for if those accustomed insects had assumed such size and noise, the end must indeed be near.

Those trees could not know that the new sort of animals meant, not the end, but the beginning of better culture, work done quickly at the right season, plenty of time left for the pruning and spraying and close attention that would enable the trees to do better than the best of their days gone by.

There were eight or ten of the machines, including those made by the Holt Mfg. Co., the Bean Spray Pump Co., the Hendy Iron Works, the Yuba Construction Co., the C. L. Best Gas Tractor Co., the Samson Sieve-Grip Tractor Co., and R. Hamilton, an orchardist of Sonoma county.

The last named had a 1750-pound baby not yet on the market; but being tried out for the sake of public comment. It pulled two 10-inch bottoms.

Some plowed deep, others shallow, some with disks, others with moldboards, and ever the crowds followed the machines or talked among themselves about their workings. One tractor, built low down, turning sharp corners, pulled a gang plow of five disks.

So good an orchard tractor demonstration has probably never before occurred in California.

Field Demonstration.—But the orchard demonstration was not all. Close to the railroad station, a field of 25 acres was laid out in sections for the various machines. Here, some others took part, including the Mogul and Titan of the International Harvester Co. This demonstration was of plowing, and manipulation of the machines, affording opportunity for comparison and questions as at the orchard. Weight of machines, quick turning, power, and price were the subjects of most questions.

The industrial and machinery exhibit installed in the grove beside the field was very instructive. It included many displays of local manufactures, oils, a miniature of the local shoe factory, etc.

The General Chemical Co., the Cal. Spray Co., the Standard Chemical Co., the De Laval Dairy Supply Co.,

and the Bean Spray Pump Co. had a fine exhibit of sprays and spray-pumps. Farm implements, gas engines, separators and barn equipment, as well as grape juice, nursery stock, a weed collection (by the State Commission of Horticulture) parcels post, etc., filled the exhibit building and the grove around it.

GRAVITY DISTRIBUTION OF MANURE.

[Written for Pacific Rural Press.]

Proper and economical liquid manure disposal is a continual problem with the dairyman, and especially is this true where the product is being sold as whole milk to the city trade.

Frampton Bros. of Los Angeles county have probably been more successful in disposing of both liquid and solids from their dairy and at the same time preserving it for the fertilizing value of the land, than any other dairy the writer has had an opportunity of visiting.

This is accomplished, first, by having a well-drained concrete floor in the milking barn, with a fall of eight inches to 60 feet, so that all droppings are quickly and easily flushed into the concrete pipe drainage system that leads from the barn and milk room to the pumping plant some distance away.

At this point the drainage pipe dumps into the underground cement pipe irrigation system, through which all irrigation water is pumped for the alfalfa and other farm crops grown.

At the junction of the barn drain and the irrigation system proper is a valve which is opened when the pump is not in operation, thus allowing the liquids to run by gravity into any of the laterals desired. By this method the manure is all distributed in the irrigation water later, and may be spread over fields as much as a mile away from the barn without labor. While pumping, the valve connecting the drainage pipe and the main laterals is closed, otherwise the water would be pumped back to the barn in the drainage pipe.

KEEPS AN EXTRA TRACTOR.

[Written for Pacific Rural Press.]

Quick cultivation after each rain is imperative on the "red hog-wallow soil" in E. W. Killian's 240-acre orange orchard in Tulare county or it would bake. It would cost too much to keep enough horses the year around to do the big rush spring work quickly enough, so Mr. Killian has four tractors. These, with eight horses, are rushed onto the orchard as soon as suitable after each rain and the soil pulverized in double-quick time. The cover crop being grown winters, is hoped to improve the soil; but in spring there is a rush to get it worked into the soil with double cutaway disks, properly and at the right time. All the horses and tractors are used at this until the ground is worked down fine into perfect shape. In fall, all that is needed is to check zigzag

LAYNE & BOWLER PUMPS

Built in Different Styles, Sizes, and Capacities.

There are over twenty different types of Layne & Bowler Pumps to select from. No matter what your particular requirements may be, whether you desire to pump 5 to 500 inches of water, and even if your lift is as great as 1500 feet, there is a Layne & Bowler Pump to do the work—and do it efficiently and economically. "Let the world's largest water developers solve your pumping problems."

Our elaborate catalog No. 25 is free for the asking.

Drivers Do Not Repair Tractors.—The tractor drivers are not allowed to monkey with the machinery if anything goes wrong. They drive or haul the disabled tractor to its shed and when not all of them are in use, simply take out another with least loss of time. A mechanic, or Mr. Killian himself, does the repairing in the shed where the tools are handy. It is considered cheaper to pay interest on investment in an extra machine rather than allow inexperienced men to tinker with them.

TRACTORS OF THE FORD FAMILY

[Written for Pacific Rural Press.]

There are Fords and Fords, but you can't afford to buy a Ford tractor without investigation. Then you may find one of them that suits your needs; but remember that the Ford tractor you are looking for will not be on the market for two or three years at least according to Henry Ford himself.

Meanwhile other Ford tractors or attachments may interest those who are looking for lightweight machines. One shown at the Fresno District Fair and made in Minneapolis claims 8 drawbar horsepower, pulling three 14-inch plows. It is 6 feet wide, about 5 feet high, and has a wheel base about 5 feet long for short turns. Two drive wheels $4\frac{1}{2}$ feet in diameter hold the weight of the 2 cylinder engine and transmission. The steering wheel is behind, under the driver's seat.

The real Ford tractor was tried out at an Eastern demonstration this summer. It is a good bit like the Ford car, being built heavier but with similar engine, radiator, and transmission.

At the Puente demonstration, a tractor attachment for a Ford car was exhibited but not tried out in the general demonstrations except the last day, when its plowing was not good. This was laid to the fact that they did not have a 12-inch plow. They had a 16-inch mold-board, but did not get it deep enough to make much of a furrow in the hard adobe.

The attachment is simply a frame to hold two 30-inch tractor wheels 8 inches wide, just back of the rear axle of the car. A little pinion put onto each end of the rear axle in place of the auto wheels, runs the tractor wheels by a cogged gear inside the wheel rims. The attachment weighs 710 pounds, and can be put on in half an hour or less.

It is geared down $7\frac{1}{2}$ times, so that the car in plowing at $2\frac{1}{4}$ - $2\frac{1}{2}$ miles per hour, requires an engine speed of about 600 r.p.m., equaling a speed of 12 to 15 miles as an automobile. Tractor work is done entirely on high gear except in emergencies. At the private demonstration at Puente, it usually pulled a 15-tooth gooseneck cultivator 10 feet wide.

Colonel Harris Weinstock, State Market Director, and J. L. Nagle, manager of the California Fruit Exchange, resumed their debate over the merits of the State Fruit distributing bureau before the State Fruit Growers' Convention at Napa. Despite their arguments matters stand very much the same as before. Nagle and about fifty growers still stand "pat" and this blocks Weinstock's efforts.

FIVE STANDARD

KILLEFER
QUALITY

SUB-SOIL PLOW

KILLEFER
EFFICIENCY

Reports from bean growers who used subsoil plows this past season show enormous gains over previous years. One large grower reports that, had he taken our offer of giving him a subsoil plow for one-half of the increase in his crop on about 600 acres, his plow would have cost him over \$1500.00. Subsoil work will pay on any kind of crops, and should be used in preparing land for orchard or alfalfa as returns will amply repay for the outlay.

The tractor is giving us the power needed to do deeper and better work, and it is up to you. Look over your land and see if your crop output can not be increased by better methods of cultivation.

Live Stock and Dairy Notes.

(Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.)

THE DAIRY.

Mottled butter is due largely to uneven distribution of salt.

Tulare creameries paid dairymen \$101,200 for October deliveries of cream.

It is impossible to make sweet, clean-flavored butter from old, unclean cream.

Garlic flavor can be eliminated by heating milk to 145 deg. F., and blowing air through it.

W. J. Higdon reports the sale of a young Guernsey bull to T. R. Bond of Tipton and one to the Visalia Fruit Co.

In the Truckee-Carson Co-operative Cow Testing Association begun November 1, 1916, 630 cows have been entered.

Clayton N. Slocum of the firm of H. B. Slocum & Son is figuring on another trip back East to buy purebred Duroc-Jerseys.

Contagious abortion is rapidly becoming one of the most costly of animal diseases. It is estimated that it costs the dairy industry \$20,000,000 a year in dead calves and dry cows.

The annual meeting of the National Dairy Union was held in connection with the annual convention of the National Creamery Butter-makers' Association in Minneapolis, Minn., Nov. 14, 15, and 16, 1916.

Whole milk testing 4 per cent butterfat brought \$1.71 per hundred-weight for the entire month of October to dairymen supplying the factory of the Carpenter Cheese Co. at Salida.

Ernest Otto McClure, the stockman, has located permanently at Santa Ana, having moved there from Modesto. He has taken with him his 53 head of registered Holstein-Friesian stock.

Prices paid Nov. 16 at Ferndale by the various creameries were as follows: Central Creamery Co., 38c; Grizzly Bluff, 38c; Capital, 38½c; Valley Flower, 38½c; Libby, McNeill & Libby, 38½c.

After testing his 17 cows through a cow-testing association, a Nebraska farmer sold 7 and received more profit from the 10 remaining animals than he had received formerly from the whole herd.

The first annual convention of the Dairy Manufacturers' Short Courses Alumni Association was held at Davis, Calif., Nov. 8th. It was well attended by former dairy manufacturer short course students.

Bull associations reduce the cost of the services of a purebred bull for the dairy herd. The average annual cost of service in a large number of associations investigated by the United States Department of Agriculture was \$3.48 for each member.

Refusal on the part of the creamery men of the State to sell even their surplus butter to the Russian Government has been directly responsible for keeping the price down to where it is at the present time, according to N. J. Beck, manager of the Visalia Co-operative Creamery.

Twenty cubes of butter and fifteen cheeses were entered at the fifth 1916 California Educational Butter and Cheese scoring contest. Glenn Decow of Perris received the highest score on butter with a score of 94. Arthur Schoenrock of Galt tied with Ray Weedmark of the University Farm for first on Cheddar cheese with a score of 95. C. P. Beffa of Gilroy received first on California (granular) cheese with a score of 94, and Chas. Basciarini of Kings City first on Jack cheese with a score of 93½. The average score on the butter was 91.7; on the cheese 91.96.

Cow-testing associations are be-

coming yearly more popular. They rout the old saying, "The poor ye have always with you." The first such association was started in Michigan in 1906. There are now 346 in the United States. The first one was started in Calif. in 1909. Up to July 1 of this year this State had 9 altogether. Its work is fatal to the unprofitable cow.

To improve the methods of producing and marketing whole milk in the territories tributary to the principal cities of America, the first national meeting of milk producers was called today for Tuesday, December 5. The meeting will be held under the auspices of the National Conference on Marketing and Farm Credits which holds its fourth annual meeting in Chicago December 4-9 at the Hotel Sherman. Delegates are expected from New England, New York, Iowa, Ohio, Minnesota, Wisconsin, California and Missouri.

The butter situation has become quite acute of late. It has been many a day since butter has sold as high as it is now. Production is running light and cold storage stocks are much lighter than a year ago. The government report shows that there were only 79,294,000 pounds of butter in 142 cold storage warehouses November 1, against 92,718,000 pounds the same date last year, a shortage of 13,424,000 pounds. A good deal of butter has been going abroad by the way of Canada which has excited the Eastern market, and the strength there in turn has been reflected here on the Coast.

BEEF CATTLE.

Hayes & Devaney have leased the famous Howard Cattle Company's range of 40,000 acres south of Newman. There are 7000 acres of farming land in the tract.

The United States Meat Inspection service certified to the wholesomeness of 11,220,958,000 pounds of meat from 61,826,304 animals during the last fiscal year. It condemned 738,361 parts of animals, equivalent to about 84,320,000 pounds of meat.

A call has been sent out by C. N. Hawkins and D. J. Stollery to Shorthorn breeders of the State for a meeting to be held at the Palace Hotel, San Francisco, Dec. 11th, for the purpose of organizing a co-operative association for the advancement of the breed. Every breeder of Shorthorns is invited to attend.

SWINE AND SWINEMEN.

Allen Thompson, Duroc Jersey breeder of Tulare, sold his herd to Defender Perfection to the Rockford Orange Co. of Lindsay.

Work has been inaugurated on a hog-packing plant at Hanford. The plant is being erected by W. C. Gallagher on his ranch, a mile east of the town. It is expected to be in operation in about three months.

Alex. D. McCarty has just sold to the University of Nevada a boar from the spring litter of Oak Grove Pearl 4th, Grand Champion sow at the P. P. I. E.; three gilts and two boars to Hills Bros., Newman; and bred gilts to H. H. Hart, Denair; and Lloyd & Tointen, Santa Rosa.

The coming annual meeting of the California Swine Breeders' Association in Los Angeles in January is being looked forward to with much interest by the packers and livestock men here. Mr. Frank M. Hauser, chairman of the entertainment committee, says everything is progressing favorably with him and a successful meeting is being looked forward to.

Co-operative marketing of hogs under the auspices of the Stanislaus County Farmers' Union has proved so successful that this method will

LIVESTOCK DIRECTORY.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all ages, reasonable prices. Some fine bred sows and gilts, and top quality young boars. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, E. H. Whitten, Route 5, Box 647, Los Angeles.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

REGISTERED POLAND-CHINA BOARS of serviceable age. A Wonder and Chief Picture breeding. Every animal guaranteed. Price \$25. Big N. Ranch, E. A. Noyes & Son, Props., Sutter, Cal.

POLAND-CHINAS—Bred gilts, \$15; young boars, \$10 and \$15; bred sows, \$25. Weanlings, either sex, \$6. Registered and crated, purchaser to return crates. E. A. Hall, Watsonville, Cal.

REGISTERED POLAND-CHINAS—Prolific, pabulous, profitable porkers. Choice boars now ready for service, \$25 each. Weanlings \$15. Dr. J. A. Crawshaw, Hanford, Cal.

LAKEVIEW STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hank Alton Humboldt Co., Cal.

POLAND CHINAS—Big type. Shoats, either sex, or in unrelated pairs. O. L. Linn, Lincoln, Route 4, Modesto, Cal.

POLAND-CHINAS—Big type combined with quality. Choice bred sows, gilts, boars. W. D. Trewhitt, Box 82A, Hanford, Cal.

REGISTERED POLAND CHINA SWINE—Prize-winners. Finest stock in the State \$20 on. M. Bassett, Hanford, Cal.

POLAND CHINA HOGS FOR SALE—Registration papers furnished free. C. A. Cordes, Durham, Cal.

REGISTERED POLAND-CHINAS and Duroc Jerseys. Cholera immune for life. T. H. Beckman, Lodi, Cal.

POLAND-CHINAS—Large type. The Browning Stock Farm. W. H. Browning, Woodland, Cal.

DEACON RANCH POLAND CHINAS—Prize winners. Young stock reasonable. Box 27A, Davis, Cal.

KNOB HILL STOCK FARM—Registered Poland-China Swine. A. M. Henry, Farmington, Cal.

REGISTERED POLAND-CHINA HOGS—J. A. Clark, R. 4, Lodi, Cal.

POLAND-CHINA HOGS—C. A. Stowe, Stockton, Cal.

REAOAKS RANCH herd of registered Poland Chinas. W. J. Hanna, Gilroy.

POLAND-CHINAS—Prize-winners. Money-makers. W. Bernstein, Hanford, Cal.

Berkshires.

GRAPEWILD FARM BERKSHIRES—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion, but the sire of Champions. At the 1916 California State Fair his daughters won first in all of the senior sow classes, including the Grand Champion Sow. At the 1916 Oregon State Fair a Grand Leader sow was Junior Champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for Fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

ONE OR A CARLOAD—Foundation herds of any size. Select them from our large herd at any time. They are all grown from pig-hood to maturity under the natural conditions of woodland and pasture range, with shade, pure water, and everything to make a hog clean, healthy, and strong. Visit us or write to Butte City Ranch, Home of Good Berkshires, Box P Butte City, Cal.

RANCHO RUBIUS DUROCS—About closed out. A few extra good rows, choice July gilts and weanling pigs, both sexes. Your last chance for high-class stock at common prices. Remember breeding stock will be scarce next year. Elmer Lamb, Ceres, Cal.

REGISTERED BERKSHIRES—Prosperity of Improver B. Young stock now ready for sale. Start your herd with breed and strain of established reputation for California conditions. Geo. G. Meckfessel, Berlin, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

WINONA BERKSHIRES—The get of Laurel Champion have won to date, at State fairs, 147 prizes, 65 firsts, 22 championships, 11 grand championships. Winona Ranch, R. 1, A-Box 105, Grants Pass, Ore.

BARGAINS IN BERKSHIRES—Write today for our Special List of high-class boars and open gilts. Both the offerings and prices will please you. Silver Birch Farms, Box P. P., Newnort, Wash.

CHOICE REGISTERED BERKSHIRES—Exceptionally fine pigs, \$15 each. Unrelated trios, \$40. Boars, sows, and gilts at reasonable prices. W. H. Waugh, Riverside, Cal.

REGISTERED BERKSHIRES—Weanling pigs, \$10 each. G. A. Casey, R. 7, San Jose.

SPECIAL—Six good service boars and a few sows in pig to Premier Leader due to farrow in October. Geo. M. York & Son, Berkshire breeders, Modesto, Cal.

REGISTERED BERKSHIRES—For sale, bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Novato, Cal.

REGISTERED BERKSHIRES of prize-winning blood. Write for description and photos. Imperial Stock Farm, Morgan Hill, Cal.

ROSE CREST BERKSHIRES—Rivals Champion Best blood. Open and bred gilts. Service boars. F. L. Hall, Ferris, Cal.

30 REGISTERED BERKSHIRES—Boars and gilts for sale. J. H. Benedict, Lemoore, Kings county.

BERKSHIRES—Carruthers Farms, Mayfield, Cal. Second annual sale, August 1, 1917.

HOPLAND STOCK FARM—Registered Berkshires. Prices on application. Hopland, Cal.

REGISTERED BERKSHIRES—Young stock for sale. F. W. White, Elk Grove, Cal.

CHAS. GOODMAN—Breeder of high-class Berkshire Swine. Williams, Cal.

Duroc-Jerseys.

DUROC JERSEYS—My hogs won highest honors at State Fair, taking first prize herd, first prize sow, second prize boar. Were the largest of their age exhibited. Stock all sows for sale. Prices reasonable. Breeding and satisfaction guaranteed. Haden Smith, Route 1, Box 84D, Woodland.

DUROCS from River Bend Farm, St. Helena, Cal., are large type, smooth, rangy with fine backs and deep cherry color. We sell only those we'd like to keep in our herd. Don't write us if you want cheap stock.

REGISTERED DUROC-JERSEYS—Service boars from prize-winning stock are money-makers. They grow faster. New England California Corporation, Ripon, Cal.

DUROC JERSEYS—Herd boars. E. M. Colon and Tulare Boy. Sweepstakes winner at Fresno, 1915. Choice breeding stock. J. P. Walker, Visalia.

REGISTERED DUROC-JERSEY SWINE—Both sexes. Big-boned type. B. F. Kendall, Hanford, Cal.

REGISTERED DUROCS of guaranteed breeding. All ages. Weaned pigs \$10. E. E. Bondar & Son, Napa.

REGISTERED DUROCS—Crimson Wonder stock. Young stock, both sexes. L. D. Collins, Denair, Cal.

DUROCS—Defender Cantic B and Golden Model strain. The big type. Allen Thompson, Tulare.

WINTON DUROC-JERSEY FARM, Winton, Cal.—High-class pure-bred hogs, both sexes, any age.

REGISTERED DUROC JERSEY MALES—Three months old, \$10. H. J. Schell, Atwater, Cal.

CURTIS DUROCS of either sex at all times. E. C. Curtis, Napa, Cal.

REGISTERED DUROCS—All ages. Either sex. W. A. Pack, Hollister, Cal.

REGISTERED DUROC-JERSEY SWINE—D. L. Herley, Lemoore, Cal.

REGISTERED DUROC JERSEY SWINE—Frederick M. Johnson, Napa, Cal.

REGISTERED DUROC-JERSEYS—S. S. Southworth, Napa.

Yorkshires.

LARGE YORKSHIRES—Choice spring boars, gilts, and weaned pigs from Champion sow P. P. I. E., or from breeding of champion boar and sow, Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

LARGE YORKSHIRES—The ideal hog for the progressive farmer. Young stock for sale. A. L. Tubbs Co., Calistoga, Cal.

Other Breeds.

BULLIKEN HERD OF IMPROVED CHESTERS—Prize winners at the State Fair. The Farmer's Utility breed. Size combined with quality; producers of big uniform litters of growthy pigs. 15 bred gilts due to farrow in Jan.; boars and sows of spring farrows; first class and extra well developed; best blood lines obtainable; prices reasonable and every one cholera immune. Write for special prices and circulars. C. B. Cunningham Mills, Cal.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

REGISTERED IMPROVED CHESTER Whites—Grizzly Bear Ranch, East Auburn, Cal.

DAIRY CATTLE.

Holsteins.

REGISTERED HOLSTEINS—Herd sire King Korndyke Hengerveld Ormsby 7th, 86623. His full sister, as Junior 3-year-old, made 32.04 lbs. butter in 7 days. The record of his sire's dam averaged 30.98. George Koumias, Modesto, Cal.

REGISTERED HOLSTEIN BULL CALVES—Sired by Lorena Korndyke Alcantara, whose dam made 29.75 pounds butter fat in seven days as a four-year-old. J. M. Campbell, Escalon, Cal.

FOR SALE—Purebred Holstein Bull—"E. Sur Captain"—under 3. Three-quarters black. Healthy. Good-tempered. Sure stock-getter. Price \$150. H. P. Rosenberg, Box 540, Mill Valley.

REGISTERED HOLSTEINS—Grandsons of King Segis and of world's record cow Creamelle Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

REGISTERED BULLS by King Korndyke (Pontiac and out of A. B. O. cows. A splendid selection old enough for service. Write or call. J. H. Harlan, Woodland, Cal.

TULARE GUERNSEY AND HOLSTEIN Farm is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Higdon, Tulare, Cal.

A NICE YOUNG SON from El Prado Wayne Colantha and from a 24.26 lb. dam. J. W. Benoit, Breeder of Registered Holsteins, Route C, Modesto, Cal.

Livestock Facts and Fancies---IX.

(By the Editor.)

Last week we exhorted the California Swine Breeders' Association, as the California stock organization which has largest membership and most "pep" in it, to get busy to find out what is the matter with California stock-selling and show growers how to improve it. They can make a brisk start in this direction at their Los Angeles meeting in January next. We invite the officers of this association to tell the public, through our columns, what they will be doing about it, so that the Los Angeles meeting may be really a California livestock convention under the leadership of the wide-awake swine men. If a start is made at Los Angeles it would be easy to arrange for a few monthly meetings at other points convenient to other parts of the State and the whole movement would be under way, and out of it would grow such a forceful, popular association of all California stock growers as the present conditions and outlook demand.

We are not piping up now for any kind of a control organization or any scheme to invite growers to take stock in an organization to do their own slaughtering, packing, marketing, etc. We do not know that that would be a good thing to do and, worse still, nobody knows. On the other hand, in view of the popular lack of knowledge about conditions of all kinds, we have an idea that it would be a very bad thing to do, because general ignorance is not a good force to make things go right. It is a great mistake to think that all that is needed to settle marketing problems is to project a capitalized corporation. People must be wise and willing first, and they can be neither wise nor willing until it is demonstrated what the matter now is with local and central selling methods and how fairly, or otherwise, the present great slaughtering and packing interests are being conducted. Therefore the first thing to do is to get all interests together. All interests, growing, transporting and packing, have troubles and they are free enough to talk about them when their representatives are brought together in an open assembly. After discussion every interest is wiser and freer to work for improvements. Discussing is the best cure for "cussing"—which never gets anywhere. Therefore we are advising no "control organization" which closes out most that a grower needs to know and calls upon him to take risks which really may be foolish. If "control" is needed or if growers' co-operative packing is essential to fairness as between producer and consumer—that idea will grow later if there is really anything for it to grow upon.

But of course organizations of growers are necessary: organization is the only way to understanding and to enforce anything which understanding shows it necessary to do. Investigation is necessary also, because association of ignorance may yield temporary force, but it is force without wisdom. Organization is the way to get investigation. As suggested last week, the way for

California growers to get investigation of their local marketing methods and conditions is to ask for it as a representative organization of those most interested. The United States Department of Agriculture is now making an investigation, as suggested last week, into the methods of marketing meat animals in different sections of the United States in the form of a survey of the livestock marketing conditions of the country. The data obtained have been published as Part V. of a report of an exhaustive study of the meat situation in the United States. Readers should apply to their congressmen for copies of this publication and study it carefully. This will form the background for such local investigation as needs to be made here to determine why California wholesale stock prices are relatively lower than elsewhere—as was shown in the case of hogs on the first page of this journal for November 11. If we are energetic enough to get a government investigation of all the causes underlying such a condition we shall begin to know something about it and probably what to do about it, also.

It is pretty clear that we need a popular California livestock association such as we have exhorted the Swine Breeders to bring forth in January next. For handling local problems in stock growing neighborhoods we also need local associations. The report of the Department of Agriculture, which we have indicated above, shows that co-operative associations of cattle raisers are becoming an important factor in marketing. Seven hundred and fifty organizations which market cattle in a co-operative way now exist in 15 States. Four hundred and thirty of these organizations are primarily livestock shipping associations. The greatest activity of this sort is found in Minnesota, where 215 co-operative livestock shipping associations are located. The Department declares that these associations bring greater returns to the farmers because of the reduction of marketing expenses and the realization of the prevailing prices at the centralized markets, and that they are also valuable because of their educational features.

This seems to be a clear suggestion of what we need first in every stock-growing neighborhood. Everyone who joins such an association will probably be surprised not more by what he can do than by finding out other things which need to be done to give him proper rewards for his capital and labor.

N. J. Higdon, Guernsey and Holstein breeder of Tulare, has put up two 100-ton silos this year. He has one entirely filled and the other about half filled with field corn. He has just completed a big tank house. The tank has a capacity of 5,000 gallons. A direct-connected motor-driven pump is so arranged that when the water level is lowered it starts to pumping, and when filled it automatically shuts off. The motor is so arranged that in case of fire or other emergency the pump can be run and a pressure of 50 lbs. secured.

REMCO Air-Dried Redwood

PIPE For Irrigation—Water Supply—Power. Sizes 8 inches to 12 feet. For pressure up to 400 feet head. Guaranteed for 100 per cent overload. Costs less than any other pipe of equal capacity, efficiency and endurance. Not affected by worms or insects, acid or alkaline soils, electrolysis or roots. Withstands extremes of heat and cold, dryness and moisture. Outlasts any pipe except cast iron, and maintains its full flow capacity to the end.

TANKS For Water—Wine—Vinegar—Oil—Acids—Solutions. For Storage—Mixing—Fermenting—Pickling—Leaching. In all shapes and sizes—500 to 650,000 gallons.

SILOS For Dairymen—Stockmen—Feeders. Sizes, 25 tons to 300 tons. The STANDARD.

ALL REMCO PRODUCTS are manufactured to your order from CLEAR, AIR-DRIED REDWOOD. Selected from our stock of forty million feet. Their outstanding features are HIGHEST GRADE MATERIAL, SUPERIOR EFFICIENCY, MECHANICAL PERFECTION, MAXIMUM DURABILITY.

Sold direct to users. Catalogs sent on request.

Shorthorns Under Ideal Environment.

[Written for Pacific Rural Press.]

With 700 acres of rich bottom land suitable for cultivation, nestled against a 300-acre hill range profuse in its yield of natural grasses and watered the year around by running streams, the Barco Ranch in San Benito county presents an ideal situation for the raising of purebred beef cattle.

As a purebred breeding establishment, the history of this ranch dates back to the spring of the present year when the new owners, Mrs. Barton and Mr. Colomb, took possession. Purchased as a home for registered Shorthorn cattle, development work on the ranch has naturally been along lines most likely to be advantageous in the care and feeding of the herd.

A 200-ton silo was erected and filled with Indian corn grown last summer in one of the young orchards which the ranch supports. This with alfalfa hay, which was purchased this year, but which will later be grown on a portion of the bottom land, will supplement the hill grasses, the belief being that the combination will develop all of the desirable characteristics that a Shorthorn should possess, both for the purebred breeders and range cattle growers' requirements.

But in establishing their present herd the owners of this ranch have had in mind a highly commendable object. It is their belief that California is only in its infancy as a purebred breeding State and that one reason for this is the difficulty prospective breeders experience in securing choice bred females for foundation purposes. Accordingly,

they used more than ordinary precaution in selecting their cattle, choosing their 65 heifers from three herds.

One large bunch of these came from the E. M. Hall herd at Carthage, Mo., being the pick of that herd before the dispersion sale after Mr. Hall's death. All of these heifers were in calf when purchased to the bulls' Village Flash, Master of Orange and Wallhurst Goods. As herd sires the young bulls Hallwood Flash, a roan calf by Village Flash and Hallwood Villager, a white calf also by Village Flash, were purchased. These as well as the young bull Texas Sultan, sired by Sultan and purchased from the Coleman-Fulton Pasture Co., Gregory Tex., are of straight Scotch breeding, as are also many of the females.

Another lot of heifers were purchased from H. C. Johns, all bred to Choice Sultan, a grandsire of the now famous bull Whitehall Sultan. The third lot of heifers were purchased from the Coleman-Fulton Pasture Co., being bred to Sultan Skylight and Roan Hero, both high-priced herd sires used in that company's herd of registered cattle.

From the standpoint of fashionable breeding and good individuality of foundation animals, Mrs. Barton and Mr. Colomb have creditably stocked a good cattle breeding ranch, thus giving to the State a broader opportunity of securing good beef cattle, a factor which is important in the development of our livestock industry and one which presents unusual opportunities for profitable participation at this time.

The Value of a Prolific Boar.

[Written for Pacific Rural Press.]

Although there is a general tendency among swine raisers to select prolific brood sows for breeding purposes, it is just as important that they should keep boars with the ability to transmit prolificacy. Also that the brood sow be fed generously enough to supply her own body

needs as well as the unborn pig.

Both of these points are well illustrated in the experience of Donald Graham, who is establishing an extensive hog establishment in Antelope Valley, Los Angeles county, working into purebreds since the following facts were established:

The foundation sows on this ranch were secured in Shasta county, where they had been run on the open range most of the year. All of them were in pig when received by Mr. Graham.

Records show that the first litters from these sows averaged a trifle better than five pigs per sow, of which a little over four were raised.

After weaning their pigs they were again bred, this time to a purebred Duroc boar. At the next farrowing time the average litter was eight and three-fifths pigs and the average number raised was seven, and two-fifths pigs per sow.

The difference in number of pigs grown per sow for the two groups of litters was almost three and half pigs per litter in favor of the purebred boar.

The high school boys in Imperial Valley between the ages of 13 and 18 are to be urged to enter the pig-feeding contest to begin Dec. 9. The feeding period has been cut from 120 to 104 days. The clubs formed will be open to students in high schools and to others. Prizes will be on a basis of profits and gains.

Half a Cow—

Half a cow means half a profit—really a loss, because a poor producer costs as much to keep as a good milker. If you have a cow that is below par, chances are some vital organ is impaired and she needs treatment.

Kow-Kure is the one cow medicine that quickly tones up the digestive and genital organs and puts a backward cow on her feet. Try Kow-Kure on your most doubtful cow. It is especially effective for the prevention or cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Lost Appetite, Scouring, Bunches, etc.

Sold by feed dealers and druggists. In 50c and \$1.00 packages. Write for free book, "The Home Cow Doctor."

GEO. A. SMITH'S 8th SALE

CORCORAN, CAL.

WEDNESDAY, DEC. 15

75 Extra Fine Nicely Marked Selected High Grade Bred Holstein Heifers, from 20 to 28 months old. Fresh and coming fresh soon. Bred to purebred Holstein bulls, sired by Registered Holstein bulls, and from heavy producing grade Holstein cows. They are the heavy milking kind and a very desirable lot. A better or more uniform lot of heifers has never been offered for sale in this State. This is your opportunity to buy some good useful, promising heifers at your own price.

These heifers are the property of the La Hacienda Ranch. For the sake of convenience they will be sold at the Geo. A. Smith Home Ranch, 2 miles south of Corcoran.

TERMS: A credit of 12 months will be given with approved security. Notes to bear 8 per cent interest. Five per cent discount for cash.

IN ADDITION TO THE ABOVE GEO. A. SMITH WILL SELL:

10 Registered Holstein Bulls, ready for service, from great milk and butter producing ancestry.
10 Registered Poland China Sows, and 10 Registered Poland China Gilts, sired by Iowa Wonder and bred to Joker, First Prize boar at the Wisconsin State Fair.
10 Registered Poland China boars ready for service.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E. 1915; Sacramento 1916.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Most Wonderful Milking Machine Made To-Day.

Most durable, most practical, most economical and most sanitary method for milking cows. Big success from the start 8 years ago. Pays 100 per cent on the investment the first year. Great labor saver. Nets more profit for your dairy. Increases the milk yield. Cuts milking time in two. This machine milks like the human hand. Perfect method of suction; suction gradually increases; cows like the soothing action, as there is no strain on teats or udder. The milker has no complicated mechanism; only two moving parts; no vacuum tanks or pipe lines; no metal pipes to freeze or become foul; no vacuum in pail; few wearing parts; easy to keep clean; simple in construction; boy or girl can operate; low cost of upkeep; little power needed to operate. Write for free catalogue which tells the whole story. Address C. F. DANIELS & SON, 2511 Prince St., Berkeley, Cal.

Beef on Range and Alfalfa Ranch.

[Written for Pacific Rural Press.]

While it is the contention of some that the rich level lowlands of California are too valuable to make beef cattle raising a popular occupation there is good reason for the belief that such lands when tributary to good range lands will furnish the nucleus for many a fine herd of beef cattle in the future.

It is such a combination of conditions that made the feasibility of purebred Hereford breeding a certainty in the minds of E. A. Noyes and Son, on their properties known as the "Bar Ranches" in Sutter county.

Two very distinct kinds of land are found on these ranches; one a range of 1400 acres in the mountains known as the "Buttes," where alfalfa and bur clover pastures are abundant during the winter and spring months, and the other, rich lowland on which alfalfa, corn, and cereals yield heavily. It is on this latter ranch of 320 acres that Messrs. Noyes are for the present maintaining their herds of purebred Hereford cattle and Poland China swine, using the mountain land as winter range for a band of high grade beef cattle which are summered on 320 acres of overflow land that has been leased for a term of years and which is adjacent to their own valley ranch. Later the grades will be replaced by purebred Herefords, the theory being that the mountain land will produce sound, heavy bone and constitution; and that the lower land with its rich, succulent feed will be conducive to early maturing qualities.

While it is premature to write much about the Herefords on this ranch because of the newness of the venture, it is an interesting fact that the cost of maintenance is small, feed being about the only requirement, and this secured by the cattle in the stubble fields and on the 30 acres of alfalfa. The alfalfa could be cut twice and still produce a crop of seed without irrigation if it were not pastured.

At present the purebred herd is not large, Messrs. Noyes preferring to be conservative at the outset. But they are now determined to add to their eastern importations of last spring with the hope of eventually having 500 registered cattle on their two ranches.

Purebred Registered HOLSTEIN CATTLE

Purebred registered Holstein cows hold all records, and the bright and shining high marks of production which enthrall Holstein owners and amaze the world are, forty-four and forty-two hundredths lbs. butter and 808.5 lbs. milk in 7 days; one hundred seventy-one and four hundred ninety-seven thousandths lbs. butter and 3,242.6 lbs. of milk in 30 days; and fifteen hundred and six and thirty-six hundredths lbs. of butter and 3,239.4 lbs. of milk in 365 days. The Holstein cow in her rapid forward march of progress is so profuse with remarkable achievements that even the above wonderful figures are "subject to change without notice."

T. J. GILKESON, Lemoore, Cal.

With hogs it has been different, for by purchasing eight registered Poland China sows from Bassett and Young, together with an outstanding boar from Bernstein, it has been comparatively easy for them to increase the size of their herd in a short time.

With hogs as with Herefords the intention has been to breed and raise heavy and sound-boned animals, able to carry almost any amount of fat that may be added in the fattening pens in later life, and with early maturing qualities.

To secure such stock good judgment in selecting animals with good bone, backs, and hams was used and to further strengthen these characteristics a sensible feeding system has been inaugurated.

Instead of confining their breeding stock in small dry pens they have had the run of alfalfa and barley stubble pasture, when the latter is available. At other times the alfalfa pasture is supplemented with barley, either soaked or dry, and at times some corn. They have not secured as good weights as they would have with more intensive methods; but they have bone, frame, and constitution which are desirable for breeding animals. That fat cannot only be added but easily maintained on such an animal is a well known theory and one thoroughly proved on this ranch with animals which have been confined to close quarters.

With the growth of the Poland China herd on the home ranch, another herd is being founded at the mountain ranch; and by this process all of the hogs sold for butchering purposes from the range land will some day be of pure breeding.

With more cattle and hogs on the headquarters ranch will come the need for more alfalfa, and this will be planted at an early date as well as a considerable acreage of white clover, if the latter proves as successful as a small patch this year indicates.

GROUND FEED FOR HOGS.

To the Editor: I have put in an alfalfa and grain grinder on my ranch in San Benito county to grind hay and barley for hogs. What proportion of each will give best results with growing hogs along with pumpkins?—A. B. T., Gilroy.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

The proportion of alfalfa meal to barley for hogs will depend considerably on the size and age of the animals to be fed. It would seem advisable to feed the pumpkins probably in the middle of the day, and feed as many as the hogs will clean up readily.

For growing pigs for market it does not seem advisable to feed more than 1 lb. of alfalfa meal to 6 of barley up to 100 lbs. weight. It is only when the price of barley is real high and alfalfa meal moderate in price that the amount of meal should be increased in proportion to the amount of barley when hogs are heavier than 100 lbs. If the price of grain continues high you might feed 1 lb. of meal to 5 of barley to take the pigs from 100 to 200 lbs.

Brood sows can be fed more meal in proportion to the grain; perhaps at times $\frac{1}{4}$ meal and $\frac{3}{4}$ barley.

Swine Raising on a Coast Dairy.

[Written for Pacific Rural Press.]

Horse beans, in the opinion of J. H. Russell of Cambria, San Luis Obispo county, are one of the most valuable hog feeds that can be grown in districts adjacent to the coast, not only as a growing but as a fattening food as well.

Mr. Russell has grown this variety of beans for his hogs for several years, having three acres in the past season. Early planting is desirable with him because of the heavy rains which make it impossible to get the soil into good condition later. December is the usual month for planting, frost not being a factor.

This year the beans were ready to start feeding about June 15, at which time grade Poland China shoats were fed a ration composed entirely of beans and skim milk, the former being hauled into the pens, vines and all, so that the pigs would

do their own harvesting. These pigs were sold locally weighing 125 pounds and then feeding was commenced with 45 head of weaned pigs which were to be carried on the beans till the supply was exhausted about September 1.

Mr. Russell is favorably situated for the raising of hogs in connection with his dairy inasmuch as he grows good alfalfa on rich bench land adjacent to a mountain stream from which he secures his water supply.

With this advantage over most farmers in the county he is able to carry his hogs through the summer months at a continuous growing rate, the alfalfa being supplemented with

skim milk and barley at all times of the year except when the hill pastures are green and the horse beans available.

As hot weather is not a factor the pigs can be farrowed at most any season, but January and July are the usual times as the pigs farrowed at the earlier date are able to take full advantage of the enlarged milk flow and spring pasture, for while year-round dairying is possible through the aid of the alfalfa in the summer months, advantage is taken of the heavy spring pasture by having most of the cows freshen at that time.

GRAIN FOR HOGS.

To the Editor: Please give me a good grain ration to feed with cooked

potatoes to fatten pigs.—J. Walter Foster, Petaluma.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

It takes 4 to 4½ lbs. of potatoes to equal a pound of barley in feeding value; so it should be first determined whether the potatoes are as cheap as barley at present prices. Or if milo maize can be secured it may show a feeding value fully equal to that of barley and perhaps as high as 10 per cent more. About 2 lbs. of grain per 4 to 4½ lbs. of potatoes should be fed; and the ration would be more valuable if whole alfalfa hay were fed in a rack. If alfalfa hay is not available, tankage should be used in a self-feeder. It is more economical to let the pigs waste the coarse stems of the alfalfa than to eat them.

PERUVIAN ALFALFA.

To the Editor: Replying to your inquiry, we have not as yet had many reports concerning the actual superiority of Peruvian alfalfa over the common Chilean variety ordinarily grown. Large areas of Peruvian alfalfa do not show the vivid green color so characteristic of the common variety, but have a grayish white appearance. This is due in part to the pubescence, or hairiness, which covers the plant, and to the broad veins that give the leaves a silvery gray look. The leaflets are long with wedge-shaped basis. Many plants are found which have four or five, and even six leaflets per leaf. The flowers are longer than in other varieties, and are a plum purple instead of a violet. The stems are taller and less branched and have fewer stalks arising from each crown. It grows more rapidly than the common alfalfa, and recovers more quickly from a cutting, which often means an additional cutting per season. On account of the fewer branches, however, this does not always mean that four cuttings of Peruvian alfalfa would be more in weight than the three cuttings of the common variety. In a mild climate it has a longer growing season on account of the temperature at which plant growth ceases. In Peruvian alfalfa this is 48 degrees F., against 57 degrees F. for the common alfalfa. In other words Peruvian alfalfa under such conditions of temperature will continue to grow while other varieties may go into a dormant condition. This is a disadvantage in a cold climate, as all plants are more readily killed by severe cold, unless they have prepared themselves for the cold by going into a dormant condition. Tender growing tissues are killed with real cold weather. This information is secured partly from a bulletin of the Bureau of Plant Industry from the United States Department of Agriculture, together with one-quarter acre plot which we have grown at the Experiment Station, Davis. We have received verbal reports from Fresno south to Los Angeles and San Diego where it has been grown in a small way, and they seem to be well pleased with it.

University of Cal. P. B. Kennedy.

The Most Beautiful Book of HOME BUILDING PLANS Ever Offered. Cost us \$5000.00 —its YOURS for the asking

—for the Home Builder

This is the most complete, most beautiful Book of Home Building Plans ever issued. It contains complete plans of the coziest, prettiest, California Ready-Cut Bungalows you ever saw, in a variety large enough to meet the requirements of all tastes and demands. It shows you how you can own and erect one for yourself and save hundreds of dollars.

Everybody owns a home, or hopes to have one, and no prospective "home-maker" can afford to proceed with any ideas and plans he may have at present, without consulting this book.

All the bungalows pictured in it are reproduced in colors, exactly as they appear when finished. Probably the very bungalow you have always wanted is in this book—to be had at a saving of hundreds of dollars.

It is the new idea in home building, showing how any man who is handy with tools can build his own home according to our Special Free Plans, and save hundreds of dollars.

Because of the cost of the book, the edition is limited, so send for your copy NOW, before it is too late.

—Special for Carpenters and Contractors

In designing and selling our Ready-Cut Houses, we have the contractor's and carpenter's interests constantly in mind. We cooperate with him in every possible way by saving him money on materials and labor, and at the same time afford him an opportunity of making a legitimate profit on the building. In writing for your copy of the book, please ask for "Special Proposition for Contractors and Builders."

California Ready-Cut Bungalow Co.

Raising Poultry for Profit

CHICKENS, PRUNES, AND BEES.

[Written for Pacific Rural Press by Susan Swainsgood, Pomona.]

This paper is written by request, and as this is the time when the farmer thinks about what he is going to do next year it may help more than the one subscriber who made the request.

You can substitute any fruit trees for the prunes I am talking about, so far as I know, though I do know prunes require very good land to make them fill up with sugar.

In 1895 my husband planted two rows of young prune trees, where had been two rows of Bartlett pears. When these prunes commenced to bear, the prunes were very little larger than grapes; and as most people know, young prune trees generally bear good-sized fruit. I got an expert to prune them, as my husband was not living then, and also to prune the whole orchard. For about three years we had very small prunes on all the trees; yet every winter there was a good cover crop of alfalfa, bur clover, and other greens.

About that time I was going heavily into chickens to see if I could not pay off the mortgage I had been paying interest on for several years, and I noticed that wherever I had spread the droppings from the hen-houses the trees took on a dark green color to the foliage that was different from the other trees. Also my boy about that time got interested in bees; and the next year we put the hen droppings and bees where these young trees were that bore such remarkably small prunes. That year the prunes were the largest and best, and we had the largest crop on those trees of any part of the orchard. The next year we experimented more. My boy was as much interested as myself; and the facts were more than confirmed, for wherever the bees worked on trees in blossom time the fruit stuck, and where the trees were not near enough for the bees to work, a great many blossoms failed to get fertilized and fell off, either in the first stages or later. And where the ground was not enriched with hen droppings the prunes were lacking both in size and sugar, consequently in weight. At times I had as high as a thousand chickens; and my boy had quite a number of hives of bees; but there was a something about bees and me that did not agree; we did not mix well, and it got to be a question as to who or which had to be run off those premises. I have been blinded in both eyes for a week at once; yet I never fought back, and I will say that bees are the only antagonists I ever met in what is called a "Christian spirit." All my life I have tried to hit back when a brick was thrown at me, but I always gave in to the bees, maybe because they were so small—maybe? Anyway, since the bees and chickens left that orchard, it has never produced the old-time crops for which it was noted in the late nineties, and up to six years ago.

I will be willing to gamble that

if two or three good colony houses full of chickens are set between the rows of trees in any orchard and two or three hives of bees located near in the spring time to fertilize the fruit blossoms, an orchard that is run down can be brought up to a 100 efficiency in one year. The bees fertilize the blossoms and the chickens fertilize the ground, and put back the elements that the fruit takes from it. But if there happens to be a member in the family that the bees get after, it is not safe to keep them near buildings. My chickens called me all over the ten acres and the bees made my work a danger instead of a pleasure.

PRACTICAL POULTRY POINTERS.

To the Editor: We had several cases of chicken pox among our Golden Antlers when we first bought this place. As we were feeding sprouted oats, we dusted the sprouting boxes (lug boxes) well with sulphur to prevent the oats from getting musty, and the sick hens got well. At that time we were not aware that the sulphur had anything to do with it, but we now believe it did. We have never had another case of it since. We always use sulphur to keep our sprouting boxes sweet after washing them out. We have noticed that lice could not be found on the fowls as long as we used sulphur, but did not connect their disappearance with the sulphur until the chicken fleas fled also. Now we cannot find a louse, a mite, or a flea, in any of our poultry houses. As an extra precaution against mites we give the perches a heavy coating of crude oil once every two years.

Sand Under Perches.—Under the perches we put 6 or 8 inches of dry sand, kept in place by a 12-inch board on edge. The fowls use the sand as a dusting place. The droppings are easily raked off the dry sand every week. As the fowls keep the sand stirred up, the droppings soon dry up, therefore the flies will not breed in them. Before adopting this plan of using sand under the perches some of them were troubled with diarrhoea. When we found the moist droppings alive with maggots in the hot weather and the fowls picking them out from between the cracks in the boards, we tore the whole lot down, and now use a dry earth floor, covered with 6 inches of river sand, and have no more diarrhoea. Rats and mice are banished with sweetened bread and strychnine.

Green Feed.—The poultry yards (2 acres) are planted to fruit trees, with kale of the broad-leaved variety between the trees on one-half, over which the fowls range at will. On the other half we plant beets in alternate years, so they always have fresh, clean ground each year. The manure from the houses is hauled onto the beet crop and cultivated under. This makes a heavy crop of beets one year and an equally heavy crop of kale the following year. By scattering grain in the kale they keep up a dust mulch and eat every particle of green stuff as it appears

Doing "the Impossible"

The Gordian knot is the ages-old symbol of the seemingly impossible. Alexander the Great gave it a place in legendary history when, unable to untie it, he cut it in twain with his sword.

This famous incident of antiquity has its modern counterpart in the real work of the men whose vision and unrestricted initiative brought forth the great Bell System.

In the development of the telephone, one Gordian knot after another has been met with. Yet each new obstacle yielded to the enterprise of the telephone pioneers. Every difficulty was handled with a will and a courage which knew not failure.

Man's words have been given wings and carried wherever his will directs. Electrical handicaps have been overcome one by one.

The feeble current of telephone speech has had a way hewn for its passage through all physical impediments, until the entire country, from the Atlantic to the Pacific, is within hearing of a child's faint cry.

This record of the Bell System for past achievements is an earnest of future accomplishment. New problems are being met with the same indomitable spirit, which guarantees a more comprehensive as well as a more perfect service.

QUESTIONS ANSWERED.

Chickens' Legs Weak, Necks Extended.—My chickens 6 months old, White Leghorns, have weak legs, necks extended nearly to the ground, eyes very dull, and they are droopy but still eat. I feed mixed scratch feed mornings, mash at noon and wheat at night; they have free range. —Subscriber.

Your chickens are finding something on the range that is poisoning them—dear gophers, squirrels, mice or some kind of dead animal food. The symptoms are those of "limber-neck," and undoubtedly the chickens are eating maggots. As long as you turn them out, your chances for curing them are small, but if you could shut them up a day or two and give the place an overhauling while you treat the chickens, it can be done. Put equal parts oil of turpentine (not spirits) with olive oil, add as much sweet milk as both, and make all into pills with good ground ginger and white flour to hold them together. Give the pullets a couple of good-sized pills made into long rolls about half an inch. About twice treating will cure if not too far gone. I don't understand why you have not lost some, but perhaps you have, and the pullets may be feeding on the dead carcasses. Better have a good look.

Turkeys Walk on Joints.—There is a disease among my turkeys that prevents them from walking. When they do walk, however, they go on their joints. They eat and look well but the disease has always proved fatal. —Inquirer.

There are two diseases whose symptoms appear so much alike that it is hard to diagnose without examination. I am inclined to think that it is tuberculosis of the joints, from the fact that it has proven fatal. The other disease is rheumatism. While that is bad, it rarely proves fatal except when the bird is left out in rain and cold. Make a test by killing one, or if one dies, open the joints. If there are any little yellow lumps and if liquid runs from the joints you had better get rid of them. You could send one to the University poultry farm at Davis and have them tell you what it is.

Has Good Duck Ground.—I have a slough in which there is water three inches to two feet deep containing an endless amount of vegetable and animal growth. Would it not be a fine place for ducks? If so, what breed would be the best? Would they sleep and nest in a house if fed in it regularly?—W. A. Mc.

It would be an extra fine place for ducks. Make the house just a good shed with wire front, low roof and always keep them in until they have laid in a morning. If you don't, they will lay in the water and you will never get the eggs. Ducks lay early in the morning, as a rule. Pekin ducks every time for profit.

Carbolic Nest Eggs.—One of our readers has kindly sent a suggestion from an Australian guest, which I am pleased to give:

We blow an egg in the ordinary way, mix plaster of Paris with water till as thick as paint, add a

Widen the Orbit of Your World

As a prominent Iowa farmer said at a recent convention: "It's a bigger world and a better one since I learned the values in Firestone Tires. If the knotted binder breaks, I get to town and back in time to cut the field by sundown. All because there's never a delay in the going with Firestone."

Because Firestone strength is equal to the strain, Firestone resiliency makes fast going good, and Firestone building insures "Most Miles per Dollar."

SAN FRANCISCO

San Francisco, Nov. 22, 1916.

WHEAT.

The Eastern market shows a little less strength at the moment, but the local situation is very strong, with difficulty in getting shipments from producing districts. Sonora is sharply higher, and there is no club of either local or northern varieties offered. Bluestem is quoted up to \$3, and everything is very closely held.

[First-hand prices on strictly first-class grain, San Francisco.]
 Sonora wheat\$2.75@2.80
 Northern clubNone offered
 Calif. club, cti.None offered
 Northern Bluestem2.85@3.00
 Northern RedNone offered

BARLEY.

No shipping barley is coming out at the moment, and choice feed has advanced sharply. Sales are light, but holders refuse to make any concessions. Shipping, cti.\$2.20@2.25
 Choice feed, cti.2.20@2.15

OATS.

Red seed is about cleaned up, and white oats are higher. Red feed appears to be still in fair supply, and move well at the old range.

Red feed\$1.80@1.85
 White2.15@2.20
 Black seed3.00@3.25

CORN.

No Eastern corn is offered on the spot, as the price at shipping points is not regarded favorably by local handlers. Egyptian is in strong demand, and even inferior lots are very firmly held, though only choice grain can be moved readily at the figures quoted.

[First-hand prices on strictly first-class grain, San Francisco.]

BEANS.

The white beans are now pretty well out of growers' hands, and activity in that line is subsiding somewhat, but the trade is taking renewed interest in the colored varieties, and buyers show considerable anxiety to cover their requirements in pinks and red kidneys. Growers are holding firmly, however, and the movement has forced prices up for good offerings of both kinds, the growers still holding a large proportion of the crop. Limas also show a further advance, and are moving off steadily.

HAY.

Arrivals are still decreasing, reflecting an even worse car shortage than was experienced in the season. There is hardly enough arriving to take care of actual requirements, with the result that prices locally are firmly held, with dealers frequently getting a premium for immediate delivery, while consumers are drawing as much as possible on their reserve stocks, buying as little as possible. Alfalfa is in fair supply, comprising a large part of the arrivals. There is not much export trade, but the demand is strong in many parts of the country, where the car shortage is also affecting deliveries.

POULTRY.

While the turkey demand is stronger, dressed stock is arriving freely and has prevented any advance. Dealers expect

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
 Prices Quoted as Paid to Producers.

a wide range of prices Thanksgiving, with fancy stock scarce and high, but large offerings of poor, unfinished turkeys, which will cause low prices for the less attractive offerings. This is due to the high cost of feed, which is causing some pressure to sell among growers. The same influence is bringing in large supplies of poor chickens, having a retarding influence on the market. Young roosters, squabs and ducks, however, are doing rather better, and Belgian hares show a wider range, with small stock higher.

BUTTER.

A sudden urgent demand for shipment to New York, notwithstanding the comparatively high prices here, has forced the market up to new high levels. This demand has been felt for several days, and is apparently likely to continue for some time, being a reflection of the shipments to Europe earlier in the year. The lower grades are now responding to the advance.

DECIDUOUS FRUITS.

Huckleberries and strawberries are both higher, with diminishing supplies. Christmas apples are beginning to move, being held at \$2 to \$2.25 per box. Other California apples are about as before, except that Newtowns are stronger, with considerable inquiry for shipment to England; and several cars have gone out, notwithstanding the difficulty of getting shipping space. Sales have been made at 85c, f. o. b. Watsonville; and the price on the street is higher. Winter Nellis pears are much higher, with few left.

Casabas are higher, with lighter offerings and a very fair demand.

DRIED FRUITS.

Advances continue to appear in various lines, with most varieties well out of growers' hands. Another advance is noted in apples, which are getting quite scarce and are in demand both locally and for export. Ordinary pears are slow and steady, but fancy stock in Lake county is bringing as high as 11½¢ in the orchard. Peaches also have been marked up again. Apricots are about cleaned up, the few scattered lots remaining being held at high prices. The tonnage of prunes left in the country is running very light, and the trade is rapidly absorbing all offerings, having advanced the offered price to meet the views of most growers. The strength of the market has been increased by a demand from Europe for direct shipment, resulting in the repurchase of contracts by local handlers from buyers in the East, at advanced prices.

Special Livestock Market Report.

Los Angeles, Nov. 21.

CATTLE: The market holds up fairly well. California and Arizona continue to furnish this market with a fair number of very good hay fed cattle. Killers were all in the market and made fair purchases, but did more or less picking around, and prices while not quotably lower were inclined to weakness.

Quotations f. o. b. Los Angeles:
 Beef steers, prime 1000 to 1100 lbs.\$7.00@7.75
 Stockers and feeders5.50@6.00
 Prime cows and heifers6.25@6.50
 Good cows and heifers6.00@6.25

HOGS: There were more hogs in the past week. California increased its supply and there were several shipments in from Idaho. While there were increased numbers in, they were not very well finished, showing the effects of the high price of feed. Killers were all in the market and wanted hogs and in sympathy with high markets East values ruled steady with a week ago.

Per cwt. f. o. b. Los Angeles:
 Heavy, averaging 250@300 lbs.\$8.50@9.00
 Mixed, 200@2509.25@9.50
 Light, 175@2009.25@9.50

SHEEP: While there is no change to note in this market from a week ago its tone was firm. A fair number of very good sheep and lambs were in from Arizona and Utah and a few from Idaho. Killers were all in the market and wanted supplies and bid up well for everything, and the market was firm without being quotably higher.

Per head f. o. b. Los Angeles:
 Prime wethers\$7.00@7.25
 Prime ewes6.50@6.75
 Yearlings6.50@7.00
 Lambs6.50@7.00
CALVES: Not many coming in and

market steady and firm. Selling at \$8.50 to \$9.50 per cwt.

San Francisco, Nov. 22.

The cattle market continues strong, especially for steers. Quotations are same as last week, but an advance may be looked for within the next few weeks.

Hogs are a little higher. They are coming in rather freely, sufficient to supply demand. Proportion of light-weights is rather large. The sheep market is steady. Lambs very scarce.

The wool market continues strong Southern fall wool a cent higher. [Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

GROCERIES.

Flour is now quoted here at \$9 to \$9.40 per bbl., and sugar at \$7.70 per 100 lbs., granulated basis. Lard and salad oil are higher, and salt meats are very firm. Corn meal and a number of breakfast foods are advancing.

LOS ANGELES.

Los Angeles, Nov. 21, 1916.

BUTTER.

There was a decidedly firmer tone to this market the past week all along the line. Quite a falling off in the receipts and the government report November 1 showed that there were in 142 cold storage warehouses 13,424,000 pounds of butter less than the same time last year. Under this showing the market here advanced 3c for the week and San Francisco 2½c. Chicago is up 3½c and New York 2½c. Light production and a very good export movement by the way of Canada must be charged with this upward movement, as the home consumption is said to be no better, if as good, than a year ago at this time. The market is 8c higher than this time last year. Receipts for the week ending Tuesday were 215,200 pounds against 248,130 pounds the same time last year, a shortage of 32,930 pounds.

We quote fresh extra creamery .38c

EGGS.

This market as well as that for butter exhibited a decidedly stronger tone the past week. While the cold storage stocks are as good as a year ago and the current receipts holding up very well. The government report of November 1st showed that there was a shortage of 1,392,238 cases in 142 cold storage warehouses compared with a year ago. Here the market advanced 1c up to Monday and San Francisco 3c. Chicago is 2c higher and New York is 8c higher. Tuesday brought no change. On call there was no trading. Fresh ranch case count was bid for at 50c, but there were no sellers. Receipts by rail for the week were 703 cases and estimated receipts by truck 600 cases, total 1303 cases. The same time last year the receipts by rail were 492 cases and estimated receipts by truck 600 cases, total 1092 cases.

We quote fresh ranch case count .50c

POULTRY.

Receipts the past week were very good and all light stuff, such as broilers and fryers were slow sale. Heavy hens continue to sell very well, but light ones are slow. Turkeys are coming in more freely, but in anticipation of the Thanksgiving demand brought a little more money. The eastern markets are very high, and a good many Texas turkeys that previous years have come to this market have been diverted East. Ducks steady and in fair demand and geese are selling fairly well.

Broilers, 1½ to 2 lbs.22@23c
 Fryers, 2½ to 3 lbs.20@22c
 Hens, over 4 lbs.18@19c
 Hens under 4 lbs.14@15c
 Ducks15@16c
 Geese14@15c
 Roosters, 3 lbs. up (soft bones)12c
 Turkeys, heavy, 12 lbs. and up.23@24c
 Turkeys, light21@22c
 Squabs, live, per doz.\$1.50@3.00
 Dressed3.75@4.85

HAY.

There was a little more doing in this market the past week. Stocks have been pretty well reduced and there was more buying than for several weeks. But as the receipts were better the market made no quotable improvement. Indeed the general tone of the market is hardly so strong. Receipts 203 cars.

[F. o. b. Los Angeles.]
 Barley hay\$16.00@18.00
 Oat18.00@20.50
 Alfalfa, Northern15.00@16.00
 Alfalfa, local17.00@18.00
 Straw7.50@8.50

COTTON.

Cotton is bringing fancy prices in the Imperial Valley: 1000 bales were sold last week at Calexico, including both long and short staple. The buyers were Liverpool and Japanese firms. The short staple brought 18.90c per pound and the long staple 25.50c to 25.75c per pound. Cotton seed sold for \$80 to \$40 per ton.

The market the past week showed

more life and there was an advance of 25c per cwt. all round. There was a noticeable improvement in the demand for everything, with limas and whites showing most life.

We quote from growers:

Limas	\$7.00 @ 7.25
Large white	9.50 @ 9.75
Small white	9.50 @ 10.25
Pinks	7.50 @ 7.75
Blackeyes	5.25 @ 5.75

WALNUTS.

The California Walnut Growers' Association reports the season closed and says it has been a very successful and

satisfactory one. There are no more No. 1 walnuts now to be had at Association prices. A half cent advance is being bid outsiders and but few are being bought at this advance. A good many culls are still coming in and they are bringing 5@6c per pound.

The Associated prices for this year and last are:

	1916	1915
No. 1	\$15.50	\$13.50
No. 2	12.50	10.60
Budded	19.00	17.00
Jumbos	17.50	16.50
Orchard run 3c per lb less.		

Special Citrus Market Report.

Los Angeles, Nov. 21.

Shipments of oranges from Southern California from November 1 to November 16 were 272 cars of oranges and 302 cars of lemons. The shipments for the same time last year were 372 cars of oranges and 170 cars of lemons. Shipments of oranges from Central California from November 1 to November 15 were, 96 cars of oranges and 60 cars of lemons. The same time last year the shipments were 21 cars of oranges and 25 cars of lemons. Shipments from Northern California from November 1 to November 15 were 53 cars of oranges and no lemons. The same time last year the shipments were 3 cars oranges and no cars of lemons.

There was a little better tone to the market the past week at all the eastern centers and demand fairly good for all desirable sizes. Prices show little change from a week ago. Locally the market was better. Some new navels were received every day from

Tulare county. The fruit was well colored for so early in the season and met with a fair demand. It generally tested 8 to 1. Valencias are still bringing 2 1/2 to 3 1/2c per pound in the groves and grapefruit 2@2 1/2c in the grove, which is lower. The receipts showing quite an increase. But at the prices there was a very fair demand. New navels selling very well at 2@2 1/2c in the grove. Lemons are still dull at 1 1/2@2c per pound in the grove.

New York, Nov. 20.—Twelve cars of Valencias and six cars lemons sold. Valencias averaged \$2.15@3.10. Lemons averaged \$2.40@3.50.

Boston, Nov. 20.—Ten cars sold. Market is unchanged on oranges, doing better on lemons. Valencias averaged \$2.75@3.65. Lemons averaged \$2.55@3.40.

Philadelphia, Nov. 20.—Two cars sold. Market is unchanged. There is a good demand for oranges and lemons at prevailing prices. Valencias averaged \$2.95@3.20. Lemons averaged \$3.55.

MARKETING TURKEYS.

If you will follow these instructions, they will help to sell your turkeys to the best possible advantage:

A poor, light turkey is worth more money on the ranch than on the market; therefore dress and ship only fat turkeys. Keep the light ones until they are fat and sell them on a later market.

Dressed to market turkeys under ten pounds and hen turkeys under eight pounds are not desirable. Turkeys are not wanted at any weight unless they are fat.

Dressing—Turkeys should always be dry picked, heads and feet on, undrawn for the San Francisco market. Be careful in dressing not to rub or break the skin; also, be sure that all birds are well-bled.

Packing—Be sure that birds are thoroughly chilled—or, in other words, that all animal heat is out of the body before packing. Clean blood off heads and wring heads in paper. Put paper between layers.

Shipping—Ship by express and be sure to mark each package with both your name and consignee, and send them the shipping receipt.

Publisher's Department.

A new advertisement in our columns this week is from the Armstrong Mfg. Co., who has designed and built an engine very much simplified, leaving out unnecessary parts.

In our poultry liners this week we print an ad. for the Roofden Poultry Ranch. Mr. Ellison now has 100 incubators with 540 egg capacity each, and is prepared for all orders he may receive.

Many subscribers to the Rural Press will be interested to learn that the old established firm of W. Davis & Sons have moved to 333 Market St., San Francisco, where they occupy a large 6-story building in manufacturing leather goods.

"California Pure-bred Livestock Breeders' Directory" is the title of a new book of 62 pages recently issued by the Wahlgreen Co., San Francisco, and which was compiled by D. O. Lively. The book furnishes an up-to-date list of purebred stockmen in California, and is well worth the price of 25c per copy.

Here is another case where we lose an ad. because we sold out the stock. Geo. Boock of Los Molinos writes us as follows:

"Please take out my ad. in your paper about Sudan grass seed and send me bill for same. Have sold it all on your first ad. Talk about selling like hot cakes—it went more like greased lightning this time."

This is catalogue time with the nursery trade. Already this office has received several and we know that they are gotten out for distribution among those who intend planting this season. If you expect to set out trees it will be well for you to send to your nurseryman for his latest catalogue. And by the way, we would suggest that you order your nursery stock early, as already there is a scarcity of stock in some lines, notably prunes, walnuts and almonds.

"Principles of Feeding Farm Animals," a new book by Sleetor Bull, of the College of Agriculture, University of Illinois, has just reached our desk. It is a book of 400 pages, cloth bound.

well illustrated, and published by the Macmillan Company, 66 Fifth Ave., New York, at \$1.75 per copy. The book covers in a technical way all the subjects connected with farm animals, their feeding, by-products, efficiency of rations and fertilizing values of feed stuffs. A set of feeding tables in the back of the book make it of great practical value to the breeder.

Western Meat Co. San Francisco

Mrs. Best's Letter.

My dear Friends: Quite early in the fall the white hat was the new, desirable article, but as the season progressed, the dark hats have been seen more and more, but by some whim of fashion, the white hat is back in popularity again.

You see them in soft, boyish felts for walking or driving, and also in beautiful white plush trimmed simply with an ornament or a wing for dressier wear. They are beautiful on women with fresh skins, but a little trying to anyone whose skin is browned or whose color has faded.

The full pleated skirt is back in favor again and many times it is trimmed with a broad band of contrasting color. One very nobby one was made of a large black and white check with a broad band of black at the bottom of the skirt. This was made of a soft velour cloth—in fact, nearly all suits and coats are in the soft weaves.

Broadcloth suits are having a great run of popularity; they are shown in a light weight satin finish cloth and also in a heavier weight almost like men's tailored goods. Many of them are fur trimmed and a few have velvet collars and cuffs. Skirts are rapidly growing longer, many of them being not more than four inches from the ground. And as is usually the case in the fall, suit coats are long, many of them three-quarter length.

There is a new sport suit on the market made of a heavy material woven like flannel that is wonderfully good looking. It comes in solid colors and is made with a medium long coat and large collar and is conservative enough to be suitable for many occasions.

Crepe-de-chine underwear is quite popular now. We have had it in pink and white, and now it is being shown in an orchid tint. It is not practical for every-day wear, but is lovely to own for dress-up occasions and makes a beautiful gift for a young lady.

The light-colored shoes continue to be worn and so do the light spats. If all the rumors we hear about advancing shoe prices are true, it would pay all of us to lay in a year's supply. For although they are high now, the prospects are that they will be much higher in the near future.

A great many women are wearing white stockings with dark high shoes, but it is not an attractive style, for with short skirts it makes the leg so noticeable.

Rosabella Best.

CARE OF BED LINEN.

If available, a closet is better for bed linen than a bureau or chiffonier. The closet should be filled with shelves and they should be of varying distance apart. The top shelves should be used for extra blankets and articles not in common use, and the middle shelves should be devoted to those articles that are in use every day.

Have a separate shelf for different articles, and the work of keeping the closet in order will be much reduced.

For articles that are in constant use, it will be found to equalize wear if each week the linen that has been washed is put at the bottom of the pile. This may take a little more time, but it pays.

THE HOME CIRCLE

WHOLE WHEAT BREAD.

Editor Home Circle: Would like to know how to use whole wheat flour in making light bread. I have been told to not make the dough too stiff, but am not successful.—Mrs. W. D. C., Laton.

Try this recipe: 1 pint milk, 1 teaspoon salt, 1 pint water, $\frac{1}{2}$ cup sugar, 1 compressed yeast cake. Scald the milk and add the water. When luke warm, add salt, sugar, yeast cake (dissolved in 2 tablespoons water) and sufficient whole wheat flour to make a batter that will drop from the spoon. Beat continuously for 5 minutes. Cover and let stand for 3 hours; then add sufficient whole wheat flour to make a dough. Knead at once into loaves, put in small greased pans, cover and stand in warm place for an hour. Bake in a moderately quick oven 45 minutes.

MINCE PIE.

One cup of chopped cooked meat, one cup of seeded chopped raisins, one cup of cleaned currants, $\frac{1}{4}$ cup chopped citron, one cup brown sugar, $\frac{1}{4}$ cup of molasses, three cups of chopped apple, one cup of meat liquor, one teaspoon each of salt and cinnamon, $\frac{1}{2}$ teaspoon each of mace and cloves, the grated rind and juice of one lemon and one orange and one cupful of boiled cider. If you cannot get this, use one cup of the rich syrup from pickled peaches. Mix thoroughly and cook until the apple looks clear.

HOUSEHOLD HINTS.

If the steel parts of the kitchen range have become dull, the best and most economical method of cleaning them is to rub them with very fine coal ashes, carefully freed from grit, which might scratch the steel.

Sweeten old lard or butter jars by filling them with very hot lime water.

A coat of varnish applied to oil cloth or linoleum will greatly prolong its usefulness.

For upholstered furniture use a new paint brush to clean crevices.

Iron can be kept from rusting by touching up with mutton suet.

USING BURLAP SACKS.

Nowadays when salt, sugar, wood—blocks—and many of the commercial stock and poultry foods are sold in burlap, one soon accumulates many of these valuable sacks which may be put in many and varied uses. Those that are in good condition I rip apart and wash carefully. This year I sewed enough together to make a splendid curtain for our screen sleeping porch. Our bedroom floor borders were badly splintered and in need of some sort of borders, for we used rugs. I dyed sacks to harmonize with the rugs, one a rich golden brown and the other a dark olive green. I cut the sacks so as to make a triangular piece for the corners of the rooms, and fitted the rest carefully together with neat seams. We were all delighted with the result.

Another exceedingly practical use is to sew enough together to make a protector for the mattresses. Fit them carefully and sew to the springs. They do not bunch up, so fitted and sewed allowing one to turn the mattress without hindrance and protect the mattress from dust and rust. I use them to cover the cushions the men use on the hard wagon and farming implement seats, also for porch and extra cushions for the automobile. Those that are too worn or torn to use I patch and the men use them about the ranch.

Fresno. Mrs. W. M. Bowen.

BOSTON BROWN BREAD.

One cup sour milk, 2 cups Graham flour, $\frac{1}{4}$ cup white flour, $\frac{1}{2}$ cup molasses, 2 tablespoons brown sugar, 1 teaspoon salt, 1 rounded teaspoon soda. Pour this mixture into large baking powder cans that have been well heated in the oven. Fill $\frac{3}{4}$ full, cover tightly and set cans in a kettle of cold water and bring to a boil. Then let simmer on back of stove or place in fireless cooker for several hours. When done, take off top and set in oven for a few minutes.

Camphor gum kept in the drawer where silverware is stored will prevent tarnishing.

Floral Department.

[By Geo. N. Tyler.]

Pelargoniums that were planted in August and September, and were potted into two or two and a half inch pots, are now ready for a shift into four-inch. Pot them firm and use a good fibrous loam, with a five-inch pot full of hydrated lime to a barrowload of soil. Also do not use manure for them, as it makes a soft, long-jointed growth, but use fine bonemeal for a fertilizer—a four-inch potful to a barrowful of soil. They should have full sun, and be kept on the dry side through the winter, for if kept too moist they are liable to damp off. The main secret of growing good pot pelargoniums is to keep them in a growing condition all the time. This applies especially to Easter greetings and the sports from same.

The severe cold weather and frosts that we have had, makes it the right time now to prune your roses and all deciduous shrubs. You can also transplant these now.

Roses.—If you are going to have any new roses in the spring, now is the time to buy and plant. Some of the new roses are fine—Mrs. Aaron Ward, Sunburst, Prince E. C. Ehrenberg, Jonkeer, J. L. Mock, Lady Hillington, Prima Donna Ophelia, Hoosier Beauty are all good summer bloomers, and should be in every garden. Irish Fireflame, an improvement on Irish Elegance, and Mrs. Geo. Eldger, the yellow Cecil Bruner, are also fine growers.

In buying your plants, get field-grown ones; they do far better than out of pots or cans. I advise those grown on their own roots. Grafted roses are all right, but you will get more and better flowers from own root plants.

Pansies should now be in their blooming beds, and should be given a mulch of half-rotted cow manure.

Dahlias should be cut off close to the ground, and lifted and stored away as described in my last article.

Bulbs.—It is not too late yet to plant bulbs. Be sure and plant the baby gladioli, convolvulus alba (white), Blushing Bride and peach blossom, a delicate pink. They are perfectly hardy and bloom in early spring. Plant about three inches deep. Freisias can still be planted.

If you have a plant in your greenhouse or conservatory that has been frozen, you can save it if you get at it before it has a chance to thaw. Spray it with cold water, which draws out the frost, and then cover it with a newspaper, and put in a shady, cool place for a day or two. If you stand pans of water among your plants it will have a tendency to draw the frost and prevent them from freezing.

JELLIED PRUNES.

Pick over, wash and soak one-third pound prunes in two cups cold water and cook in same water until soft; remove prunes, stone and cut in quarters. To prune water add enough boiling water to make two cups. Soak two and one-half tablespoons granulated gelatine in half cup cold water, dissolve in hot liquid, add one cup sugar, one-fourth cup lemon juice, then strain, add prunes, mould and chill. Stir twice while cooling to prevent prunes from settling.

Genuine Army Shoes for Farmers

Made from the strongest and very finest prime calfskin leather on earth—genuine Indian tan—Goodyear welt—heavy soles and bellows tongues—soft and velvety feeling to the feet. These shoes are made over the lasts and patterns designed by Edward Lyman Munson, A.M., M.D., of the Medical Corps of the United States Army, and approved and adopted by the War Department. This is the shoe on which we were awarded a contract for making 150,000 pairs for the Government. This is a real outdoor shoe for farmers, stock raisers, fruit growers, hunters, hikers, campers and general outdoor service; made for perfect comfort and long wear. Our name is stamped on every pair. Order No. 202 R Tan Army Shoe.

Good Health.

[By H. E. Pastor, M. D.]

"Fat Is Fat"—But with a Difference.

Some interesting experiments have been conducted recently for the purpose of determining whether or not butterfat possesses any advantages over other fats as an article of diet. These experiments were undertaken in view of efforts made by promoters of other forms of fat as substitutes for table butter—for example, oleo-margarine, butterine, peanut butter, etc. It is claimed by those interested in these substitutes—and by some dietists and chemists as well—that there is no essential difference between the various forms of fat as to their food values. In other words

the claim is put forth that "fat is fat"; that the function of fat in the human economy is to generate heat and energy; and that butterfat has really no superiority in this respect over fats derived from other sources, except perhaps in greater digestibility. The experimenters included tallow, peanut oil, olive oil, cottonseed oil, and others, and the conclusion arrived at was this: While butterfat, in common with other fats, yielded heat and energy when taken into the animal economy, it also performed a service which the others did not; namely, it "promoted growth." The only other fats experimented with that yielded the same results were the fat of the yolk of egg (lecithin), and the fat cells of a pig's kidney. All of which would seem to indicate that the fats which induce animal growth are derived from living protoplasm, and that butterfat as an article of table diet is not adequately replaced by the commercial "substitutes," so-called.

A Mexican Menace.

The State Board of Health is interesting itself in another matter in behalf of the health of the body politic. The numerous Mexicans who have crossed over the border line into California, owing to the family disturbances in their own country, are said to show unpleasant evidences of the neglect of the fine-tooth comb, and that these "evidences" are active in spreading typhus fever. Twenty-five cases in this State are said to be attributable to this cause. Quarantine has been ordered against premises occupied by persons suspected of harboring these unwelcome parasites, whose monosyllabic name is taboo in polite society. Mexico is a country of marvelous resources.

No Appetite—What It Means.

Loss of appetite is nature's way of saying the system requires no food. This warning, however, is rarely heeded by the human kind. Animals, are more obedient to nature's danger signals. Observe a cat or a dog when it is ailing. It will crawl off to some out-of-the-way place where it will not be bothered. A horse, if it is ill, cannot be persuaded to eat. And the same is true of nearly all the lower order of animals. Don't force food on a sick person to whom food is repugnant. The salivary glands are deficient in secretion, or there is a deficiency of gastric juice or of bile, or torpor of the pancreas or of the intestinal glands. Give nature a chance to reassert herself.

Buttermilk for Erysipelas.

Buttermilk has been successfully tried as an application for erysipelas in all its stages. It is said to check the spread of the infection, allay the pain and abort the whole morbid process. As it is harmless, costs little or nothing, and is easy to apply, there can be no objection to giving it a trial. Such efficiency as it possesses is probably due to the lactic acid contained.

Bee Stings.

A favorite homely remedy for the sting of a bee is an onion poultice made with raw pulp or roasted onions. Epsom salt or common salt may be used to make a thick plaster.

10-rib Warmth

Turns
your
winter
into
June

BROTHER! Just get your fingertips *inside* a Mayo 10-rib garment and feel that fleeced inner surface.

"Velvety," say you. Right. Imagine how good it feels when the icicles hang from the house 10 inches to 1½ feet long.

But the velvety hug of Mayo Underwear is due to far more than its fleeced inner surface. Mayo has the same knitting that's found in dollar underwear—ten ribs per inch instead of 8.

You can easily prove that by putting a ruler next to the fabric and counting those 10 ribs.

Does that close, snug, 10-rib knitting turn winter into June? It *does*! Will it turn *your* winter into June? It *will*! Get your Mayo underwear before winter gets you.

Men's Single Garments. Men's Union Suits
Boys' Union Suits

Those who prefer the old-style 8-rib garments will find Mayo 8-rib Underwear an excellent value.

Mayo

THE PACIFIC RURAL PRESS

SAN FRANCISCO

DECEMBER 2, 1916.

LOS ANGELES

Sentimentality in Land Building.

[Written for Pacific Rural Press.]

SENTIMENT seems to be a poor foundation upon which to invest thousands of dollars in an agricultural undertaking; and yet it was undoubtedly sentiment which caused the four members of the Henderson Company to use the old Henderson homestead seven miles east of Galt as a nucleus for one of the largest pure-bred breeding establishments in the State. Before the members of this firm left home to engage in more profitable pursuits in the city, the 500 acres contained in the "home ranch" was no better or worse than thousands of acres of land in the immediate vicinity. Portions of it were slightly rolling in character; some was in the bottoms adjoining a small stream that ran through the place; but all of it was valued chiefly for its grain growing possibilities.

But many years of tenantry changed the character of the soil. Gradually the virgin fertility was carried off to grain dealers in ever-decreasing amounts and nothing was being done to replace it.

Livestock Medicine.—It was in this run-down condition that sentiment came to the rescue. It was an eye-sore to the children in its dilapidated condition when they conceived the idea of bringing it back to its early-day productivity by a system of livestock farming.

Tradition said that intensive livestock growing was out of the question because of lack of irrigation water; but sentiment determined the company to develop water from wells. There were disappointments in wells, but four of the holes that were bored proved productive and with electrically-driven pumps installed, these wells furnished solvent hopes for alfalfa.

The development work started two years ago. Sentiment has had many a hard bump since then; but through it all the main idea of growing feed has been kept in the forefront with the result that 160 acres of land is now in alfalfa, and corn for three silos has been

anything else, but had been cropped to the limit.

The irrigable land produces alfalfa and corn; the herd of registered Holsteins, besides producing valuable calves and lots of milk, yields an immense amount of manure; and this manure when applied to the higher grain land increases the yield of grain and adds humus to the worn-out soil. Duroc and Chester White hogs add to the economy of this system. With keen competition it behooved the owners to buy the best and breed better ones if possible. At first they confined their purchases to Cali-

Home Coming Scene on the Henderson Ranch.

fornia, learning in this way their first lessons in the purchasing of pure-bred stock. Next they journeyed East, where they selected a large number of registered Holsteins from some of the leading breeders. Included

in this lot were the bulls Supreme Glista Pietje, a son of Woodcrest Pietje Ormsby and out of the 32-pound cow Glista Eglantine; King Lillian Walker Segis, a son of King of the Black and Whites and whose 15 nearest dams averaged 29.26 pounds butter, and King Pontiac Segis Inka, a son of King of the Pontiacs, who has almost 200 A. R. O. daughters and is considered by many the premier sire of the breed.

Equipment.—Such cattle called for comfortable quarters if they were to make records in keeping with the times, so a set of modern buildings were erected; not gaudy or fanciful affairs, but convenient and sanitary structures.

Included in this scheme are two milking stables with a combined capacity of 120 cows. Well-drained concrete floors make these sanitary and plenty of window space provides good ventilation. Each building is equipped with a tight-floored attic where mill feeds can be stored. Two stave silos separate the milking barns and a third silo is located between one of the milking barns and the combination test and calf barn. Still another building was erected for the bull stalls, where both old and young bulls can secure protection from the weather. Hay feeding of cows and young stock is done in separate lots where feed sheds are provided. With good feed, cattle, and buildings it naturally follows that good records should be

made; and while it is a little premature to write about this work, although several very excellent records have already been made, Superintendent Jay Dutter has a program of test work outlined for the coming winter which should result in some creditable records. This is only a start, for every cow will be required to have an official stamp of approval to hold

(Continued on page 613.)

Dollars Have Followed Sentiment for Business Reasons.

grown the past year. All this tonnage fed to stock on the place will make fertility.

Manure for Grain Land.—On the higher rolling land, the problem is entirely different. Irrigation there is impracticable, so other means of returning fertility have had to be practiced. It was this land that most badly needed livestock; for it was better suited to grain growing than

CAUSES FOR REJOICING.

THE great first cause of rejoicing, from our point of view, is that a good rain has fallen over all the upper part of the State, northward of the latitude of San Francisco and very acceptable showering for considerable distances southward of that line. There has not been depth enough in the precipitation to drown the dry-weather prophets, it is true, but enough, we trust, to render their prophetic soles damp and disagreeable, which is a proper recompense for their pessimism. For it was really a good rain, dropping nearly three-quarters of an inch at Eureka, San Francisco and Red Bluff and more than one-quarter over the central valley around Sacramento. And it was the right kind of a winter storm, too, for it was our end of a great northern disturbance which struck the coast in the regular winter way, and there is no reason why we should wait a month for more of it. At San Francisco we are now a little in advance of the normal to this date, so why worry? Over more than half the State it is enough to hold the new grass, to plump out the olives which have not gone too far with frost, to start new foul-growth for the land-cleaner and to prepare for early grain-sowing. It says, as clearly as weather can, smooth out your brow and get to work!

It is Thanksgiving week and we shall spring the legs of our editorial tripod a little wider than is our wont, to catch themes for comment beyond our chosen field of California agricultural technics—in fact, we shall not refuse California pyrotechnics if they happen to come our way.

WHAT WE GET WITH WILSON.

WE HAVE already sounded the joy-bells over the honorable publicity which comes to our State for our election of President Wilson. Some of our earnings along that line are of deep industrial significance—such as the establishment of a federal district land bank at Sacramento, which seems assured. Of course this is non-political and fully justified by geography and by our agricultural development, and yet one can never tell how the general fact of good will may illumine or obscure even such colossal facts as these. We are surely in the sun for everything which the government can justly do for us—and who is such a hog as to want more than that! But there are graces and favors which are not coldly calculated: there are smiles and kisses which one cannot command by the sharpness of his nose or by the fullness of his belt-line. They are just pure joy, without price or condition. Such, for instance, will be the glory of California at the inauguration in Washington, next March. For President Wilson has consented to have "I Love You, California," played by the United States marine band in the inaugural parade. The story is that F. G. Kaufman, superintendent of the exposition zoo at San Diego, a short time ago wrote to the President, saying: "Kindly have the band play 'I Love You, California' in the inaugural parade." On Friday last he received a letter thanking him

on behalf of the President for the kind suggestion and asserting that the selection certainly would be played on the day of the inauguration.

Mr. Kaufman's name surely has a hyphenated sound, though he may have been American for generations. If so, he will not be angry if we suggest that the quick accession of the President to his request may be taken as a sign that Mr. Wilson has no such anti-Teutonic prejudice as he is credited with. That, however, is less important, from our point of view, than the fact that a Teuton, more or less remote, should call out to the President of the United States: "I love you, California!" and the President should reply: "I surely do." Music by the band!

CALIFORNIA PEACE DRIVE.

AND now California, having re-seated the peaceful Mr. Wilson, launches a new offensive against the devil of war, which Mr. Wilson is to actuate in the name of the United States. The Californians who are leading in this beneficent project announced at the close of last week that the plan is to present to President Wilson a petition bearing the names of several million Americans urging him to take action looking toward the abridgment of the world war. The leaders assure us that their purpose has already been communicated to England, France, Germany, Austria and to nearly all neutral nations, and that very exceptional information has been received both from Germany and England that the time is rapidly approaching when negotiations may be substituted for armed conflict. They patriotically declare that California has two weeks the start of the rest of the country in pushing this project, and it is desired to send it along with at least half a million California signatures. They intimate that as California has re-made Wilson so she may make world peace through him. Perhaps if they happily settle world-strife they may have courage to tackle Mexico. However, this is the basis upon which the belligerents are expected to accept peace potions:

We, the undersigned citizens of the United States of America, declare our conviction that adequate guarantees against future wars—the avowed aim of both belligerents—can be secured by

1. Repudiation of military conquest as a means of territorial expansion;
2. Recognition of the right of each people to determine its own social, political and economic development;
3. World organization for the development of international co-operation and the settlement of international disputes.

If the warring nations will accept this rational basis for an everlasting peace it will surely be good for the world and good for California as a sponsor for the effort. It is interesting also from an agricultural point of view that Edward Berwick of Monterey, a California farmer, has been a leader in the undertaking. And the importance of our leadership will be widely conceded. It is telegraphed from a meeting of the national committee in New York that "warmest praise was accorded California for the initiative and energy already evidenced. Everyone declared that the splendid work of California would expedite the progress of the movement all over the country."

HANDS OFF OUR MILLIONAIRES!

THAT is our ultimatum to the sovereign States of Kentucky and New York. Before California gets the world's peace finished, she has a little scrapping to do on her own account before such joyful exercise is prohibited. It is this way: About a third of a century ago Kentucky and New York seized upon the persons and property of several California millionaires, carried both away to their respective States, held the persons enchained, by what sorcery we know not, and appropriated their residuary belongings to the adornment of those States with buildings, institutions and what not. Their California possessions, achieved in ways sometimes more or less devious, were sold and the proceeds, blown into blue grass and skyscrapers for the upbuilding of those States, were lost to California. And now comes our reprisal. A contest has arisen between California, New York and Kentucky as to which State shall have the nine millions of inheritance taxes ac-

cruing from the ninety million estate left by the Standard Oil millionaire, L. V. Harkness, who died near Hollister, in this State, eighteen months ago. Kentucky seems to have scored first in a decision by Judge Hudner of Hollister that Mr. Harkness was a citizen of Kentucky, but California and New York kept on and the matter is now in the California Supreme Court on a suit to reverse the decision of Judge Hudner, and it seems likely that California will make good. Since the action by which California accepted \$117,960 as her tax on the part of Mr. Harkness' estate existing in this State, it has been discovered that the decedent on four different occasions made affidavits in New York that, California being his home, the Empire State could not tax him. It is shown also that Mr. Harkness owned for nine years before his death a home in Pasadena, and he paid his last federal income tax of \$180,000 from Hollister, where his daughter, Mrs. A. King Macomber, has a landed estate and residence. It may be all right for distant States to get our millionaires away from us while they live and move and have their being, but when they make investments and live for years in California, and particularly when they are able to put to shame New York tax gatherers by singing: "I love you, California" with one hand on the holy book, we hereby notify all and several of such States that, in the line of their grabbing tithes from estates of Californians as they pass from one heaven to another, there will be strictly nothing doing!

JACK LONDON'S LEGACY.

BETTER though than millions from successful wealth-gatherers is the legacy which California receives in the memory of the late Jack London. It befell this distinguished Californian to be called hence in his prime, but two score years from his birth. As one remembers that he had to give about one score to become a man, it is little short of marvellous what he accomplished with the other. This young Californian, having no advantage of birth or fortune, having in fact during his second score to triumph over errors committed and misfortunes incurred in his first, came in this brief time to be universally recognized as one of the world's great writers—the most widely known and admired Californian of his day. There are many things for which California has to thank him. His love of rural life, which was in him a revelation from nature's heart, for he was city born and bred, and his exaltation of rural life, will long remain a forceful call to the country, which our State development and the quality of our citizenship demand should be loud and clear. His conception of the scope of farming life as determined by effort for the best things in agricultural science and practice will also long remain influential in California's upbuilding. He was at his death just at the beginning of his greatness for himself and his goodness for mankind, but he left a priceless legacy. Though their social philosophies were quite unlike, we count Jack London a partner of that other young man whom we lately lost, Jack Eshelman, who made an enduring inscription of the rights of the common man upon the laws and policies of the State. Both rose from similar strata by the same inherent force of honesty in thought and action and the love of it, though they saw differently the means and ends of human uplift, and both left the State better for their living in it. We have it not in mind to measure the service of either, but as we bid farewell to the self-made farmer of the Valley of the Moon we cannot forget that in his advice to college men, who asked his counsel about essentials to success in writing, he said, among other things, these:

Don't loaf and invite inspiration; light out after it with a club, and if you don't get it then you will get something that looks remarkably like it. And work! Spell it with capital letters. WORK, WORK all the time. Find out about this earth, this universe, this force and matter, and the spirit that glimmers up through force and matter. The three great things are: good health, work, and a philosophy of life. I may add, nay, must add, a fourth—sincerity. Without this the other three are without avail; with it you may cleave to the greatness and sit among the giants.

Be sincere and work! This legacy of Jack London's will gleam in the California morning sky while heaped-up millions vanish in the afterglow.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address

From Pears to Pears.

To the Editor: I have uprooted four acres of a pear orchard, blowing the stumps out. I have a very heavy soil to handle. Would it be best to lime the holes before filling, or lime the soil used in setting the new trees? My pear orchard was 30 years old, but never bore more than two good crops in nine years, owing, I think, to the heavy character of the soil, which bakes badly and gets hard where it should be loose for the rootlets.—J. M. P., Healdsburg.

You are pretty courageous to plant pears again in a place which has only given you two good crops in nine years. You surely do believe in looking for your money where you lost it. There is something more than the weight of the soil involved. A pear tree should be young and vigorous at 30 years if it is not knocked out by something else than heavy soil. Our judgment would be that that piece of land has had pears enough for the present and we would plant on another piece. We would rip up that old land, plowing in a lot of manure as deeply as we could and sow rye and bur clover. Feed it down during the winter (when the surface is dry enough to carry stock without puddling). Take off the stock in March and let the green stuff grow up, to plow under in April (in your district) and then keep the land in a well-worked summer-fallow until you plow deeply again for next winter's planting. However, if you like your way better, put on about a ton of lime per acre, in the holes and out of them; let it get a lot of rain, plowing in a month or so, filling the holes and planting new trees between the old rows each way. Never put lime or anything else in the fine clean dirt with which you fill around the roots of young trees. Put your medicine on the top afterwards and cultivate it in. Keep on growing green stuff in the winter, after you have spread what manure you can spare, and plowing it all under early in the spring. Such land as you describe must need good farming as much as it needs medicine.

French Pear Stock.

To the Editor: I am sending you the butt and roots of a young Bartlett pear tree supposed to have been budded in the wild pear of France, commonly called "French root." Can you tell me what it is?—W., Walnut Grove.

What is known as "French stock" for pears consists of pear seedlings, grown and graded in France and largely used in this country because they can be had of uniform size and quality more cheaply than they can be grown in this country. They are not supposed to be from a "French wild pear," but from any cultivated pear which makes plenty of plump seeds, easily to be had in quantity.

The specimen dead tree which you send has probably such a root. The peculiar appearance of the rooting of the tree is due to the fact that it was planted from four to six inches too deep and has been trying to live by sending out a new system of roots near the ground surface. These come from the Bartlett above the budding point and were probably induced by the fact that the old root was rendered inactive by too deep planting. Without knowing more about the soil and moisture conditions under which it was growing, it is impossible to decide why the effort the tree has made to get on its own roots did not succeed.

The Time to Spray.

To the Editor: Is this the right time of the year to spray fruit trees? Would it not be better to spray after the heavy rains?—H., San Francisco.

The time to spray depends not at all upon the calendar and very little on the rains. As a rule you cannot wait for the rains to be over because of the likelihood that the trees will start growth and make some kinds of sprays destructive to the tree or to its blossoms, or that the pest be too far advanced in its work to head it off. On the other hand, some kinds of spraying can only be effectively done during the growing season. For these reasons, there can be no right time to spray all kinds of fruit trees for all kinds of pests. The grower has to know what pest he sprays for and

the best time to hit it. This will differ on different kinds of fruits and on different kinds of pests on the same fruit. You may be able to hit several pests with the same spray, but you cannot hit all the pests with one spray material nor at one date. Our "Second Thousand Answered Questions in Agriculture" gives full details of sprays and the times to use them for particular pests. Also, nearly every issue of this journal contains hints of treatments for some particular pest. The successful grower has to master all these details: learn to recognize symptoms and apply remedies like a wise doctor. There is no panacea for either pests or people.

How He Killed Bermuda Grass.

To the Editor: I have six acres on which I killed the Bermuda grass, and I have plowed five acres more of it about a month ago. I want to kill the grass this winter by plowing under deep. Will Bermuda come up if it is plowed under about five inches? I will state how I killed my Bermuda grass the first year. I plowed and sowed barley. Right after the barley was harvested, I plowed shallow, about 2½ inches, and let it dry out about three weeks. Then I plowed again a little deeper. I plowed four times with a J. D. Case sulky plow, 16 inches with a rolling cutter.—H. G. N., Dinuba.

If we had ever killed Bermuda in a year in one way we should be so glad that we would keep right on in the same way, and never ask for another. The reason you did so well was that you dried out the land with the barley, and then you smothered the Bermuda by cutting it to pieces and burying it when it needed light to strengthen itself. You cannot do that in the winter because the plant will not try to grow, but will keep life in the roots until the ground gets warm enough to start growth. The more you cut of the roots the more plants you will have. We do not know how deep you will have to cover the roots to kill them, but five inches will only be a good planting depth for them. We should put on barley now and then tackle the summer treatment of the land just as you did before.

Trees After Vines.

To the Editor: I have an old Zinfandel vineyard where I dug out the vines three years ago and put some Philips cling peach trees in the holes where the pines had stood. The trees do not do well. They shed their leaves in the summer and start to grow later in the fall around the crown. Of course the tops grew all summer. Is that on account of the grape roots in the ground? A few of the trees died. I dug them out and the roots seem to be all right.—E. P., Kingsburg.

Trees have followed vines so frequently in the course of California fruit growing without complaint of poison in the remains of the vines, that we are inclined to think you must find the troubles of the peaches in some other condition. Were the old vines thrifty, showing that the soil suited them? If not, the trees are probably up against the same trouble. Even if the vines were thrifty, we believe you must account for the behavior of the trees on the ground of irregular moisture supply, presence of alkali or some other condition inhospitable to peaches.

Getting Back to the Apple Box.

To the Editor: I notice your inquiry in the issue of Nov. 11: "Who invented the apple box?" In the early '50's a man named Bellinger, who lived near Jefferson, Marion county, Oregon, bought nearly all the apples raised in that part of the country, and hauled them overland to the mines in California. He paid as high as \$5 per bushel for the best apples, and tried to make a box that would hold a bushel of apples. Whether Mr. Bellinger was the first man who used the apple box or not, I do not know.—Geo. M. Frazer, Glen Frazer, Contra Costa.

This is a good start toward the beginning. Whose memory is just a little longer?

Time for Vine Pruning.

To the Editor: Which is the best time to prune grape vines? Is it too early now, or would it be better to wait?—F., Pleyto.

The best time to prune for the conservation of strength in the roots, for a vigorous growth of the following summer's top, is soon after the leaves have fallen. If the canes are bare it does not seem to make much difference in vigor later whether the pruning is done from now until some time in January. In frosty places it may be safer to prune later, say in March or April, because pruning then, even when the buds are swelling, delays new growth from the spurs which are retained and thus may bring them into spring frost with no new growth to be killed. For convenience in dangerous places it is a good plan to slash off the tops of the canes a foot or two from the stump for convenience in cleaning up and working the ground and then prune back to the proper point, say in April, as the outer buds are swelling.

Sawdust for Smudging.

To the Editor: I am wondering whether in smudging fruit trees, wood or sawdust is sometimes used, with the crude oil, at such points as the wood would be much cheaper than to haul in the crude oil. It occurs to me that sawdust would be more apt to smudge than wood, be easier to handle, though it might require an extension to the commonly used pots.—E. G., Berkeley.

Smudging to prevent frost is a very old horticultural art, though given new importance and practicality in California. Damp sawdust has been used from the beginning, and later a mixture of one part coal tar to two parts of sawdust was used to some extent. California experience has shown that nothing else available produces smoke with such quickness and volume as crude oil, and all recent effort, so far as we know, has been concentrated on appliances for burning it to best advantage and organization of growers to secure best results from its burning.

Re-Seeding Alfalfa.

To the Editor: We have some alfalfa to re-seed; will it be better to do it this or next month, or to do it in the spring? What month is best to sow or re-seed alfalfa? Is it advisable to disk the old stand, and then sow over the top again?—H., Angels.

Unless you have a place where alfalfa keeps growing in December and January, it is not wise to seed or reseed as late as this. Fall sowing should be early enough to allow the seedling to get several pairs of leaves before sharp frosts come. If you cannot do this, do not sow in the fall. Taking the State as a whole, the average date or month in which most alfalfa is sown is February, unless it is an unusually cold season. But this is too early in many places. March is better, or even April, on low, wet soils. Disk the old stand with disks set pretty straight, and sow—following with a light brush.

Exchanging Seed Grain.

To the Editor: Is it better to sow the seed grain that one raises, or is it better to exchange seed with some one in the neighborhood?—H., Angel's Camp.

There is no possible advantage to you in changing unless your neighbor has a better kind, or a plumper seed of the same kind. There is no benefit in merely changing. In fact, if you have a particularly good sample grown on your own soil it would be risky to change. The old idea of changing simply on the fact of difference in conditions is exploded. You would not gain anything in swapping breakfasts with your neighbor, unless he is a better provider and his wife is a better cook. If you get ham and eggs and coffee instead of flapjacks and mud, you will gain that much. It is the same way with seed grain.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., November 28, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data

Dormant Deciduous Spraying.

[Written for Pacific Rural Press.]

"Don't spray unless you have something to spray for; but be sure you know what diseases and insects your trees are heir to, and then spray properly in time to prevent troubles becoming serious," is the advice of leading horticulturists.

There is no practical way of knowing whether certain diseases exist in your orchard, except by previous history. If they are there, you cannot know it by the usual examinations, until they have gone beyond control for the season. They will then do their damage in spite of you, provided the climate does not interfere.

A sick tree is worse than a sick man in your employ. You have to pay the tree as much in the form of fertilizer, pruning, rent for the land it occupies, etc., as if it were thrifty. You could replace your sick man with a well one and keep on making profit. A sick man may be doctored at once, but a sick tree does not become profitable for at least a year.

Our first exhortation, then, is to learn the appearance of impending diseases and insects, the specific

remedies, and the times to apply them. Then you will know what diseases you must treat while they are yet invisible. You will be able to identify the visible insects and diseases, and treat them at the proper time. So our second exhortation would be to inspect the orchard minutely with a magnifying glass, and frequently. For the spraying of the coming months until the buds begin to swell, there are only a few generally serious troubles, and fewer remedies.

San Jose Scale doesn't worry those who are prepared for it; but there is a pretty general infestation by this pest of practically all kinds of fruit trees all over the State, except in limited districts such as Santa Clara county, where Horticultural Commissioner Earl Morris says there is practically none. It kills tree branches and marks fruit with red rings. Lime-sulphur applied any time while trees are dormant is generally conceded to be the most effective control.

The Brown Apricot Scale is perhaps next most widely distributed on many kinds of deciduous fruit trees. Crude oil emulsion is most effective on these and the cheapest spray to use. Santa Clara has plenty of these scales, but many growers figure on natural parasites keeping them controlled. The result is often a bad infestation causing a lot of sticky, dirty fruit and trees that are weakened so that the tops die back and the prunes drop before maturity.

Moss and Lichens on the trees sap their strength some, but their great damage is due to the shelter they afford everything else that infests fruit trees.

Italian Pear Scale.—One of the commonest and most serious because most insidious scales in the Bay counties is the Italian pear scale which breeds and piles up many-deep under the moss. Crude oil emulsion is a satisfactory control if the moss and lichens are thoroughly soaked to their roots. For apple and pear trees, lime-sulphur is used largely; while crude oil is used on the others, and on the pears also of the Sacramento River district.

Oystershell Scale is general all over the State, but winter spraying with lime-sulphur or crude oil emulsion controls this along with other pests, so it is not much feared. If allowed to plaster small limbs, it often kills them. A serious infestation on pears was recently reported from Solano county.

Black Scales infest many kinds of trees, but are most troublesome on citrus and olive. In certain Coast districts, they are the worst insect on the apricot. Fumigation or distillate sprays seem most effective here. In Ventura county, the general practice is to use distillate and caustic soda mechanical mixtures with water. In Sacramento county, insects liberated by the State Insectary seem to have cleaned up a serious infestation in the Fair Oaks district; for last year it was bad, but the trees are now clean.

Most Aphids and Mites winter over in the form of eggs on the trees; and if these are generally killed, there can be only a light in-

festation in the early part of next season. Lime-sulphur, crude oil emulsion, and miscible distillates are used for these, the latter being considered most effective on account of their greater penetration. Among common serious aphids that can be controlled principally by such sprays applied in winter are those that infest walnuts, mealy plum-lice, green and rosy apple aphids, black cherry aphids, green peach aphids, and brown mites of almonds, prunes, etc. Careful inspection of buds and other rough places on the bark is necessary to find these or their eggs; and most of them are commercially uncontrollable if not killed before they have been at work many days in spring. Many of them curl leaves over themselves for protection from sprays.

Fungous Diseases.—Hardest to find, however, are the over-wintering spores of fungous diseases. Chief of these is the shothole which attacks many kinds of fruit, killing even fruit buds, spurs, and twigs; and is most dreaded on the peach where it is called "blight." Its damage next year can practically always be prevented by Bordeaux or lime-sulphur spraying before Dec. 15 and lime-sulphur spraying just before the buds open. Shothole on almonds and apricots is sometimes sufficiently controlled with one lime-sulphur spraying in spring when the buds are swelling. Such a spraying on peaches also controls worms, and the curl-leaf which alarms so many people when it is too late to avoid. But since the shothole works in wet weather, there is always danger that it will penetrate buds before the spring spraying, which cannot then save the buds. Apple scab winters over on trees and leaves so that early spring plowing and winter application of lime sulphur or application of Bordeaux as buds are swelling are desirable; and with certain varieties, very necessary, since as soon as one knows whether the weather will encourage it, there is no remedy.

Crude Oil Sprays.—Several forms of oil sprays are used. The commonest and cheapest are crude oils from which the gasoline and kerosene have been distilled. They have very little penetrating power and their killing is supposed to be due to clogging of their pores and suffocation by the varnish-like residue left when the moisture has evaporated from the emulsion. Natural crude oils contain varying percentages of gasoline and kerosene, though that from each well may be practically constant. Sprays made from them kill not only by penetration and the fumes from the lighter oils, but also by the suffocating varnish which continues to work after the water evaporates, and which resists weather more than a year.

Distillates penetrate quickly, forcefully, and dangerously unless certain precautions are taken. They evaporate quickly and do not leave the varnish residue. For this reason, they are almost entirely used on olive, citrus, and other evergreen trees. State Horticultural Commissioner G. H. Hecke tells us of olive trees whose leaves have turned yellow and dropped because of the varnish left by crude oils which plugged the leaf pores.

Amboy GYPSUM

Increases Crop Production

Chemists agree that California soils need Gypsum badly. Amboy Gypsum increases the fertility and lengthens the life of your soil. It converts inactive elements into productive and available forms. It improves the soil texture. It aids in the decomposition of vegetable matter and the formation of humus. It counteracts black alkali, turning such land into productive soil.

Invaluable for alfalfa and field crops, citrus orchards, lawns, etc. Gypsumed soil requires less irrigation.

Amboy Gypsum greatly increases the value of manure by retaining the essential elements of the manure which are usually lost in the form of gases. Eliminate flies and germs.

Bartlett Pear

On Blight-Resistant Roots

There never was a more favorable time for Pear planting, but be sure your trees are planted on Japanese Roots. We have given this root a thorough test for over five years, and discarded all others in its favor.

All our trees are propagated from trees selected for their bearing qualities and grown in the granite soil in the foothills of the Sierra Nevadas, assuring a fibrous root system second to none in California.

Write for catalogue and full list of trees.

Shippers,

Orchardists, Newcastle,

Nurserymen, California

more important than the amount of oil. Surely avoid all spraying with oil sprays and to a great extent with soaps when trees are suffering from lack of water," says Prof. C. W. Woodworth of the University of California. Moisture in the bark prevents penetration of the spray, but permits the insects to be killed. Prof. Woodworth has poured pure kerosene on rose leaves with no damage, when they were full of water and the dew was on. This is not recommended, however. The water in the tree or bush must have come principally from the soil; atmospheric humidity will have little effect, according to the Professor. If the wood cells are turgid, oil will not be absorbed; if they are shrinking, oil is likely to be drawn into the cells and kill them, according to Earl Morris.

Oil Sprays may be bought in three forms: emulsions ready prepared, miscible oils, and pure oil of the various kinds to be emulsified at home or applied in a mechanical and

But the emulsion which is made from miscible oils by addition of water, is in a more finely divided form, probably molecular; while in a regular emulsion the particles of oil surrounded by the emulsifier are larger.

Mechanical mixtures of oils are safe only when trees are well supplied with inside moisture, and when the oil is kept violently stirred all during application. If the agitator and pump are stopped for a short time, the oil separates and is likely to be too strong when spraying is resumed. Damage has resulted from separation of the oil and water in the hose which was not emptied back into the tank when spraying stopped. Horticultural Commissioner A. A. Brock of Ventura county has noted cases where oil accumulated around the bases of deciduous trees making a moist decay of the bark, which peels off. Mr. Morrison prefers emulsions at the additional cost for soap because more damage may occur due to slight

European Fruit Lecanium. Damages Many Fruits, but Especially Bad on Apricots and Prunes. Saps the Twigs and Covers Leaves and Fruits with Sticky Black Honeydew. (Photo by State Hort. Com.)

very unstable mixture unsafe if trees have been dried out by lack of fall irrigation or by dry winds.

Prepared emulsions are ready to dilute with water for the spray. So are miscible oils, which are distillates with the emulsifier dissolved in them much like sugar dissolves in water, but there is a minimum of water in miscible oils. They are hard to make because each oil must have its own proportion of emulsifier.

carelessness with mechanical mixtures, than the soap would cost for emulsions.

Lime-sulphur.—Though lime-sulphur may be made at home, the danger of wrong proportions, poor mixture, and sediment which clogs the nozzles makes it generally much more desirable to buy the commercial concentrated spray which is ready for dilution with water according to directions.

OLIVE PICKING SACK.

[Written for Pacific Rural Press.]

To use both hands picking olives, G. L. Camden of the Fair Oaks district of Sacramento county sewed to the lower edges of an old vest, canvas bag pockets holding about 15 pounds each. They hang at the right height for convenience in putting the olives in as each handful is picked. To empty them easily the bottom of one is closed with a pucker string, which seems more convenient than the hooks which hold the bottom of the other.

Orchard Cover Crops and Irrigation.

To the Editor: On the editorial page of the Nov. 11 Pacific Rural Press you quote from University Bulletin No. 270 about cover crops at the University Farm. I am inclined to doubt the wisdom of circulating a bulletin of this kind, and of creating the impression that you do in your editorial. While the bulletin may be technically correct (which from my own experience I doubt), it is doing an immense amount of damage by simply disposing of the whole cover crop matter without any qualifications.

There are a great many, in fact the majority, of the fruit growers in the deciduous districts of California who have not yet realized the absolute necessity of growing a cover-crop in the orchard, and to all those who read your article or the bulletin No. 270 it is putting the seal of approval on not making every effort to restore humus and nitrogen to a soil worn out by years of grain growing, followed by another long term of fruit growing.

I have tried cover crops in my orchard for the past three years and can see a great change taking place in many ways, especially in the ease with which the soil can be worked as compared with its condition before cover crops were grown.

I am quite sure that the full benefit of the cover crop is not realized (in some instances) on account of having to plow it under in the spring before it has reached the proper stage of maturity. However I dislike very much to have the whole thing condemned because we are not able to get the maximum benefits.

I hope before long to be able to make some demonstrations that will convince the most skeptical, along the line of irrigating the cover crop in the spring and early summer and not plowing until the crop is in the right stage. I believe that the prune should be irrigated during its growing period in California just the same as it would in any other arid climate in the world.

There is no reason why a prune that is ripened with the proper amount of moisture in the ground and vitality in the tree should not dry better than one that is forced to ripen by a lack of those elements.

There is no place else that water for irrigation could be had, that it would not be used, and I can see no reason why California should be any exception. There are very few orchards of old prune trees that do not show distress about the time the fruit begins to ripen, and why this

should be allowed to famish year after year is more than I can understand. Geo. Hollenbeck. Gilroy.

[We are very glad that you read just enough of our editorial comments to cause you to light your fuse and not enough to show you that you might have saved the bomb. Such a punch as you give the subject will serve excellently to wake up other readers to more careful consideration. The discussion was of cover crops for grain and not at all for orchards or other uses which involve other economic considerations. In the editorial to which you allude this paragraph occurs:

Of course the reader must not conclude from these results that the soil does not need added nitrogen nor that rotation is irrational, but they must be provided for upon some other economic basis. There is also no arraignment of the value of cover crops when measured in other terms than those of a grain crop when the whole cost of cover-cropping is charged to it.

This, it seems to us, is clear enough warning that the fact that a grain crop will not return the cost of a cover crop (when the whole cost of it has to be charged to the grain) does not apply at all to cover crops for horticultural purposes. But we are glad that you stir up the subject just as you do. It will call new attention to the dozens of pages of demonstration and exhortation which we have printed during the last few months in favor of cover cropping when the use made of the land warrants it.

We agree fully with you about the quality of prunes and other deciduous fruits as dependent upon adequate moisture. You cannot get good fruit without that and if the soil does not naturally afford it it must come by irrigation. Your experiments to determine at what time and in what condition a cover crop should be turned under and the use of irrigation to secure that condition, will be very important.—Editor.]

Perfect Sidehill Irrigation.

[Written for Pacific Rural Press.]

A unique orchard of 1200 acres is planted on the red-brown loam hills between La Habra and Fullerton, Orange county, where only sheep found pasture in the early days. Practically no dirt was moved, no terracing done, yet the irrigation system on these sidehills, mesas, and "canyons" is under the most perfect control.

When the elder Bastanchury used some of his sheep money to educate his four sons, he little dreamed that their engineering ability would cover those hills with walnuts, Valencias and Eurekas, the very foundation of whose success lies in thorough control of water.

Over 150,000 feet of cement pipe-lines 6 to 14 inches in diameter cover the place, but none are run on contours. A 250,000 gallon steel tank crowns a hill above all the trees. It is supplied directly or indirectly by several electric pumping plants capable of watering 2000 acres. Being scattered about the ranch, the pumps are ordinarily used

directly for the nearest orchards, but any lull in irrigation permits them to refill the main and subsidiary reservoirs. One man does nothing but watch the pumps.

In laying out the pipe line, Gaston Bastanchury, president of the company, which includes three of the brothers, had and has direct charge of the engineering since the work and planting started 6 years ago. Pipe laying and planting were still going on when the place was visited in September, and some 800 acres more are to be developed. Planting is done any time between Feb. 15 and Dec. 15.

The ranch covers several hills or ridges, on the sloping sides of which are other minor ridges. These were not leveled or terraced, because of danger of washing the loose dirt in winter, and because trees planted on the scraped-off spots do not catch up with the rest, according to Mr. Bastanchury, who tried it out early in the game. Steepness of the hills gives a maximum of the very essen-

tial air and water drainage and allows percolation of water from the single furrow per row thus needed in irrigation.

Water from the reservoirs and pumping plants is gravitated or forced to all high points where standpipes are located. From these, lateral pipe lines are run directly down the crests of all side-hill ridges, so they may irrigate both directions from small standpipes located at the right distances for the tree rows. Zigzag furrows, contours, or other devices are used to control the water between each standpipe and the bottom of the ridge. Smaller streams are of course turned on for the steeper grades. Once adjusted, the water often runs all night without attention.

Amount of Water Controlled.—The amount of water to flow into each lateral pipe line depends on its length, grade, season of year, number of trees on its sidehill, and kind of soil. In laying out the system, the engineers figured this out to a fraction of a miner's inch, though of course seasonal variations must be determined currently.

Weirs.—The irrigators regulate the amount of water into each lateral by means of valves and a weir in the

standpipe at the head of each lateral. The weir is a cement partition across the center of the standpipe, high enough so the water runs evenly over it at a depth which can be measured with a rule. Water enters the standpipe on one side of the weir and runs into laterals from the other side. Standpipes in the laterals have closed tops so water cannot run out of the lower one any faster than its little gates permit, and it must run an even stream out of the upper ones. Gate valves in the higher standpipes must be opened wider than in lower standpipes where the pressure is much greater. The system has been used without a disappointment all this summer.

Tree Locating and Planting.—Having plowed the land, surveyed it, and located stakes and pipe-lines and standpipes at proper distances for irrigating every row and every tree, the planting crew of about 30 men gets busy. The stakes have been located on contours for most convenient irrigation from each standpipe through a furrow above the tree row. In determining steepness of the contour grade, the percolation character of the soil is the prime consideration in connection with the

Economical!

The BEAN is an economical sprayer. It will do more work, cover more ground, and spray more trees in a given time than any other sprayer of approximately the same size and horse-power. This holds true for all

BEAN Power Sprayers

The chief difference between the various Bean outfits is in size and capacity. BEAN economy is the result of —BEAN PATENTED PRESSURE REGULATOR, which saves one-third the gasoline and wear and tear on engine and pump. When spraying the overflow simply runs back into the tank under no pressure (not through a safety valve under full pressure), as in all other types of control. When not spraying the engine runs free. —BEAN PUMP WITHOUT STUFFING-BOX. This pump is made with molded cup-shaped plunger and on the upstroke when there is no pressure there is no friction. Power saved is money saved. —UNDERNEATH SUCTION, which enables pump to throw considerable more liquid with same power. —DIRECT CONNECTED ENGINE AND PUMP, which eliminates the loss of power that results from the use of a belt.

There are other economy features, also, described in our catalog.

See your nearest Bean dealer—or mail the coupon at once.

BEAN SPRAY PUMP CO.,

amount of water that is to flow from each standpipe. The grade must be less steep for porous soils and large streams, also for tight soils where small streams are to be used; but need to be steeper for porous soils where small streams are to be used. Such a case would be a short side hill where water is to be run all night without attention. The stakes are set by means of a level-board 24 feet long.

With stakes set a furrow is run where the trees are to go, water is run through to put the soil in good condition to pack around the balled citrus roots without drying them out, the trees are planted within a few days, and irrigated to settle the dirt about them.

All trees are balled. The loss with naked roots proved too great.

One man with plenty of helpers does nothing but ride over the place, noting any trees that lack vigor, or need attention for any other reason, and seeing that such attention is given. One man does nothing but trap gophers, which, however, are getting scarce now.

OLD APRICOT ORCHARD RE-NEWED.

The old apricot orchard was getting in rather bad shape and wasn't bearing much. The trees had come to that stage where they would not send out new growth. The sap channels seemed to be clogged. They were pretty well covered with moss and fungus. Ordinary pruning did not induce enough new spur growth to develop good fruit buds. But the trunks and roots seemed healthy.

This was a block of Royals and Blenheims on the ranch owned by the Central Nurseries Co. in San Joaquin county. They now have a beautiful new bearing orchard on the same trunks. Three years ago, half of the old trees were cut back severely, leaving only two or three feet of the main limbs. Next year the other half was cut back. Stubs were left three to five inches in diameter, but were painted over the top. Since then, the weather has checked them so the paint is of no value in preventing entrance of decay fungi.

Some of the stubs extend as much as five inches above the sprouts and will doubtless be cut off soon; for they threaten the strength of the new growth when it shall have a heavy crop. They were cut off square. The new growth is not covering most of them very well, for much of it comes from buds some distance below the cuts. The stubs will probably be cut off slanting upward to the crotches formed by the sprouts, to enable new growth to cover them quickly.

Heavy Crop Set.—The new growth was thinned out this season in June, but not cut back at all. It had been covered with blossoms and set a heavy crop last spring, though the rains rotted the young fruit so there was only a quarter-crop.

The idea of cutting the trees back was suggested by a trip to Folsom vicinity, where is an old orchard renewed twice by this means. The owners are highly pleased with the project.

A San Joaquin winery bought approximately 40,000 tons of grapes from the Lodi section this season. The growers have averaged \$12 a ton for their grapes.

Roeding's Page

Apricots

ON TREES

AS A commercial proposition, California has practically a monopoly in apricot culture, as no other section of the Union produces the apricot in quantities at so small an expense and so little risk of failure in crops.

A PROFITABLE CROP

Now that the California Prune and Apricot Growers are forming an organization along the lines already proven so successful by the Raisin Association and the Peach Growers, there should be no question about future prices. In fact, the question of profit on apricots may well be considered settled. Prices for the dried fruit this year have been very high and a handsome return has been made to the grower. If the new organization can be effected, there is no doubt but what profitable returns can be obtained for the apricot growers each season.

DRYING AND CANNING

In appearance the apricot is perhaps the handsomest of all stone fruits and contains less acid. For canning, evaporating and drying purposes, as well as for use in the fresh state, the fruit can hardly be excelled. It seems particularly adapted to the Coast counties,

where the fruit attains the largest size and the highest flavor. In the interior valleys it has the distinct advantage in that it ripens its fruits fully a month earlier than in the cooler sections of the state.

VARIETIES TO PLANT

Owing to the success with which the apricot can be budded on dif-

ferent stocks, it adapts itself to a wide range in the matter of soil, moisture and climate. Apricot trees are mostly budded on apricot and myrobalan plum roots. Apricots on almond should never be planted, as there is no affinity between the two stocks and the trees will break off at the bud even when several inches in diameter. The apricot is well adapted to a light, well-drained, warm, sandy soil, and it has the natural tendency to develop a sturdy, magnificent, fruitful tree. The Myrobalan root withstands a surplus of moisture, is rather free from sour sap, has a tendency to cause trees to be longer lived, adapts itself to moist and very heavy soils.

HOW TO PRUNE

In "Roeding's Practical Planters' Guide" will be found many details on planting and pruning that space will not permit of mentioning here. This booklet also contains information on peaches and other fruits, and we will be glad to send a copy to any grower or prospective grower, free, upon request if you mention this advertisement.

Citrus Trees

Growers of citrus fruits have certainly harvested nice profits the past season and indications point to even greater profits in the future. The demand for California oranges and lemons is constantly increasing—but this applies particularly to the fancy packs.

Make sure that the fruit you send to market will be the finest that can be grown, and thereby assure yourself of topnotch profits. We have a splendid stock of oranges, lemons, pomelos, and other citrus fruits, and our trees are the best that can be grown.

Fancher Creek Nurseries

425 Holland Bldg.
Fresno, Cal.

Mr. Etter's Work with Apples.

To the Editor: Making good my promise, I am sending you another bunch of my new varieties of apples grown from selected seed. I am not saying much about these varieties yet, because they are too new and untried. Still, it might be as well for those interested to prepare for many new varieties of new and striking characters. I see that the publication of my personal note to you, in your issue of October 7, has aroused an interest in this branch of my plant-breeding work. This work has been under way for many years in a preliminary way, and now all is ready to try out thousands of seedlings. I will not say just how many, because I do not know. But, if facts uncovered as the work progresses justify it, there is ample room and facilities to try out several hundred thousand varieties in the next twenty years. Results obtained so far more than justify my plans for the future, which are to make haste slowly, and sell guaranteed stock under a registered or copyright label.

If I had my way about it, I would say: I am "just stumbling along as usual," as I said last spring about my strawberry-breeding methods. But one of your subscribers who is making a big success of Ettersburg No. 80 strawberries received through the Pacific Rural Press, wrote me that I was careless; that if my No. 80 was a fair sample of my output, I had a better system than the professors. So I will be more careful this time.

When I had figured out the lines of desirable variation in the dahlia species, as a boy of eighteen, I dreamed of taking up the apple trail. The best horticulturist I knew in that day, an old gray-bearded man, after listening to my dream frankly told me to forget it. The idea of trying to do that which trained men, with all the recorded knowledge of the world on the subject, could not do, or they would have done it long ago!

But I could not forget it. As I remember, I kept thinking of it until I reached the conclusion that the apple varieties we have at this late day are a harum-scarum lot, to make the most of it, to represent possibly 4000 years of human endeavor. What is more and worse, as apple breeders, we are making little progress.

Improvements we need in the apple are: Strictly high-class canning varieties; varieties which are firm, crisp and solid, and which will hold that crispness and juiciness for weeks after they are picked. Those essentials, combined with brisk acidity and high sugar content, making a flavor of great volume, I already have.

I am satisfied I can produce varieties with these desirable features with a thousand and one variations.

We need varieties that have an "ossified" suture instead of an open one, so the fruit will not drop, but remain on the tree until picked.

We want varieties that are contented to set only one or two in a place instead of four or five. And we want varieties that are immune, or nearly so, to the scab fungus. All these desirable features are close in to where I am working now, and can be obtained.

I have surveyed my ground by fruiting out nearly 600 named varieties of American and European origin. There are just a very few good varieties among them, but there are some good characters among inferior varieties.

I have good climatic conditions to work under, abundant stock to top-work the seedlings on, and presumably about 40 years to work yet. Maybe I will get old and lazy before that, but I despise a man who is looking for an easy row.

Albert F. Etter.

Ettersburg, Humboldt county.

[Mr. Etter's seedlings which we have examined with much interest

and have kept on exhibition in our office since their arrival, certainly justify much more than he claims to have attained in his sketch of his preparatory work. They have very striking and novel characters, external and internal. In our judgment he has already attained things which generations of apple-growing have not developed. We are glad to put on record this early record of his work which will some day be looked upon as of great historic interest.—Eds.]

TRAINING YOUNG CHERRY TREES.

[Written for Pacific Rural Press.]

We recently saw a large orchard of cherry trees whose six-inch trunks two feet high were denuded of bark on the southwest side by sunburn. This will not happen to a thousand Chapman and Burbank cherry trees six years old trained from infancy by the hand of E. H. Goepfert of the Vacaville district. They are beautifully symmetrical, presenting a solid wall of foliage outside, rather open centers, but with enough growth inside to prevent sunburn.

No Sunburn.—Not a tree of the thousand shows a sign of sunburn, though no kind of artificial protectors have been used. This is due to low heading and encouragement of leaf growth from the ground up. The trees were headed five to 10 inches high. This also affords a better spread of the main limbs. Some were headed higher because always a strong bud securely fast to the tree should be left just below the cut and on the windward side where convenient. Workmen handling trees often loosen buds or break them off.

One tree we noticed had a bad crotch close to the ground, but this had been remedied by spring pinching; and we were assured that within two years more, the crotched trunk would be solidly grown over.

The Pinching is simply removal of the terminal bud not later than May. This causes the shoot to throw out two or three laterals not very close together. Pinching in July or August would cause a lot of weak shoots to come from the end and severely check the tree's growth. The May pinching was practiced in the first three years. Where over-vigorous shoots came, they were pinched late in summer to set them back even with the rest. This has to be done more especially on the lee side; for the tendency is always to

overbalance in that direction.

The winter pruning has consisted in cutting back half of the new growth and thinning to two shoots on each branch, regardless of vigor which was regulated by the summer pinching. In the fifth year the tendency was to throw more spurs and less wood, but all spurs were cut off last winter. The aim is to build the trees strong enough to hold the heavy load of fruit which they will have two years hence. This winter, having made six years' growth, the spurs will be left, but not many of them have the plump buds which portend fruit next season. These spurs, however, extend almost to the ground, and their bunches of leaves will do much to protect the bark. Two or three leaders on each branch

Coates French Prune Trees

We have the stock, first-class in every way, grown on new land far removed from any orchards. No root knot or any other disease.

PLEASE NOTE THAT

Our Coates French Prunes are making good. Orchards are in bearing, and the fruit comes true to type and size. Full line of all other stock, including ornamentals in great variety. Landscape gardeners should write for list.

Call or Write: We have what you need, and it will pay you to deal with us. Our experience in California extends over 40 years.

Leonard Coates Nursery Co.

Morganhill, California.

"Over 25 Years Experience back of every Tree, Vine, and Shrub that we sell."

Splendid Qualities and Abundant Crops are assured if you buy your Nursery Stock from us

For over a quarter of a century we have studied and produced nursery stock, taking particular pains to secure only the very best qualities.

This means that you can place your confidence in us and order freely with the knowledge that what we send you will give entire satisfaction.

We have sold nursery stock to hundreds, and have never failed to supply stock that produced generously and stock that was free from disease and insect pests.

In our experience and in our service you can place implicit confidence, for we know that whatever we sell you will grow sturdy, and that you will receive the kind of crop that you anticipated—and in generous quantities.

THE FRESNO NURSERY CO., INC.
FRESNO, CALIF. P.O. BOX 615

will again be left this season and no effort will be made to keep the tree top down. The leaders will not be cut back.

Always in cutting back, an outside bud was left at the top, for the upright cherry growth is better spread out for enough sun to encourage inside growth. This, in addition to the branches which are left thick enough to protect their inner sides from sunburn when weight of fruit spreads them, protects the trees. Spreading in this case is also desirable because the trees are 30 feet apart. Twenty-five feet is plenty, however, according to Mr. Goepfert.

Sprouting from most of the trunks on the southwest side are shoots which not only shade the trees but will also produce fruit. In the winter pruning they are cut back to one bud or two. These are not hard to obtain in the early life of the tree but are almost unobtainable later on, so the importance of early training can scarcely be overemphasized.

ASPHALTUM FOR BIG PRUNING CUTS.

[Written for Pacific Rural Press.]

Grade D asphaltum used on big wounds made in pruning does not permit cracks to open and receive the spores of decay, in the experience of W. H. Lyons of San Joaquin county and A. G. Tucker of the Vacaville district.

"It is the best kind of dope, beats any kind of paint," says Mr. Tucker, whose applications of a year ago are still intact with new bark growing over the edges. "But too hard a grade of asphaltum may burn the bark as it did some scions for me. Too high a temperature is required to melt it."

Mr. Lyons had some in September which had stayed perfect two years; and it is the boast of his son F. F. that there is no rotten wood in the orchard. The asphaltum is applied hot, as soon as the pruning wound is dried off. Mr. Lyon aims to go over all cuts each fall with fresh applications.

In summer if the wood checks at all the asphaltum runs down into the cracks; but there is always enough left to keep the stub sealed.

COMMISSION MERCHANT LAW MUCH NEEDED.

To the Editor: Read this statement received by a member of the Coombsville Farm Center and tell your neighbors what you think. Here it is:

San Francisco, Cal.,
November 14, 1916.

Mr.
Napa, Cal.
August 14:
15 boxes pears—
3 at 40c\$1.20
4 at 30c1.20
8 lost.
Total receipts\$2.40
Charges:
Freight\$1.00
Cartage52
Commission24
Total\$1.76
Net proceeds 64c.

We wonder why it was necessary for this commission merchant to wait four months before sending our friend the 64c. He might just as well have reported 15 boxes lost in place of 8. The prices he reports are eye-openers. Just imagine, if you live in the city you can go to this man and buy a 50-pound box of good Napa Valley pears at 30 and 40c a box. The poor people of San Fran-

cisco must be delighted with his presence. We wonder where the boxes that were lost are now traveling.

But what about our Coombsville friend—he pruned, sprayed and cultivated his trees. He bought shipping boxes, picked the fruit carefully, packed it so that it might reach the consumer in the best possible condition, expecting to get paid for his labor.

After patiently waiting four long months he received sixty-four cents. Did this farmer get a square deal? If not, why not? H. J. Baade,
Napa County Farm Adviser.

A. . Morey, a dairyman of Orland, has purchased a valuable registered Jersey heifer from the famous Mossdale herd at Stockton.

ESTABLISHED 1889

Read This

---one tree or 100,000

No matter how few or how many fruit trees you require I want to make you an estimate on same.

---every tree a "Good One"

DECIDUOUS, CITRUS and OTHER TROPICAL FRUITS.

Impossible to secure or grow a better trees than an Armstrong Tree—clean, thrifty, well rooted, carefully dug and packed and guaranteed to reach you in first-class condition for planting.

---all Commercial Varieties

Also many new varieties, propagated solely by ARMSTRONG NURSERIES, all of which are described, and many of them illustrated, in my new 1917 Catalogue, which is free to you. Write now—today. Your copy is ready.

John S. Armstrong, Prop.
406 EUCLID AVE.

ONTARIO, CALIFORNIA

If you are planning to plant any of the following fruit trees, you should have a free copy of my 1917 Combined Catalogue, Planter's Guide and Price List before placing your order.

Apple, Apricot, Cherry, Fig, Nectarine, Medlar, Peach, Pear, Persimmon, Plum, Pomegranate, Prune, Quince, Almond, Chestnut, Pecan, Walnut, Olive, Avocado, Cherimolia, Feijoa, Guava, Loquat, Sapota, Orange, Lemon, Pomelo, Lime, Tangerine, Kumquat, etc.

If a large number of trees are wanted for acreage planting, write me stating about what you will require and I will make you an attractive price on same by personal letter.

Largest and most varied stock of Ornamentals, Roses, Vines, etc., in California.

Indian Corn, 90 Bushels Per Acre.

[Written for Pacific Rural Press.]

Corn seems to have been held back by tradition as much as anything else; and it has only been in recent years that the silo and the growing need for rotation crops have slightly overcome old-standing prejudices as to where it may be profitably grown.

To any close observer of California agriculture it must be apparent that corn can be successfully grown under a great variety of natural conditions.

During the present year the writer has seen corn growing under most widely differing conditions; from the short, damp-seasoned river bottoms of Humboldt county to the southern boundaries of the State; in the irrigated sections of the hot interior valley and on the high, dry lands of the coast region.

True, much of this corn was to be used for silage purposes, but it seems almost a certainty that where corn can be sufficiently matured for silage it can also be cured for grain, even in such unusual locations as Humboldt county where at least one man is working to that end by corn breeding and seed selection.

Mostly, corn has just grown in California, there having been no concentrated effort to improve yields or varieties by intelligent seed breeding and selection, fundamental factors in corn culture in the great corn growing States of the Middle West.

But with the wider field that corn is serving in the State at this time there is a growing disposition among farmers to follow the Middle Westerner's example and fit the right corn to the right land, rather than to haphazardly plant the seed most available at the time of planting.

It is toward that end that farmers should be working at this writing. If corn has been grown the past year and the variety is the one decided upon as most desirable, seed selection should be started in the field before husking, to get the best results.

Prof. John Nicholson of the University of Arizona details a plan for seed selection in the following manner:

"After the husks have turned yellow, go into the field and tie rags or strings on enough ears to more than plant next year's crop (it requires 12 to 15 ears per acre). In this way you can see the type of parent plant that produces the selected ears. You will want to select for early maturity; best form of ear, leafy stalks, not too coarse stalks, with ears the proper height from the ground, stalks with one or two good ears, no nubbins, ears with shanks of medium length and size, and ears that droop slightly. This last characteristic is to be preferred to upright ears on account of drooping ears shedding rainwater better, thus preventing moisture from running into the ear when the corn is fully mature. These marked ears should be gathered and stored in a suitable curing room, where the temperature is uniform and dry. By selecting more than would be required for planting, another culling can be made, selecting the best type of ear for grain; also, when the seed

is tested for germination next spring, ears showing poor vitality can be discarded, and still enough seed will be secured for the planting.

If you follow this system for several seasons, the yield and quality of your corn will be greatly increased."

Some idea of the results that may be achieved in California by intelligent seed selection and good cultivation is shown by the experience of M. Bassett of Kings county, a corn grower for 20 years, whose yields range between 80 and 100 bushels per acre.

During Mr. Bassett's early experience in corn growing, he planted White Dent, but believing that yellow Dent is a much stronger feed for hogs he changed to the latter and has been growing that variety ever since.

Good corn is considered in the same light as good livestock on this ranch; selection for quality and quantity tells in the next generation, and so it is that while husking the corn in November, seed for the following year's planting is chosen.

The basis for this selection is not the largest ear or the stalk producing an unusually large number of ears, but rather for a uniform stalk and ear, the former having straight rows of kernels and the rows extending from tip to butt in a uniform manner.

The kernels on both the tip and butt are broken off to insure seed of the best type. The first selection is made in the field in November, the seed from this selection being stored by itself till planting time when it is again sorted over and the best ears used for planting.

But corn growing is no lazy man's job. Mr. Bassett believes that more than seed selection is required if a good crop is to be harvested. Too much emphasis, he thinks, cannot be placed on seed bed preparation and cultivation.

Moisture being one of the important factors, deep plowing in the early winter is the rule, the land then being allowed to stand till well along in the spring when it is irrigated to insure plenty of moisture, and again plowed, this time 12 inches or more deep.

Planting is usual some time in May, after all danger of frost is past, an ordinary corn planter doing the work satisfactorily. If rain falls before the plants come through the ground, he harrows the crust that forms.

After the plants are above the ground, the cultivators work continuously till the height of the corn will no longer permit.

This cultivation has a lot to do with the ultimate yield, for it aids in conserving the moisture which has previously been stored in the deeply plowed soil. By this time also the pumpkin vines have spread out over the ground and made further cultivation an impossibility, for never a year passes that Mr. Bassett doesn't get a fine lot of hog feed from pumpkins grown in the corn field.

By the first of November the corn is ready to husk, the only pests which have bothered during the

growing season being the corn worm, which sometimes eats into the end of the ear. Blackbirds are about the surest eradicators of these unfriendly worms, the birds picking the worms out of the end of the ears, but doing no damage to the ear proper because of the protecting husk.

Still further improvement in yield and quality could be attained, Mr. Bassett believes; and by such selection with varieties already established in California, together with deep and thorough cultivation, he believes corn can and will be grown in most, if not all of the irrigated regions of the State.

Naturally a large part of the greatly increased 1916 acreage was for silage; but the silo owner usually plants more corn than is actually needed for the silo and the balance of the field is allowed to ripen.

These small patches of ripened corn are significant factors in the promotion of corn culture at this time. They act as an object lesson to the farmer on his own farm, prov-

ing to him in most instances that the reason we do not grow more corn is because we do not plant it.

CERTIFIED RICE SEED.

[Written for Pacific Rural Press.]

About 300 acres of certified rice seed have been grown this season in Yolo county by three ranchers, according to Horticultural Commissioner Wm. Gould. It was inspected several times for purity of variety and freedom from watergrass; and a more thorough inspection of each check was made after the water was taken off. There is very little watergrass in the county, and certified seed producers ought to be encouraged by better price to keep the weed from running out the rice culture as it has on thousands of acres in the older California rice districts. About 80 per cent of Yolo county rice is Waterbune, and 15 per cent Italian.

The six crop varieties favored by Merced Co. fruit growers are almonds, peaches, figs, olives, prunes, and apricots, in the order named.

A Schmeiser Giant Leveler Will Work Wonders on Your Farm

SCHMEISER POWER LAND LEVELERS, the great time and labor savers, are the only logical machines for leveling large tracts of land, not only because of the immense amount of dirt they move daily, but also because their giant strength enables them to work on ground too hard and rough and full of tough roots, etc., for a Fresno and horses to touch, thereby making it possible for the farmer to make ready for cultivation land which heretofore he had considered untillable.

Three Sizes, "Giant," "Junior," "Midget"

SCHMEISER "GIANT" LEVELER — Bucket 11 feet wide, 3 feet high, 4 feet sides; capacity of 35 cubic yards. With 2 men and tractor does the work of 9 men and 36 horses with Fresno. Price, f. o. b. Davis, Calif. \$900

SCHMEISER "JUNIOR" LEVELER — Bucket, 8 ft. wide, 3 ft. high, 3 1/2 ft. sides; capacity 24 1/2 yds. Price, f. o. b. Davis, Calif. \$650
"MIDGET" — Bucket, 8 ft. x 7 1/2 x 2 1/2 ft. Capacity 14 1/2 yds. Price \$350

601 BANK OF SAN JOSE BLDG., SAN JOSE.
H. BOOKSIN, MGR.

Progressive Agriculture in Nevada.

[Written for Pacific Rural Press.]

Our traveling representative has recently returned from Nevada after a few months' trip through this State. Conditions there look very good notwithstanding the off year in weather conditions and the numerous frosts. Hay, grain and potato crops have been good in general and high prices received this year.

In the "Truckee Meadows" a considerable increase in small farms of 40 and 80 acres are in cultivation in the past two years. These farmers are doing well. The principal production is alfalfa, hay, and grain. This is also true in Washoe Valley where the farms are larger. Carson Valley is probably the richest community of the State as well as the oldest valley in cultivation. Alfalfa crops going five tons to the acre is a common sight and the wheat crops are exceptionally good this year. There is quite a little dairying, and the farmers have a co-operative creamery as well as a flour mill. Apples and pears are also grown in Carson Valley, but due to the heavy frosts the crop was very light this year. Smith Valley is a great country of turkey raising and is sometimes called Turkey Valley.

Mason Valley, 50 miles long, was producing thousands of tons of potatoes of the finest quality. Alfalfa, cattle and hogs are also in great evidence here. In the Fallon country, the government has built the great Lahontan dam for the Truckee-Carson Project. Here is found the largest agricultural community of Nevada. Hundreds of farmers in the past few years have taken up 40- and 80-acre tracts from the government which gives them 20 years to pay for the water rights. Thousands of acres are still to be had here with irrigation water rights. Lots of the poor homesteaders that settled on this land a few

years back are beginning to feel a wave of prosperity. They are growing alfalfa, grain, and potatoes; and this coming year many acres will be in sugar beets. Fallon has a sugar factory that cost more than one million dollars.

The government is about to put in a better drainage system, which is necessary. One great help to the settler in this project would be for the government to level the land before settlers go on it. Aside from this one cannot see how Fallon country can help going ahead. The same can be said of the Fernley country, where the same waters are used. Lovelock Valley, or what was formerly known as the Big Meadows, still has quite a few large ranches. Some of these are being cut up. The land here is very good and is principally used for hay, grain, and livestock pasture. The main drawback to Lovelock is that some years the water supply is short, as all the water is used from Humboldt river. There is some talk of bringing the waters of the Truckee river into this valley. Stock raising is going on in a very large way all over Elko county, where everyone seems prosperous.

One thing that was very noticeable is the interest taken by the farmers in raising purebred cattle and hogs; and in the near future Nevada will be heard from in this line. Fruit raising has been done in only a small way, although more will be planted. Almost every kind of vegetables are raised in Nevada and of fine quality. Celery is exceptionally good, and one does not want to eat better potatoes.

Farmers just starting in the State can receive help for the asking from the University of Nevada, which has done great work in both the agricultural and animal departments.

with this idea in mind that the entire herd of 68 head were entered in the Kern County Cow Testing Association when that organization was formed this year.

The object of this is to improve production by breeding to purebred Jersey bulls, and without individual tests it is impossible to select the most likely heifers, except by guesswork. Guesswork though is poor policy, as shown by the record of a cross-bred cow during the month July 20 to August 30.

It was known that this cow gave a good flow of milk, but from its color it was judged to be poor in quality. What then was the surprise to find that she was not only the best cow in the herd but in the entire association as well, producing just a trifle over 65 pounds of fat in the 30 days' time. Needless to say her heifer calves will be painstakingly kept in the future.

During that same time there were 10 cows in the 40-pounds-of-fat or better class of the association and none of them were under 30 pounds. Alfalfa forms the major part of the ration supplemented with beet plup and barley in the winter and Bermuda-infested alfalfa pasture during the summer months.

RENEWED ALFALFA BY PLOWING.

[Written for Pacific Rural Press.]

Some surprises have been pulled off when people have plowed up old alfalfa fields because they were unproductive. F. H. Brubaker of Tehama county tried to kill a piece of alfalfa by turning it upside down in winter. It simply threw out a lot of new roots which made it grow twice as fast and twice as tall on the loosened ground, and made bigger, thicker bunches. He tried to grow barley there for two or three years, but got enough alfalfa to make good crops every season. Even the roots on top of the ground started to grow, but would have been in the way of the mower so were hauled off. Disking never gave Mr. Brubaker much results on alfalfa because it didn't go deep enough.

This was on clay sediment soil in an irrigated orchard, and the same results might not come in the open. However, F. P. Stratton of the same locality comes from Idaho where they irrigate much alfalfa and consider the quickest way to renew worn-out fields is to plow it up deeply, sow barley, and soon there is a fine growth of alfalfa. This has been observed by many California farmers.

Producing Clean, High-testing Milk.

[Written for Pacific Rural Press.]

High-testing milk has not generally been sought after by producers of market milk for city delivery because as a general thing cows producing such milk do not give a large quantity.

This conditions, however, does not hold good in the vicinity adjacent to Bakersfield, and as a result a large proportion of the dairymen supplying milk to residents of that city keep a large number of Jersey cows in their herd.

D. H. Bitner maintains such a herd on his 200-acre ranch, the product selling for 18 cents a gallon because of its richness and the sanitary method in which it is handled, the bacteria count keeping close to 10,000 per c.c.

The conditions under which this quality of milk is produced are such as most any dairyman could afford to have, the barn having a well drained floor and hay mow overhead, the floor of the latter being made of tongue and grooved lumber which does not permit dust falling into the milking stable. And this is further provided against by having the stanchions face the outside wall where doors, hung from the bottom on hinges, are placed at regular in-

tervals.

Similar doors, hinged at the top, are directly above the lower set, but open out from the hay mow so that in feeding hay from the mow it is forked out through the top door, falling on the inclined bottom door and then into the manger. By this method all of the dust is on the outside rather than on the inside of the milking stable.

The milk room, while convenient and sanitary, has been built at a minimum cost, being equipped with a concrete wall about four feet high and a well-drained concrete floor. On the outside a wire enclosed stairway was built from which the milk is poured through the wall over a cooler, then passing into the bottling machine.

Above the concrete walls on the south, east and part of the west side a screened space was left for ventilation and sunlight, and a utensil rack along the south side provided a good sunning place for the cans and utensils. A small addition on the west side provides room for boiler, washing apparatus, bottle storage room, etc.

In cows as in sanitation the object is to have the best and it was

*2 1/2 tons

Information Concerning Rye Grasses.

To the Editor: Will you kindly inform me about English rye grass? Is it a perennial; does it stay green all the year round; or does the frost kill it? I want to get some kind of grass that will make a dairy pasture that will grow all the time, but I don't want anything to do with Johnson grass.—R. V., Arbuckle.

[Answered by Prof. P. B. Kennedy, Univ. of California.]

There are two rye grasses commonly grown on the Pacific coast. One is the Italian rye grass, or Australian rye grass, *Lolium multiflorum*, or in the older books on grasses, *Lolium italicum*. This is the one more commonly used because it is a more rapid grower and will persist on a number of different kinds of soils. Its life period, however, is not as long as the other, being one to three years. On sandy lands which become dry in summer, it usually dies out the first year; on clay lands it may persist for a number of years, reseeding itself quite freely, thus making it appear as if it were a long-lived perennial.

The other is the English or perennial rye grass. This is usually

somewhat finer leaved and is more leafy at the base, does not grow quite so quickly and readily as the former, but in the same character of soils as above mentioned, will persist longer when once established. It is really a better pasture grass than the Italian rye grass, while the Italian rye grass is considered better for hay. The amount of growth received from either of them is dependent on the character of the soil and the amount of moisture supplied to it. Under irrigation, the rye grasses may be cut several times throughout the season. They will withstand some alkali. Flooding will not injure them so long as the water is not allowed to become too stagnant. I consider now the very best time to seed land to this grass.

Rye grass is quite nutritious, as much so as any of the grasses, and does not deteriorate so quickly as most if allowed to become quite mature. On rich land the hay and pasture seem to be more nutritious than when grown on poor land, even if the growth should appear the same.

Borrowing Money from Uncle Sam.

To the Editor: Has the "Rural Credit Bank" been established on the Pacific Coast? How should we go about it to get a loan?—J. L., Elk Grove.

To borrow money under the Federal Farm Loan System, enough farmers who want to borrow money will have to get together to borrow at least \$20,000. They must have property on which they can give first mortgages for loans of not more than 50 per cent of the value of the land and 25 per cent of the value of the buildings on it.

They must elect a President, Secretary, and a Board of Directors and apply to a Federal Loan Bank for a charter. The Federal Loan Bank is one of 12 which are established each in one of 12 districts in the United States. These are not yet established, and you cannot borrow money until they are.

At that time, your local Loan Committee will appraise your property and allow you to borrow up to the amount mentioned previously, at

an interest not to exceed 6 per cent and more than likely to be less than 5 per cent, repayable in yearly payments which will extinguish the entire debt with interest at the end of the period for which you borrowed the money. This period must be at least 5 years and may be 40. After the first 5 years, you can pay up the whole thing if you wish.

In the borrowing, you will have to subscribe for stock in your local association to equal 5 per cent on the loan you wish to get. Your local association will invest this in the Federal Bank. The Federal Bank must have \$750,000 capital. If this is not subscribed for by private people or local loan associations, the Government will subscribe whatever is necessary.

Groups of farmers all over the State are already organizing preparatory to applying for loans as soon as the banks shall have been established. We will soon have an article covering the situation.

HARD TO SELL SUNFLOWER SEED.

To the Editor: A small boy of nine has harvested his crop of sunflower seed (his first experiment in agriculture). He will have several grain bags full of seed and would like to know if there is any market for them and what they are worth.—J. H. Y., Meridian.

[Nobody seems to want sunflower seed in any quantity, and we have to advise that you try to sell it in your local stores if possible. If you will write to one of the wholesale grocers in Marysville, telling him that you are sending under separate cover a fair, representative sample of the lot, that he can have them at 2½¢, and how many pounds you have, the chances are that he will take it if he has any use for sunflower seed. If you ask him how much he will pay, your letter will probably go into the waste-basket. The average price of sunflower seed for a term of years in carlots in San Francisco is 2½¢ to 3½¢, according to Geo. H. Croley, but everybody

here seems entirely loaded up. The C. C. Morse Co. advise that clean seed should be worth \$2.00 per hundred pounds, but they do not need any.]

SWEET POTATO FOOD VALUE FOR STOCK.

To the Editor: What is the value of sweet potatoes as compared with corn or barley?—J. H. K., Arvin.

[Answered by J. I. Thompson, University Farm, Davis.]

Barley has a total feeding value of 79.4 pounds to the 100 pounds [after the fat is converted into carbohydrates] and out of this 79.4 pounds, nine pounds is protein. Sweet potatoes have a total of 25.8 pounds, of which only 0.9 pound is protein. You will see, therefore, that the sweet potatoes run relatively high in carbohydrate material since about one-fourth of their digestible contents is made up of it. When fed with alfalfa pasture or skim milk or tankage, they give reasonable satisfaction. A number of breeders in the northern San Joaquin valley have used them satisfactorily.

TALKS ON Nitrogenous Fertilization

Number 1

WE WANT to talk with you a little once in a while about nitrogenous fertilization. These talks will appear in future issues of this journal. We hope they will arouse your interest and perhaps afford you some valuable information.

The leading agricultural authorities and the successful growers of California have about come to the conclusion that nearly all soils and nearly all crops will profit by an application of a readily available nitrogenous fertilizer. Indeed, the question is not so much whether or not to do it, but rather what to use and how.

SULPHATE OF AMMONIA

There are half a dozen good reasons why Sulphate of Ammonia is the best form of nitrogen to use.

It is a uniform, definite chemical compound, always up to the guarantee of 25% ammonia (20.56% nitrogen).

It does not deteriorate by storage.

Its nitrogen is all soluble and all quickly available as plant food.

It does not leach out of the soil readily, and it is ready for use when the feeding roots want it.

It is a fine dry salt, easy to apply, and does not take up water and grow damp under ordinary storage conditions.

Its chemical composition is peculiarly suited to most California soils.

SENTIMENTALITY IN LAND BUILDING.

(Continued from first page.)
stable room on this model ranch.

Cheese Factory.—With the en-
larged herd, there being 120 head of
cattle at present on the ranch, came
marketing problems; for it was early
seen that milk buyers did not pro-
pose to pay a fair price for the out-
put. As a result a modern cheese
factory, with a capacity for handling
5,000 pounds of milk daily, has been
erected and placed under the man-
agement of Chris Kolbeck, formerly
cheese-maker at the University Farm
at Davis. Cheddar cheese of the
highest quality is now made, closing
a leak which for a time seemed
serious.

The hog department has also
grown in proportions, both the Ches-
ter White and Duroc herds gaining
in numbers and strength, thus fur-
nishing a profitable outlet for whey
from the cheese factory and the
various cheap feeds of the ranch such
as stubble fields, cut-over alfalfa
fields, etc.

And so while there was a whole
lot of sentimentality about the place
originally, it is a hard-headed busi-
ness proposition now and every
move is made with the ultimate idea
of making money from the invest-
ment. This simply adds to the old
pride felt in the "home place" by
every member of the company.

SUDAN AND ALFALFA FOR HORSES.

To the Editor: If sudan and al-
falfa make practically a balanced ration,
how many pounds per day are
required by a horse of about 1200
pounds doing little or no work?—
E. M. S., Elsinore.

[Answered by Prof. J. I. Thompson,
University Farm, Davis.]

Sudan grass runs somewhat higher
in carbohydrates and lower in pro-
tein than alfalfa hay, so that the
two fed together would be reason-
ably satisfactory for a horse not at
work. Some grain would need to be
added, preferably barley and oats in
equal parts, if sufficient work was
done to cause the horse to lose con-
dition. Seventeen to 20 lbs. of hay
would be necessary for an average
1200-lb. horse at very light work,
but this amount could be decreased
to 12 pounds, with ½ pound of grain
for each 100 pounds weight of the
horse added, for medium work; for
your horse this would be 6 pounds of
grain to 12 of hay. For real heavy
work the grain should be increased
to 12 pounds per day, and the hay
reduced to 9 or 10 pounds.

PUBLIC SERVICE PATENTS.

Twenty-nine valuable inventions
and discoveries made by scientists
of the U. S. Dept. of Agriculture
have been dedicated to the public
during the last fiscal year, accord-
ing to the annual report of the So-
licitor. In accordance with the policy
of the Department, its workers, when
they discover valuable processes or
devices, obtain what is popularly
known as a "public-service" patent,
the chief purpose of which is to pre-
vent any one else from patenting the
invention. This insures to the pub-
lic the free use of these processes
and devices which have been devel-
oped at public expense in connection
with the investigational work of the
Department.

The rate on bean shipments out
of Ventura will be increased begin-
ning December 31.

General Agricultural Review.

FIELD CROPS.

The average rice yield of Butte county is thirty per cent below normal.

A Chinaman of the delta section sold 10,000 sacks of potatoes recently for seed purposes for \$2.75 per cental on the river bank.

A. C. Whittemore, manager of the Southern Pacific Co. warehouses, estimated that this year's crop of beans in Lompoc valley will amount to about 200,000 bags.

It is expected that a total of 40,000 sacks will be taken from the Paulsell rice fields near Oakdale, this year, some of which ran as high as 80 sacks to the acre.

Stockton reports show a shortage in the available supply of potatoes, which is estimated at 1,500,000 bags less than the normal amount required for California consumption.

Ventura's big bean crop was so large this year that farmers found it necessary to work nights. Threshing machines worked every night by electric light from nine to eleven o'clock.

Manteca is to have a million and a half dollar modern sugar refinery to be erected by the Spreckels Sugar Company, which this season shipped out a total of 512 cars, or 20,000 tons of sugar.

Sweet potato shipments are in full blast at Livingston. The car shortage has embarrassed operations somewhat, resulting in unfilled orders, and at times halting hauling from the fields.

High prices paid for grains and a natural shortage is inducing San Joaquin valley farmers to plant from 25 to 30 per cent more wheat this year than they did last year, according to reliable reports.

Simon Kohn, of El Rio, disposed of his entire lima bean holdings for a sum aggregating \$85,000. The beans represent holdings of three years, and comprise 17,000 bags at a net price of \$6.25 per 100 pounds.

It is thought that turning off the water before the grain had sufficiently ripened explains the falling off in weight of Glenn Co. rice. The average weight is 92 pounds to the sack, whereas in former years rice weighed 100 or more pounds.

The American Beet Sugar Company's plant at Chino turned out 321,817 100-pound sacks of granulated beet sugar this season, running 24 hours a day for 100 days. It is estimated the plant manufactured 3317 sacks of sugar every day. This production is valued at \$2,477,677.

Hop growers of the Sacramento Valley are not optimistic over the outlook. They claim that it costs 11 cents to produce hops, and many who are "up against it" are selling out at 10½ cents. The British embargo on American hops and the spread of the "dry" wave resulting from the late election are the two main factors of depression.

DECIDUOUS FRUITS.

Two-thirds of the Concord prune and apricot acreage signed up under Manager Hersman's plan of organization.

The prune growers of the Chico district intend to join in the statewide movement for organizing a marketing body.

Fritz Klope, banker and rancher of Calxico, says that his winter pears are paying him well. He has twenty acres of pears now in full bearing, and he says he is getting \$50.00 per ton for his pears at Calxico, and that the crop is paying him \$50.00 per acre.

Paradise fruit growers are earnestly discussing the advisability of adopting a system of uniform planting. It is believed that if the growers over a large area will concen-

trate on some one fruit, and the best variety of that fruit for their locality, a better article will be produced, and that the plantings will all mature about the same time, making possible the economy of carload shipments.

The apple crop of the United States this season amounts to 67,695,000 barrels, which is approximately 9,000,000 barrels less than last year, but nearly 2,000,000 in excess of the average. Of the total crop, 67.6 per cent, or 45,759,000 barrels are of the winter varieties, and of these, it is estimated that 52.5 per cent, or 24,011,000 barrels, will be marketed, compared with 25,478,000 barrels, which was 50.6 per cent, of last year's crop of winter apples. Of the 1915 crop about 65.7 per cent were winter apples.

CITRUS, NUTS, SEMI-TROPICAL.

The olive crop was not damaged by the late cold snap.

Riverside passed the 8-to-1 ordinance against the shipment of oranges below standard.

The first shipment of "Sunkist" oranges from Los Angeles county was made last week from Azusa.

Monrovia shipped four cars of early navel oranges last week to the Eastern and Canadian markets for the Christmas trade.

The entire olive crop of the Natomas Consolidated Co. has been contracted for five years by Libby, McNeil & Libby.

A new industry in Lindsay, the Ripe Olive Company, began canning Nov. 18 for the first time, when the output was 250 quart-size cans.

County Horticultural Commissioner C. F. Collins estimates the orange crop of Tulare Co. this year at 6,326 cars.

The five-day session of citrus growers, held at Riverside last week under the auspices of the University of California, was taken up with discussions on inspection of plants, orchard fertilization, and scale control.

It is announced from San Bernardino that the orange season in San Bernardino Valley opened December 1, and several carloads are expected to be shipped before the middle of the month. A normal crop is expected.

H. W. Seager, manager of the Redlands-Highland Fruit Exchange, who has just returned from New York, says market conditions East are good. Prices, he says, are high and he thinks they have the best year in sight for a long time.

The State Superintendent of Weights and Measures announces that on and after July 1, 1917, all olive oil must be sold in tin containers, in accordance with the United States standard gallon liquid measure, and its regular subdivisions—half-gallon, quart, pint, half-pint and gill.

The total production of lemons in Italy this past season was 440,200 tons, two-thirds of which are exported, the remaining one-third being worked up into by-products, such as citrate of lime, essential oils, etc. In normal times the United States takes 30 per cent of Italy's lemon exports.

The commercial orange crop of the United States shows a probable increase of 2,635,000 boxes this year, according to the Department of Agriculture. California's production is 17,500,000 boxes, or 2,450,000 more than last year, and that of Florida 6,335,000 boxes, or an increase of 185,000.

Returns from the first citrus fruit shipped from Tulare county to the eastern market for both the Porterville and the Woodlake districts showed the fruit selling in New York for \$2.85 f. o. b. Porterville or Tulare county points. The high price

BASSETT'S POLAND CHINAS

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

GRAND CHAMPION SHOW,
P. P. L. E. 1915; Sacramento 1916.

California Hog Book

BY W. S. GUILFORD.
Price, \$2.00 per Copy, Postpaid.

is due in part to generally higher prices, and to the 8-to-1 test. The crop stands to net \$6,000,000.

Orange packing started last week at Lindsay. Heretofore it has always been the practice to sweat the fruit to hasten packing condition, but this will largely be eliminated this season, as the cool weather has served to ripen and sweeten the fruit on the trees earlier than common. Boxes will for the first time bear the label: "Not artificially colored; tree ripened."

A new bleach for walnuts was tried at Santa Ana recently with seemingly successful results. The excessive cost of chloride of lime heretofore used in the solution for bleaching caused efforts to be made to find a substitute. Chloride of lime has advanced from 4 cents a pound to 13½ cents. The formula of the new liquid reduces the cost to the equivalent of paying 2 cents a pound for chloride of lime.

It may interest the citrus grower to learn that the Chief of the Bureau of Plant Industry has invented a machine which successfully removes the oil-bearing portion of the rind of waste and cull oranges and other citrus fruits, thus making it possible to eliminate a large part of the expensive hand labor which has heretofore rendered the domestic production of sweet-orange oil commercially unprofitable. This machine has been patented and dedicated to the public.

There is a strong feeling against the 8-to-1 orange test in Southern California. Growers contend that the oranges of the foothill groves are peculiar in that their acid and sugar contents are both unusually high. A southern orange may have more sugar than a northern orange. It may also have more acid, so that the ratio is less than 8-to-1, though the orange is perfect of its type. It is also said the high acid content along with plenty of sugar makes the orange of the Monrovia-Duarte district such an excellent keeper and shipper.

GRAPES.

Tokay shipments from the northern part of San Joaquin Co. have aggregated about 2,400 cars for the season.

BARREN HILL NURSERY,
C. E. PARSONS, Prop. Calif.
Nevada City.

The Calif. Associated Raisin Co. has purchased 20 acres of land situated on the main line of the Santa Fe and the Sanger branch of the Southern Pacific. The purchase was made as a future site for a packing house and seedling plant in case the Pacific Coast Seeded Raisin Co.'s plant was not re-leased.

The returns on grape shipments this season have averaged about \$1,000 gross per car. This sum is distributed about as follows: Freight, \$300; refrigeration, \$85; shock, \$80; making a total expense of \$465 per car. The balance of \$535 a car is distributed at the point of production, approximately \$200 going to labor, \$70 for commission, and \$265 to the grower.

According to a statement made by the president of the Calif. Fruit Distributors, 500 cars of our grapes were placed with the Eastern wineries, and more could have been sold if the shippers had been able to deliver them. Most of the grapes were Zinfandels and Muscats, the cheaper varieties of wine grapes. The cold, rainy summer this year made still lower the generally low sugar content of Eastern grapes, which tended to increase the sales of California wine grapes on the Atlantic seaboard.

MISCELLANEOUS.

C. M. Bertch of Visalia is preparing to seed five hundred acres to wheat, barley, and corn.

The Stanislaus County Farm Bureau have resolved to inaugurate a month's campaign against the squirrel pest.

George McKee, a rancher of Oxnard, has disposed of his entire holdings, 12,000 sacks, at something over \$6.25 per cwt.

President Chas. S. Barrett of the Farmers' Union declares that this organization will ignore politics and stand by its friends wherever it finds them.

C. R. Lucas, the nurseryman of Reedley, reports numerous large orders on file. Mr. Lucas says the planting in the Reedley district will far exceed that of last year.

The Globe Cotton Seed Mill, with a capital of \$500,000, will soon start up in Los Angeles. The plant's principal product will be oilcake meal from cotton seed grown in the Imperial Valley.

The Director of the States Relations Service of the U. S. Department of Agriculture reports an unprecedented increase in the number of secondary schools giving agricultural courses, and estimates the number of students enrolled in such courses at more than 90,000.

Imperial Valley, under the auspices of the local farm bureau, will hold a great livestock fair in El Centro from Dec. 29 to Jan. 1, according to A. M. Nelson, secretary

of the Imperial Co. Farm Bureau. The fair will be restricted to live-stock exhibits, but will have in addition special attractions.

It is announced from Washington that a tract of 97,760 acres of government land lying in the Visalia Land Office district, will be thrown open to settlement on December 11. This includes 7000 acres in Tulare county, 3000 acres in Fresno county, and the remainder in Kern county.

Imports of gold into the United States during the fiscal year ending June 30, 1916, amounted to \$494,009,301 and the exports were \$90,249,548; while in the preceding fiscal year the imports were \$171,568,755 and the exports were \$146,224,148. Hence the net imports in 1915-16 were about \$404,000,000, and 1914-15, about \$25,000,000.

The filing of deeds on Nov. 14 in the County Recorder's office at Sacramento attested that the Calif. Fruit Cannery Association and the Griffin & Skelley Co., two of the biggest factors in the fruit-packing industry in Calif., have come into the control of the Calif. Packing Corporation in a deal involving \$2,500,000 in cash and the transfer of 55,000 shares of stock.

The possibilities of asparagus culture in the Turlock district are being brought to the attention of the farmers of that section as the result of investigations being made by the G. W. Hume Co. and the Turlock Merchants & Growers, Inc., and it is safe to predict that within the next two or three years Turlock will become as well known for the extent and quality of this product as for cantaloupes and watermelons.

Seventy-three high schools in California now have practical courses in agriculture. Forty-seven schools reported general farming courses; 28 animal husbandry; 23 courses in dairying; 30 courses in horticulture; 13 courses in market gardening; 15 courses in plant propagation; 15 courses in the study of soils; 13 special science courses; 9 farm management courses; 16 courses in farm mechanics; 1 course in viticulture.

C. E. Bartlett of Petaluma, who spent three years in Fallon, Nev., in the Truckee-Carson Government project, writes us a few words in commendation of that district. He says that: "While a small district comparatively, it has as good opportunities, or better, for a man with a little money and plenty of energy, as any place on this Coast. It is no get-rich-quick scheme, but takes work, and lots of it; but it offers a home and a good living to the right people."

PRUNE AND APRICOT GROWERS' MOVEMENT.

A banquet was given to the local business men and fruit growers of Santa Rosa, Nov. 24, at the Overton Hotel. The affair was promoted by S. W. Baker of the old Cured Fruit Exchange and the Santa Rosa Chamber of Commerce in behalf of the Prune and Apricot Growers, Inc. A strong delegation from San Jose was present, among whom were H. S. Hersman, H. G. Coykendall, O. A. Harlan, Dr. F. M. Coleman, W. G. Alexander, Joseph T. Brooks, Secretary San Jose Chamber of Commerce, and G. E. Merrill.

Half of the Ventura and Orange County bearing acreage have signed up.

The Hemet Cured Fruit Assn. will meet next Monday night to discuss organization. The directors have already expressed approval of the movement.

CURL LEAF SPRAY.

To the Editor: Which is the best time and best spray material for curl leaf on peach?—H. L., Wheatland.

Spray with lime-sulphur 1 to 9 just before the buds open in the spring. The sprays to apply now are for shothole fungus or peach blight, or for aphid eggs or scales.

Sunday Round Trips for One Fare

Between many points, at figures ranging from 50 cents to \$5.00

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

UNIVERSITY TRACTOR SCHOOL.

[Written for Pacific Rural Press.]

A tractor demonstration isn't in it when you want to learn the real inside workings of tractors, how to keep them out of trouble, how to get them out of trouble, and how to make them work for you.

A tractor demonstration would be the finest thing going for those purposes, were it not for the Tractor Short Course at University Farm, Davis, under management of Prof. J. B. Davidson Nov. 13-23.

A day there is worth two at any tractor demonstration we have seen in California. Each day there was a morning and an afternoon lecture by Prof. Davidson the first week and by the service men of various tractor companies during the second week. All told, about 100 students enrolled. Practically all were ranchers, and to judge by the awkwardness with which they handled the various machines, most of them had never tried it before. Some even confessed an ignorance of the general principles of gas engines.

Several ladies enrolled. One of them wanted to know why one of the tractors "strained the smoke." The rest of the bunch showed their ignorance by laughing.

The students were divided into classes. Each class was assigned to one tractor from the end of each lecture until noon or 5 o'clock. About 70 attended the lecture which we heard and will report later.

There were ten tractors when we

attended Nov. 21. Each of eight manufacturers was represented, and the drivers, usually service men of the companies, were designated "instructors." They took the plates off the crank cases, explained the inner workings of their machines, answered questions, and taught the students to run the machines.

The questions were intelligent all right. A list of them as long as your arm had been given the students in one of the early lectures, and recorded in the notebooks which most of the students carried.

The questions concerned carbureter adjustment, air heaters, dirt removers, service systems of manufacturers, removal of pistons, re-boring cylinders, valve grinding, valve timing, clutch systems and materials, how to remove clutches, transmission gears, bearings, speed, cost of replacing worn parts, kind and frequency of lubrication, accessibility of bearings, spark and gas control, gear and clutch levers, etc., etc.

Tractors represented and working on allotted portions of the fields were Sandusky, International Harvester, Yuba, Holt, Best, Samson, and Big Bull.

They all lined up Tuesday morning in the presence of at least 150 students and visitors, and again in the afternoon for a dash past the movie camera, once all abreast; next, one after another, in a long line pulling plows, cultivators, disks, a Schmeiser giant land leveler, etc.;

and all loaded with students on every accessible perch. These pictures will be shown throughout California.

LONG-DISTANCE PIPE FROM PUMP.

To the Editor: How large a cement pipe would be required to carry water to a reservoir $\frac{3}{4}$ of a mile on an 18 ft. grade, using a 4-inch centrifugal pump? Would cement pipe be strong enough to stand so great a head? Could wood pipe be used for the first several 100 feet where the pressure would be the greatest and cement pipe for the remaining distance? If so, what size would be required and how many feet of each should be used? —W. E. C., Colusa.

[Answered by E. P. McMurtry, Krogh Mfg. Co.]

A 4-inch centrifugal pump has a normal capacity of 400 gallons per minute. Assuming that this is the capacity that he desires, we would recommend that this 4000-foot pipe line be 8 inches in diameter, resulting in a friction head of 20 feet, which added to the elevation of 18 feet will give a total head of 38

feet, and require 7 horsepower to operate.

If 6-inch line is used, the friction head would be 60 feet, which, added to the elevation of 18 feet, would result in a total head of 78 feet, requiring 14 horsepower.

You will note that the above estimate does not take into consideration any suction head. If there is a suction head to be added to the 18 feet, it will increase the total horsepower in direct proportion to the increase in head.

We would not recommend that concrete pipe be used if 6-inch pipe is installed as the pressure due to friction is too high.

If the 8-inch line is installed, it can be made of concrete. If concrete pipe is adopted, however, it must be of the reinforced type properly made and containing the proper kind of sand and cement.

We would recommend that your client contract with some cement pipe manufacturer for this pipe, obtaining definite guarantees.

Less Carbon

—because Zerolene is made from Asphalt-base crude. It burns up clean, and goes out with the exhaust.

ZEROLENE

the Standard Oil for Motor Cars

Sold by dealers everywhere and at all Service Stations of the Standard Oil Company (California)

When a machine is so built that it will coast down a 3% grade over plowed soil, you may be sure that the power you generate is used, for the most part, to haul the load.

You may be sure that transmission is perfect, that the resistance, due to the machine itself, is lessened by the ball bearing tread—the only one of its kind used in a tractor.

Hyatt roller bearings, and steel balls which carry the load, move so easily that this powerful machine COASTS, as was proved by the scientific tests made at the Agricultural College.

In a tractor you want the power at the drawbar—you want as little as possible of it utilized to propel the machine.

The accurate machining, the perfect work of the mechanics, the superior materials used in manufacturing the YUBA BALL TREAD TRACTOR result in its easy running—in its coasting.

This scientific test proved the principle to be right, and the workmanship perfect. Proved it to have the accuracy of a watch, with the power of twenty horses on the drawbar.

COASTING

THE Division of Agricultural Engineering of the College of Agriculture, University of California, at the University Farm at Davis, Professor J. B. Davidson in charge, made some tests (see picture) to determine the extent of friction in the ball tread of the Yuba Ball Tread Tractor.

The result was the astonishing discovery that the tractor actually coasted over soft ground, down a 3% grade. The maximum motor power of the Yuba is delivered at the drawbar—where it will accomplish useful work.

TRACTOR DRY FARMING.

[Written for Pacific Rural Press.]

With 16 to 24 inches average of rain on the level bean fields of Ventura county, E. E. Dunning has irrigated only 6 or 7 times in the past 33 years, and has had only one year when he didn't make a good crop. That was 1898, with only three or four inches of rain. This is due to moisture retention by the finely pulverized soil. The pulverizing is made possible by repeated use of a tractor which in spring chisels and mashes the clods "fine as silk."

Plowing is done in the fall before the rains, 12 to 14 inches deep with the Yuba 18 and a 3-disk gang plow. This turns up big clods which are left rough all winter for the rains to soak in. If weeds start too soon, he pulls a 12-foot Cyclone cutting three or four inches deep.

On his soil, a 60 h.p. tractor proved too heavy. It packed down so hard in wet ground that cultivation tools would jump out of the ground when they hit the packed tracks afterward.

The balls in the Yuba track used to crack and chip, taking several hours to replace them. Of late, the company makes balls of steel instead of cast iron, and Mr. Dunning has experienced no trouble, the track and balls not being worn appreciably though he used it last year on his 70 acres for beans. At first some of the pipes choked up and it cost \$10 for an expert to come and fix it. Besides that, the total repairs for the year's work had not been over \$15.

DYNAMITE AND TRACTOR SUBSOILER FOR TREE PLANTING.

[Written for Pacific Rural Press.]

Orange trees in the orchard on one side of Dr. Bell's house in the Fair Oaks district are two years older than on the other side, but the older trees average only 1/2 as big. Not only is the size small and un-even, but the stand is not so good, and the leaves are not so healthy.

The difference, according to Prof. Elmore Chase, is due to the preparation of the ground before planting. In one case, the trees were set in spade holes; in the 10 acres on the other side of the house, a four-horse team pulled a moldboard six inches deep; then a subsoiler 20 inches deeper was pulled at intervals by a dozen horses, stopping to rest every four or five rods. The plowing and subsoiling cost \$14 an acre. Then two sticks of powder were exploded four feet deep at the proposed tree holes.

To avoid the cost of powder, another man mentioned by Mr. Chase is having a \$1500 Killefer subsoiler made, to loosen the soil three feet deep in a strip at least three feet wide. These strips are to be as far apart as the tree rows. The field will be treated similarly crosswise, and trees planted at the intersections. He expects it to require about 100 horsepower, to be furnished by three big tractors.

Despite the fact that the Southern Pacific Co. is receiving about 200 new box cars every day from the builders of 1,500 cars it is unable to come anywhere near meeting the enormous demand made upon it by Calif. shippers. It is thought the resulting interruption to the crop movement is only temporary.

POWER NOTES.

To keep the plow going on a turn, there needs to be plenty of power and grip on the ground.

A dust collector for air to the carburetor has recently appeared, which removes the dust dry by centrifugal force.

A blue cast to the exhaust is probably caused by lubricating oil according to Prof. J. B. Davidson of University Farm, and indicates that the mixture is not too rich.

FREE ENGINE BOOK

Before you buy any Engine—Read my Book, "How to Judge Engines." Tells how to distinguish a High Grade Engine by the difference in cylinders, pistons, valves, ignition, etc., with less cost for fuel, up-keep and repairs. REDWOOD TANKS SILOS

Water Troughs, Windmills, Frames, and Towers, Steel and Wood. Prices the lowest. BROWN & DYSON 640 So. Center St., STOCKTON, CAL.

Live Stock and Dairy Notes.

(Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.)

THE DAIRY.

Yolo county is being considered as desirable territory in which to establish a \$75,000 milk condensary.

Whole milk testing 4 per cent butterfat brings \$1.71 per hundred-weight to dairymen supplying the factory of the Carpenter Cheese Co. at Salida.

Dairymen of the Chowchilla district have organized a cream association. The members number about 80 per cent of all who are in the business in the district.

Dairymen in Sonoma, Marin and Napa counties have been heavy purchasers of all kinds of feed this fall, many of them being compelled to buy alfalfa hay for the first time.

Geo. W. Wilder of Colton has recently added twenty-six pure-bred Guernsey cows to his dairy herd. They were purchased in Ohio and represent the best strain of their breed.

The Petaluma Co-operative Creamery is now turning out about a ton of butter a day. This amount will be increased shortly as most of the cows in that district are just freshening.

Convinced that butter prices will continue to advance and possibly reach a maximum of 50 cents per pound for the consumer, dairymen of the State are reconciling themselves to paying high prices for concentrated feeds.

The Napa State Hospital has recently completed A. R. O. tests with two of their Holstein heifers, and according to Manager Owen Duffey, all of the registered cows owned by that institution will be tested as fast as they freshen.

Stanislaus dairymen will receive a visit this month from Dr. W. L. Williams of Cornell University, leading authority of the country on contagious diseases among dairy cattle. Dr. Williams comes to California to make a study of diseases of cattle.

M. H. Gardner, Superintendent of the Holstein-Friesian Association, writing from Delavan, Wis., Nov. 20, says: "The Holstein-Friesian cow Hester Aaltje Korndyke, 133222, has just produced 576.5 lbs. milk containing 34.332 lbs. fat in seven consecutive days.

The Napa-Petaluma Cow-Testing Association, the outgrowth of the Napa-Solano Association, has over 1400 cows entered at this time. Of this number the larger number are from Sonoma county herds. A flat rate of one dollar per cow per year is charged with 30 as the minimum sized herd accepted.

Six cows in the T. B. Purvine herd of registered Jerseys have recently completed Register of Merit records made under semi-official test rules. The largest one was made by Legacy of Byrondale, an aged cow who produced 534 pounds of fat. Fairy Boy's Ethel Louise, a two-year-old, has just completed a ten-month record with 315 pounds of fat. These records were made under dairy conditions, two milkings a day, on feeds grown in Petaluma district.

A big and important sale of purebred Holstein cattle is announced by Rhoades and Rhoades, the auctioneers, to take place at the Vista Holstein Farm, Rivera, Cal., December 12. At that time 70 head of high-class cattle from the Edgemont Holstein Farm, Burbank; Whittier Holstein School, Whittier; and Anita M. Baldwin's Anoakia Breeding Farm, Santa Anita, will make up the offerings. The cattle, it is said, will be fine individuals and showing the best of breeding.

The milking barn just being completed on Revada Farm, owned by B. Nixon, near Rutherford, Napa county, is without question one of the finest structures of its kind ever

built in the State. Cork brick floors, plastered and enameled sidewalls and ceiling, modern steel stanchions with individual drinking fountains are a few of the modern appliances which are being installed. The milk house is equally as modern, with refrigeration plant, sterilizing vat, etc. When completed certified milk will be sold in San Francisco from the imported Guernsey herd which Mr. Nixon has established during the past year.

The two-year-old heifer, Lottie Walker Spofford 3rd, 256340, daughter of the four-times 30-pound cow, Lottie Walker Spofford, and the King of the Black and Whites, owned by the Henderson Company, Sacramento, has just finished both a 7-day record and a 30-day record. She made the record under normal conditions, ran at pasture in the daytime with other cows, and was kept in the barn at night. Without special feeding she made 21.06 pounds in 7 days and 82.36 pounds in 30 days. Her best 7-day record was five weeks after calving. She made 453.2 pounds of milk in 7 days, and 1822 pounds of milk in 30 days.

BEEF CATTLE.

It is current report in Reno, Nev., that the Western Meat Co. of San Francisco is about to take over the holdings of the Nevada Packing Co. of Reno.

Three trainloads of cattle, most of them from Nevada, arrived last week for stockmen in the Oakdale section, who will fatten the steers for the coast markets.

D. O. Lively announces that he expects to hold an auction sale of registered Hereford cattle at his ranch near Mayfield on April 21 next. He will shortly make a trip to Denver to purchase sale cattle for this auction.

A report reaches us that O. Harris and Co. of Missouri have recently opened a branch in Southern California for the disposal of purebred Hereford cattle. A shipment has recently been made to their southern headquarters comprising several carloads.

Six hundred head of cattle turned in on uncut rice west of Colusa are doing so well that Herman Dunlap and son are bringing the rest of their cattle from the range in the western foothills and will pasture them on the plantations where the rice was not harvested in the Cheney slough project.

Both the International Livestock Show at Chicago and the Pacific International Livestock Show at Portland are attracting prominent California breeders this year, Chas. Hawkins, W. M. Carruthers and Prof. Gordon H. True being in attendance at the former and Wm. Bond and D. O. Lively at the latter.

E. F. Curtis, a well-known Napa boy, graduate of the Davis State Farm, has become an expert stockman, and is now managing a stock ranch near Suisun. He left recently for New Jersey, and will bring back a carload of Shorthorn cattle imported from England by a well known California importer.

David J. Stollery informs us that his letter calling for a meeting of Shorthorn breeders in San Francisco Dec. 11 has met with approval from practically all of the Shorthorn breeders in the State, word having been received from 20 or more that they would be in attendance, and several others having personally told him that they would attend.

Mr. A. W. Foster, owner of Hopland Stock Farm in Mendocino county, advises us that there is now under construction at that place modern beef cattle, dairy cattle and swine buildings which he expects to have completed by the first of the year. Mr. Foster has accumulated

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all areas, reasonable prices. Some fine bred sows and gilts, and top-quality young boars. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, B. H. Whitten, Route 5, Box 847, Los Angeles.

Shorthorn Bulls and Percheron Horses for
sale. Paicines Ranch Co., 320 Sharon Bldg.,
San Francisco.

a choice lot of Shorthorn and Hol-
stein cattle as well as a select herd
of Berkshire hogs and the comple-
tion of these buildings will make this
one of the show places of the State.

SWINE AND SWINEMEN.

The aggregate output of hogs from
the Oakdale section this year has
exceeded \$75,000.

Twenty thousand dollars' worth of
hogs have been shipped out of Han-
ford in three days recently for the
San Francisco market. Still more
would have been sent had cars been
available.

W. W. Everett of the River Bend
Farm at St. Helena reports that he
has sold a large number of Durocs
of both sexes, since the State Fair
but that he has a choice lot of pigs
recently farrowed.

D. O. Lively of San Francisco con-
templates a trip through the Middle
Western States early next year in
search of foundation animals for his
purebred Duroc herd which he ex-
pects to establish at Mayfield.

H. P. Slocum and Son of Glenn
county have recently imported from
Nebraska what is said to be an ex-
ceedingly fine lot of registered Duroc
Jerseys. A portion of these were
for other breeders in the State.

W. M. Carruthers leaves tomorrow
for the East to attend the Interna-
tional Stock Show at Chicago. He
reports good sales of purebred hogs
during the past few weeks, having
sent to buyers over sixty head.

H. E. Boudier of Napa county re-
ports recent sales of seven head of
registered Duroc hogs to parties in
Napa county. The boar, Royal
Colonel, purchased by him from
Haden Smith, is proving to be a good
breeder and Mr. Boudier is expect-
ing great things from his get.

H. R. N. Boyd of St. Helena, Cal.,
is starting in the registered Duroc-
Jersey field. He has purchased his
foundation stock from River Bend
Farm, and, with abundant pasture,
combined with a thorough knowledge
of the hog business, is certain of suc-
cess in the future.

A new farrowing house with a
capacity of 12 brood sows has just
been completed by Homer Hewins
at his Napa county ranch. The
building is well lighted and ven-
tilated by windows on the south side
and will provide good winter pro-
tection for Mr. Hewins' increasing
herd of registered Berkshires.

J. E. Thorpe of Stockton reports
seven winners in the guessing con-
test held at the fairs the past season
on the weight of his Duroc-Jersey
sow, "Long Wonder's Queenie."

CROLEY'S CALF FEED with skim milk
will raise fine dairy heifers cheaply. Geo. H.
Croley Co., Inc., 631-637 Brannan St., San
Francisco.

Diamond G Ranch, Escondido, Cal.

GEORGE WATTESON—Breeder registered
Herefords. Bishop, Cal.

SHORTHORNS—Carruthers Farms, May-
field, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT
Co., Eugene B. Croley, Manager, solicits for-
eign orders for purebred registered and merit
breeding animals and fowls. California has
great diversity of climatic and other condi-
tions that enable us to select animals that
have been raised under conditions similar to
those of the location for which they are in-
tended. We should be informed regarding
these conditions and be allowed ample time
to make selections. Nearly all disappoint-
ments in buying afar are the result of insuf-
ficient information as to conditions or to lack
of time for proper selection. Our plan and
terms for "raising animals to order" to fit
into peculiar foreign conditions is worth in-
vestigating. References: Dun or Bradstreets,
or San Francisco banks. Office 219 Under-
wood Building, 525 Market St. San Francisco.

CROLEY'S BALANCED PIG FEED for
growing youngsters; also cheaper hog feeds for
big hogs. Geo. H. Croley Co., Inc., 531-637
Brannan St., San Francisco.

HUMBOLDT STOCK RANCHES—Cattle cor-
respondence solicited. C. E. Robertson, 105
Montgomery St., San Francisco.

D. O. LIVELY, 216 Hobart Building, San
Francisco, buys and sells livestock—any kind
—any quantity.

DUROCS AND GUERNSEY BULL CALVES
Bred to 900-lb. boar. Ed. E. Johnson,
Turlock, Cal.

whose correct weight was 763
pounds. V. B. Garden of Selma,
eventually captured the prize as he
won from the other six in a draw.

A. B. Humphrey, Berkshire
breeder of San Joaquin county, ad-
vises us that he contemplates turn-
ing off about 500 head of purebred
Berkshires a year for pork in the
future. With that end in view he is
fattening a carload of choice Berk-
shires at the present time and is
constructing a modern fattening
barn. It is Mr. Humphrey's conten-
tion that there is more money in
fattening purebred hogs than there
is in grades and with this system he
will be able to make profitable dis-
posal of animals undesirable for sale
for breeding purposes, thus insuring
breeders the pick of the tops at all
times.

SHEEP.

Twelve thousand head of sheep,
the first of 36,000 to be brought in

A price of 30 cents per pound for
wool to Callaghan & Owens, sheep
growers of Livermore, broke records
for the highest price ever received
here in recent years.

It is said that more than 500,000
sheep are now on the annual winter
drive south from Flagstaff, Arizona,
to the plains north of Phoenix for
shearing and lambing.

Twelve thousand head of sheep,
the first of 36,000 to be brought in
from the ranges, arrived recently in
Visalia, and will be quartered in the
new feed sheds, holding 5000 at a
time, at the Visalia sugar factory,
where the Western Meat Company of
San Francisco is to undertake this
big feeding experiment.

CATTLEMEN'S RESOLUTIONS.

About fifty range cattle men from
various parts of the State assembled
in this city on Saturday last at the
annual meeting of the California
Cattlemen's Protective Association,
which was active and interesting
throughout. Henry Lynch of Mon-
terey county presided.

Resolutions were adopted as fol-
lows:

Favoring the holding of a live-
stock show in San Francisco in 1917:
the establishment of a U. S. Quar-
antine Station near San Francisco;
the requirement of watering facili-
ties, kept in order, in railway stock
corrals; legislation to make chattel
mortgages on livestock negotiable.

O. B. Fuller carried through an
amendment to constitution of the
association giving the directors the
power to assess all members 2c per
head of stock assessed to them to
finance the work of the society. In
accordance with such an amendment
members were speedily signed up
for a total of nearly \$3000.

The association revived its demand
for legislation like the "hide and
brand" bill, which the governor dis-
approved after the last session of
the legislature, to provide that all
cattle shipped must have hides and
brands registered by inspectors. It
is designed in great part to do away
with cattle rustling. An amendment
was suggested which permits the
farmer or butcher in remote sec-
tions of the State to kill cattle by
obtaining the signatures of two wit-
nesses to a certificate of inspection,
if upon twenty-four hours' notice
an inspector is not available. This
amendment, it was stated, would do
away with the objection raised by
Governor Johnson.

A special committee was appointed
to reorganize the association on the
basis of affiliation with local protec-
tive associations in different parts
of the State.

A resolution was adopted express-
ing deep regret that H. A. Jastro of
Kern county was detained by illness
from attending the meeting.

Officers were re-elected as follows:
President, H. W. Lynch; first vice-
president, Fred H. Blxby; second
vice-president (to be filled); third
vice-president, T. A. Trescony, and
treasurer, Ed de L. Cebrian. The
personnel of the executive committee
and the directors will be the same
as last year.

GET YOUR DE LAVAL NOW

IF YOU are selling cream or
making butter, and have no
separator, or are using an infer-
ior or half-worn-out machine,
you are wasting cream every day
you delay the purchase of a De
Laval.

You can't afford to wait until next
spring. It means too much loss. Let the
De Laval start saving cream for you
right now, and it will soon pay for it-
self.

Hogs Grind Grain

THE HOG MOTOR is both a grinder
and feeder. With it your hogs
will grind their own grain, saving
you money and labor. This machine
will care for 30 hogs on full feed at a
savings of 25 per cent of the grain and
a pig of 40 pounds can operate the
grinder. Grinds all kinds of grain,
coarse or fine, separate or mixed. No
waste—grain always dry, clean, fresh.
We will keep the machine in repair one
year free, and refund money if not sat-
isfied at the end of sixty days.

Livestock Facts and Fancies---X.

[By the Editor.]

We shall now break away for a time from the attractive line of preaching, that reforms in our present conditions of livestock marketing in this State must come through co-operative action of growers to understand and to change these conditions wisely and efficiently. We shall proceed to seek demonstration that the secret of success is to grow better animals, although conceding that marketing conditions do seem to prevent the grower from attaining success in fullest measure—which is the thing which is up to him for correction. As our associates are filling our columns continuously with demonstrations of what Californians are achieving in growing stock with more or less of purebred capacity and quality, as contrasting with scrub characters, we shall not intrude upon their occupancy of the local field. We shall select instances of the profitable superiority of purebred and high grade animals in the experience of growers at more distant points. The contention will be, though it need not be cited in each case, that, subject to local conditions which may need correction and will, we hope, soon get it, the growing of better animals is fundamental in profit-making here as well as in the distant localities indicated—is, in fact, fundamental everywhere.

First, just a word about the horse. It is clear enough that only horses which are best fitted to specific purposes are likely to live in the future. An all-around horse is as pointless as a pork barrel and is sure to be smashed when it rolls in front of a motor. A modern horse must have points and must get as close to a purebred, embodying these points in its generation of breeding for specific purposes, as possible. The animal which is just a horse has as small chance of yielding profit to its grower as its progenitors have of climbing out of the asphaltum beds where they have been found. This claim cannot be argued for lack of space; the reader must open his eyes and demonstrate it for himself. It is claimed that though this country has sold some 500,000 for war purposes, there are now more horses in the United States than ever before. And yet the pounding to pieces of "skates" on city pavements is closing the demand for common horses. It is reported from Chicago that in the period from 1911 to 1916 the number of licensed horse-drawn vehicles dropped from 58,000 to 49,000, and the number of motor vehicles increased from 11,000 to 43,000. This shows that the horse has not lost so much but that the motor has gained more, and we take it to mean that the "old plug" finds fewer holes to enter. It does not mean that good horses will lose as much as motors gain, for the country is growing and changing all the time. Kentucky is still raising some fine horses, which sell as high as \$1000 each, but the business has declined greatly. The five-gaited breed, selling from \$500 to \$5000, and the expert racing breed will very likely be revived. All over the country there is an increased interest in purebred horses which indicates a revival of horses

instead of their permanent retirement.

"Feeding" beef cattle for market is a very close business indeed. It looks as though it would be the influence of the purebred which would save it. Here is the experience of John Trumbull and son of Marshall county, Ill., who purchased 150 beef calves from farmers last fall and fed them out during the winter. Mr. Trumbull picked up these calves in the fall off of their dams on pasture. They were purchased from men who have rough land pasture that cannot be cultivated. He says the cows that raised these calves are mostly Reds of a good beef type headed with a purebred bull. Some of the cows are milked for a few months, and some of them are high grades with the color of purebreds. He paid an average of \$37 a head for the 150 calves. Some of the better ones cost him over \$40, these prices being at weaning time. He says he can afford to pay more for these calves than range calves because they still have the milk fat on them, and there is no freight to pay. He likes to buy them that way, too, because he can see the sires and dams, which he says goes a long way in picking out good feeders. It is evidently the purebred quality which helps the growers of these weanlings to get such a price and also makes it profitable for Mr. Trumbull to pay it.

How does the purebred do it? Well, take the word of the Missouri Experiment Station for that, as follows:

The purebred sire means: 1, uniformity; 2, individual superiority; 3, early maturity; 4, more marketable stock; 5, more money for your feed; 6, credit to the owner; 7, bigger profits.

The scrub sire means: 1, lack of uniformity; 2, mongrels and misfits; 3, late maturity; 4, poor market demand; 5, less money for your feed; 6, discredit to the owner; 7, loss and dissatisfaction.

These are some of the facts which explain why stock producers who are producing the good stock are the ones who stay in business when so many others drop out.

Consider these points well. Those who doubt the value of purebreds are quite apt to cry out against "fancy points" as valueless, and sometimes they are right. But these are not fancy points—they are the real issues in profitable stock growing.

GOATS TOO FAT TO BREED.

To the Editor: Two goats, one Angora, the other Toggenberg, have failed to get with kid. They are in good health. The Angora is extremely stout and 19 months old. The other is 21 months. They failed to catch in November, 1915, and again May 1, 1916. What months are best to breed goats?—A. D. G., Soquel.

[Breed them at any time you desire. It looks as if you had them too fat; and it will be best to reduce them in flesh before breeding again.]

Fred Mendonsa has rented from Will Gray 160 acres of uncut rice in the Cheney slough project, Colusa, and will pasture 2,000 sheep on it.

Southern California Breeders

December Sale

Tuesday, December 12, 1916

at the Rio Vista Holstein Farm

RIVERA, CALIFORNIA

70 Head of High Class Registered Holsteins 70
Tuberculin Tested

The cattle included in this sale are of exceptional individuality and are bred in fashionable lines. Every animal has been inspected and there is not an animal in this sale but what measures up to the highest standard.

The females that are bred are in calf to high-class sires, including the coming young sire

KING SEGIS PONTIAC JANNEK,

whose two nearest dams average over 33 lbs. of butter in 7 days. He is a son of the great KING SEGIS PONTIAC. This classy youngster is now at the head of Mr. Jas. J. Jeffries' herd and his future is particularly bright.

There are just a few bulls in this sale but they are real herd headers. They are sired by great sires and from high record dams.

Dairy Herd Improvement Proved.

[Written for Pacific Rural Press.]

Three thousand two hundred and twenty-seven dollars a year is the additional income C. S. Rasmussen of Humboldt county receives on his herd of 132 cows as a result of herd testing for butterfat and the use of good registered Guernsey bulls for six years.

Seven years ago when Mr. Rasmussen took possession of his present ranch, comprising some 240 acres, he bred both Holsteins and Jerseys, but later decided upon Guernseys with the result that he not only purchased registered Guernsey bulls but a small foundation herd of registered Guernsey cows as well.

At the outset he entered his entire herd in the local cow-testing association, gradually culling out the older cows and those with poor yearly averages of butterfat, replacing them with younger females of his own breeding and out of the highest producing cows in the herd.

The result of this system is best explained by the annual reports of the Ferndale Cow Testing Association, which show the following averages for the years 1909 to 1914, inclusive:

Year	Cows tested.	Average lbs. fat.
1909	123	227.4
1910	121	279.7
1911	123	301.6
1912	113	313.1
1913	130	275.1
1914	132	308.9

It will be noticed that in 1913 the average decreased, but this was caused by flood conditions on the ranch and not by breeding or culling.

Clover and rye grass pasture, hay and root crops have been the feeds used exclusively, the cows being bred to freshen every 12 months, thus allowing them a 10-month lactation period and two months rest before freshening again.

Both the purebreds and the grades are run on a purely commercial basis, no attempt being made to get a high record on any one cow, but rather to keep them all on a high uniform average production of fat. Notwithstanding that, one of the registered cows, Gypson's Isabella, made 500 pounds of fat or the equivalent of 600 pounds of butter as a two-year-old.

Another factor which tends to keep down the herd's annual fat production is the addition of 25 to 30 heifers to the herd each year, making a total of 55 to 60 two- and three-year-old heifers in the herd at all times.

In the course of time this condition will be overcome, and as the purebreds increase in numbers, they will be cared for separately and put on official test, thus making a better average annual production for the entire herd.

Among the herd sires with which Mr. Rasmussen has accomplished his surprising results, some of which are still in use, are the bulls Imp. Raymond's Pearl King, sired by Imp. Raymond of the Preel IV. and out of Princess May of Hunguets IV., a prize winner in 1910 and 1912, having an official Island record of 585 pounds of fat. Two daughters of this bull sold at Florham Farm auction sale in 1915 for \$2,000 each, and Mr. Rasmussen has several

daughters of this bull in his herd at this time.

Among the younger bulls which are in service are Isabella's May King of the Pacific, a grandson of Imp. King of the May and out of Gypson's Isabella, with a record of 500.89 pounds of fat under dairy conditions as above stated. Pacific Glenwood Yekra, a grandson of Glenwood Boy of Haddon, who sired Dairymaid of Pinehurst who has a yearly record of 910 pounds of fat, is another of the young bulls now in service, and Isabella Pacific Glenwood is another one. This latter one was sired by Glenwood of Rosendale, a fine individual out of Countess Fantine, 502 pounds fat at two and a half years of age.

With his practical knowledge of herd improvement, as shown by results in the past seven years; and with climatic conditions favoring the growth of a large variety of rich succulent feeds, Mr. Rasmussen should be able to make some very creditable official tests in the future.

RAISING HEIFER CALVES.

[Written for Pacific Rural Press.]

In visiting dairymen in all parts of the State, it is evident that too much importance cannot be attached to the practice of everyone raising his own heifer calves.

Sometimes an entire community is visited where market conditions have not seemed to favor this practice; but usually at least one herd in all such districts is outstanding in quality both as to production and type.

Such is the case with the herd of John Foletta of Monterey county, where the custom for years was to make cheese, buying cows instead of raising them in the majority of cases but never seeming to have a definite object in view when they did breed for heifers; as bulls were selected indiscriminately.

For over 15 years, Mr. Foletta has been using purebred and registered Holstein bulls, sometimes paying what seemed an exorbitant price, but always with the view of improving his herd.

As a result of his work he now has what is conceded to be the finest herd of dairy cattle in the Salinas valley; and even though his product is sold to a milk condensary, he continues to breed and raise heifers.

Raising the Calves.—This is done by feeding whole milk for about two weeks after the calf is born; after which the whole milk is reduced and a handful of linseed oil cake meal added to each calf's ration. Water is also added to dilute the mixture, which is fed till the calf is 3½ to 4½ months old, the latter for calves born during the winter months.

By that time it has received a good start and is well able to care for itself on pasture till it freshens at two years of age.

Needless to say his breeding to good bulls has given him a larger herd production; and it has also made his females highly prized and priced among neighboring dairymen.

The melting point of southern-made butter is higher where cattle are fed cottonseed products.

Three Years With a Silo and Silage.

[Written for Pacific Rural Press.]

In August, 1913, the writer visited the ranch of R. F. Guerin in Tulare county and found under way of construction a silo, also a farmer with enthusiasm for the silo, but an enthusiasm founded on the experience of others rather than on his own.

When we again visited Mr. Guerin this summer we found a man with a much broader vision of the benefits of silo than was the case three years ago.

Erected primarily for the purpose of affording his purebred Holstein herd a better balanced ration in connection with alfalfa we found it had filled that requirement to a nicety. Naturally it has saved hay, but of equal importance it has increased the milk flow perceptibly.

But above all that, it has made possible a better system of farming which has resulted in more feed being grown to the acre. This is accomplished by the plowing up of old alfalfa, badly infested with Bermuda grass, and using the land for grain and silage till such time as the ground is again in the proper physical condition for alfalfa planting.

After plowing up the sod in the fall the land is planted to barley,

usually in January or February—earlier plantings grow too rank and lodge before harvesting time.

By the latter part of June the grain is ready to harvest, the yield this year averaging 25 sacks to the acre. As soon as the grain is threshed the land is irrigated and plowed and then planted to corn, usually somewhere near the fourth of July. In the four seasons that he has grown corn Mr. Guerin has found that corn must be planted either as early in the spring as the weather will permit or else some time between the first and fifteenth of July. That also seems to be the experience of others in the same district.

After planting, the corn is cultivated till it reaches a height of six or eight inches, when it is irrigated, and another irrigation is applied when it begins to silk out. By culture the average yield of silage per acre has been around 15 tons to the acre, which, with the 25-sack crop of barley that has preceded it, makes the land handled in this way extremely profitable. So much so, in fact, that Mr. Guerin believes there should be a silo on every alfalfa ranch where dairy cattle are kept.

Work and Cows a Good Combination.

[Written for Pacific Rural Press.]

Plenty of hard work and dairy cows will help a fellow lift himself up by his boot-straps better than anything else R. F. Guerin of Tulare county knows of, for that is virtually what he has done since he came to California a number of years ago.

The first years were mostly hard work, for he started with small capital and had to get along with a poor bunch of cows. But even poor cows work while you sleep and little by little he was able to improve their breeding.

Finally he began growing alfalfa seed; and with the money from that, he bought purebred Holstein calves from one of the prominent Holstein breeders of that time.

To the average farmer's mind in those days this was a rank piece of

foolishness, but to Mr. Guerin it looked like good business, not solely on account of the possibilities of selling breeding stock because that end of the purebred business lacked development in those days, but because he wanted cows that would produce the maximum amount of butterfat.

Now after some 10 years' experience as a breeder Mr. Guerin looks at the business in the same light as he did when he started. It is to the purebred Holsteins that he gives most of the credit for the 180 acres of land that he now owns and farms; and while he has realized additional money for his young stock because of their registration, the cream check has been the big factor in all of his financial reward.

MENDOCINO COUNTY HOGS.

[Written for Pacific Rural Press.]

In Potter Valley, Mendocino county, hogs were shipped out by the hundreds last week. Not because they were shy of feed, as it is in some instances, but because the prices were right and the animals were finished and ready for marketing. They were some of the finest hogs I have ever seen.

As I was about to leave this Valley, I met Gowan Bros. one morning when they were loading up their truck with pigs to go to the Ukiah market. The boys told me that they usually hauled five at a time on their truck, but were unable to get on the fifth one that morning, so they had to take four and let it go at that.

These four pigs were about six months old, and when we got to town I found out what the four pigs weighed. They weighed 921 pounds, or nearly 231 pounds each. Some

pigs! How can it be done?

I will tell you in a few words how the Gowan Bros. did it: When in the dairy business at Shelter Cove, Humboldt county, they learned that skim milk was not only a great feed for small pigs, but also good for fattening them. They believe that all the grain fed to hogs should be properly ground. They found that ground barley mixed with skim milk from the dairy, if mixed and allowed to stand in barrels about 36 hours before commencing to feed, gives best results. Even corn ought to be soaked before feeding.

They raised about 50 head this year, and a butcher could hardly see the difference between them, so equal were they in size. The hogs were a cross between Poland-Chinas and Hampshires, and were sold in Ukiah for 7½¢ per pound.

Note: Unpasteurized skim milk is held responsible for the large percentage of tubercular hogs coming from the dairy districts.

THE RAREST OF HIS RACE

Uniformity

Production

Color

Manteca, King of the Black and Whites, 187787, is one of the most grandly bred bulls of the breed. His sire is King of the Black and Whites, a son of Marion Walker Pietertje, a 31.63 pound cow and grandson of both Aabby Hartog Clothilde, and Mary Walker Pietertje, each with a record of over 31 pounds. His first 7 dams are over 30 pound cows, 4 of which have each produced 30-pound cows, that in turn have produced 30-pound cows each with a 30-day record of 125 pounds or more.

The dam of our young bull is Belle Segis Colantha, daughter of Belle Segis, a 31.60-pound cow, the 2d best daughter of King Segis. The dam made a record as a 2-year-old, of 17.84 pounds with first calf, and she is just good enough so that I will refund \$400 of the purchase price of the bull if she does not make 30 pounds or over next spring.

The first 13 dams in his pedigree average over 30 pounds. Where can you find better breeding than this?

This bull is a fine individual, more white than black.

PRICE \$1250.

Nothing adds to the cost of hay more than handling and for that reason R. F. Guerin of Tulare county stacks all of his hay for winter feeding in the field.

This field is also used for pasture and to regulate the amount of hay eaten by the cattle a fence is strung around the stack. During the winter the hay is fed from the stack instead of hauling it in to the milking barn which would necessitate a lot of additional work at no saving in hay.

POLAND CHINAS

We have 20 head of good gilts and 2 two-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, Reserve Champion at the P. P. I. E. Also a few extra good young boars ready for service sired by I. B. A. Wonder.

Also a fine lot of Fall pigs.

We please you or refund your money.

W.A. YOUNG, Lodi, Cal.

Why Do Little Pigs Die?

To the Editor: When anything ails a little scrub black pig, I can bring it to the house and after proper treatment of a few days, put it back in the pen in fine condition. Since I have been breeding a registered Yorkshire boar on common sows, if, at farrowing, any of these white ones are not just as lively as they should be and I take them home for treatment, as I did the scrubs, they die every time. I have stopped trying with them. What is the matter? I give them cow's milk, warm from a bottle, but they scour on it, while the scrubs do not, and any scour treatment that I give is of no avail. Are young Yorkshire pigs not robust? Should cow's milk be diluted for baby pigs? I tried that too, but nothing would bring them on. The black ones thrive on whole milk.—A. L. W., Barstow.

[Answered by C. F. Tubbs, Calistoga.]

Purebred swine are able to assimilate a great deal more nutriment than scrubs—that is, a given amount of feed will go further with purebreds than with scrubs—hence the reason for the former making faster and cheaper gains.

A young pig's stomach is very susceptible and easily disarranged, and if fed too much whole milk will assimilate too much protein therefrom, become scoured, and probably develop acute indigestion, from which it dies. An experiment along these lines was made at the Iowa Experiment Station not long ago, in which purebred weanling pigs were fed whole milk until they died, the reason being—too much protein and lack of carbohydrates to make a balanced ration.

Skimmed milk is much better, and can be fed without fear of disastrous results, although a certain amount of whole milk would do no harm.

I have never tried taking a young pig away from a sow, shortly after it has been farrowed, as the teat which it has been suckling will dry up almost immediately, and hence it will not receive sufficient nourishment after it has been put back. I think it better to leave a pig alone, and it will usually come out all right if there is nothing materially wrong with it.

One of the main characteristics of the Yorkshire breed is the lively, healthy litters they produce, and the strength of the pigs from the day they are born.

I had a good deal of experience raising scrubs before establishing a Yorkshire herd, but none of them could compare with Yorkshires in this respect, consequently I have never had occasion to try doctoring a Yorkshire pig in the manner described by Mr. Waterman.

If the young pigs are not as strong as they should be, it would appear that the sow has not had proper care during pregnancy, lack of mineral matter, or something of the sort. Perhaps she was fed too soon after farrowing. Purebreds require more care than scrubs, but they are so much more profitable to raise that any extra care or labor expended will come back many fold in the returns.

[Answered by A. D. McCarthy, Riverina Farms, Modesto.]

We have 50 purebred Yorkshire brood sows on our place that farrow an average of ten pigs and raise bet-

ter than an average of eight. It is impossible for me to answer the Waterman letter intelligently for the reason that I don't know how the sows are handled or fed. A Yorkshire sow regularly farrowing 9 to 14 pigs, if the entire litter is to be raised, would probably require different treatment before farrowing than a scrub sow farrowing 4 or 5 pigs and probably raising 3. If both the scrub sow and the Yorkshire sow are fed properly, the Yorkshire sow will not require any more feed than the scrub sow in order to grow out the pigs properly before farrowing and furnish sufficient milk to keep them in a strong, healthy condition; but it is probable if the two sows were turned out to rough it that the ten pigs of the Yorkshire might not be as strong as the four pigs of the scrub. The Yorkshire is generally admitted to be one of the most hardy of all breeds. We have never had any trouble and never heard of anyone else having trouble with weak pigs from Yorkshire sows. We occasionally do have a weak one and we don't waste much time with them. If they are chilled or anything of that kind we take them in, feed warm milk and if they show signs of vigor, we put them back with the sow. If they don't come around quickly, we put them out of their misery.

Our experience has been that in raising both Yorkshires and other breeds, the Yorkshire will thrive on whatever is good for any hog.

CHEAP SCALDING WATER FOR THE DAIRY.

[Written for Pacific Rural Press.]

A simple but efficient sterilizing vat and fire box is in use on the ranch rented by Healion Brothers in Monterey county.

In making it a heavy piece of sheet iron was used for the fire box and kettle support, being round in shape, riveted at the ends, and about three feet high, with an opening near the bottom for firing purposes.

The large iron kettle fits snugly into the top of this iron frame and the entire outfit sets on the concrete floor of the milk house, having a stove-pipe connection to carry off the smoke. A board cover lies on top of the kettle to keep the steam from escaping. When necessary the entire outfit can be taken apart with little trouble or moved to another place on the cement floor. With it there is no danger of fire and it is easy to keep in clean and sanitary condition.

Following is the list of cows in the Yolo, Solano, and Colusa counties cow-testing association that produced over 50 pounds of fat for the month of October: C. Garrett, Williams (D), 79.95; O. P. Gilliam, Dixon (H), 67.73; J. Watson, Dixon (H), 62.82; J. Watson, Dixon (H), 60.10; W. W. McNair, Dixon (J), 59.13; J. Watson, Dixon (H), 58.25; G. B. Isham, Woodland (H), 54.34; Hughes Bros., Woodland (D), 53.45; H. and O. Wildenkorf, Woodland (H), 52.96; W. H. Martin, Woodland (H), 51.60; O. P. Gilliam, Dixon (H), 51.47; F. Beebe, Woodland (J), 51.00; W. W. McNair, Dixon (J), 50.97; W. Gould, Woodland (H), 50.94.

The Alpha Automatic Power Spray Outfit

Fitted with 2 in. or 2½ in. Automatic Duplex or Triplex Pump.

Equipped with the New Mechanical Automatic Pressure Governor

THE TWO ESSENTIALS in a power sprayer are a thoroughly dependable engine of ample horse power and a positive and reliable pressure regulator that will insure uniform pressure and safety; also eliminate unnecessary wear.

THE AVERAGE SPRAY RIG IS EQUIPPED with a cheap engine and a makeshift pressure relief valve or diaphragm, which is exposed to the corrosive action of the spray material, which soon puts it out of commission.

THE ALPHA AUTOMATIC PRESSURE GOVERNOR with which the Alpha Spray Outfit is equipped is a simple arrangement of a combined lever and spring on each plunger connecting rod, which, when the pressure reaches a pre-determined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.

THE POWER PLANT DEPENDING on the size rig is either a 2½ H. P., or a 3½ H. P. Alpha Engine, equipped with a "built in," gear-driven, positively timed magneto, requiring no batteries or coil, and is easily started on the magneto without cranking.

CAN YOU AFFORD to own a spray outfit that will balk? When you get ready to spray you have no time to tinker with a defective engine, pump, or relief valve, but want an outfit that is capable of a continued high pressure maintenance, and one that is thoroughly dependable in every particular.

THE ALPHA AUTOMATIC SPRAY OUTFIT will meet your most exacting demands. The entire frame work is made of channel and angle iron, fitted with a wrought steel bed-plate on which the engine and pump are mounted, direct connected with machine-cut steel gears.

BUILT IN ALL SIZES from a 2-inch pump and a 100-gallon tank to a 2½ by 3-inch pump and a 200-gallon tank. (Either duplex or triplex.) Brass fitted throughout.

IT WILL PAY YOU to investigate thoroughly the merits of the Alpha Combination Power Sprayer before buying.

GEO. A. SMITH'S 8th SALE

CORCORAN, CAL.

WEDNESDAY, DEC. 15

75 Extra Fine Nicely Marked Selected High Grade Bred Holstein Heifers, from 20 to 28 months old. Fresh and coming fresh soon. Bred to purebred Holstein bulls, sired by Registered Holstein bulls, and from heavy producing grade Holstein cows. They are the heavy milking kind and a very desirable lot. A better or more uniform lot of heifers has never been offered for sale in this State. This is your opportunity to buy some good useful, promising heifers at your own price.

These heifers are the property of the La Hacienda Ranch. For the sake of convenience they will be sold at the Geo. A. Smith Home Ranch, 2 miles south of Corcoran.

TERMS: A credit of 12 months will be given with approved security. Notes to bear 8 per cent interest. Five per cent discount for cash.

IN ADDITION TO THE ABOVE GEO. A. SMITH WILL SELL:

10 Registered Holstein Bulls, ready for service, from great milk and butter producing ancestry.

10 Registered Poland China Sows, and 10 Registered Poland China Gilts, sired by Iowa Wonder and bred to Joker, First Prize boar at the Wisconsin State Fair.

10 Registered Poland China boars ready for service.

Regular Milk Flow.

[Written for Pacific Rural Press.]

Three silos with a total capacity of 645 tons play an important part in the feeding operations on the Peacock Dairy in Kern county, where 145 dairy cows are milked, and where it is necessary to secure about the same milk flow each week in the year in order to fill a whole-milk contract.

Here silage is so well thought of that it is used as a feed in connection with alfalfa hay and brewers' grain during the major portion of the year, being substituted when the supply is exhausted by dried beet pulp.

This year 90 acres of land were planted to corn, Red Cob and Yellow dent being the seed used, but the former being preferred because it produces more fodder.

The custom is to grow a crop of barley hay on the land before the corn is planted, this calling for corn planting about the last of June. Before planting, the land is plowed and then irrigated, the dry plowing being practiced because it tends to retard the growth of Bermuda, which is a serious pest in the locality.

The Giant Of The Dairy

Grade up with a Jersey Bull! He is half the herd, and the breed determines half the profits. Breed him to your grade cows and bring the herd average near the Jersey average—489 pounds of butter fat per year. Your calves will be beauties. They'll mature quickly into gentle, hardy, vigorous and persistent milkers, long-lived and adapted to any climate. Let us tell you more about them. Send for our book, "The Story of The Jersey." It's free and it's a dandy. Write for it now.

Portland Seed Co., - Portland, Ore.
Spokane Seed Co., - Spokane, Wash.

Thorough cultivation is given the fields as long as practicable and when it is no longer possible to drive through the field, another irrigation is applied for the purpose of pushing the later growth along faster through the additional moisture supply. By this system of culture the usual yield is 15 tons to the acre.

Not the least of the advantages of a silo on this ranch is the fact that it keeps the milk flow up as well as pasturing, without the resultant loss from bloat, loss of feed, and damage to alfalfa plants that follows pasturing. Sometimes pasturing is practiced on old stands in the fall, after the last cutting, but never on young alfalfa.

BEET PULP AND ALFALFA.

To the Editor: If grade Holstein cows, fed alfalfa hay and a little pasture, give one pound butterfat per cow per day, will it pay to feed 5 pounds dried beet pulp per day per head when it costs 1 1/2 cents per pound?—R. D. K., Richfield.

This question was answered in the issue before it was asked. We would add that alfalfa hay alone is not an economical feed for cows because its excess of protein over the required ratio of protein to carbohydrates is wasted, while it could be used for additional production if combined with a carbohydrate food to balance its excess protein. If your cow is not far past freshening, a noticeable gain in milk and butterfat would probably follow addition of beet pulp to the ration. If she is far along, the beet pulp will put her in good condition for heavier production after her next calving.

Veterinary Queries.

TELLING COW'S AGE.

To the Editor: A cow has four rings around the horns. How old is she? Can you tell a cow's age by her teeth?—M. F., Groveland.

[Rings around the horns are not absolute proof of age. The teeth are positive proof. At four she will have six permanent incisors; and at five all eight of the incisors will be permanent.]

PERSISTENT DIARRHOEA.

To the Editor: A cow has had diarrhoea all summer but eats well and is in fair condition. Was feeding alfalfa meal and coconut cake, but stopped that and now give her dry pasture and alfalfa hay. Is not any better. Has access to salt. Will chew any piece of leather she can get. She is in calf and milking well. Does not cough or have any difficulty breathing. Is 15 years old.—A. C. S., Hayward.

[Age is against this animal. Give her four 30-grain tablets of sulphocarbolates twice a day.]

SWELLING ON HOCK.

To the Editor: A 16-months colt has a bad swelling on the side of the hock, but from no apparent injury. It is gradually growing larger, is soft, and does not seem to bother the colt.—H. E. J., Woodland.

[Apply tincture of iodine to this swelling with a tooth brush and rub in well for five days; then skip four days and repeat this process for an indefinite period until a cure has been attained.]

REMCO

Air-Dried Redwood

PIPE For Irrigation—Water Supply—Power. Sizes 8 inches to 12 feet. For pressure up to 400 feet head. Guaranteed for 100 per cent overload.

Costs less than any other pipe of equal capacity, efficiency and endurance.

Not affected by worms or insects, acid or alkaline soils, electrolysis or roots.

Withstands extremes of heat and cold, dryness and moisture.

Outlasts any pipe except cast iron, and maintains its full flow capacity to the end.

TANKS For Water—Wine—Vinegar—Oil—Acids—Solutions. For Storage—Mixing—Fermenting—Pickling—Leaching. In all shapes and sizes—500 to 650,000 gallons.

SILOS For Dairymen—Stockmen—Feeders. Sizes, 25 tons to 300 tons. The STANDARD.

ALL REMCO PRODUCTS are manufactured to your order from CLEAR, AIR-DRIED REDWOOD. Selected from our stock of forty million feet. Their outstanding features are HIGHEST GRADE MATERIAL, SUPERIOR EFFICIENCY, MECHANICAL PERFECTION, MAXIMUM DURABILITY.

Raising Poultry for Profit

PULLETS SPOILED IN THE RAISING.

[Written for Pacific Rural Press by Mrs. Susan Swayngood, Pomona.]

Some interesting facts may be reached from the egg-laying contests, when they are carried on by people who know and are willing to tell the truth concerning them.

In Petaluma Poultry Journal for Nov. 15, we learn that Mr. Hogan, of the Hogan system renown, was called to Pullman, Washington, to select the layers for the contest now going on. Mrs. Helen Dow Whitaker, director of the Washington experiment station, gives a few sidelights on the manner of judging the pullets. Mr. Hogan was handling a pullet which should produce 115 eggs in present condition and 220 eggs in good condition. Said she to him, "There is a chance for us to make a good showing in the contest." "No," said Mr. Hogan, emphatically; "there is where you make a mistake. This bird is immature; she has a slight cold; she has other indications of low vitality. With such a handicap, in spite of all you can do, she will mature so slowly that she won't get down to laying until January. She has then only nine months instead of twelve to make her record in. Further, she has not the vigor to digest enough food to lay heavily during those nine months." "Then," I asked, "why do you score her 220-egg type?" Because," said he, "that is her type—the capacity, the build is there, but she couldn't lay 200 eggs."

The reason is this: the pullet had been hatched late, from stock that was probably overworked as breeders, or overfed, to make them produce more eggs; then, in addition to being hatched late, from weak parentage, the weather had not been ideal, and she had caught a slight cold, perhaps in chickhood, that was never quite cured, and she had not been fed just right all along the journey.

People that raise good, well-boned, vigorous, healthy pullets, that are fit to hold their own in an egg contest, are as few and far between as the great stars in drama. I am not afraid to say that ninety-nine pullets out of every hundred are spoiled in the raising. People do not need to keep thousands of hens to make a comfortable living, if they adjust the business so that some pullets are coming in to lay when others are resting, and they raise the pullets in the right way. Mrs. Whitaker states that there are 1116 hens in the contest. During the first 17 days 2073 eggs are laid, and they were sold for \$79.46. Still further in her account, which I have received from a Washington friend, she says, "Twelve hundred hens, well selected, can be made, in a year, to yield a profit of 10 per cent on the capital invested, and a monthly salary of \$100 or over, depending on the skill of the caretaker."

To get her figures she estimates the lay of the 1200 hens at 150 each, or egg sales totaling \$4500 for the year. At the end of the year the birds would be worth 30 cents each, or \$360, for table purposes only. Mrs. Whitaker places the cost of

feed for each hen at \$1.80 cents, the total cost for the year reaching the sum of \$2160. Adding the cost of hens, or raising pullets at \$1 each, would bring the total cost up to \$3,360. Interest at 10 per cent on cost of housing the birds was figured at \$240 for the year, and salary of the owner, or caretaker, at \$100 a month, adding \$1200, giving a grand total expenditure of \$4800.

There are one or two things that might play havoc with that \$100 a month and 10 per cent. Mrs. Whitaker forgot that some of the flock would most likely turn up their toes; perhaps they might be ungrateful enough to do so before laying any or all of the portion of eggs allotted out to them as their part in the rounding up of the grand total of figures. Second, I read that paper to a man who has lived in several parts of Washington, and he says: "Somebody ought to go and steal that egg-laying contest before it gets into trouble. He says you can't sell eggs for cash at any price in Washington; every farmer keeps a few hens, and the farmers' wives trade the eggs for groceries or whatever they want, getting about 10 cents a dozen as an average price in summer and more in winter, but that 'real' money is seldom passed in a farming community for eggs in Washington."

In California I know that we can not raise good pullets for \$1 apiece, but feed is sure to be cheaper in Washington. And it is quite possible, too, that marketing conditions have improved since my friend lived in Washington; time was when we, too, traded eggs for groceries, but we have several big markets in this State, while Washington has not any big centers that are not surrounded by thousands of acres of land, fit only for farming and livestock. Our fruit industry cuts off very many people from raising poultry, because they cannot raise any feed for them. So, taking things altogether, we may say this is the ideal State for poultry raising from every point of view. We have the climate, the cash markets, big centers that demand quantities of eggs and poultry at fair prices.

QUESTIONS ANSWERED.

Hen's Necks Drag.—A few of our chickens have something the matter with their neck this week. They drag it on the ground, and run their head in the ground, and are not able to stand up. I hold their throat so that they can't swallow, and pour some coal oil in, and let it run out, then grease the neck with oil and lard, and they seem to get all right in a few hours. Kindly tell me what it is.—Mrs. G. E. S.

Your hens have been eating maggots that lodged in the throat. It would not hurt to let some of the coal oil go down the throat. Your treatment is as good as any, but you should find the source from which the hens are getting the maggots, or some may die.

Tobacco vs. Worms.—How much tobacco shall I use for worms for grown hens and young chickens; and how often shall I give it to them to keep worms down in general.—R. P. F.

Soak the tobacco in hot water un-

til it is strong, about like black tea. There is no particular amount. I would just mix about a quarter pound to 100 hens, and mix in mash so, all will get it. About once a month for keeping them clear.

Chickens' Feet Draw Up.—What is the cause of chickens losing the use of their legs. The feet draw up and seem to be in a paralyzed condition. Have good henhouse, feed wheat mornings and nights, ground wheat and barley at noon, and plenty of fresh water.—G. W. M.

Your chickens have rheumatism; the cause is not so easy to discover. It may be from inherited weakness, from cold, damp ground, or from a lack of some such element, as iron in the drinking water.

If the attack is recent, put the birds on a good bed of straw, and let them have all the sunshine possible. Sometimes a change of climate will both cause it and cure it. I bought a very valuable bird once from another State, and two days after he arrived I found him stretched out on his side with his toes all drawn up. I removed him to a sunny place that was protected from north winds and rain; and in a week he was all right, and never had another attack. If you will shelter the birds, and give them a little iodide of potassium in the drinking water, you will be doing about all that is possible. Give fifteen grains of the potassium in one quart of drinking water and see that they drink it. Also, if you can manage to add some alfalfa, green or dried, to your noon mash, it will be a great help. While your feed is generous, it is rather one-sided.

How Many Males?—Please tell me if all geese hiss, or is it just the ganders. Also will two geese lay fertile eggs from one gander? Also how many roosters with thirty-six hens—Black Minorcas?

No the geese do not hiss—just the gander, and he stretches his neck out when he hisses, as a rule. Yes, two geese to one gander are all right. Give them a tub of water to mate in, or there will be no goslings. You will need at least three males to thirty-six hens for good results, and four would be better.

Sparrows Eat Feed.—I am building a new poultry house and scratching shed, as the sparrows rob my chickens of so much feed. Can you tell me how to keep them out of the scratch shed.—J. B.

Use one-inch mesh wire on the front instead of the regular two-inch; the birds got through my two-inch mesh wire and ate and scratched

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from 1/2 inch to 1 1/2 inches then 20 inches of 3/4 inch mesh, topped by 4 1/2 inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it. "CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

my sprouted oats until I put one-inch wire on. Now they can't get in. It costs a little more but it saves much more than the difference in cost.

The present has been one of our best turkey seasons.

CHINESE EGGS.

The American egg-preserving plant, owned and operated by the Amos Bird Co., of Boston, Mass., and recently completed at Shanghai, is now handling 300,000 eggs daily. The product is either frozen or dried, and shipped to the United States, at present via the Pacific Coast.

The frozen product is divided into three classes—whole eggs, egg yolks, and whites of eggs. The dried product consists of whole eggs and egg yolks. In both instances the eggs are churned or "scrambled." The albumen is largely used in the manufacture of candies in the United States, while there is a demand for the frozen product at bakeries and hotels.

American machinery is used in this plant with results which are entirely satisfactory. The eggs are purchased in the Shanghai market, and the price paid averages more than half a cent apiece. Two hundred Chinese are employed and half of these are girls. Chinese girls break and examine the eggs, handling an average of 3,000 a day. In the same class of work in the United States, it is understood that American girls break and examine an average of 4,000 a day. Chinese men "candle," or examine eggs by holding them before an electric light, and average about 16,000 a day. All the Chinese employees are inspected by an American physician and all are vaccinated. Cleanliness is noticeable on all sides.

It is estimated that the Chinese girls and other employees in this egg plant are paid less than a quarter of the wages received by Americans in American plants of a similar character. While the Chinese girls will, no doubt, become more proficient with experience, they are not yet able to perform as much work as female labor in similar lines in the United States. Their present pay is approximately \$5 a month. — Consular Report.

MASH FOR HENS.

To the Editor: Kindly send me a formula for a mash feed for laying hens.—W. V. T., Watsonville.

[Answered by Geo. H. Croley, San Francisco.]

A very good, simple formula, for laying hens, that can be fed either moist or dry is made of the articles mentioned below. These are all staple articles that are for sale in practically all feed stores. Articles by weight:

Twenty lbs. bran; 20 lbs. shorts; 20 lbs. white middlings; 20 lbs. ground barley; 15 lbs. meat scrap; 5 lbs. ground bone; 2 lbs. granulated charcoal; 3 lbs. fine ground shell.

The above mixture fed with about 100 pounds commercial scratch feed, or mixture of a number of different kinds of grains, will come very near being a perfect balanced ration.

OATS OR BRAN?

To the Editor: Please tell me which is the best feed, ground oats, or wheat bran?—Mrs. M. H.

Good wheat bran contains 88 per cent of dry matter, 5.8 ash or bone-and-shell maker; 12.2 per cent protein or muscle-maker; 45.3 total carbohydrate and its nutritive ratio of protein and carbohydrates is

1:3.7. Wheat bran varies so much in quality that it is hard to say when it is good. If good it is richer in protein than oats, but it does not contain as much starch or oil. As a whole, good ground oats are cheaper, because they contain more heating value than bran. Pound for pound, you will get more food value at the prices now quoted than you will from bran.

LEAVES FOR LITTER.

To the Editor: Are dry leaves suitable for chicken litter or part of it?—B. L. B., Modesto.

Dry leaves are good for chicken litter, if they are not allowed to become moldy.

POULTRY NOTES.

Orland is to have a poultry show early in 1917.

The poultry crop of Fallon, Nev., yielded last week about \$12,000 cash. Turkeys figured largely in the shipments.

The annual State Poultry Show to be held at Modesto Dec. 6 to 9 will be under the direction of the Stanislaus Poultry Association.

The poultry convention of Loomis last week resulted in the organization of the Placer County Poultry Raisers' Association.

J. Will Blackman, president of the National Poultry Company, and breeder of fine bronze turkeys in the Imperial Valley, has just sold a fine bronze gobbler of 40 pounds for shipment to Bringham, a suburb of Melbourne, Australia.

M. A. Schofield of Gardena, at a meeting recently, in speaking on breeding of poultry, said: "There is much to be said on feeding the hen to see that she gets the right amount of food units in her egg. A watery egg never hatches a good chick."

William Young of the Young's Market Co., Los Angeles, is just back from an inspection trip through the turkey country of Arizona and the Imperial Valley, California. He says he found turkeys scarce and high; the high price of feed causing growers to market their turkeys early and save feed.

Entomologists of the United States Department of Agriculture have demonstrated that all species of lice which infest poultry may be quickly destroyed by the application of a very small quantity of sodium fluorid, according to the annual report of the Chief of the Bureau of Entomology just issued. Entire flocks of poultry were cleared of the parasites in this way and were found to remain free when ordinary precautions were taken against reinfestation by contact with infested fowls.

That eggs are high and getting higher, should surprise no one, when it is known that there is a marked shortage in cold storage stocks and that this is the period of low production. Consumption is holding up fairly well, and some eggs are being exported by the way of Canada. The government report shows that there were in 142 cold storage warehouses November 1, 1916, 2,794,295 cases against 3,686,533 cases the same date last year, a shortage of 1,392,238 cases. This showing, with the fact that winter has yet to be gone through, has caused a general and decidedly bullish sentiment.

MOTOR CAR FIGURES.

President F. L. Brown of the Elgin Motor Car Corporation, Chicago, is one of the industry's most optimistic boosters. He quotes below a few of the industry's staggering figures:

Motor cars registered in 47 of the world's leading countries, 3,108,468. Motor cars now registered in the United States, 2,500,000. Value of cars owned in U. S.,

\$2,500,000,000.

Average value per car, \$1,000.

Number of cars to each mile of American highways, 1.

Proportion of cars to U. S. area, 1 car to each 1½ square miles.

Increase in real estate values due to transportation by automobile, 100 to 400 per cent.

Value of cars exported in 1915, \$100,000,000.

Annual new roads and improvement expenditures, \$300,000,000.

Motor car steel used in 1915, 670,000 tons.

Imitation leather used in 1915, 3,280,000 yards.

Top material used in 1915, 11,405,250 yards.

Hickory and other woods used in bodies, 1915, 8,450,850 board feet.

Hinges used in 1915, 4,893,560.

Additions to factories in 1915 total 11,000,000 square feet.

Cost of these additions, \$12,000,000.

Number of motor cars which made the transcontinental trip in 1915, 5,000.

Number of men employed in the industry (approximately), 700,000.

In the United States there is one car to every 40 people.

In Iowa there is 1 car to every 19 inhabitants.

In Los Angeles there is 1 car to every 8 inhabitants.

To test out the commercial feasibility of the manufacture of potash from kelp on the coast of Southern Calif., the U. S. Dept. of Agriculture has definitely decided to go ahead and establish the experimental station, for which \$175,000 was appropriated by Congress at its last session.

It is announced from Highland, that Stockton and Patterson, owners of the Hoosier ranch, have sold their orange crop on the trees, off forty acres, estimated at 28,000 field boxes, for \$18,000 cash.

Poultry Breeders' Directory

ROOFDEN RANCH CHICKS—January will soon be here. Book your orders now for early delivery. Barred Rocks, B. I. Reds, Black Minorcas, Brown and White Leghorns. Quality chicks from first-class breeding stock. Hatched right and shipped right—at right prices. By the dozen or thousands. We can fill it if you book in time. Circular for the asking. Roofden Poultry Ranch and Hatchery, Campbell.

BARRIED PLYMOUTH ROCKS—(Cockerels—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champions. Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog, Chas. E. Voden, Box 296, Los Gatos, Calif.

WANTED—A number of hot water incubators. Jubilee preferred. 200 egg capacity or over. 220-egg type, Hoganized, S. C. White Orpingtons and Sicilian Buttercups, cockerels, hatching eggs and chicks. All information gladly furnished. M. S. Woodhams, San Mateo, Cal.

INCUBATOR CHICKS—Thoroughbred White Plymouth Rock, \$25.00 per hundred; White Leghorn, \$12.50 per hundred. Highest class of stock bred to standard and to lay. Awarded all first prizes at California State Fair 1916. Mahoney Farm, P. O. Box 597, Sacramento, Cal.

CROLEY'S DRY MIXED INFANT CHICK—Feeds for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by Geo. H. Croley Co., Inc., Poultry Supplies, San Francisco.

McFARLANE STRAIN White Leghorn Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$8.00 per 1000; chicks, 12c each, until March 1st, then 10c. Big plant, lowest prices, best stock. Catalogue free. Newton Poultry farm, Dept. 1, Los Gatos, Cal.

DANISH S. C. W. LEGHORNS—If you want to increase the size and vigor of your stock or the size and number of your eggs, use one of our cockerels. River Bend Farm, St. Helena, Cal.

THE SANTA CLARA VALLEY HATCHERY solicits your orders for Fall and Spring delivery in all breeds of baby chicks. Order early and get the best. Jos. A. Bihn, Lincoln Ave., San Jose, Cal.

SICILIAN BUTTERCUPS—Best stock from Vermont and Pennsylvania. Fine cockerels with spotted hip fluff, bring spotted pullets; \$5 each. Eggs from extra fine matings, \$3 per 15; \$5.50 per 30. Orders booked for Spring delivery. Home half mile west of Graton. All welcome. J. Parnell, Rt. 1, Box 64, Sebastopol, Cal.

BABY CHICKS NOW READY—Hatches every week. R. I. Reds, Barred Rocks, White Leghorns hatching now. Brown Leghorns and Black Minorcas later. Place Spring orders now, and be sure of getting them when you want them. Send for circular and price list. Campbell Poultry Ranch, Campbell, Calif.

EASTMAN'S BRED TO LAY Barred Plymouth Rock Chicks, Eggs Cockerels. Fairmont Poultry Farm, Fairmont, Cal.

WHITE WYANDOTTES—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. R. W. Staweteld, Route 2, San Jose, Cal.

HATCHING EGGS from our "Bred-to-Lay" S. C. White Leghorns. Season opens Dec. 1st. The early hatch lays the early winter egg. Booking now. E. H. Dickinson, Dept. IV, Los Gatos, Cal.

HIGH GRADE ANCONAS—Fancy and utility. Settings, \$3.50. Fertility guaranteed. J. R. Bell, Livermore, Cal.

SILVER-SPANGLED HAMBURG—Hens, Pullets, Roosters. Entire flock. None better. Tribble Nurseries, Elk Grove, Cal.

DAY-OLD CHICKS—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

CHICKENS, DUCKS, GEESSE, GUINEAS, Pea Fowl, Pigeons, Wm. A. French, 545 W. Park St., Stockton, Cal.

BLACK MINORCAS—A few well-bred cockerels, \$2 each. Mrs. C. E. Parsons, Nevada City, Cal.

TURKEYS, DUCKS AND GEESSE.

BOURBON RED TURKEYS—Early maturing, creamy skinned. The stay-at-home kind. Our stock winners at P. P. I. E., Los Angeles California State Fair. Rich, dark-red young Toms, sired by 1st Los Angeles Old Tom, \$8 and \$9. Pullets, \$6. Can mate stock not skinned. Ferris Ranch, Rt. 2, 144 D. Pomona, Cal.

BOURBON RED TURKEYS and Eggs for hatching. My birds won all the honors in the Alameda County Poultry Exhibition in Oakland, 1914, and just as fine this year. A. E. Balmer, Alhambra Valley, Martinez, Cal.

THOROUGHBRED WHITE HOLLAND and Bourbon Red Turkeys. Toms \$5; Hens \$2.50. Old White Holland Toms, \$7.50. Pearl Guinea, \$1 each. E. A. McKinley, E. D. Ukiah, Cal.

HART'S BRONZE TURKEYS AND EGGS—Large reduction in price of stock. Order now for fall delivery. Free Circulars. Albert M. Hart, Clements, Cal.

California Poultry Practice

A Practical Treatise on Poultry Raising in California

By Mrs. Susan Swaysgood

Writer and Breeder of Utility Poultry.

160 pages of text, besides many full-page illustrations. Cloth bound.

This Book Will Help You in the Many Details of POULTRY RAISING.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

WALTER M. ROSS,

SECRETARY,

224 W. Colorado St., Glendale, Cal.

Mrs. Best's Letter.

My dear Friends: I saw such a pretty afternoon dress in one of the stores this week that I want to tell you about it. The material was pink silk crepe and the skirt was full with several broad tucks. The waist was very simple, plain but loose, both front and back, with round neck, while the sleeves were rather snug and very long, coming well down over the hand.

The unusual feature was the blue velvet Japanese collar. As you doubtless know, these collars open on the shoulders and the front is almost as high as the back so that the effect is very different from the ordinary V neck. A narrow band of the velvet confined the sleeve at the wrist and finished in a bow.

Another very handsome afternoon dress was of white velvet made with a plain skirt with an eight-inch band of dark fur. The waist was simple, fastening across the shoulder and under the arm, with a high standing collar at the back and the sleeves were of white crepe rather snug to the elbow when they flared out gradually until at the wrist they were fully six inches wide and finished with a three-inch band of fur.

Many of the afternoon and evening dresses are made with a long loose bodice almost like a middy. They are especially pretty when braided or beaded in contrasting colors.

The dancing dresses are quite largely made of tulle over satin, but there are some very pretty ones with flounced skirts of metallic lace.

For party petticoats there are white satin skirts with wired crepe flounces bound in satin and also soft crepe de chine with lace flounces. Lace from an old dress could be utilized that way for some girl for a pretty petticoat.

Bolivia cloth and velour in a wide range of colors can be purchased by the yard and a clever seamstress could make a coat at home in the loose styles, when there is no interlining required.

Cut steel buckles are shown on the new dark dancing pumps—the larger they are, the better style they seem to be. Gold and silver cloth slippers still lead in popularity, and although they are high in price, they last much better than the satin.

I recently saw a most attractive muff and hat set made of a combination of Paisley and dark fur. The muff was of two strips of the fur at the edge and the center a strip of Paisley, while the small toque was made entirely of Paisley with narrow bands of fur for trimming.

Sport garments seem to be just as popular one season as another. One of the new sport skirts is of white satin made very full and plain, shirred onto a belt, each shirring having an inch heading. The full patch pockets had the same style shirring. To wear with this skirt was a sport shirt made with a thousand-tuck front with high turnover collar, long sleeves and plain back with yoke.

Rosabella Best.

Gilt frames should be washed with plain water with a little flower of sulphur dissolved in it.

THE HOME CIRCLE

NOVELTIES IN THE SHOPS.

One of the shops is showing a "boodle bag" which is a satin envelope purse, lined with chamois and attached to a round garter, to be worn below the knee.

Little powder books are covered with satin of a dainty color and then have a case of filet crochet.

Crepe-de-chine handkerchiefs in soft colors are being shown with hemstitched edges and also with a crocheted edge and cross-stitch design in one corner.

Enameled Parisian Ivory for toilet sets is wonderfully attractive and orders will be taken at one of the very best stores for any individual designs.

Handkerchiefs for children are shown in sets of three with Mother Goose pictures and rhymes upon them.

Bonbon dishes of enameled wood in many beautiful colors are shown. Orders will be taken for any desired color.

IRONING HINTS.

Have your ironing board well padded and the cloth clean, otherwise the results in fine work will not be satisfactory.

A quarter of an inch of tallow candle to a tablespoonful of starch makes the ironing easier, and gives a slight gloss. The garments should be thoroughly dried, then sprinkled with warm water, and rolled tightly and left until uniformly damp.

Lace edgings should be gently pulled out first with the fingers, or the delicate little outer edgings will not show.

A delicate lace insertion or insert, which is beginning to show signs of wear, may be strengthened and made to last twice as long by a lining of thin Brussels net.

TOMATO CATSUP.

Editor Home Circle: I should like a recipe for tomato catsup. — Mrs. M. B., Raisin City.

Wash and quarter $\frac{1}{2}$ bushel ripe tomatoes. Cook until soft, remove from fire and rub through wire sieve. Add to the strained juice, 2 teacups of salt, 2 teacups of mixed spices, 1 quart of vinegar. Boil over a slow fire for two or more hours, stirring constantly to prevent burning. Fill the bottles to overflowing with the hot liquid and seal at once. Wrap in paper to exclude the light.

AN ORIGINAL FRIEZE.

If the wall of your room is painted or papered with plain paper, you can make a frieze by cutting art pictures, photographs or magazine covers.

Paste the pictures on plain wall paper that harmonizes with your room, and then tack carefully around the room. If the pictures are well arranged, the effect is very unique.

TO WAX A HARDWOOD FLOOR.

If the floors have never been finished, they must be scraped and sandpapered, then they are ready for the hardwood filler. This can be purchased ready-made, but can be made more cheaply at home. To two quarts of boiled linseed oil, add one and one-half packages of common cornstarch. Stir well with a paddle and add a pint of gasoline. It should then be about the consistency of common varnish.

With a wide brush, go over a spot as wide as you can reach and let dry for fifteen minutes. Then with a handful of excelsior or shavings rub crosswise of the floor first and then lengthwise.

Hard rubbing brings out the grain of the wood as well as filling the pores.

Proceed in this manner until the whole floor has been gone over and then let dry twenty-four hours.

Prepare your own wax by melting in a dish set in a kettle of hot water one-quarter pound beeswax and one quart turpentine. When melted add one teacupful ammonia. Apply hot in strips with a soft paint brush.

After twenty minutes, polish with a weighted brush, first across the grain, then lengthwise.

This amount of wax will do for two rooms. If there is any left, put away in a closed tin to use later in touching up worn places.

REVARNISHING OLD FURNITURE.

Articles of furniture that need revarnishing should first be thoroughly sandpapered. As sandpaper comes in various degrees of fineness, the rougher quality should be used first to remove the top varnish. Then the use of the finer grades completes the work without danger of scratching the wood.

All carvings or indentations must be cleaned carefully, or the succeeding coats of varnish will fill up the spaces so that the original design is lost.

When this has been done, a thin coat of the best varnish should be applied. Three coats of varnish are necessary, and after the first and second coats, the varnish should be worn down slightly with the finest sandpaper. This prevents blistering or too high a lustre.

Where a stain is desired on any article, always apply it before the first coat of varnish. Never mix the stain with the varnish.

SWEET POTATOES WITH APPLES.

Put one cup boiled sweet potatoes (cut in $\frac{1}{4}$ -inch slices) in a buttered baking dish. Cover with $\frac{3}{4}$ cup pared and thinly sliced apples; sprinkle with $\frac{1}{4}$ cup brown sugar, dot over with 2 tablespoons butter and sprinkle with $\frac{1}{2}$ teaspoon salt; repeat. Bake in a moderate oven 1 hour.

MOCHA BUTTER CREAM FILLING.

Work 6 ounces of sweet butter until creamy. Beat whites of 4 eggs to stiff froth. Place 5 ounces of granulated sugar with a little water in a small sauce pan and let boil until the sugar forms a soft ball when dropped into cold water. When the sugar is cooked, pour it slowly in the stiff egg whites, stirring briskly. Let cool, then add the butter and some coffee extract and work together a few minutes. Spread between layers of cake.

PRIZE FOR DRIED PEAR RECIPE.

For a better recipe for cooking dried pears, than the one below, F. T. Swett, pear grower of Contra Costa county, offers to Pacific Rural Press readers a 20-pound box of dried pears.

A Spanish friend taught Mr. Swett and his family to like cooked dried pears. Says he: "I have been drying pears for 20 years; but until this year, we have never made regular use of them at our own ranch and family tables. Most folks who experiment with them quite naturally assume that they should be cooked just like dried apples. The result? Usually a soft, slushy, mussy, sloppy mess. One trial. Never again."

A Spanish friend taught them how to do it right. "It isn't a new recipe; it's probably been in use for hundreds of years. Wash the fruit clean, and simmer for a half hour. By that time the pears will have swelled to almost original size, but will not have softened so as to fall to pieces. If you kept on stewing they would. Take the pears out, lay them in a shallow dish or pan, strain the water back over them, sprinkle sugar over the pears, flavor, if you wish with spice to taste, and bake for fifteen minutes. They will come out of the oven nicely baked, with the sugar crystallized on the surface of the pears. Serve with cream, and you have a dish that everybody enjoys. Dried pears, according to analyses, are one of the most nutritious of fruits; and at the same price per pound have a greater food value than dried apples."

DYEING.

With the use of gasoline and oil paints, the veriest amateur can have fairly good success in dyeing articles. Take a bowl of gasoline and squeeze into it enough tube paint to produce the desired color. Be sure the color is thoroughly dissolved before dipping the article.

White silk gloves may be made any desired shade, while lace can be made a perfect match for any dress goods.

Ostrich feathers are very easy to dye. If much soiled, they should be given a bath in clean gasoline first and then shaken dry before dipping in the dye.

Flowers that have faded may be touched up with a paint brush dipped in the gasoline dye, if it is not desired to have them all one color. Party slippers of delicate shades may be treated the same way.

MUSIC IN THE HOME.

Mothers should remember that music belongs to the child as one means of expression. The tendency of small children to sing at their play should be encouraged that they may grow up to love music.

If there is talent to produce music on instruments, by all means encourage it, but to enjoy music does not necessarily carry with it the ability to produce.

If the household has either piano player or Victrola, have records of good music. It is a mistake to think that children care for only light, cheap music. A taste for good music and a familiarity with the works of the masters can be cultivated and is a never-ending pleasure.

WORRY.

Kathleen Wheeler Ross.

They are peering in the windows,
They are climbing up the wall,
The things that we are dreading,
But which never come at all.

They play upon our heartstrings
With a sad and warning note;
They beckon with long fingers
From their hiding-place remote.

They disturb our peaceful moments;
They intrude upon our joy;
They choose the queerest pretexts
To approach us, and annoy.

They stand beside our guest-chairs,
Uninvited, at the feast;
They creep into our pleasures
Just when we expect them least.

Very ghostlike in their actions,
Drawing nearer, they appall,
Those things which we are dreading,
But which never come at all.

So like ghosts they should be treated,
Laughed at, banished, put to rout,
As the filmy clouds above us
Vanish when the sun comes out.

ELIZABETH'S CHOICE.

By Amy V. Beal.

This is a true story about a little girl named Elizabeth. She was ten, and she had a sister Lucy, who was eight, and a little sister Frances, who was only four.

They were very nice little girls, and they loved one another dearly. Elizabeth was generous and unselfish, and often sacrificed her own pleasure to make her sisters happy.

Grandma liked to reward Elizabeth for her unselfishness, and so, one day, she said to Aunt Daisy:

"I have asked the little girls to come over this morning and get the presents we brought them from Europe. I am going to let Elizabeth choose the one she likes best. I think she deserves a reward for sending Frances driving with Aunt Mary yesterday, in her place. She was very good to give up her treat to make her little sister happy."

The little girls soon arrived, and Grandma kissed them and helped them take off their coats and hats. Then she led them into the living-room. The three gifts were lying in their boxes on the table: a turquoise ring, a little pearl locket, and a bracelet with a tiny clover on it.

"Oh, how lovely!" cried Elizabeth. "Weren't you good to bring us such pretty presents, Grandma?"

"Which is for me?" asked Lucy with shining eyes.

"Me choose, Grandma?" said little Frances, with an engaging smile.

"No, dear," answered Grandma, "Elizabeth is to have first choice this time, because she was so good to let you go with Aunt Mary yesterday. Come, Elizabeth, which do you like best?"

Elizabeth clasped her hands and drew a long breath of excitement

and rapture.

"They're all so beautiful," she said. "May I really do just as I like about choosing, Grandma?"

"You certainly may, dear; this is your choice."

Elizabeth looked at the gifts again closely, and touched each with a careful finger, lingering over the locket. Then she glanced at Lucy's wistful face, and at Frances, who was resting her little nose on the edge of the table in her endeavor to see the pretty things.

"Which do you wish you had, Lucy?" Elizabeth asked suddenly.

"Oh, the ring, the ring!" cried Lucy, dancing up and down.

Elizabeth took the ring from its box and handed it to her, and was nearly choked by Lucy's "bear-hug."

"Which do you like best, Frances?" Frances stood on tip-toe and waved a fat hand.

"I fink I'd ravver like the bracelet," she said. Elizabeth clasped it on her chubby arm, and Frances gave her a big, big kiss.

"Then this is mine," said Elizabeth, joyously, taking up the little pearl locket. "It's just what I wanted, Grandma. Thank you a hundred times for it."

As she kissed Grandma, she whispered, "It's lots of fun to have first choice, isn't it?"

Grandma looked at the little sisters dancing for joy, and then at Elizabeth's radiant face, and smiled.

"It is when you are generous," she said softly.

What do you think of Elizabeth's choice?

HOUSEHOLD HINTS.

After washing your dust cloths and rinsing well, saturate with coal oil and hang out to dry.

To prevent odors of cabbage in a kitchen, set a small can on the back of the stove with a little vinegar and let it simmer.

To clean silverware, dissolve two pounds of salsoda in a gallon of water, let it come to a boil and either add a sheet of aluminum or put in an aluminum pan. Add the silver, boil a few minutes and rinse in cold water.

To cleanse teeth, dip a cloth in peroxide and then in powdered pumice stone and rub over the teeth until all stains disappear.

For hardwood or painted surfaces, dip a cloth in coal oil and rub over the woodwork. It will cover all scratches and fly specks.

CORN, SOUTHERN STYLE.

To one can chopped corn, add 2 eggs slightly beaten, 1 teaspoon salt, ½ teaspoon pepper, 1½ tablespoons melted butter and 1 pint scalded milk. Turn into a buttered pudding-dish and bake in slow oven until firm.

STEAMED CORN MEAL PUDDING.

Put 1 quart milk in double boiler; when very hot, add 1 cup corn meal slowly and cook, stirring constantly till grains of meal are soft and transparent. Remove from fire; add ½ cup sugar, 1 cup suet, free from strings and finely chopped, ½ cup flour sifted with 2 teaspoons baking powder, 1 teaspoon salt and 1 teaspoon ginger; mix thoroughly, turn into a well-greased pail with fitted cover, and steam 3 hours.

Serve with stewed apples, pears, or plums, and hard sauce. One cup dried fruit—dates, figs, or raisins—may be added before steaming, instead of using stewed fruit when pudding is served.

"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

Ghirardelli's Ground Chocolate

It's easily assimilated — it's extraordinarily nutritious — and it is supremely delicious."

It comes PROTECTED—as all chocolate should—in ¼-lb., 1-lb. and 3-lb. hermetically sealed cans.

Lunches and Learning.

We haven't seen Farmers' Bulletin No. 712, but if it contains all the sensible suggestions on the wisdom of serving hot lunches in public schools that we are told it does, it should be in the hands of all parents of children attending public schools in the country, and also of the school teacher; and they should co-operate with a view to replacing the stone-cold and unappetizing lunch eaten by so many little school children with something warm and nourishing. Cold victuals chill the stomach and stimulate but feebly the flow of gastric juice, upon which the digestion of the food so largely depends. Unless the child is very robust and full-blooded, cold food lies on its stomach like a lump of lead, and is about as nourishing. These are the days of sullen skies and wintry

winds, and the depressing chill of wintry weather should be thrown off at the noon hour in the little country schoolhouse by eating a good, hot, appetizing meal. We have a cult of food faddists among us who seem to feel it a religious duty to warn the rest of human kind against hot meals, or food that is cooked at all, eaten hot or cold, and point to the eating habits of the animals of the field and declare theirs to be the "natural" way. But if these people would stop long enough to dissect the digestive apparatus of various animals of the lower order and make comparisons with the digestive equipment of man they would quickly perceive that Nature never intended the digestive process to proceed in the same way in the two organisms. Fire is the peculiar prerogative of man, and its possession and use argues some relationship to his comfort and welfare.

So give the country school child a square lunch, with at least one dish of hot, fresh-cooked food, if only a bowl of soup or a cup of hot milk or cocoa. It will impart added vitality, and capacity for absorbing more instruction, and send the little one home bounding and buoyant. Send for the bulletin and learn more about it.

Bad Mouth-Hygiene.

If you don't own a tooth brush invest two-bits and acquire one. It's as necessary to cleanliness as a bar of soap or a nail-brush, and from the standpoint of sanitation even more important. The dirt on the outside is not near as deleterious to health as the dirt on the inside, and the unclean mouth generates more disease germs in a day than you can count on a Burroughs adding machine in a week. Just because you never used a tooth-brush in your life and have lost only half your teeth by neglect, is no reason why you shouldn't start in now and try to save the rest. You seldom meet a man or woman displaying a row or two of rotten and rotting fangs who hasn't a chronic whine about ills and aches of sundry kinds and degrees. The mouth is a hotbed of microbic infection. Bad mouth-hygiene is a large factor in the development and continuation of catarrh, and is frequently a contributory cause of pneumonia, not to mention numerous stomacach and intestinal ailments. An aggravated case of the bad result of neglected mouth hygiene was once witnessed in a dental clinic in San Francisco. A girl of 15 or 16 from the squalid quarters "south of the slot" had applied to the professor of ophthalmology for treatment of a pair of badly inflamed and matterated eyes. Prof. C. observed a mouth full of decayed, discolored teeth, covered with sordes. He told the girl the condition of her teeth was responsible for the condition of her eyes, and sent her to the dental clinic. All of her teeth—what was left of them—were removed. She was asked to report results in a few weeks, which she did. To the surprise of the young medicos who had never seen a similar case, the eyes were nearly well, though the girl was still toothless. The writer lost track of the young lady shortly afterward, and was not profoundly sorry—though it was a very interesting case pathologically.

BEANS.

Trading continues as active as ever, being now mainly on the colored varieties, which continue on the upgrade. Pinks have advanced rather sharply this week, and bayos also are up a little, though other descriptions show no further change. The white beans are said to be pretty well sold out everywhere, and other varieties are moving off faster than usual. Shipments from Stockton have been very heavy, and it is said that the bulk of the crop has already gone out from that section.

[On wharf, San Francisco.]

HAY.

The serious local shortage resulted in a strenuous effort on the part of dealers to get cars, which resulted in a slight increase in arrivals on the city market during the week. The shortage had begun to interfere seriously with general business, and shipments were made largely in open cars, which fortunately suffered no damage. Dealers are predicting a great deal of difficulty in the city during the winter on account of the car shortage, which looks as if it would continue for some time. Local prices have naturally remained very strong, and are not necessarily in line with country values. The light offerings are quickly sold out from day to day, and a good deal more could be used. There is a fair export demand, but shortage of vessels as well as cars interferes with shipment. The country demand is quite strong. Alfalfa comes in fairly well by boat. Straw is in good demand.

[Wholesale prices per ton, carload lots, San Francisco.]

POULTRY.

At present writing it is impossible to say what the wind-up of the turkey market will be, but the week has started extremely strong, for ordinary as well as choice birds. Arrivals have been fully as heavy as usual if not heavier; but everything appearing is readily taken, and there seems to be a large speculative demand. Fine stock sells for 30c, or possibly a little more, and off-grade lots bring almost as much. Live turkeys also have advanced. Chickens are in liberal supply and rather quiet, without change in price; while geese show a further advance.

DRIED FRUITS.

Notwithstanding the holiday interruption, the market continues very active and strong for everything on the list. Apples are in especially strong demand, both for export and for the Middle Western markets, and supplies are running rather low. There is also quite a demand for apricots, despite the high prices. Growers are already well sold out, and stock in packers hands is now moving off. A few white figs are coming out, and black figs are higher. Stocks of prunes in packers' hands are light, and there is said to be nothing of any consequence left in the country, while there is considerable export inquiry. The shortage in other lines is causing more interest in pears, and choice stock is bringing high prices.

Special Livestock Market Report.

Los Angeles, Nov. 28.

Cattle—There is no change to note in this market from a week ago. A very good number of California hay-fed cattle were in the past week, and in good condition. They met with a very good demand and old prices were fairly sustained. Killers were all in the market and wanted supplies. Fat cows and heifers, as well as steers, met with a fair demand, and what came in were sold without trouble.

Quotations f. o. b. Los Angeles:
Beef steers, prime 1000 to 1100 lbs.\$7.00@7.75

Stockers and feeders5.50@6.00
Prime cows and heifers6.25@6.50
Good cows and heifers6.00@6.25

Hogs—Steady and rather firm hog market was had the past week. The rain was fairly good and mostly from California, with a few scattering lots in from Idaho. While the receipts showed fair flesh, they were not so well finished as previous years, showing the effects of the high price of feed. Killers were all in the market, and wanted supplies and the arrivals were placed without trouble.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs.9.25@9.50
Mixed, 200@2509.25@9.50
Light, 175@2009.25@9.50

SHEEP—The run the past week was only fair and mostly made up of yearlings and lambs from Arizona and Utah. The offerings were in fine condition. But few heavy sheep in. Killers were all in the market and wanted supplies and a firm and fairly active market was had for all offerings at old prices, and more could have been disposed of if here.

Per head f. o. b. Los Angeles:
Prime wethers\$7.00@7.25
Prime ewes6.50@6.75
Yearlings6.50@7.00
Lambs6.50@7.00

CALVES—Receipts only fair and market steady, and those coming in selling without trouble. Bringing \$8.50 to \$9.50 per cwt.

San Francisco, Nov. 29.

Cattle are scarce and not much available stock in the country. Medium to

heavy weights are wanted. No surplus of these exists as there was a year ago. There will probably be a fair demand for them all winter. Very few people are feeding grain to beef cattle now, considering the prices of both.

Hogs of 175 to 200 pounds are wanted, as usual, and all offerings of good stock this size are welcomed. Hog receipts now are of very good quality.

Sheep for butchering are practically all in the hands of packers or butchers now. The new crop of lambs is expected to be somewhat heavier than a year ago; and at the same time demand is likely to fall off on account of the talk of high-priced lamb. Probably more young breeding stock was reserved this year than last for the year before; but its influence cannot be felt next season on the meat market. The country is bare of wethers on account of the high prices ruling for lambs last season.

[Prices paid for stock, live weight off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

Green Mountain range horses, 950 to 1200 lbs.20@75

GROCERIES.

The general market is strong, but with few price changes. Graham flour and some other mill specialties are higher. Bluestone is a little lower.

LOS ANGELES.

Los Angeles, Nov. 28, 1916.

BUTTER.

Receipts of week ending Nov. 28, 1916—261,600 lbs.

Receipts of week ending Nov. 28, 1915—227,490 lbs.

The market was hardly so firm the past week, though it strengthened up toward the close. The first half of our review week the market broke a cent under larger receipts. Since the opening of the current week, the early loss has been regained under the influence of stronger markets East, values there being so high as to draw shipments from the Pacific coast. This is also the period of light production and increased home consumption incident to the tourist season, which is now opening, and is having its influence. While receipts are running somewhat better than a year ago, prices are 10c higher.

Special Citrus Market Report.

Los Angeles, Nov. 28.

Shipments of oranges from Southern California, from November 1 to November 20, 354 cars of oranges and 338 cars of lemons. The shipments for the same time last year were 395 cars of oranges and 219 cars of lemons.

Shipments of oranges from Central California from November 1 to November 19 were 197 cars, and lemons, 73 cars. Shipments the same time last year were 46 cars of oranges and 30 cars lemons.

Shipments of oranges from Northern California from November 1 to November 19 were 167 cars and lemons none. The same time last year the shipments were 12 cars oranges and no lemons.

The Eastern market held up fairly well on oranges, but it was dull and lower on lemons the past week. But with the arrival of new navels a weaker market is looked for.

Locally the market the past week did very well. New navels coming in in quantities to control the market, and they were given the preference over Valencias, which are lower. The new

navels coming in are of good color and testing well and finding ready sale. Local packers are still paying 2 and 2½¢ per pound for them in the grove. With this competition Valencias have dropped down to 2 and 3¢ in the grove, and the new navels are being given the preference at the difference in price. Grapefruit is steady at 2 and 2½¢, and is meeting with a very good demand. Lemons continue to drag at 1½ and 2¢ per pound in the grove. Weight of oranges, loose box, 50 to 55 pounds; grapefruit the same. Lemons, loose box, 55 to 60 pounds.

FROM EASTERN AUCTION SALES.

New York, Nov. 27—Nine cars Valencias and seven cars of lemons sold. Valencias 25¢ higher; lemons 15¢ lower. Weather fair. Valencias averaged \$3.50 @ \$6.45. Lemons averaged \$2.50 @ \$3.35.

Boston, Nov. 27—Eight cars sold. Market strong on oranges, unchanged on lemons. Valencias averaged \$3.75 @ \$4.85. Lemons averaged \$2.70 @ \$3.30.

Philadelphia, Nov. 27—Two cars sold. Market better on lemons. Lemons averaged \$3.00 @ \$3.55.

Publisher's Department.

Two weeks ago the editor "spoke his mind" freely about not liking the quality of paper we were using, which brought from many readers responses, the tenor of which makes us feel better. One writer says: "Honestly and truly, we think only of two things: Selfishly, first, the profit and pleasure we get, and then the big-hearted, strong and faithful editor and friend who makes the paper what it is."

Another subscriber writes: "Your paper has come to our home for more than twenty-five years, so you see we enjoy it very much."

A newer subscriber from La Jolla writes: "Kindly change my address to Anaheim. I have read the Rural Press until I got the fever, with the result that I have purchased a ranch near Anaheim."

Mr. Douglass of Hanford writes us that he has taken the Rural Press for about forty years, and hopes to continue several years more.

We stated last week that the third edition of "California Vegetables" was nearly exhausted, and that fact is more nearly true now. Owing to the high cost of making books, we will not get out a new edition for some time. If you want a copy of the book, send in your order. Price, \$2 postpaid.

HOW CATTLE RUSTLING WAS CHECKED.

[Written for Pacific Rural Press by C. E. Robertson.]

The cattlemen of Humboldt county have been losing stock for years and local conditions are such that they did not seem to get anywhere, individually, in suppressing cattle rustling.

During the spring of 1915 I gave this subject considerable attention, having the District Attorney draw up a paper offering a reward of \$500 for the conviction of parties unlawfully killing or stealing cattle and \$100 reward for unlawful killing or stealing of other stock.

As a result of this I was able to secure subscriptions totaling \$1,000; and at a well attended meeting held August 15, at Bridgeville, a committee of five was appointed to draft constitution and by-laws, the Humboldt Stockmen's Assn. resulting from this committee's work at Eureka, November 27.

The dues were fixed at \$3 annually with a \$5 initiation fee, but after several months the dues were reduced to \$1 a year and the initiation fee was abolished. Last August the writer was authorized to secure new members at the reduced fee and secured 140 members, owning 70 per

cent of the range cattle in the county.

Our second annual meeting, held at Fortuna October 7, was not only well attended but we also had as speakers Prof. Gordon H. True of the University of California and Geo. A. Clough of San Francisco, attorney for the California Cattlemen's Protective Ass'n and owner of large cattle interests in Tehama county.

At this meeting it was decided to reduce the dues permanently to \$1 a year, it being the impression that this will pay a secretary and the running expenses of the association. When special funds are needed to assist in prosecuting cattle rustlers it is probable that an assessment of not over three cents a head on all cattle in the association will finance any ordinary prosecution.

The activity shown here has checked three-quarters of the loss of stock in Humboldt district; and Mr. Clough was promised the support of our association for the Hide and Brand law which the State Association is advocating. This law is patterned after that of Arizona, which has stopped 95 per cent of the cattle stealing there.

THE NATIONAL CONGRESS OF HORTICULTURE.

An organization under the above name was effected in Washington City, November 17, 1916. The event was the outcome of a meeting called by the American Pomological Society. It is intended that the organization shall serve as a clearing house for national, international and interstate problems, legislative and commercial questions; and also as an active agent in the collection and dissemination of scientific, statistical and economic data in so far as such touch upon the development, promotion and progress of American and foreign horticulture.

The preliminary steps are looking to the establishment of an organization of from 50,000 to 60,000 members, ultimately to include every paid-up member of all horticultural organizations in the United States, the active voting membership to consist of delegates appointed by the affiliating bodies on a basis of something like one delegate for each one hundred members.

This scheme in its entirety contemplates a real or actual Congress, meeting annually and having an active voting membership from 500 to 600, with a corresponding attendance at its sessions, which would be business meetings for the discussion of the big interstate, national and international fruit, flower, vegetable, ornamental, seed and plant problems of this United States.

ANGORA PRICES.

To the Editor: What is the average price for Angora wool? What is the price for young Angora goats for meat?—L. O. H., Hanford.

The average price for wool taken from Angora goats is 35¢ per lb. where it is long, and 25¢ per lb. where it is short. Fat young Angora goats that are shorn would be

worth 3¢ to 3½¢ per lb. Alive and unshorn, with good fleece they would be worth 4¢ to 4½¢.

There is not much of an outlet here for goat flesh, but from time to time small lots of one or two carloads are purchased.

"HOW TO LIVE ON LESS"—a guide to cheaper living. Wholesale catalogue free. Pacific Co-operative, A236 Commercial St., S. F.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. SMITH'S CASH STORE, 106 Cay St., San Francisco.

SEEDS, PLANTS AND TREES.

ALFALFA PAYS!—Fancy, double-recleaned, dodder-free alfalfa seed from non-irrigated stands. Purity 99% plus. Reasonable prices. Also Scarified White Sweet Clover Seed. Free bulletin on Sweet Clover. Ralph Waldo Elden, Central Point, Oregon, Box 22.

CELERY SEED FOR SALE—Dwarf Golden Heart variety. Produced from seed purchased from C. C. Morse & Co. Strictly fresh and clean. Price, per pound, \$1.50. James Mills Orchards' Corporation, Hamilton, Cal.

WALNUT TREES—Franquette, Mayette and Mammoth on Black Root; also Grafting Wood and Black Seedling Trees. Lowest prices. Mammoth Walnut Nurseries, Watsonville, Cal.

MISSION OLIVE TREES—Raised from my own bearing trees. This is the only sure way to get what one wants. W. A. Hayne, Box 461, Marysville.

SUDAN GRASS SEED WANTED—This year's crop. Send sample and amount you can supply to J. P. Cundell, Lathrop, Cal.

QUALITY TREES—Seedlings, 5¢. Prunes, 10¢. Walnuts, 30¢. Cash Nurseries & Seed Store, Sebastopol, Cal.

WANTED.

WANTED—Young men and women to attend the Western Normal Courses—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A," Western Normal, 524 E. Market St., Stockton, Cal.

AGENTS—Take orders for raincoats. Big commissions. Easy profits. Cooper made \$314 last month. We deliver and collect. Sample coat free. Comer Mfg. Co., 12 Cable St., Dayton, Ohio.

PRUNING WANTED—By a thoroughly competent pruner; work on vines or trees. Address P. W. Brodt, 2150 Center St., Berkeley, Cal.

COUNTRY LANDS.

STANISLAUS FOOTHILL COUNTRY—After extensive search over California I purchased a year ago excellent 300 acres bench land bordering Stanislaus River, very attractive scenically on main highway S. F. to Yosemite. Soil and climate adapted to fruits, oranges, nuts and alfalfa—we are specializing on almonds and alfalfa. Tract watered by gravity ditch. Brother and self developing portion for own holding. Practically all balance sold to parties doing same. Will sell the three or four fine remaining tracts to desirable parties at very reasonable price and long time. Bank references. George S. Henry, C. E., Oakdale, Cal.

RANCH FOR LEASE for a term of years and stock for sale. 120 acres of Alfalfa, A-1 building, in the Modesto irrigation district. Two strings of A-1 grade Holstein cows, horses, hay, hogs and implements. Will take part cash and give long time on balance. \$6000 will handle this nicely. J. R. Coon, Route A, Box 220 Modesto, Cal.

40 ACRES choice level land. Improved. No alkali. Bargain price Might trade. John Buck, Chowchilla.

Read How Fortunes Are Made Quick by Pulling Stumps

LET me send you my new, fine free book at once. I want to show you *proof* of how you can turn each acre of stump land into a double profit the first year, in extra crops and added value of land—by pulling stumps with the Hercules All-Steel Triple-Power Stump Puller—and how you can make *big money* in your spare time by pulling stumps for your neighbors or by renting your machine at a nice fat profit.

**HERCULES
Hand-Power
Stump Puller**
LOW PRICE

120,000 lbs. Pull
ASK US ABOUT IT

My book shows *actual photographs* and prints *actual letters* from many owners, telling of the remarkable feats of the Hercules—how it pulls any size stump, green tree or hedge in less than five minutes—how it

easily pulls *an acre a day*. Read how one man increased his land value from \$25.00 an acre to \$125.00. Read why the Hercules is the *best investment* you can make now. The

Hercules Triple-Power Portable Stump Puller

is the puller that has the single, double and triple power features, giving you three machines in one. One man with a team can handle it and move it from place to place. No heavy lifting. The new portable is equipped with a solid steel bedplate and broad steel wheels. There isn't a stump, green tree or hedge grown that the Hercules won't pull out without straining or breaking any castings. It's the low-down constructed puller that has self-anchoring and stump-anchoring features—the one with double safety ratchets that insure the absolute safety of men and team. I want to send you a Hercules on

more will surely follow because of Hercules quality and efficiency. So I can easily afford to sacrifice my profit on the *first* machine in each locality. Take advantage of this big profit and big saving opportunity *now*. Besides my 30 days' free trial offer and money-saving price I give you a

3-Year Guaranty

that means something. The *all-steel construction*, the *triple-power* feature that saves your team and gives a tremendous increase of power, the *double safety ratchets* and the careful *turning and grinding of every part*—all these things make it safe for us to guarantee the replacement of any casting of a Hercules that breaks any time within three years, whether it is the fault of the machine or your fault.

This Free Book Tells All

Just simply send your name and address on the coupon or on a postal so I can send you the convincing facts about the superiority and efficiency and value of the Hercules Stump Puller. Only 5000 of these machines will be sold at this remarkable introductory price, so get your name in now. My new book is a beauty. See the real pictures of big stumps it has pulled out like you would pull weeds. Read the many interesting letters from farmers, lumbermen and land promoters. Stumps, stumps, stumps, pulled out quick, making fortunes for owners of Hercules Stump Pullers. I want you to know the facts. Just mail coupon or postal *now*. I'll send the book and price by return mail. I'll tell you the best crops to raise on virgin land where stumps were before. I simply want to get my free book to you at once, so that you can read the remarkable facts about the Hercules All-Steel Triple-Power Stump Puller and how it does such a splendid work making big profits for owners everywhere.

30 Days' Free Trial

so you can see how powerful it is and how easy it works. I want you to know for yourself that the all-steel construction means 60% less weight and 400% greater strength than cast-iron or "semi-steel." Besides that, I want to save you big money on the cost. I'm making a

Special Price Proposition

to the first buyer in 5000 different parts of the country. If I get one Hercules in each locality

Coast vs. Valley Seed of Red Oats.

[Written for Pacific Rural Press by G. W. Hendry, Univ. of California.]

THE California Red Oat, variously known as Texas Red, and Rust Poof, is the standard red oat variety of California. It is cultivated in all parts of the State and is widely known and highly prized because of the fine quality of hay which it yields. It is practically the only variety cultivated in the interior of the State, but in the coastal sections it comes into competition with the black oat (North Finnish Black). The black oat is a large, vigorous, coarse growing, late maturing variety, requiring a long, cool, humid growing season. It is slightly more rust resistant and yields more grain and more, but coarser, hay than the red oat in the coastal sections, particularly on the better soils. In the interior of the State the climatic conditions are not suited to this variety and it does not produce well except under the most favorable conditions.

Only one variety of red oats is grown in California, but two classes, based upon geographical origin, are recognized by the grain trade. These two classes are known as coast red and valley red. The coast red is produced largely in western Humboldt, Mendocino, San Mateo, Monterey, and Santa Barbara counties, and is easily recognized by its large size and dark color. It averages 17 millimeters in length by 3.2 millimeters in thickness. The valley red oat is produced in all parts of the Sacramento and San Joaquin valleys, particularly the latter; large quantities being exported each year from the Lodi and Oakdale sections. It is easily distinguished from the coast red oat by its lighter, paler red color, and its smaller and more slender kernels. It averages 14.8 millimeters in length by 3 millimeters in thickness. These two classes of red oats seek the markets and compete as seed in all parts of the State, a condition which has resulted from the general sentiment among farmers that an exchange of seed is a good practice.

Numerous experiments have been conducted in recent years, both in California and elsewhere, in which home-grown seed of various cereals has been compared with imported seed of the same variety, and almost without exception the home-grown seed has given the better results. And so the doctrine of home-grown seed has originated and has been spread by the United States Department of Agriculture and the several State experiment stations. But farmers in general are a conservative lot, slow to adopt new practices, and the California grain farmer in particular is almost a reactionary in this respect, and has consistently continued to import his seed, especially his oat seed, which he gets from the seaboard for planting in the interior of the State.

In the light of previous experimental work this practice might be regarded as unsound, but we have proven it to be not only a sound prac-

tice, but under certain conditions, particularly when oats are grown for hay, to be highly desirable. The fact that most of our red oats is cut for hay rather than for grain makes of this crop an exception to the general rule, and coast oat seed has been found to be decidedly superior to the home-grown seed for the production of hay in the interior of the State.

On the seventh of March, 1916, typical lots of coast and valley red oat seed were planted at Davis for comparison. The coast seed came from the Salinas Valley, and the valley seed from Davis. The two lots of seed, although quite different in appearance, were palpably of the same variety and both yielded seed of the valley type. Had the two lots been grown near the coast, both would have produced seed of the coast type.

The plants were similar in the early stages of growth, but those from the coast seed developed more slowly and were slightly darker green in color. The valley oat stooled earlier and ultimately produced an average of seven mature heads per plant. The coast oat stooled as freely as the valley oat, but the stalks developed more slowly and produced an average of but five mature heads per plant. The valley oat ripened June 20th, 105 days from planting, while the coast oat had many green heads the day cut, June 30th, 115 days from planting. The valley oat averaged 20 inches in height at maturity, while the coast oat averaged 25 inches in height at maturity. The valley oat yielded at the rate of 3.8 tons of green hay per acre, and the coast oat 5 tons per acre. This weight includes the entire plant with a portion of the root as shown in the photograph.

The yield of grain was the same for both, at the rate of 46 bushels per acre, but it should be remembered that the month of June, 1916, was unusually cool, a circumstance favorable for the filling of the later maturing coast oat. Had the customary hot weather and drying north winds prevailed, the coast oat could not have filled as it did and the yield of grain would have been reduced. The valley oat matured earlier and was independent of the weather conditions for the filling of its grain at a much earlier date.

If the planting had been done during December or January, instead of in March, both kinds would have given better results, and the coast oat would probably have yielded more grain than the valley oat, because of its later maturity and more vigorous growth.

In conclusion, several important facts of considerable practical value have been demonstrated:

1. Source of seed is an important consideration in determining the yield of red oat hay in the interior of California and is of as great importance as the variety itself.

2. Coast grown red oat seed produces plants which mature later, grow taller, and yield a greater tonnage of hay per acre, than seed of the

(Continued on page 642.)

INTERIOR AND COAST RED SEED OATS CONTRASTED.

The Yield of Red Oat Hay Is Greatly Influenced by the Source of the Seed. Both Sheaves Are Composed of Common Red Oats, and Each Is the Product of 57½ Feet of Drill Row; the Sheaves Were Grown Side by Side on the University Farm, and Were Given Exactly the Same Treatment. All the Available Evidence Points to the Conclusion that the Difference in Growth Is Due Solely to the Source of the Seed. The Tall Sheaf on the Right Was Produced from Coast-Grown Seed, and That on the Left from Seed Grown in the Interior of the State.

EDITORIALS

THE SEASON'S PROMISE.

NOW that we have the false prophets of dry weather snugly tucked in their hospital cots, with hot bottles poured into them and hot bottles stacked over them to drive away the hard colds caught from exposure to storms which their philosophies prohibited, we commend their spiritual parts to rapt contemplation of the record that the Lord said unto Noah: "I will not again curse the ground any more for man's sake; while the earth remaineth seed time and harvest shall not cease."

For the fact is, and everyone should have trustfully awaited its appearance, that the outlook for the season is as good as we can humanly discern to be possible. The storm which appeared since the date of our last writing covered the State from end to end, and the precipitation is now beyond the normal at all points where it is likely to be too little and less than normal on the upper coast, where it is likely to be too much. A better start for the season could not exist, and there should be swiftness to make good use of it. We shall need every acre of grain which can be well put in, and the price will reward the grower amply. The demand for fruit, in spite of the obstacles which were conjured up in the distribution of it, has not only given a surprising schedule of prices, but has demonstrated an expanding consumption which justifies the new drive on planting which those who have land and money for it are now entering upon. Our nurseries will be emptied of all good stock if they let the public know they have it. The croaker over increased fruit production has surely been hard hit this year, and he should know that what fruit we now have is only about enough to make a start toward the future, because the growers are only now lighting the lamps along their new commercial boulevard, which will lead them to real achievement. And the producers of animal products should also be lighting their lamps. The world never was so hungry as now, and in this country, at least, was never so able to appease its appetite. We need better products, and vastly more of them of standard quality. We need markets fairer to both producers and consumers, and there is more encouragement to strive for these in the fact that prices will be high, anyway. It is simply a question of who will get the money.

CRAZY QUILTS FOR CONGRESSMEN.

IT IS not surprising that many of the solons at Washington are enfolding themselves in crazy quilts. The old, conventional togas are too bland to attract the public eye, which is now blind to all but lurid lights. It can only see red in the prices which it now has to pay for food, and Congressmen are hurrying to Washington to redden the statutes to match. They will probably not be able to do more than make them flesh-colored, and that will be a good thing, for they usually too little reflect the real life of the people. The political parties are too evenly matched and the different parts of the country too widely represented, to

allow any division of men or of geography to put over anything very bad on the rest of the country. And yet, some representatives, who are fairly panting for publicity, will doubtless try to do their worst on the ground that it will be best for them. For instance, a representative from New York has introduced a bill providing for an out-and-out export embargo on farm products and manufactured foodstuffs for one year. And the same man, seeing that the foregoing would be recognized as a gallery play, put in another bill authorizing the President to suspend exportation whenever prices become extortionate and the public interest requires such action. Of the two propositions, the first is irrational, arbitrary, and intolerable; the second may be worth discussion as a means of reducing speculation, breaking corners, etc., and will doubtless receive careful attention. In fact, this control of speculation figures in several other measures, one of which would provide that the government be empowered to seize foodstuffs on which a corner is attempted, condemn them, and then resell to the public. Still another measure provides for a food dictator with plenary powers, and there are others which are clearly unconstitutional in a time of peace and offensive to the rights and liberties of citizenship. We simply indicate their character without comment, for perhaps all of them have already served their purposes as light-bombs for their introducers, and may now sleep in the cradles of committees until final adjournment of this congress in March next.

DOES THE PUBLIC NEED PROTECTION?

BUT some reader, thinking us over-scornful of efforts put forth in the guise of public service, may ask if we do not believe the public needs protection against the current high retail prices of food. We certainly believe it does need protection, but not in arbitrary embargoes against exports of food products, which would ruin producers by creating internal gluts and force sale below cost of production; nor does it need protection in the guise of seizure and sale of products by a dictatorial functionary, for that would destroy all incentive to enterprise and invade all individual rights proudly called American. Such proposed recourses are defensible as war measures, but are intolerable otherwise, and an insult to the conscience and intelligence of the country. Any congressman practicing demagoguery along such lines ought to be de-Americanized.

So far as we can see, the consumer should be protected in two ways: first, in the practice of his inalienable right to refuse to buy when prices are unreasonably high; second, in government action, which may make conspiratory speculation illegal and unprofitable. But the real cure for the condition which is now working great hardship to consumers is constructive, not destructive. It is very fortunate that this week, when fool notions about legislative cures are burdening all the wires from Washington, through the call of congressmen for publicity, there is being held in Chicago the most wide-reaching and representative assembly that ever convened in this country, to voice its mind forcibly as to what needs to be done to place producers and consumers in proper relations to each other, and to protect both from waste and exaction in distribution and from conspiracy and greed in speculation. The problem which this conference sketches for its own efforts at solution is this:

While the people are complaining of the high cost of living, many farmers are finding that their business does not yield profitable returns on labor and investment. This constitutes the giant paradox of our times, and is so because of certain remediable defects in the economic structure of the nation. We believe these defects come from a crude organization of the farmers' way of doing business. The losses occurring yearly amount to millions and affect producers, transportation lines and many business interests. This waste not only makes for exorbitant retail prices of foodstuffs, but also renders impossible a healthy growth of the farming industry.

This is an outline of the fundamental difficulty which exists in this country and which certain congressmen declare can be removed by such blasts of legislative dynamite as they wish to explode. There is no reason to fear them. The only service they can render is to arouse the country to serious

study of present conditions, and such studies will disclose the remedies. We hope our readers will keep thinking hard on these matters, for much of the better adjustment of affairs of production and consumption will depend upon their co-operative action.

WASN'T IT WELL TO TRY?

ALL who had to do with the sending of animals from the University Farm for competition at the Fat Stock Show in Chicago have reason for satisfaction. Just as we write on Tuesday the announcement comes that "California Favorite," a yearling Hereford-Shorthorn cross-bred steer, and "California Jock," 2-year-old Aberdeen steer, have not only taken first prizes in their divisions at the Exposition, but the grand and reserve championship prizes as well. It is also telegraphed that sheep exhibited by the university have been awarded a blue ribbon.

The success of these animals not only demonstrates that they are good, but it demonstrates that the instructors of the University Farm are "practical" in their selection of animals fit to gain condition and in their knowing how to attain that condition. It will assure the scores of pupils who participated in the preparation of the animals that their instruction was right and their experience dependable. For, though it may be conceded that fitting a prize steer may not be an item in common farming, it is still an illuminating practical operation and suggestive of wise action in commoner things than prize-winning. In its broader aspects, also, the achievement of the University Farm feeders will be a good thing for the State.

CALIFORNIA ON WHEELS.

WRITING of fetching California victories at distant points reminds us that nearly thirty years California promoters sent a train load of California products, properly arranged for exhibition, rolling over the eastern railways, side-tracking in all the larger towns and welcoming throngs of people to see the exhibits and listen to the qualified demonstrators who used the exhibits as texts for exhortations to seek homes and investments in California. It was a moving spectacle, both geographically and influentially, and was very pertinently called "California on Wheels." Now it seems that the old method of demonstration is to be used to make known new and sublimated phases of California development, to-wit: the advancement of women to equal public rights and privileges with men, and to demonstrate to the benighted Eastern States that the knighthood of California women robs them of no feminine charm, but really equips them better for the enthrallment of men which is their birthright. This might be as hard to establish by statistics and argument as is the fact of love, but first sight may make it sure as eternity: therefore the sight method may be effectively invoked to demonstrate the beauty, quality and capacity of California's voting women. Annie Wilde makes this announcement in the San Francisco Chronicle:

President Wilson is about to experience something new from the feminist movement. A delegation of California women will be present at the inauguration in March, and will proceed across the continent in what will be called the "California Special." The travelers on the California special will not only "not bother Wilson," but will "not bother anybody," its intention being to proceed across the continent, "merely looking" at everybody, and making suggestions to nobody. It will not tell any man or woman what his or her duty may be to humanity. The hope is held that the sight of free, enfranchised Western women, passing through the country on their way to an inauguration they had been instrumental in making possible, would have a good, wholesome, uplifting influence on the Southern women and make them conscious of the darkness in which they are hidden, and of the light which will shine on the special, making its swath across the country perfectly discernible to the naked eye.

It will surely be a unique exhibit and quite worthy of the dash and enterprise of California. As it is ostensibly a message to move women we can claim no insight into its constitution, for we have never yet discovered what will surely appeal to them. If it were a message to move men to vote

for justice to women, we might have a suggestion or two as to the intelligent censoring of its contents. We are confident we could fill that special with exhibits which would cause the men to sing "I love thee, California," wherever its wheels stopped turning; but, then, such an excursion would leave plenty of trouble in its wake—not to speak of filling our own orchard shades with Eastern youths, whose sighs might blow the blossoms

off our fruit trees, or our matrimonial pastures with tough, old, staminate grasses. It is perhaps best that the enterprise should proceed as the women have planned. There will be less danger of de-manning the Eastern States. We shall anxiously wait to see whether the Eastern critics classify the rare collection as broadly ornithological or, less reverently, assign it to the gallinaceous group.

of trees by irrigation if the rainfall is inadequate. You ought not to expect much the fourth year, though you may get quite a lot. No one can prophesy what a particular orchard will do, unless he has lived with it for a time, and then it will fool him more or less. In the long run the orchard could probably be calculated to yield the average for the State. Mr. Weldon figures the bearing prune acreage of the State at 91,470 acres. The prune crop, as variously reported, averages about 75,000 cured tons a year, so the average might be a little over .8 of a ton per acre. As you will expect your trees to do better than other people's you may count a cured ton to the acre. You may get more or you may get less; only the trees can tell you, unless you can find an old orchard under similar conditions to measure by.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address

Beans on Heavy Soils.

To the Editor: Will pink beans do well on heavy soils?—Reader, Del Rey.

Although the lighter soils are generally prescribed for beans, recent experience has shown that beans have done well on what might not be called "bean land." This is partly due to the fact that "heavy soils" is not a very definite term, just as "adobe" is not. Both terms are oftened locally used to mean soil which is heavier than the other soils near by, when there may not be any really "heavy" soil in the region at all. The ability of land to grow beans is often dependent upon the local moisture supply, for if there is neither rainfall or irrigation enough to water-log the soil, beans are quite likely to accept it, if the cultivation is right to conserve enough to suit the plant. Beans like neither water-logging nor soil-baking, nor cementing—all of which bring the plant into distress. For this reason most of our commercial crop is grown on rather light soils, both on the south coast and on riverside lands, because they most nearly meet the requirement of the bean naturally, and therefore give the grower least trouble and most profit. But it is not safe to say that "heavy" land will not give a good crop, if the moisture supply is kept about right. You should try out your land in a small way, and pinks, teparies, and blackeyes, or other cow-peas, are most likely to succeed.

Myrobalan Root on Hillsides.

To the Editor: I am advised to plant prunes and apricots on myrobalan root on hillsides in the Saratoga region. Is not the almond root better?—S. E., San Francisco.

If your soil is rather heavy, or if it is light over a clay subsoil, myrobalan is best. There has been much trouble from sour-sapping on uplands on your side of the valley. This is to be expected from roots like the almond, which cannot endure too much winter water in the soil. Even on hillsides, where one would suppose all the surplus water would run off, there may still be too much of it soaked in, or brought in by seepage from above, over a heavy subsoil, and unable to escape soon enough to avert injury. The myrobalan is the best root to resist this for prunes and apricots, though the pear will also do it for itself. The myrobalan is not only best to resist this standing winter water, but it is also best to help itself to moisture from a heavy subsoil in the summer. The top growth is usually less than from a freer growing root in a soil which suits it, but it is safer and also satisfactory in fruit-bearing. The almond root is good for prunes (but not for apricots) on deep, well-drained soils. This is found on valley lands, and also sometimes occurs on benches or uplands of gravelly character or of light loam with rock fragments. Where there is much depth of this stuff the myrobalan seems unable to reach enough water.

Is It Clean Sand?

To the Editor: I have a piece of river bottom land that was covered with about 18 inches of clean sand during the flood last season. Do you think Windsor beans would go down to the good ground; or would a mixture of rye and vetch be more likely to make a fair growth; or is there some other winter growing crop that would do better than the above?—R. H. W., Oceanside.

Are you sure it is clean sand? What has it done since the September rains which were heavy down your way? If it started good weeds it would probably grow beans if you plow in what green stuff you get during the next two months—providing

you get enough rain this winter to keep the over-layer moist enough to save the beans from burning up. Unless you have some natural demonstration of fertility in the sand we would put on rye as soon as you get enough moisture again. This will determine whether it is clean sand or not and save the money-risk of seed beans or vetches. If it will grow green rye it will probably take a stand of alfalfa next year if there is moisture enough to let it get down, and that will make soil of the sand quicker than anything else we know of.

Food Value of Buckeyes.

To the Editor: I desire to know the food value of the California buckeye, and the name and character of the poisonous element that is harmful to stock when they eat it. How can the poison be separated from the pulp? Can this poison be saved and utilized in the making of denatured alcohol?—G. W., Three Rivers.

Professor Jaffa of the University of California will make the analyses and determinations which you desire, and the results will be made public in due time. The Kentucky station recently published some statements with reference to the Ohio buckeye, the sweet buckeye, and the red buckeye, indicating that they are all poisonous, and according to Prof. Chestnut the same thing is true with reference to the California buckeye, unless the poisonous or objectionable matter is leached out with water, in much the same way the acorn was sweetened for food by the aborigines. Many attempts have been made in Europe and elsewhere to treat the fruit of the common horse chestnut in some way so that it might be made wholesome and palatable, for it undoubtedly contains an abundance of nutritive material, particularly starch, but none of these attempts have been really successful.

As for making the poisonous matter into alcohol, there would be relatively too little of it, even if it were otherwise possible. It would be more reasonable to make denatured alcohol out of the whole starch contents of the buckeye, but we have no idea that enough of them could be obtained cheaply enough to warrant the equipment of a distillery. Making denatured alcohol is a very narrow economic question.

"Lime and Salt" Spray.

To the Editor: Some orchardists of Napa have been spraying prune trees with "lime and salt"—three pounds salt to forty pounds lime. I would like your opinion of the mixture, and what good it will do.—H. J. S., Napa.

Are you sure they are not using sulphur also—making the old "lime, salt and sulphur" wash for the San Jose scale? If they are using only lime and salt they are simply making a whitewash which will prevent sunburn, if it makes a good white covering to reflect the heat. It may also clean off moss if the lime is hot and sharp, but there are better things for that. The salt only helps the lime to hold on, probably. Lime and salt do not possess either insect or fungus killing power enough to pay for the spraying.

What Will Prunes Do?

To the Editor: Will prunes do well on rich, heavy adobe soils, with the water level about sixteen feet? How many tons per acre of dried prunes can a person expect the fourth summer after planting? How many tons per acre can a person expect from an orchard in full bearing on good prune land?—Reader, Del Rey.

Yes; prunes on myrobalan will take that soil all right if the moisture is kept adequate to the needs

Split-Pit and Fruit-Gum.

To the Editor: Kindly inform me as to the cause of split-stone in Crawford peaches, and if there is a remedy for same. The peaches mature well, but are unsatisfactory for the market.—D. P., Mt. View.

To the Editor: My Phillips cling peaches were affected with wax on the surface of the peach. The fruit was good size but unsaleable on account of wax. Please tell me the cause and the remedy.—A. L. H., San Francisco.

Both troubles are attributable to the same cause or causes and no one knows what these causes are, although much expert investigation has been pursued. It is fairly established that the troubles are not due to parasitic invasion of any kind and that, from that point of view, there is no disease and no remedy in the form of spray or other application. The plant pathologists agree that both troubles are physiological, which means that the plant is not growing right or its components are not functioning right. There has been a great deal of theoretical exposition of reasonable causes and treatments but no demonstration of either. The way to proceed, in a place where a variety acts that way too badly or too often, is to work the trees over to some variety which behaves better. When the trouble comes only occasionally, or in small amount, you have to grin and bear it.

Starting Privets.

To the Editor: Please tell me about starting of "privet" (Chinese preferred). Are the small plants started from seed, cuttings, or rootings, and is it practicable for a novice to undertake?—F. M. L., Orosi.

Practically all the privets (*Ligustrum*) can be grown in the open ground from hardwood cuttings made and treated like rose cuttings. They can also be rooted under glass from soft wood during the growing season. Of course to get quick, uniform results it is desirable to buy small rooted plants from the nurseries, as they are not expensive. The plants can be also started from seed, but germination is often delayed or irregular.

Pacific States Industries.

To the Editor: Which is the greatest industry of the Pacific Coast States—agriculture, mining, or lumbering?—W. E. C., Reno.

The following figures of values produced by the three industries in the three Pacific Coast States are from the U. S. Census of 1910:

	California	Oregon	Washington
Mining ...	\$ 63,382,454	\$ 1,101,512	\$ 10,537,556
Lumbering.	45,000,276	30,109,857	89,154,820
Agriculture.	153,111,013	49,040,725	78,927,053

The values are of the products at the mine, the mill, and the farm. They are, of course, much less than values at selling points.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m. December 5, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm

New Tool for Side Grafting.

[Written for Pacific Rural Press.]

Instead of cutting off the tops of the trees in winter and cleft grafting, J. Garnet Smith of Solano county saves the top and the year's crop by inserting scions into the sides of limbs at desirable places, and allowing them to get well started while the tree bears a crop. Practically all of the 5,000 scions he set last winter are doing well.

Where limbs are cut off and grafted, the scions sometimes fail to grow and the limb dies back, putting the tree out of balance. Often too, the wind blows a living graft out with similar results, or at least the loss of a year's time. When tops are severely cut back, the remainder is usually badly exposed to sunburn which may shorten the profitable life of the tree several years.

In Mr. Smith's practice, the old branches protect the grafts until they are established, and protect the trunks from sunburn. If the grafts fail, which is seldom the case, the limb is still thrifty to bear a crop and to be grafted again later. By this system, too, new limbs may be placed where needed to balance a tree.

About 2% of the labor and 9-10 of the grafting wax are saved, and the trees do not need whitewash for sunburn, according to Mr. Smith.

The reason for a high percentage of living grafts is that the cambiums must cross at four points and are very likely to all be in close contact, with no chance for the bark to loosen. Since the scion is inserted even into the wood, into a sort of a self-locking "pocket," it has a firm grip on the tree from the start. The "pocket" is not much larger than the scion, which may completely fill it, presenting only bark-covered surfaces to the weather. Very little wax and less effort are required to seal it perfectly, with no danger of weather checks admitting rot.

Mr. Smith, who has several hundred acres of fruit this year, grafted peach, plum, prune, and apricot trees 10 to 40 years old, all bearing fruit, and growing new grafts 2 to 6 feet long last May. One tree has 110 scions growing.

Others in this section believe in side grafting. F. H. Wren, who has

long been a professional grafter, is using this system on his own place. J. W. Caughy, Supt. for the Buck Co. fruit ranches, says the method looks to him like a success. Wm. Grant remembers when in his boyhood the side-grafting system was used in France and England. He has done side grafting by boring holes into trees and cutting them with a knife so the scions would fit.

The system is not new, but Mr. Smith has made a great advance in the tools with which it is done. A hammer and a special tool are all that are required for making the hole or pocket. A sharp knife is used to cut the scions. Great speed is possible with little care and great success.

The tool is of steel about a foot long, bent to a right angle about 4 inches from one end. The short end is flattened with its edges coming together to a point at about 60 degrees. The long end can best be described as having been flattened to a broad triangle, with its edges sharp and its point at the end of the tool. Fold this triangle along its center in line with the tool so that it makes a trough whose sides taper down to the point and whose back edge is in line with the back of the tool. Cut off the two corners rounding for appearance and convenience.

To use the tool for grafting, drive the short flat end into the tree crosswise and downward. Drive the other end of the tool square into the tree or slightly downward just below the first cut, until its edges both touch the first cut. This will loosen a solid-triangular plug of bark and wood in whose place the scion is to be driven with a light stroke. Which way it faces and which direction it points matter little.

Give the Graft a Chance to Grow.—Leaving the old growth on the limb draws sap upward and past the new graft so it is assured of a supply to start on. Enough brush must be cleared away to allow light and air required by the growth from the graft. In the second year, still more original brush must be cleared away to make room; so that while most of the succeeding crops may be grown and saved, they should not be allowed to rob the graft and make it of spindly growth.

The Fertilization of Oranges.

[Written for Pacific Rural Press.]

A "black" orange orchard as compared with a yellow one is a pretty good indication that the former has been much better fertilized, according to Fred Arth of San Bernardino county, who has some 60 acres of Navels and Valencias, mostly as "black" as one could wish. This "blackness" is not due to scale, but to shiny good health.

Blood and bone have been the main fertilizers every year for the past four or five years, not stopping when the freeze shut off the income. The soil is somewhat heavy but mellow, on account, probably, of the vetch cover crop plowed under every year. This same cover crop has made manure unnecessary, though some was applied last winter

for the first time. On trees 10 years old he applies about 15 pounds of blood per tree and five pounds of bone. No nitrate of soda is used on account of its mottling effect after continued use. These fertilizers conflict a bit with the vetch, for Mr. Arth believes they should be applied and plowed under Jan. 15 to Feb. 15, a month before they are needed at blooming and fruit-setting time. He would give the roots time to heal before the fruit demands too much sap. He, however, delayed plowing somewhat, for the sake of getting greater vetch growth to turn under.

Where vetch is growing, he would broadcast fertilizer on it, especially among older trees. Among smaller trees he would apply the fertilizer

closer to them, but not in the middles because the ground there dries out more, and the roots do not get at the fertilizer soon enough. From three acres of 270 Valencia trees 9 years old in 1914 Mr. Arth picked over 1800 boxes. In 1915 he picked 2192 boxes which were sold early in the season for \$2500. The 1916 crop is estimated at 2000 boxes.

The value of fertilization is illustrated by Mr. Arth by mentioning a 30-acre orchard not far from his, which yielded about \$6000 boxes in 1915, the same total as one of Mr. Arth's blocks of 10 acres. Similar care had been given both, except that the larger orchard had not been fertilized.

THE FINEST CROP COVER.

[Written for Pacific Rural Press.]

The best growth of mellilotus cover crop we saw just before Thanksgiving in the Fair Oaks district was that on four acres belonging to J. E. Adams. He had planted it shortly after the Pacific Rural Press recommended planting in August.

The seed was broadcasted, cultivated in, harrowed, and ditched for irrigation. Three furrows per tree row were used, and two miner's inches of water were run into the ditches 1/2 to 3/4 of a day per acre.

Always after each of the monthly irrigations, the orchard is cultivated both ways and harrowed both ways. Another irrigation would have been given the cover crop in October had Mr. Adams not withheld it to hasten the coloring of the oranges. Even so, the cover crop was a foot high before Thanksgiving.

Mellilotus was grown here last year and each the year before, but no cover crop previous to that. This year his crop from four acres of oranges is between 30 and 35 tons.

The cover crop is adding a heavy nitrogen fertilization, and lots of humus, is improving the texture of the soil, and will prevent its washing this winter.

DRYING OLIVES.

[Written for Pacific Rural Press.]

Mission olives that hung on the trees all winter in the orchard of G. L. Camden of Sacramento county were dried last spring and are in perfect shape now. Mr. Camden used what he calls the Greek method. Layers of salt and ripe olives untreated were put in a small barrel. About 2 1/2 times as much weight of olives as of salt was used. No water was added. Every 24 hours for six weeks the keg was turned the other end up. A brine developed and took out most of the bitterness. Eight weeks will be taken for this in the coming winter, for last spring's olives are a trifle too bitter to be relished at first.

At the end of six weeks, the olives were washed out in fresh water and part dried on trays in the sun. These dried up rather hard. The rest were laid out in the basement until they dried like prunes and some of them were kept in a glass jar. They certainly make fine nibbling for lunches and between meals.

The value of the first pool of walnuts from Goleta and Carpinteria valleys is \$215,395.50.

Crude Oil Emulsion Spraying.

[Written for Pacific Rural Press.]

From 10 or 12 years' experience in spraying apricot and prune trees, W. H. Stuart of San Jose speaks with authority on crude oil sprays, which he uses constantly for dormant trees.

When to Spray.—He begins as soon as leaves are off, because then the spray will work all winter before the hot sun strikes it. Early spraying also means that you sure get it on; while the ground and the weather are good for spraying. But he uses the crude oil spray all winter, having even drenched almonds in bloom with a 12 to 13 per cent emulsion of 14-degree crude oil without damage. The later spraying has the advantage of finding insects weakened by winter weather, and trees pruned so they are more accessible. If crude oil spray is on the trees four or five hours in good drying weather, it dries to a sort of varnish which resists weather.

What He Uses.—Either the commercially prepared crude oil emulsions or a home-made product are used by Mr. Stuart. The commercial kind is preferred because it requires less effort and is less disagreeable to handle, though a trifle more expensive. Where help is scarce or time short, the commercial emulsions are used; and are more likely to be of uniform strength and more surely emulsified.

When Mr. Stuart makes his own emulsion, he ordinarily uses a 14-degree crude oil because there is less possibility of damage than with that up to 19 degrees, which contains more of the lighter and more penetrating oils and is more expensive.

Distillate, besides being more expensive and dangerous, is unnecessary for winter spraying on the brown apricot and Italian pear scales, the moss and lichens, and the brown mite and other aphid eggs which are the most general pests in Santa Clara Valley. Mr. Stuart has noted a tendency for distillate sprays to "burn the bark, leaving it

hard, harsh, and dead-like, while the crude oil sprays leave it pliable. Crude oil is to the tree what harness oil is to leather." Distillate sprays used carefully are necessary in the spring, but may burn the buds. He has burned walnut bark, but has never known of injury to prunes and apricots from dormant spraying with crude oil. The 14-degree oil is harder to emulsify but makes as good a kill of fruit pests as the 19-degree oil, according to Mr. Stuart. The only danger is from an imperfect emulsion.

How to Mix It.—Melt four pounds of common laundry soap if whale oil soap is not available. Dissolve completely two or three pounds caustic soda. Put 5 to 25 gallons water into the tank, add the soda and the soap, keeping the agitator going. If the soap is poured into a large amount of cold water, it will "freeze," says Mr. Stuart. Then add water until within 25 or 30 gallons of filling a 200-gallon tank. Finish filling with oil, keeping agitator busy.

Spraying a Tree.—It is best to spray from the top down, says Mr. Stuart, being most sure to drench the twig ends where insect eggs are often laid. Spray till the fluid begins to run down the branch. Don't be afraid to step around so you can shoot the spray directly at all sides of every limb.

A nozzle giving a flat sheet of spray is used in order to get more force to penetrate hiding places and even knock off bugs in the case of spring spraying. It is easily opened if clogged, and the spray goes where you aim it. When the sheet of spray is directed up and down toward a limb, it gives the limb full benefit of all the spray. This of course is in regard to trees when leaves are off. In any event, an angle nozzle is used for greater convenience in doing a good job, and about 200 pounds pressure kept up in the pump.

CRACKED PRUNES — MEALY PLUM APHIS.

[Written for Pacific Rural Press.]

Last year the mealy plum aphid was particularly bad in various sections, including Placer and Contra Costa counties, though it was absent from Santa Clara county, where it had done severe injury the season before on French prunes. This aphid, according to Placer County Horticultural Commissioner C. K. Turner, "seems to infest only plums of domestic varieties, while cracked plums are nearly all of the Asiatic species." In Santa Clara county, however, Horticultural Commissioner E. L. Morris found "associated with this insect a form of cracking generally across the ends of French prunes opposite the stems and often deep enough to expose the pit."

Last July we found a disheartening loss of prunes in Contra Costa county by the same kind of cracking which seemed to occur mostly after the fruit commenced to color. Some were split clear to the stem, and many were so wide open that the pits would have fallen had they not

been stuck to the insides. Most of the prunes had three cracks leading to the end. Leaves and fruit were nasty with honeydew oozed by the insects and the road dust, etc., collected on them. The aphids were gone.

It is noted by Mr. Turner that about July they leave plum trees and remain on tules until fall when the females return to the trees and lay eggs largely on the tops and tips of outside twigs.

Control.—Two means of control are thus apparent. During the first two or three weeks in September, a maximum number of the insects can be destroyed by burning all tules in the neighborhood.

Burning pruned twigs and spraying the rest, especially the tips, with crude oil emulsion 15 per cent strength, during the dormant season is pretty sure to minimize the infestation. If this seems impracticable, Mr. Morris recommends a lime-sulphur-tobacco spray just as the buds are swelling when the eggs are hatching. Mr. Turner suggests blackleaf 40 and soap when the first green leaves appear.

Remedy for Declining Lemon Trees.

[By J. D. Guthrie, Santa Paula.]

The symptoms of decline in a lemon orchard, as we have observed them, do not all appear simultaneously in each and every tree in a given orchard.

Symptoms.—Perhaps the most common symptom, be the crop large or small, is the tendency to produce a high percentage of fruit which habitually matures undersize despite generous fertilization; hence an undue proportion of ripens and small sizes overabundant, not only in the ripens but in all of the better grades as well. This forces a larger proportion of the fruit to sell at a discount—some of it possibly not at all—besides requiring greater expense in handling and packing, and subject always to heavier decay.

To this poorer quality is often added the loss from greatly reduced yield. Frequently many lemons hang far out on the ends of rather long, attenuated fruit spurs. These are always of poor quality, irregular shape, and disfigured by sun and wind scars. The foliage is usually more or less dwarfed, sparse and of poor color. Many leafless fruit spurs may be found in all parts of the tree, both inside and out, bearing little or no fruit.

Checking and cracking of the bark of the main trunk often takes place, frequently extending from bud line upward and well out on the main branches. Later this flakes off, exposing a new bark underneath. Many trees appear to be in great distress during this process—a trouble not thoroughly understood, but thought by some to occur earlier on trees that have been consistently heavy producers.

The above symptoms of decline are given with reference to trees supposedly well cared for in every way and on first-class soil. A very different class of trees, showing many of the same symptoms, consists of trees whose inability to produce fruit of quality has been due to: lack of adequate water; soil impoverished for want of organic matter, resulting in poor physical condition; lack of nutrition, apparently in most cases, because of an inadequate supply of nitrogen in proper form; shallow soil underlaid with sand and gravel incapable of the capillary power necessary to bring back moisture and soluble plant food that have passed through to lower levels during winter rains and irrigation; loss of part of the root system, through injury or disease, or, perhaps more frequently, a similar loss of bark on the main trunk.

Cure.—Mature fruit trees of all kinds, suffering from poor soil, water, or cultural conditions, or from disease, have long been known to be greatly aided toward profitable production by liberal pruning, even if the other disadvantages are not removed. Indeed, it was largely from object lessons obtained from pruning trees with such special disabilities that the conviction came to us that if heavy pruning would so conspicuously improve them, how much more fully might not this be realized in a tree not thus handicapped.

Another matchless object lesson was the heavy freeze of January, 1913. A fifteen-acre block of our twenty-year-old trees that had be-

gun to show many of the symptoms of decline was frozen just enough to kill probably eighty per cent of the fruit wood, and many of the larger exposed branches were so injured that the outer portion of the main structure was reduced at least thirty per cent. Advantage of the opportunity was also taken to remove all cross limbs and unnecessary leaders. It need not be told how these trees "came back." Nearly every community has been a witness to a similar rejuvenation of at least a few lemon trees of mature years. That year's crop was zero, of course, and even during the second twelve months after the freeze we gathered less than two field boxes per tree, though of superb quality. The third year, however, the crop was ten per cent above any prior yield, and again of highest quality. The present year promises even a greater production with quality still unimpaired.

Thirty years ago Nathan W. Blanchard, of Santa Paula, the well-known pioneer in lemon-growing, was shipping one hundred packed boxes of lemons per acre from an Eureka orchard planted in the '70s. The trees were allowed to grow very much like seedling orange trees until twenty-six or twenty-eight years old. By that time the symptoms of decline, as we know them today, were very evident, both in the orchard and on the balance-sheet in the office. Low heading of lemon trees was being vigorously agitated throughout the lemon-growing sections. These considerations led to a most severe top pruning, so heavy, in fact, that the crop was cut to forty-five per cent of normal. The second year it rose only to eighty per cent, but the third year the yield was one hundred and eight per cent of normal quantity, and of such a superior quality that it was probably equal to one hundred and fifty per cent of the previous normal value. The production has steadily increased to one hundred and twenty-five per cent of the original average crop, but now, after an interval of thirteen years since pruning, the fruit sizes are growing smaller and the percentage of ripens increasing—premonitions of the day when possibly another pruning may be necessary.

[Editor's Note.—Methods of rejuvenating Limoneira orchards is described in the rest of the address, which will appear in another issue.]

GOOSEBERRY FAKER.

[Written for Pacific Rural Press by W. D. Guthrie.]

A man is selling to Placer county farmers what he claims to be an exceptionally large and heavy yielding gooseberry. He is considered a faker by those who know his methods. He will not tell where the gooseberry plants are grown. He promises to build a cannery and buy the gooseberries at 6 cents a pound, but furnishes no bond. He sells the plants to one farmer at 25 cents each, to another for 5 cents. One lot of berry plants delivered had a tag showing who shipped it. A registered letter written the shipper by Farm Adviser E. A. Amundsen received no reply.

It was suggested to the agent that

a good way to sell the plants would be to get the Farm Adviser's approval; but he has not met Amundsen. He is said also to have given different names and different addresses to the different ranchers.

He usually sells the plants, taking five dollars down to bind the contract. The size of the berries is shown by a sample which he carries in a little glass bottle.

I understand that he has operated in the Santa Clara Valley and no doubt plans to work the whole State. Better buy from established nurseries.

In grafting over old peach trees, wait if possible till the buds are swelling. By cutting back too early in winter the bark dries out and shrivels dangerously for the graft, and there is not such a strong burst of young wood.

MISSION OLIVES

EARLY RIPENERS.

THE EHLMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.

Mr. W. A. Hayne, Box 461, Marysville, Cal.

Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Fogg crop, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners.

We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know. Yours very truly,

(Signed)

E. W. EHMANN.

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive trees, and, like the Fogg trees, they are all propagated from the large size cuttings.

W. A. HAYNE.

Box 461, Marysville, Cal.

NEW WINTER PEAR

of delicious flavor, good size and good-bearing habit—the A. J. COOK. A late-blooming seedling of Bartlett, ripening in season for the Thanksgiving and Christmas market or most desirable for the home orchard. Also the early money-getters—Wildor, Giffard, Lawson all ripening before Bartlett. Stock particularly fine and all on Blight-and-Aphis Resistant roots. Of course we have the other standard varieties as well.

AVOCADOS KEEP LONG IN STORAGE.

[By E. V. Willcox & C. J. Hunn,
Hawaii Expt. Sta.]

With the considerable number of varieties of avocado which are now grown in Hawaii, the season of this fruit has been extended to cover six months or more a year. It was desirable to know, however, whether some of the better varieties could be held for a month or more in cold storage in order to prevent the loss which occurs when the fine varieties are shipped in such quantities as to flood the market. Only a few fruits of the hard-shelled Guatemala variety of avocado were available for testing. These fruits were kept in the station fruit room one day before going to cold storage, and were then held in the 32° and 45° F. rooms for a period of 65 days, being examined in storage at weekly intervals. A few of the fruit had been picked too green and did not ripen or show any tendency to soften during the test. Those which had been picked half-ripe began to manifest an approach to table ripeness after a period of one month. At the end of two months the pulp was found to be of normal color and excellent flavor, with no apparent alterations due to cold storage.

In further cold storage tests of avocados, boxes of miscellaneous varieties were used from Kona and the island of Oahu, and a few boxes of finer flavor from those bearing station numbers 1855 and 1871. In all cases the fruit preserved its normal color, appearance, texture and flavor for a period of two months in either the 32° or 36° F. room. There was in no case any discoloration of the pulp or fermentation or apparent loss of flavor. The color of the skin became slightly deadened after 75 days, but the pulp was still in perfect condition.

When removed from cold storage after a period of 60 days the fruit which had been kept in the 32° F. room held up longer than that from the 36° F. room. Avocados picked green and held in cold storage for two months ripened with good flavor within three days after removal from cold storage, and held their flavor well for a period of six days. The avocado seems to be well adapted to cold storage at a temperature ranging from 32° to 36° F. for a period of at least two months.

Cold Storage Kills Fruit Fly.—Avocados are perhaps the only commercial Hawaiian fruits subject to infestation with Mediterranean fruit fly, for which there is a demand on the mainland. In experiments reported, fruit fly larva and eggs failed to live through an exposure in cold storage even at 36° F. for longer than 4½ days. It is not safe, however, to assume 4½ days as an outside limit. It would seem safe to assert that infested fruit maintained for two weeks at a temperature of 32° could not possibly contain the living fruit fly in any stage. Avocados, however, may be held for at least two months in cold storage.

MUSCAT IRRIGATION AND PRUNING.

To the Editor: Will irrigation cause the blossoms to drop when in

bloom on a nine-year Muscat in sandy soil? How many spurs should be left with two or three buds?—G. M., Sanger.

Irrigation while Muscats are in bloom encourages excessive sap flow which we believe is a principal cause for blossoms dropping without setting fruit. At that time there is practically always plenty of winter moisture in even sandy soil. Irrigate when the vines need it. If the vine made especially vigorous wood growth last season, leave enough more fruit buds (not counting the ones at the base of canes) to reduce the wood growth next season, throwing that wasted energy into fruit. Leave canes as long as will be convenient in cultivation so that there may be fewer of them and thus not crowd the fruit and leaves too close-

ly around the head where mildew would be harder to prevent. Save the plumpest canes and leave some one-bud spurs close to the trunk for next year's fruit spurs.

SIMPLE BEAN RAISING.

[Written for Pacific Rural Press by
Chas. F. Barnum.]

A fine crop of beans are to be seen on the T. Tirth ranch at Burbank. Six acres each of Mexican Reds, Lady Washingtons, and another variety are producing 20 sacks to the acre.

Mr. Tirth planted them in the bottom of a 12-inch furrow with a corn planter the first of March. Then he dragged it level, leaving the beans to average 6 inches deep. As soon as they were up good he harrowed and furrowed them; then, May 15th, gave an irrigation and none since.

ASHES FOR SOIL.

To the Editor: When is the best time to scatter ashes on the ground to loosen the soil.—J. H. C., Mountain View.

Wood ashes tend to compact the soil rather than loosen it, due to the potash they contain. Lime has the loosening effect by flocculating the particles of soil; and we would apply it as soon as possible so the winter rains would carry it down into the soil where it is to do its work. Coal ashes are good to loosen soil if dug in. Their action is mechanical, the same as any other grit.

Word comes from San Bernardino that the recently enacted county ordinance providing an 8-to-1 test for all oranges shipped out of the county has been rescinded.

Success in Growing APRICOTS

PROFIT

—is after all the main consideration in fruit growing. You know that it is the fancy fruit that brings the best returns. As California has practically a monopoly on Apricots, it stands to reason that the grower of this fruit who raises the fancy sort should reap splendid profits.

depends
upon
the
QUALITY
of the
TREES

If you want to make sure of the quality—then be sure and plant

ROEDING'S —TRUE TREES—

—the kind that can always be depended upon; the kind that bear ever increasing crops of fancy fruit.

FOR 33 years Roeding's True Trees have been planted and have never failed to win for us the confidence of the planter. Long experience has enabled us not only to grow the best but to pack and handle trees and plants so as to insure their removal to points of destination in good condition. We want every tree we sell to be a credit to us and to the planter.

Citrus and Deciduous Fruits

We have a splendid stock of apricots, oranges, lemons, pomelos, apples, peaches, pears, prunes, plums, walnuts, pecans, etc.—every tree guaranteed true to name, strong and sturdy and in good condition. Ask for quotations.

Ornamentals

Many of the finest private and public parks now delighting the people of California are the result of Roeding's ornamental trees, shrubs, vines and plants. Why not have a few ornamental trees on YOUR place?

Write for New Illustrated Catalog

If you have not already sent in your name for a copy of our 1917 illustrated price catalog, do so today. It lists and prices over 2000 varieties—and will be sent free upon request. When writing send us your list for suggestions and advice as to varieties.

State-Aided Rural Credit Not Wanted.

To the Editor: We have a State banking law and we have a superintendent of State banks whose duty it is to see that the banks are conducted according to that law. These banks are established in every city and town of the State wherever the business will warrant. In the smaller towns they are made up of local merchants and farmers. It is safe to say that half the stockholders of the country banks are farmers.

The rates of interest in country banks are about the same as the rates at the money centers and they range from five to eight per cent—according to who pays the taxes, the possible depreciation in values, the character and standing of the borrower and other conditions. The directors of these banks, knowing the value of about every acre of land in their vicinities, can make loans intelligently and at the least possible cost to the applicant.

Now, it is proposed (and for no apparent good reason,—save for the creation of another set of public officials) to pass another law, in direct opposition to the one existing, to authorize the State to borrow money, for which it must pay the current rate of interest, and loan it to farmers on long terms at four per cent per annum.

The State should not loan money at all in opposition to the banks of its own creation; it should not loan it at a lower rate than is customarily charged. If the banks can't loan money on long terms, surely the State cannot. The State is too

young and the people too changeable for long loans. The State should not force the bankers to help pay the deficiency on these loans by increasing their taxes, nor should it countenance class legislation.

If this thing were consummated, it would add one or more to our long list of commissions, which would probably be established at Sacramento. Let us suppose there is an application for a loan from such distant counties as Del Norte, Modoc or San Bernardino. The commission would naturally send out its agent to investigate—to pass on the lay, the fertility, accessibility, etc., of the land. Could such an agent (a stranger) give as intelligent a report as the local bankers? Such a trip would be expensive. Who would pay the cost and who would watch the progress of the case during the long term of years it had to run?

Gualala, Cal. C. Queen.

[We are glad to know our correspondent's views, although they do not seem to be apropos of anything now pending in State legislation and are therefore incapable of either confirmation or denial. The statements may, however, be suggestive to those who are considering the attitude of the local banks toward the general propositions for rural credit organizations.—Editor.]

GRAPE ROOT WORM.

[Written for Pacific Rural Press.]

If your grape leaves last summer were laced with long narrow holes,

partly or entirely through the leaves, or if your grapes had similar brown blotches when ripe, you may expect damage from the California grape root worm next season. The holes were eaten out by the adults of the root worm, which are beetles about 3-16 of an inch long. Their larvae are now encased in mud cells in the ground close to the vines, and may be destroyed by cultivation if the cultivator reaches and breaks the cells. Many are likely to be too deep, for they have been feeding on the grape roots since they hatched in early summer. They will transform into pupae in the spring and become beetles in May or June.

Aside from the fall and winter cultivation, the practice in San Joaquin county, according to Horticultural Commissioner H. H. Ladd, is to trap the beetles while they are on the vines along in May.

A four-foot square piece of sheet-iron is cut in two and a semi-circular hole cut into the center of one edge of each so that the pieces may fit together when laid with the holes next to the vine trunk. The upper sides of these sheets are smeared with crude oil. They are placed carefully under the vine. Then the vine is struck sharply, and the beetles "play possum," dropping onto the sticky trap.

PEARS IN LAKE COUNTY.

To the Editor: What is the average yield per acre of pears in Lake and Mendocino counties, and what are the prevailing prices paid to the grower?—G. M. B., Covelo.

[Answered by Lake County Horticultural Commissioner F. G. Stokes.]

Regarding the yield per acre of Lake county pears, much depends on the particular orchard in view and the age of the trees and the adaptability of the land for pear growing, freedom of locality from frost, etc. I can cite an instance of six acres of six-year Bartlett's producing 14 tons of pears, i. e., more than two tons to the acre, but this is exceptional as an average at that age. Also I can mention an orchard of 10 acres (20 years old) last year producing 101 tons of Bartlett's.

Growers last year got \$20 to \$30 a ton, delivered to packers and dry-yards. My pears netted me \$36 a ton, f. o. b. ranch, as I did my own shipping and drying. This year the C. F. C. A. paid as high as \$39 and \$40 a ton delivered at their dry-yard, and John Stahele, in some cases, \$35 a ton orchard run. Today our A1 dried pears are selling as high as 10 cents a pound f. o. b. ranch, boxes found; and in one case Mr. Spiller tells me he received 11½ cents. Ten cents, f. o. b. ranch, is quite ordinary.

The best thing Mr. B. can do is to come up and investigate.

HUMIDITY AND SPRAYING.

[Written for Pacific Rural Press.]

Damage by spraying a citrus tree one morning with the same spray used harmlessly across the fence on the preceding day is attributed to difference in humidity by L. G. Duval of Ventura county. Prof. Woodworth of the University of California says the soil moisture in the tree has more effect than air moisture on the tree, though the latter may act as a shield if there is enough of it.

A Rural Community High School.

[Written for Pacific Rural Press by H. K. Dickson, Kerman.]

California is rapidly changing from a State of large isolated farms, leading to a central town, to a State of many little towns with their own thickly settled rural population. When the schools open in the fall each of these communities has a common question to answer: "Are we going to send our children off to the city schools for the higher education, which they must have to compete with the present-day conditions, or shall we supply it to them at home?"

The city schools are well equipped and give good courses, but they take the boys and girls away from home at the critical, formative age, and transplant them into new conditions. These new surroundings over-emphasize some of the advantages of city life and work, while they do not give a fair consideration to the country life. The child is really forced away from the farm by the misconceptions of his town friends. He is at an age when his own judgment is at a low premium. Can a rural community afford to put its boys and girls to such a test?

Kerman is a rural community of some four thousand, lying in the San Joaquin Valley about eighteen miles west of Fresno. It has worked out one solution for this common problem by starting a community High School six years ago, which graduates students in the same standing as any of our large schools.

A medium-sized building contains class rooms and one large study hall. This hall is also the meeting-place for the bi-weekly Civic Center League of the community. The main trouble has been, the room is hardly large enough to house this enthusiastic community at its evening gatherings. Another interesting fact is that the entertainment for these evening meetings is furnished almost wholly by local talent in which the high school student learns to work with the older people.

To one side of the central building Kerman has built a modern bungalow, in which the girls are taught all of the city school courses in Domestic Science and Art. It goes farther than that, for it applies these new popular city courses to rural conditions.

Agricultural Equipment.—Kerman is an agricultural district, so it bought for its high school twenty acres and erected the school building at the cross roads. An agricultural building has a dairy laboratory with cement floor, 24-bottle Babcock tester, Little Giant Boiler, churn, scales, etc. The wall-cases in the corner of the recitation room are full of specimens of farm interest, such as tubercular lungs, hog cholera, blackleg, muscle, kidneys, peach-borers, root knot, etc. In one corner there are a number of farm levels, and in another a Cipiletti weir for measuring ditch water. Everything in and about the building deals with actual farm problems, and these fifty or sixty Kerman farm boys are getting scientific agricultural instruction in their own farm community.

The school farm contains an orchard of some fifty varieties, a school vineyard of twenty varieties, and

acre plots of different kinds of field crops. It attempts to raise clean seed of new varieties for the community, and help solve some of the community soil problems, through cover crops, rotations, fertilizer demonstrations, etc.

An Evening Dairy Course was carried on last winter in the high school laboratory by the high school instructor, with an enrollment of 26 dairymen, for 12 weeks, the attendance never falling below 18, and often above 30. Nearly the same number of new men have already asked that the course be repeated this coming winter.

Every winter the school conducts a Farmers' Institute in connection with the State University. Specialists prune a set of the school trees from year to year, and so leave a model in the community, on which records are kept by the school. The boys' horticultural class prunes the rest of the orchard and vineyard. These boys also prune and keep records on sections of their own home orchards and vineyards.

This year auto busses are bringing in children who live more than a few miles away, and so would have a long drive. Almost every child comes from a country home.

The system is working. Children may take all of the ordinary academic high school courses, and in addition, their commercial work, domestic science, or agriculture. They are at home mornings and evenings with their parents. They are not given an unbalanced impression of the city's advantages during this changing age. They are growing up with their own home community, and are really becoming an active part of it, as they grow to take part in community affairs. The community is interested in its own high school and the school in serving its community.

DRY LAND FORAGE.

[Written for Pacific Rural Press.]

What may develop into a valuable summer cover crop and forage plant in the Sacramento Valley, is the native weed Lotus Americanus, one of the Spanish clovers, found in a number of places by Horticultural Commission Harney of Yuba county.

Mr. Harney states that this plant is a rank grower on the red clay soils, without irrigation, starting growth with the beginning of the dry season and continuing till the winter rains commence. Rain seems to disintegrate the plants.

As these soils need protection from the hot summer sun, where fruit is being grown, Mr. Harney believes this plant has unusual possibilities. It may be sown at the end of the summer cultivation, thus setting ahead the usual cover crop scheme. Being a legume it should also furnish additional fertility. Under natural conditions, it starts to grow about July 1, and pods form continuously.

Mr. Harney has collected seeds of the plant for Prof. P. B. Kennedy, who will conduct experiments with the plant at the University Farm, Davis, during the next year. Its value or danger for stock-feeding is not yet known.

TALKS ON Nitrogenous Fertilization

Number 2

WE HAVE STATED that agricultural authorities are generally agreed that California crops need more nitrogen than California soils can give them. Director Hunt, of the Berkeley Experiment Station, writes as follows:

"Whether it is Mottle Leaf in orange trees, Little Peach in peach trees or low yields of wheat, the cause appears to be the inability of the plant to secure and assimilate a proper supply of nitrogen."

SULPHATE OF AMMONIA

Sulphate of Ammonia is mentioned by name among the various Nitrogenous Fertilizers recommended to overcome this deficiency.

It is by far the highest of them all in nitrogen contents (20.56% = 25% ammonia) and is particularly adapted to soils that tend to be alkaline, as this tendency is checked by the residual action of the Sulphate.

Besides, it is a definite, uniform, all-available nitrogen carrier, and comes in good mechanical condition.

Labor Needed for Silage Crop.

[Written for Pacific Rural Press.]

Silo owners are almost invariably the best satisfied lot of farmers we meet and such is the case with W. F. Mitchell of Tulare county, who has two silos on his purebred Holstein breeding farm.

In the first place Mr. Mitchell believes in silage because of its value in connection with alfalfa hay as a dairy cow ration. Before erecting his silos it had been his custom to buy high-priced concentrates, but now all of that is done away with, at a saving, considering his cost of growing silage.

On the 12 acres of corn planted this year, which had previously grown a crop of grain hay, the labor involved in irrigation, plowing the land, seeding, and putting into the silo was as follows: Plowing land, one man with team three days; harrowing land, one man one day with team; smashing clods, one man one day with team; planting, one man one day with team; cultivating, one man six days with team; irrigating, one man two days; harvesting, hauling to silo and siloing, 12 men two days with four to six teams. Labor figured at \$2.00 a day.

Allowing for all expenses, except

rent of land and water, the cost of the silage runs somewhere between \$1.50 and \$1.75 a ton. As the land has already produced a normal crop of grain hay the rental charges must be reduced accordingly.

The cost of the silos themselves was not excessive owing to the fact that Mr. Mitchell erected them himself and on that account they were better built than they would have been by contract.

This is accountable for by the fact that the best grade of resaw, six inches wide and sized on both sides, was used, the best being put on the weather side to guard against splitting as much as possible. Between the two layers was nailed a course of one-ply roofing paper and all of it was nailed to two-by-three studing set on 12-inch centers.

Before nailing the resaw it was thoroughly soaked in water, as there was less danger of breaking it while bending into place.

While the silos have only been in use two seasons Mr. Mitchell states that there has been no loss by leakage and none spoiled except the first few inches on the top of the silo before feeding is commenced.

Preventing Wheat Smut.

To the Editor: What is the formula for blue-stoning wheat for smut—also formaldehyde for the same purpose?—P. R. S., Elk Grove.

Use 1 pound bluestone per 4 gallons cold water. Dissolve by hanging it in a bag partly immersed in the upper part of the water in a wooden or copper vessel. Each grain should soak three minutes or less, being sure to be wet all over. This is impracticable if done in sacks. The sure way is to shovel it loose into a tank of the solution. Then shovel it into a tank from which a drain runs back into the first tank. The spores of bunt are killed by this treatment. Either sow within a day or two; or dry the grain thoroughly. If sown before the rains, or kept dry for any length of time, a treatment with lime water is sometimes recommended to neutralize the bluestone effect on germination. Stir ½ pound freshly burnt lime into 10 gallons of water and after settling, use the clear water. Plug the drain in the upper tank containing the bluestoned seed after it has drained ten or fifteen minutes and pour on the clear lime-water for two or

three minutes. Then drain this separately to use repeatedly until litmus paper shows that it is about neutral, when it is of no further use. Then dry the grain and keep it separate from other grain so it won't become reinfected.

Formaldehyde is a gas which is handled for grain treatment in the form of formalin, a 40 per cent solution of formaldehyde in water. Be sure a 25 or 30 per cent solution is not substituted for a 40 per cent solution.

Use a pound of 40 per cent formalin per 50 gallons of water, soaking the grain in it 10 minutes or longer. The time of soaking from 10 minutes to an hour does not affect germinating power; but a stronger mixture does. If the seed is to be kept long, it must be dried or it will rot.

During the soaking, skim off all smut balls, light grains, and weed seeds which float.

These treatments do not control the "loose smut" which is not generally worth the trouble of preventing. Careful use of hot water is the prevention for this.

THE TURN IN THE SEASON.

To the Editor: About ten days ago I wrote you that a dry November was in evidence, and probably a prolongation well into December. Since then the weather has made a decided winter's cold settled over interior Alaska, which came on only a few days before it rained, and has remained since. This cold produces a high barometer area, and thereby northern storms have a chance to come down the full coast length before very long. A decided Arctic change, not fully demonstrated by the light coast storm of Nov. 25, which was only the tag end of a heavy Washington storm, exhausting itself in the upper half of the State.

The change has come because the high barometer area to the northward moved off the map—so that forces storm areas southward in-

stead of leaving them move eastward over the British Columbia and Upper Rockies, as they do in their summer courses. The temperature at Tanana, interior Alaska, ranged above 20 degrees up to the 16th or 18th of November; since then it has fallen to 35 deg. and even to 40 deg. below. This sudden change produced as sudden a change in rain movement.

This is the first time since the heavy September rains that the weather map is coming around to rain conditions. About the 5th of November we had but a showerlet. My forecast previously was based on general tendencies to date of the weather map; also on the few years of heavy September rains.

Berkeley. L. E. Blochman.

[We regret that Mr. Blochman's note came just too late for last issue, which had to be put ahead so the

opulent printers could gorge themselves on 35c turkey. We are glad to have him tell us now how the change came about.—Eds.]

RAISING QUEEN BEES.

[Written for Pacific Rural Press.]

If you do not care to import adult queens, it will be necessary to raise some. This is done by taking brood comb from some one's pure Italian swarm, and putting it into your own hive. In doing this, it is necessary to pinch with the fingers all the queen cells already in the hive, because some of them would hatch before your Italians, and would immediately kill the latter when they hatch. Queen cells are easily recognized by their extra size and thumb-like protrusion from the regular comb surface. Having removed or killed all the native queens and the ruling queen of the swarm, insert your foreign brood and the worker bees will immediately feed the new brood specially-prepared stimulating food, which will develop a number of the larvae into queens. The young which are to become queens may be detected after two or three days by the milky color of the food which is given them; later on, by the expansion of their cells. If you want to save all of the queens developed in that brood, it will be necessary to cut out the cells before they hatch, and insert them into other swarms whose queens and queen cells have been removed, or keep them in cages whose entrances are too small for other queens, but large enough for worker bees to feed the queen larvae. These imported, newly-hatched, purebred queens would very likely mate with your old stock of drones, and you would get mixed brood, so it may pay better

to buy impregnated queens from swarms of the variety you want.

COAST VS. VALLEY SEED OF RED OATS.

(Continued from first page.)

same variety originating in the interior of the State. This is true whether the planting is done in the fall or in the spring.

3. For oat grain production in the interior of California, valley seed is likely to yield more grain than the coast seed when planting is done after January 25th. But the coast seed is likely to produce more grain than the valley seed when earlier seeding is practiced.

In short, coast seed is preferable to valley seed for hay production in the interior under all conditions. But for grain production the preference will depend upon the locality, the planting date, and the season.

NATIONAL GRANGE SESSION.

The fiftieth annual meeting of the National Grange was held recently in Washington, D. C. In his address to the body, National Master Oliver Wilson of Illinois said, among other things: "The national grange has proved itself suited for every condition and section, capable of assisting every type of farmer, not only in his labors in the field, but in the home, in the school and in national life." He declared that too much credit could not be given to the founders and to the loyal co-workers and supporters for their monumental work done at a time when antagonism, scorn and ridicule were being heaped upon them from all other interests. He declared the grange is in a flourishing and healthy condition in all sections of the grange territory. He stated that during the past year 457 granges had been organized or re-organized. These are located in 29 states.

90 Sacks of Barley and 15 Tons of Silage

There seems to be an ever-increasing number of good reasons why the dairy farmer of California should own a silo and grow silage crops, but few of these are more convincing than the one based on the experience of J. L. Jamison of Tulare county.

With him the silo has not only made an improvement in the ration but it has also been the means of raising more on an acre of land than was possible before.

Mr. Jamison grows two crops on his corn land each year, planting part of a 20-acre field to barley and part to oats in January. He does not plant earlier because it would lodge too badly later in the spring.

But he doesn't plant oats and barley for hay as is the general practice. Instead he allows the grain to ripen and then does a quick job of threshing in order that no time may be lost in getting the land plowed and planted to corn. The past sea-

son a 20-sack crop of both oats and barley was threshed on the land.

As soon as the threshing is finished the land is irrigated, then plowed and planted, this work having all been completed within a week after the grain was threshed this season.

The 20 acres would grow more than is required to fill the 100-ton silo, so five acres are planted to Egyptian corn which usually yields 10 sacks to the acre. The corn at siloing time produces on the average about 15 tons per acre, any surplus over the amount required to fill the silo being fed green to the cows or in some instances allowed to ripen for grain.

The land on which the corn has been planted is old alfalfa land, the silo and grain crop making almost ideal rotation crops where the alfalfa has become infested with Bermuda grass.

Wheat Variety Experiments.

[Written for Pacific Rural Press.]

Twenty-three varieties of wheat from the Australian exhibit at the Panama-Pacific Exposition were secured by the Sperry Flour Co. of Stockton, and planted Feb. 22 in plots of four acres and less after tests had been made of the milling and baking qualities of each variety, also laboratory tests of their gluten content. The year's crop has been tested, as was the seed, the tests corresponding very well.

The average gluten content of wheat in the surrounding territory runs from 19 to 21 per cent wet gluten. Tests on the Australian wheat raised on the experimental farm run from 25 to 32 per cent.

One variety yielded eight bags to the acre and tested 27.5 per cent wet gluten and baked a fancy loaf. In growing, it has somewhat the appearance of Bluestem, but does not grow as tall. Although spring sown, each kernel threw out four to six stalks with well-filled heads. The wheat when re-cleaned weighed 62 pounds to the bushel.

Another variety, grown on a half-acre plot, had the appearance of Sonora wheat, but reached a height of only 2½ feet. Many of the kernels threw out three to five stalks, which were well headed. This wheat tested 27.7 per cent wet gluten, and also baked a fancy loaf.

Some varieties made very rank growth and would probably turn out light if sown on summer fallow. Other varieties did not stool, and the straw was so light that a good proportion broke off. Other varieties shelled out badly. It would appear from last season's experiments that it takes a seed high in gluten to reproduce a high-gluten wheat, although these characteristics may change. No data on rust resistance were obtained, though this information is coming to the company from Australia.

Six of the 23 varieties will be planted next season, on the ranch of Mrs. W. T. Hewitt, which has been leased for the purpose. Thirty acres will be used for this. Another 30 will be planted to the Oregon bart variety, which grows well in the

north. White Australian grade will occupy another 30.

The soil on this ranch is of three kinds—sedimentary adobe, black adobe, and red clay containing gravel.

Whether these Australian varieties are better than some of the California wheats can only be determined by further experiments.

DRY FARMING.

To the Editor: I have some fine land in Lassen county without water. I would like information about dry farming.—H. A. D., Oakland.

Dry farming is mostly a matter of selecting winter-growing crops, or drouth-resistant summer crops, which can be cultivated frequently through the summer to keep a dust mulch on the surface, which will prevent evaporation of the winter's moisture.

Dry-farmed land should be disked before plowing to avoid turning under clods which tend to dry out the land quickly. Except when raising winter crops, leave it rough over winter to catch rain, but get it worked down before the clods dry hard.

Where the rainfall is less than ten inches, summer-fallowing is practiced. This is simply clean cultivation through alternate summers to save the moisture, so that almost two years' rainfall is available for one crop.

DECEMBER SCHEDULE GLENN COUNTY FARM BUREAU.

Dec. 14 and 15—Jacinto Farm Center, night meeting Tuesday, December 15.

Dec. 18 and 19—Orland Farm Center, night meeting Tuesday, December 19.

Dec. 21 and 22—Plaza Farm Center, night meeting Friday, December 22.

A suggestion comes from the State Leader asking for a conference of Farm Bureau Directors in February. This matter will come before the directors at the coming meeting.

Bean Track Pull Tractor

6 H. P. at Drawbar.

12 H. P. on Pulley

DOES THE WORK OF SIX HORSES ON THE EXPENSE OF TWO

A giant in strength, this little 2650-lb. tractor walks away with a six-horse load—Eats only when working.—Costs nothing when idle—Runs stationary machinery when not working in the field—Requires 10 to 14 gallons of distillate per day, which, with the lubrication upkeep during the days that it works, cost less than keeping a team.

IT PULLS ITSELF OVER THE GROUND.

This Tractor pulls the load like a horse, instead of pushing it, and it steers with the track that pulls. When you hit soft spots in plowing it doesn't dig itself in so you have to use horses to pull it out. You simply turn the whole front end to right or left as you would a team. Hard to turn? Well, it's almost as easy as turning a team. Fact is, this Tractor is more like a team than anything that actually isn't a team that you ever saw.

READ THESE TEN FEATURES.

1. BEAN TRACKPULL TRACTOR pulls instead of pushes itself over the ground.
2. Can be "gee-ed" and "hawed" out of holes and soft places like a team.
3. Has a full power pull on turns as well as straight-aways.
4. Turns clear around in a ten-foot circle.
5. Plows or harrows as close up in the corners of fields as a team.
6. Plows as close to vines and trees as a team can.
7. Makes little difference how far off center you hitch.
8. Goes under branches of trees that no horse can get under.
9. Light weight and long track surface on the ground.
10. Little power required to pull tractor—power all goes to pull.

IT'S NOVEL CONSTRUCTION MAKES IT

An Ideal Vineyard Tractor

It finishes plowing between a row of vines in two rounds and finishes cultivating in one. It is so narrow it does not injure the vines.

It is so light it absolutely doesn't pack the lightest soil. It pulls almost as hard in LOOSE GROUND as on TOUGH SOIL.

There is a big demand for BEAN TRACKPULL TRACTORS right now. Our factory is running to the limit of production, and reservations must be made well in advance of date of delivery desired. If you want to be sure of a Bean TrackPull, and we believe it is the tractor you want, send in the coupon today.

BEAN SPRAY PUMP CO.,
211 W. Julian St., San Jose, Cal.

Date.....

Without obligation on my part to buy, please reserve a BEAN TRACKPULL TRACTOR for me until two weeks from date. Send me prices and terms and the big illustrated folder, which tells the complete story. Where can I see the tractor demonstrated?

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

DISK OR PLOW FOR ORCHARD CULTIVATION.

To the Editor: Some ten or fifteen years ago there was much discussion as to whether the disk had superseded the plow in cultivating orchards. What is used at present?—J. P. D., Placerville.

The disk has not superseded the plow in cultivating the orchards of California, for there is only an occasional orchard which is not plowed at least once a year—in the spring. Many of them are cross-plowed two or three weeks after the first plowing. The fact that plowing cuts the roots of trees does not appear to us to be so serious as the proponents of disk cultivation believe. In the ordinary summer-cultivated orchards, surface soil dries out anyway, and all feeders in the dry soil will dry out more or less themselves, doing nothing for the benefit of the trees, but calling on the tree for a supply of moisture to keep themselves alive. The plow pruning in winter or spring would naturally stimulate roots as top pruning does the limbs. Since growing root-hairs collect the food and water for the tree, the more of them the better, but annual root pruning would seem to be enough.

For cultivation after the first plowing, a disk seems the logical instrument to use. It prevents roots from growing very much into the dry soil on top, but does not tear out roots all through the cultivating season, in the moist dirt underneath. It also should not leave the soil in ridges for the heat and wind to dry it out still more by the exposure of that much extra soil surface.

Leaving the soil rough and in ridges through the winter rains serves the purpose of catching water and saving it, and also prevents erosion to a certain extent. But that is another question.

HARROWING FOR GRAIN.

[Written for Pacific Rural Press.]

A harrow 80 feet wide hooked to G. W. Pierce's 70 h.p. tractor works over 140 acres per day on his grain ranch in Yolo county. It does 50 per cent better work than the same kind of a harrow pulled by horses or mules, according to Mr. Pierce, because a horse or mule is always picking his steps among the clods while a tractor goes steadily ahead at greater speed. The hesitating slow jerking when horses pull the drag fails to break up the soil as well as the steady faster gait of the machine.

The system of plowing, harrowing, and seeding in one operation with a tractor used to be in general operation in the San Joaquin Valley, but has been discarded for two reasons, says Mr. Pierce: (1) There is too much likelihood of something going wrong in such a series of operations all at one time, and considerable unplanted area might occur. "It is too complicated, especially where there are many turns," says he. "And you don't get the grain."

(2) Plowing times not the time to seed. The ground is cold and

loose. Seeding at that time loses much of the benefit of the plowing. The soil ought to aerate and settle before seeding. Weed seeds ought to have a chance to sprout. A rain should come between plowing and seeding for these reasons.

Mr. Pierce likes all of the winter plowing done soon after the first rains start vegetation, to kill the weeds. Then after a rain he likes to use a springtooth harrow because it loosens the soil so well. When a springtooth catches a weed root, it tears it out with a jerk and knocks the dirt off so it will die. A disk harrow just leaves weed roots in the ground, but is very desirable for cloddy ground. Some sort of clod crushing is necessary in order to get the most even stand.

TRUCK BODY ON AUTO A BUSINESS NECESSITY.

[Written for Pacific Rural Press.]

A small automobile, fitted with a box body, enables T. J. Meader of Sacramento county to sell fruit, etc., on the free market in Sacramento for himself and others, though the trip would be too long to make with horses. The truck carries about 700 pounds besides "us." "It is not large enough," says Mr. Meader, "but if it were much larger we couldn't afford to run to Sacramento with our fruit. We couldn't use it for our fishing trips, either; and that is about all the recreation I have. We just put another seat in the box, put up curtains and carry a mattress, so our camp is ready made."

The round trip to Sacramento with a load requires about 2 gallons of gas whether they take the 19-mile good road or the 14-mile short route.

Upkeep since June 20 when it was "bought for business" has been \$7.50 charge for replacing two defective tires, \$4.50 for new brake bands which were worn out at first "like all other beginners," and \$2 for small repairs due mostly to the belt having slipped off the radiator fan.

Ordinary tire patching is done with a small repair kit; nothing is ignored when it goes wrong, but is fixed at once, and care is used in driving over bumps.

GET ACQUAINTED WITH YOUR NEXT SEASON'S TRACTOR.

The suggestion comes to us that farmers contemplating buying a tractor for next season's plowing and other work should get the iron "critter" early enough to have an opportunity to get acquainted with his likes and dislikes, eccentricities and eccentricities, before the heavy pull ahead of the plow comes. Buying a tractor and putting it immediately to plowing without previous experience is courting failure, the record shows. The advice sounds sensible. A farm tractor is a piece of machinery that will keep on running right if handled right, but that won't run smoothly if handled foolishly. No farmer new to automo-

KILLEFER
QUALITY

Monarch Cultivator

KILLEFER
EFFICIENCY

Our MONARCH CULTIVATOR was made to use on bean and beet land in preparing the seed bed and the general use of it for years past by the bean and beet growers proves it to be well adapted for this kind of work. It is the strongest horse chisel made and is able to do extremely deep work without damage to the tool. See your dealer and get your order in early as prices on all of these heavy tools must advance this coming season. If your dealer does not carry them, write to us for prices.

biles would think of buying one and starting in it the same day to visit his wife's relatives in New England. He would run it around the square and to town a few times first. Same with the tractor. Plowing a 40- or a 60-acre field is a long ride, best made on a tractor previously handled to some extent by its driver.

DYING ORANGE TREES REJUVENATED WITH DYNAMITE.

[Written for Pacific Rural Press.]

In the winter of two years ago, a wide streak through G. L. Camden's orange orchard in the Fair Oaks district of Sacramento county was just about dead. Horticultural Inspector Elmore Chase corroborates Mr. Camden's description of the trees as they were then. Very many branches were dead, and the leaves that remained were so yellow that they were almost orange colored. The orchard had been neglected for five years.

Mr. Camden took the place in May, 1913, shortly after the great freeze. He and Mr. Chase discussed matters, but their combined ideas did not seem to help that streak, which included perhaps 50 to 75 trees out of the block of 294 navels and some St. Michaels.

The crop of 1915-16 on the 294 trees was 17 tons. It is more than double that amount this year, as estimated when about half picked. The trees on the streak bore well, over half as much per tree this season as those on the good ground. They are in first-class shape for next year's crop, having abundant dark green foliage and plenty of fruit wood. The soil in the whole orchard is rather light, with a hard compact subsoil in the bad streak.

Though the case seemed hopeless in Feb., 1915, it seemed wrong to tear out the trees and wait for young ones to come into bearing. So at the risk of losing a year, Mr. Camden decided to dynamite the subsoil.

With a six-foot auger, he bored from a point about four feet from each sick tree, to a point about 4 feet directly under the tree. No tap roots were encountered at that depth. Where the subsoil was gravelly, a half-stick of 25 per cent dynamite was exploded at the bottom of the bore; where it was heavier, $\frac{3}{4}$ of a stick was used.

Then to secure better drainage, a shot of 2 $\frac{1}{2}$ sticks was placed in the center between each four trees and exploded 6 feet deep to tear up the hard subsoil.

To relieve the weakened trees and make room for new growth, all dead wood and the weakest of the rest was taken out in a heavy pruning.

Fertilizer.—In 1914-15 twenty pounds of commercial fertilizer per tree and two tons ground limestone per acre had been applied. That winter, a vetch cover crop was grown. In June 1915, 2 $\frac{3}{4}$ pounds nitrate of soda were broadcasted about each tree, outside of the "drip," so that it would come in contact with the feeding roots when it had been cultivated and irrigated in. A melilotus cover crop was planted last fall. It grew three feet high, and a chain was needed to plow it under.

Irrigation.—In this district, only two irrigations are usual. Mr. Camden's turn came the first of June and

the first of August, but he noticed this season that the heavy draft of the fruit required more, which was given early in September.

Early in his irrigation experience, on this orchard, Mr. Camden did what so few undertake. He found how deep a given amount of irrigation would wet the ground in several parts. Soil auger borings showed moisture usually nearly four feet deep; but in places, five feet deep, showing that the irrigation water was available to the trees.

HEAVIER LOADING ADVISED.

Heavier loading of equipment to relieve the freight car shortage is urged as one of the effective methods of relief by the Pacific Fruit Express Co. For example, it is claimed that potatoes could be handled in one-fifth fewer refrigerator cars than are now used, and that 7 boxes of oranges could be accommodated to the six that are now loaded.

*A student at the University Short Course for Tractor Drivers asked an instructor why a certain machine "strained the smoke." He answered that sparks may fly from the exhaust if the cylinder is allowed to become corroded, and that would be dangerous in dry grain fields.

No grease is used in the tracks or wheel gears of several kinds of tractors because the manufacturers claim it would only catch dirt and grind the bearings.

The conservation of human energy is best attained by the substitution of mechanical power.

There is no question about it. Chemical analyses prove it. Experiments with crops prove it. There is enough potash in your ground now to grow all the crops that you will ever plant. The problem is how to free it, how to make it available for the roots. Tillage will free the potash, completed by lime, decaying roots and green manure. Also will free large quantities of natural phosphorus.

The best way to release plant food is to blast the soil with

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Blasting is tillage, tillage of the most thorough and intensive kind known today, more effective than can be secured in any other way. Blasting followed by proper farm practices will release the potash. It starts in motion the processes that will free the potash and phosphorus in your soil and increase the nitrogen supply.

To get the ideal results in subsoil blasting, use Eureka Stumping Powder—one of the Giant Farm Powders. It has a disruptive, heaving, action—exactly what is needed for breaking up the subsoil or hardpan.

Get the Giant Book on Subsoil Blasting

Sent Free on Request

This book—prepared especially for Pacific Coast farmers—tells how and why blasting provides drainage, gives increased moisture storage capacity, and FREES PLANT FOODS. We will send you a copy on request. Other valuable books—on Stump Blasting, Boulder Blasting, Tree Planting and Ditch Blasting—are also sent free. Mark in the coupon the books that you prefer. General Agricultural Review.

FIELD CROPS.

Large tracts of land in Stanislaus county will this year be planted to sugar beets for the first time.

Porterville begins to figure in the State markets for the first time this year as a commercial producer of beans.

The American Beet Sugar Company at Oxnard has completed a season lasting 128 days, the longest in recent years.

San Joaquin lands have been found unprofitable for rice, according to reports from sections where experimental fields were planted this year.

The total white potato shipments from California for the season up to November 28, as reported by railroads to the U. S. Dept. of Agriculture, amounted to 3917 carloads.

Samples of sugar beets raised in different sections of Klamath county, tested by the American Beet Sugar Company at San Francisco, average 16.5 per cent sugar.

Tulare county raised its banner Egyptian corn crop this year. Forty thousand sacks await shipment. It has been sold to San Francisco brokers at \$40 per ton.

Of the 926,000 acres in San Joaquin county, 224,000 acres, or nearly one-fourth of the entire acreage of the county, were devoted to cereals. Barley predominated.

Two thousand sacks of beans had been shipped to San Francisco from Porterville up to Dec. 1, this being the first time this section has appeared as a successful producer of beans.

Word from Fallon says the Nevada-Utah Sugar Company has announced that all 1917 beet contracts, which were written at \$6 a ton, will be rewritten at \$7 a ton at once.

It is announced from Ventura that a new high price for lima beans has been reached there this season. George Todd has announced the sale of 1000 sacks to J. K. Armsby Company at 7c.

Experiments with seven varieties of rice were made by the Farm Adviser in the Main Prairie district southeast of Dixon, in Solano county, and though it was not a financial success, some rice matured.

The rice men at Paulsell are cleaning up their crop, and the warehouse erected by the Oakdale Milling Co. is about full. So far rice prices have not been very good, 1½ cents being the best offer made.

Joe Robinson of Van Nuys says he finds pumpkins a profitable crop. He reports twenty to thirty tons to the acre without irrigation and they sell at \$3.50 to \$4.00 per ton in the field, which means a net profit of \$100 per acre.

The Santa Ana Sugar Company closed a successful season. It sliced 112,000 tons of beets during its four months' run. Its beets this year tested between 18 and 19 per cent. Growers received about \$7 per ton, receiving a total of \$775,000.

It is announced from Oxnard that the American Beet Sugar factory there has manufactured this season 1,150,000 sacks of sugar, which is 250,000 sacks more than any previous season. The increase is due, it is said, to the unusually high per cent of sugar in the beets this year.

Many Belgian sugar beet growers are moving from Los Alamitos to Kern county to locate on lands leased from Miller & Lux, near Connor's station. Carloads of stock, household goods and farming implements are arriving in Bakersfield for the colonists. The Belgians will go direct to their lands and begin the work of making new homes.

Sugar beets are about as profitable and as sure a crop as farmers in the

Oakdale irrigation district can grow, according to A. E. Lichau, who harvested 759 tons of beets from 39 acres of land, receiving for them better than \$100 an acre. He estimates that his net profit was \$80 per acre. "It is no lazy man's job," he says.

The Ventura Lima Bean Growers' Association distributed checks amounting to \$25,000, representing the proceeds of the November pool. E. Powers, the big grain, melon and produce man of Manteca, has rented the entire Robinson tract of 2,600 acres two miles southeast of town which will be devoted to sugar beet culture.

California rice growers will make an effort to have the present tariff revised upward, according to J. H. Stephens, president of the Pacific Rice Growers' Association. The rice men contend that under the present tariff they are at the mercy of the Japanese, Chinese and India product, and could not compete with Oriental growers were it not for the war.

The Southern California Beet Growers' Association has just been organized. The incorporators are C. J. Forbes, Alex. Jeffries, L. W. Richardson, R. B. Smith, and E. S. Ingleset, all of Van Nuys. The purpose of the Association is to organize all the sugar beet growers of Southern California into a Co-operative Association with a view to mutual help.

Sugar-beet seed was grown commercially in this country during the past year in several States from Michigan to California. The crop of seed harvested in 1915 was so satisfactory—according to the report of the Chief of the Bureau of Plant Industry, of the U. S. Dept. of Agriculture—in each of the areas tested that a largely increased acreage was planted this year. Approximately 5,000 acres are in beet seed in this country this year, while we require the product of at least 16,000 acres for a normal planting, not considering the natural expansion of the beet-sugar industry.

Lima bean men around Oxnard are in trouble. A number of members of the California Lima Bean Growers' Association early in the season agreed to deliver to the Association their crop at a stipulated price, but after the market advanced so much these growers refused to live up to their contracts. They are now being sued by the association. When the association, early in the season, made contracts, lima beans were selling at 5c, but since the fall rains they have sold as high as 7c and growers instead of filling their contracts have sold on the open market, hence they are now facing a lawsuit.

CITRUS, NUTS, SEMI-TROPICAL.

The College Heights Orange Association is putting up a new \$20,000 packing house at Claremont.

A new orange packing house at Navelencia has been established at a cost of \$12,000.

Lindsay has fourteen big packing houses, all of which are running overtime and Sundays. The crop is the heaviest for many years.

This has been a good season for walnuts in Sonoma county. There has been an unusual absence of blight, and the yield has been heavy.

A Citrus Institute will be a feature of the Seventh National Orange Show to be held at San Bernardino February 20 to 28.

The value in the East of advertising California oranges as not sweated or artificially colored is becoming more pronounced every day.

The net value of the orange crop to the growers of Butte county will be \$500,000, according to estimates made by Fred W. Mason, manager

for the Stewart Fruit Company.

B. B. Meek of the Olive Products Company states that the estimate of 30 per cent loss made a few days after the cold snap was approximately correct.

In attempts to stamp out the citrus canker in Florida drastic methods are employed. Crude oil is poured over the diseased tree and it is set afire and burned out root and branch.

W. P. Daily of Oxnard made his first shipment of lemons last week from his young orchard in Pleasant Valley. He has thirty to forty acres of two- and three-year-old trees that have just begun to bear.

It is said that Edward Balou of Lindsay has just bought of J. F. Sullemberger a ten-acre orange ranch just south of town for \$9,000. The orchard is less than five years old and is just coming into bearing.

The Stewart Fruit Company of Oroville states that after deducting all charges, including the commission for handling oranges shipped, the price per box approximated the \$3 mark.

Besides the yield of 621,000 tons of first-class walnuts in Goleta valley there have been harvested this year 120,000 tons of perforated nuts and culls. These are cracked and a crew of 75 girls pick the meat from the cracked shells.

The car shortage at Porterville still remains somewhat serious and deliveries are being made slowly. The present prospect is that not more than 50 per cent of the fruit will be out in time for the Christmas market.

It now appears that both citrus fruits and olives were damaged materially in some sections of California by early frosts and cold a few weeks back. Southern California seems to have suffered little. Competent authorities place the Tulare county damage at as high as 25 per cent.

The nursery people are looking forward to a good planting season. Wallace Nurseries, who specialize in citrus and olive trees in Southern California, seem very hopeful as to the outcome of the coming season. It was lemons from trees that were sold by this nursery that were awarded first prize at the Kern County Fair.

Walter B. Hadley, horticultural commissioner for Redlands, and A. S. Taylor, the commissioner for the Bryn Mawr district, have been making tests of the oranges from various groves in the district to see whether they would pass the 8-to-1 test. The result on eight tests of the Redlands fruit averaged 7.2 to 1, 8.3 to 1, 8.6 to 1, 9.2 to 1, 11.3 to 1, 10.7 to 1, 9.6 to 1, and 9.9 to 1.

General Manager G. Harold Powell of the California Fruit Growers' Exchange denies that the Exchange has been charging San Francisco commission men a dollar a box more for their oranges than is charged in the East, as has been asserted in some quarters. San Francisco has had the same prices that have been quoted f. o. b. to every other market in the country.

Announcement comes from Oroville of the sale of the Ralph Butler olive grove at Table Mountain to Professor A. H. Allen, manager of the University Press of the University of California. The property consists of 20 acres planted to olives and will be operated as a part of, and in accordance with the general plan of the Berkeley Olive Association. Under this plan there is individual ownership, but a community operation of properties.

Experiments conducted on the property of P. J. S. Montgomery, owner of a large orange grove in El Mirador district, this spring and summer establish the value of the announcement from the University of California that the "june drop" of oranges is caused by a fungus. Applications of fungicides made on his trees resulted in saving prac-

tically all of his fruit, and in some cases trees bore more than double the fruit in adjoining rows to which no treatment was given. It is also declared the same fungus causes the split oranges.

DECIDUOUS FRUITS.

The California peach crop this year will bring about \$3,000,000, which is nearly \$1,200,000 greater than that of 1915.

Canning peach growers of Tulare county favor the proposal of the California Peach Growers' Association to handle canning peaches in 1917.

The total apple shipments from California for the season up to November 28, as reported by railroads to the U. S. Dept. of Agriculture, amounted to 1,274 cars.

Eleven thousand Bartlett pear trees will be interplanted in the orange grove of the Mills Orchard Company at Hamilton City. The company has found interplanting very profitable and is working both its orange and lemon groves over in that manner.

About two miles out of Vacaville, on the B. F. McLaughlin ranch, there is an apricot tree measuring 2 feet 8 inches in diameter at the trunk and 57 feet from limb to limb at the top. Mr. McLaughlin claims to have removed twenty-seven 60-pound lug boxes of fruit from this tree.

Prune Week, which began last Monday and ends today, was enthusiastically observed wherever the prune is grown. Thousands of boxes of prunes were distributed from San Jose and other important points, and thus wide publicity and popularity were given to this imperial fruit. Besides which many attractive and artistic displays were made.

Those in charge of the organization of the Prune and Apricot Association report the work progressing rapidly and that the prospects now are that enough stock will be subscribed within a month to allow

the election of trustees. During the past week good meetings were held at Santa Rosa, Healdsburg and Geyersville, which were addressed by Messrs. Weinstock, Madison, Merrill and others. Promises and signatures were secured which indicate that Sonoma county growers will give the new organization fine support.

GRAPES.

The State Viticultural Commission has decided to expend \$2000 in making a detailed study of the new grape disease that threatens the grape industry of Fresno and Tulare counties. The disease is conjectured to be the result of either wrong soil or cultural conditions.

According to a report of the State Viticultural Commission, the combined raisin, wine and table grapes industries of California represent an investment of \$150,000,000. There are 360,000 acres devoted to vineyards, which annually produce \$30,000,000. About 15,000 owners are represented. There are 170,000 acres devoted to the growing of wine grapes, 140,000 acres to raisin grapes and 50,000 acres to table grapes.

James Madison, manager of the California Associated Raisin Company, in comparing the money received by the growers for their raisins before and after the formation of the Associated Company, gives these figures: Average price paid during 1909-10-11-12—Muscats, \$56.26; Thompsons, \$69.40; Sultanas, \$55.60; Malagas, \$43.80; Feherzagos, \$38.80. Price paid by the California Associated Raisin Company in 1915—Muscats, \$72.72; Thompsons, \$99.67; Sultanas, \$88.81; Malagas, \$60.00; Feherzagos, \$60.00.

MISCELLANEOUS.

Seventeen million dollars is the estimate of the crop returns of San Joaquin county for the year 1916.

The Winters Canning Company of Suisun, which closed the longest

running season in its history, put up 77,412 cases of fruit and tomatoes, there being about 15,000 cases of the latter.

A few hay and grain farmers waiting shipment, and a few raisin growers who still have raisins out in the vicinity of Hanford were hurt by the last heavy rains.

The Killefer Mfg. Co., Los Angeles, report recent sales of five Standard Subsoil Plows to the Spreckels Sugar Co., Modesto, Cal., Japan, and Honolulu. The plow going to Spreckels Co. was sold by wire.

The Lodi Sentinel tells us that the average farmer in its district received splendid prices for everything he sold, "causing him to wear a golden smile, improve his property, and buy automobiles. He has the money; he can afford it and he is right in preparing to enjoy a little of this world's sunshine."

The California State Hop Growers' Association met at Sacramento recently to consider the matter of financing the growers. They decided that in future the finances would be raised through the Association instead of individually. The Association, through its directors, will borrow from the banks all money needed for the producing of hops, and the grower receiving the money will give a chattel mortgage on his crop to the Association, who in turn will give it to the bank as security for such loan.

"Less loss of timber every year from forest fires" is the watchword of the timber owners of California. Successful results were attained this year by the timber owners who have co-operated among themselves and with the Federal Forest Service. Natural conditions in the redwood forests of California, such as a moist, foggy climate during the summer, ferns and other evergreen undergrowth, thick bark and non-resinous wood, favor a low loss from forest fires. The loss of privately owned timber this year was less than \$600.

Livestock Facts and Fancies---XI.

[By the Editor.]

We attended the annual meeting of the California Cattlemen's Protective Association recently held in this city (as noted in last week's Pacific Rural Press) because we wished to renew acquaintance with a representative bunch of men who are endeavoring to advance this important branch of our livestock industry and to know what they are trying to do for the State and for themselves. We found them wide-awake, keenly alive to needs of their branch of production and kindly disposed toward the pure-bred interest, the dairy interest, the farm-production of meat, etc. Some of them seemed to be amused at the memory that they had given over the old livestock association to the dairy interest and it was run into a cream separator, from which nothing came out—neither cream nor skim milk in sufficient amount to notice. Therefore they were more than satisfied now to trot along by themselves and do the things which they believed the range interest of the State needed.

The meeting was particularly picturesque and interesting to an on-looker because it came together like a bunch of steers at a rodeo. It apparently had at the beginning no common purpose for lack of preliminary counsels and because no work was systematically laid out for it. This may have been owing to the fact that the Warwick of the range interest, H. A. Jastro, was ill at his home in Kern county and could not flag the course of the meeting. However, O. B. Fuller of Los Angeles got the bunch under control and did more things with it in half an hour than was ever done with a constitutional assembly before in the world. He ripped open the constitution, took out the appendix which limited the powers of the directors, held a meeting of the directors with new powers and passed an order for an assessment. Then he roped the individual members, slit the legs of each of them for a gambrel, pulled him up in the face of the assembly, performed the capital operation on his pocket and laid out nearly \$3,000 on the secretary's desk. He also swore each of them to go out and rope every range cattle owner in the State and operate on him in the same way. Thus the society filled its treasury and is ready to do the work which the range interest of the State requires.

What is this work to be? Everybody present saw clearly enough that its first work is to reorganize itself and get down to a better business basis in every way. A capa-

ble committee on reorganization was appointed. It was evident that a well-planned, systematic organization is required. Mr. Fuller's hold-up was recognized as defensible only to meet an emergency. Nearly every one saw that the best course for the general association of range men is to build it on the basis of local associations which are already doing good work and commanding local support. If more of these are organized and the general association affiliates with them in a central body with the wisdom and power of all combined, a reasonable, representative and forceful organization can be secured. We hope the reorganization committee will get busy at once, and as soon as they finish their scheme call another general convention for its adoption. It might be a good idea to call it in Sacramento right after the holidays. It would be a good way to impress upon the legislature the importance of a number of things that need to be done.

Another thing we wish to talk about briefly this week is the meeting for organization of the California Shorthorn Breeders which will be held at the Palace Hotel in this city at 2 p. m. on Monday, Dec. 11. Enough prominent breeders have bunched themselves to make sure that the proposition has good bottom and backing and they invite everyone interested in purebred Shorthorns, and in the use of them for stock improvement, to join them in the rally. It is not an exclusive affair. If a man now has purebreds so much the better, but if at the moment he has only a Shorthorn in his heart, we believe he will be welcomed. Californians do not hear half as much nowadays about the "lordly breed" as they should. For ourselves we can never forget what Shorthorns have done for California, as we tried to sketch it in the issues of September 16 and October 28, last. Those who do not know that or have forgotten it, may take a hint from what an Illinois farmer said the other day, recalling his experience of forty years ago: "We had a few of those old-style square Durham cattle that were good at the pail and the block. I would give a good deal for a few today." Some old Californian might say the same for this State. Of course many breeders of thirty years ago started a drive on the beef side of the Shorthorn and made the old red, white and roan cow so ashamed of herself that she would hardly show her face in the milking corral, but others have wisely striven to regain her ancestral dairy glory for her, and have much to show for the effort.

Now let all who believe in Shorthorns for beef or for milk or for both combined, get together and put the breed back in its old place in California! And while working toward this, let the new association, which will doubtless be formed, take a strong hold on the new movement for fairer marketing of livestock in this State, in which they can heartily join with all other producers of meat or milk. Remember you are invited to the meeting of next Monday, as indicated above.

DAIRY PROSPECTS GOOD FOR WINTER.

[Written for Pacific Rural Press.]

Never, perhaps, has the immediate future of the dairy industry had brighter prospects than at this time in California so far as market conditions are concerned.

Not only is butter quotably higher than at the same time last year by a margin of several cents a pound, but the prospects are that it will continue to reign higher for the rest of the winter.

It now appears that dealers in this State overlooked a bet last summer by neglecting to buy for storage in large quantities when they should have, and this is one of the factors which bodes well for winter prices. As it happened, the summer prices kept above their ideas with the result that they have been short of the storage product and it is now pre-

dicted that by the end of the year warehouses will be practically cleaned up.

This with the fact that some exporting has been done and that more will likely take place whenever our quotations get down low enough to entice foreign shippers here leads those in touch with the situation to believe that prices will continue to remain firm until the heavy spring supply at least.

Whether dairymen of the State are in the best possible position to realize the most on this state of affairs or not remains to be seen. As is customary when hay and other feeds are high, many dairymen have sold off their cows the past summer, and while there may be enough heifers coming fresh to offset this loss it is probable that we will have few if any more cows in the State the first of next year than we had at the beginning of the present one. Receipts of butter at the present time are a trifle less than at the same time last year, but this may be accounted for by the feed situation which is serious in many coast districts.

River Bend Farm of St. Helena recently sold one of its High Model service boars and a bred sow to H. W. Comstock of Yolo county. The Farm has three weanling boars from its great Defender sow by Orion's Pal, which weighed over 42 pounds at eight weeks. These youngsters will make themselves known at the 1917 State Fair at Sacramento.

"Short Measure-eh?"

A cow can not tell you when she is sick, but her milk yield is a very accurate indication of her condition. The fact is, thousands of cows are allowed to remain unprofitable or below their reasonable standard of productivity through their owner's failure to act on the hint of the milk pail. Don't pass it off by simply calling her a "backward cow"—correct the trouble and reap the extra profit.

Kow-Kure is a medicine for cows that are "off color." It is in no sense a food, but it promptly acts on the digestive organs and enables the cow to thrive on her natural food. Its great curative powers act on the genital organs where many cow ailments originate. The success of Kow-Kure is positive in the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Lost Appetite, Bunches and other common ills.

You can buy Kow-Kure from feed dealers and druggists, in 50c. and \$1.00 packages.

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

J. S. GIBSON CO., Box 97 Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

At prices within reach of every Breeder and Dairyman.

When you buy a son of our herd sire, Prince Alcartra Korndyke, you get more than a Holstein bull with registration papers—you get a grandson of the world's greatest milk cow out of a high-testing A. R. O. dam. Our herd of females has been developed into one of the best in the State.

A CHEAP, CLEAN HOG TROUGH.

[Written for Pacific Rural Press.]

A cheap, sanitary watering trough has been evolved by W. D. Trewthitt of Kings county, through the use of second-hand urinals, secured where old schoolhouses were being remodeled. These are porcelain lined, and the rounding bottom makes them easily cleaned. They are fitted into a wooden frame that sets solidly on the ground. A frame work above shields the water from the hot sun and makes a slatted front that keeps the hogs from crowding one another while drinking; also keeping them from putting their feet in the troughs. This frame is put together with bolts, so that it can easily be taken apart for moving or other alterations.

Reclaiming Land and Cattle.

[Written for Pacific Rural Press.]

The reclamation of land and cattle is the primary business of Mesdames Alexander and Kellogg on 500 acres of Grizzly Island, fifteen miles from Suisun, Solano county, adjacent to the Sacramento river.

A few years ago this ranch, like thousands of acres of other land in the district, was a vast tule patch, providing nothing for humanity except ducks for a few city sportsmen. Now, due to a protecting levee, constructed with dredgers, it raises good crops of cereals, beans, sugar beets, and salt grass pasture, although the land is still too "new" to produce the maximum that is eventually expected of it.

Two classes of soil are found on these lands; sediment and peat, and until deep plowing and constant cultivation can intermix the two soils, yields can not be of the best. Also there is the matter of draining the soil of salts and alkali which tide-water has carried in for centuries.

This latter problem has been taken care of by the installation of numerous drain ditches, four to six feet deep, all emptying into a main ditch whence the seepage water is electrically pumped over the levee into the river. During the summer season this work is not required so often as in winter and spring when the river is at its height. But ditches of such size and in such numbers take up lots of good land and for that reason tile will be installed to take the place of open ditches. Besides the saving of land, it is thought that the tile will drain more of the salts than do the open ditches.

Indian corn for silage, Sudan grass, beets, and barley are the crops which have so far done best on this ranch; but experimental

plots of alfalfa indicate that this crop may be grown, thus completing the necessary chain of feed crops for the livestock, which is to be the form of product marketed.

The reclamation of cattle is equally unique as that of the land; for these two ladies have undertaken to reclaim the attention of dairymen to the dual-purpose cow, having selected the dairy Shorthorn for this purpose.

It is their belief that there is a place in California for a cow that will produce both milk and beef in liberal quantities; and toward that end they have imported from the East a select herd of females, all of which carry beef-making qualifications; and some of which have produced as much as 300 pounds of four per cent milk in seven days on official test.

As there has been more or less controversy as to the milking merits of the Shorthorn, official testing is being practiced, eight head being on test for yearly records at the time of the writer's visit.

That these milk records do not disqualify them for beef making is evidenced by the contention of Herdsman Curtiss that the chief difficulty he finds in testing is their tendency to become over-fat, as a result of the liberal feeding which test cows require. This, he believes, would be overcome to a satisfactory extent if hill pasture was available.

With buildings as with land and cattle, the owners of this ranch have taken pains to have the best, a modern concrete-floored milking stable and calf barn having been built for winter protection as well as commodious hay barn, bull barn, and silo.

Increasing Pork Gains With Ground Feed

[Written for Pacific Rural Press.]

Every livestock feeder should have a feed cutter and grinder in order to get the most economical gains from a given amount of feed.

Such is the belief of W. D. Trehitt of Kings county, who makes it a practice to run almost everything through his grinder that is fed to his large herd of purebred and market hogs.

About 250 head of hogs are usually kept on this ranch, all of which are purebred Poland Chinas, only the best of which are registered or sold as breeding stock.

Alfalfa pasture is provided all of the hogs during the growing season, supplemented in the winter months with mangels that have been run through the feed chopper. These furnish a succulent feed till the alfalfa pastures are again available in the spring, and when fed in connection with grain have been found very satisfactory. The mangels may be planted under Mr. Trehitt's conditions either in the spring or fall, but he has secured the best results from November and December plantings for the next winter's feeding.

During the summer months ground barley and wheat constitute the chief grains used, tankage being fed daily, both winter and summer, and charcoal, salt and sulphur every

other day. In winter the grain ration is changed to one of Indian corn raised on the ranch, its heating qualities not being considered good for the hogs in the summer. At times ground alfalfa is fed during the winter months, it having been found possible to get the stock to eat as much as one-third of this when fed with the ground grain.

Self feeders are used in feeding the young pigs and have been found economical both in the amount of labor and in feed as there is practically no waste with either. Market hogs have also been successfully run on the self-feeders.

Farrowing is done in a separate farrowing house, built especially for that purpose with capacity of a number of sows so that they may be left there with their pigs for as long as two months if necessary.

By handling his hogs in this manner Mr. Trehitt is able to market his hogs at seven to eight months of age weighing 200 to 250 and in some cases 260 pounds.

The fact that they are all purebreds undoubtedly has a great deal to do with the profits on this ranch, but Mr. Trehitt believes that the \$85 he invested in his feed cutter and grinder was the best investment he ever made.

REMCO

Air-Dried Redwood

PIPE

For Irrigation—Water Supply—Power. Sizes 8 inches to 12 feet. For pressure up to 400 feet head. Guaranteed for 100 per cent overload.

Costs less than any other pipe of equal capacity, efficiency and endurance.

Not affected by worms or insects, acid or alkaline soils, electrolysis or roots.

Withstands extremes of heat and cold, dryness and moisture.

Outlasts any pipe except cast iron, and maintains its full flow capacity to the end.

TANKS

For Water—Wine—Vinegar—Oil—Acids—Solutions. For Storage—Mixing—Fermenting—Pickling—Leaching. In all shapes and sizes—500 to 650,000 gallons.

SILOS

For Dairymen—Stockmen—Feeders. Sizes, 25 tons to 300 tons. The STANDARD.

ALL REMCO PRODUCTS are manufactured to your order from CLEAR, AIR-DRIED REDWOOD. Selected from our stock of forty million feet. Their outstanding features are HIGHEST GRADE MATERIAL, SUPERIOR EFFICIENCY, MECHANICAL PERFECTION, MAXIMUM DURABILITY.

Sold direct to users. Catalogs sent on request.

Live Stock and Dairy Notes.

(Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.)

THE DAIRY.

Tulare is being prospected as a site for a new casein factory.

The Borden condensed milk factory at Modesto is well under way and it is thought that it will be in full operation by spring.

A large acreage of alfalfa land is being prepared on Revada Farm, owned by B. Nixon, for spring seeding. With the additional feed from this land Mr. Nixon will be able to feed his herd of imported Guernsey cattle largely from his own ranch.

The second unit of the Glenn Co. Cow Testing Association, on which the Farm Bureau has been working for the past six months, will probably start work early in the coming month. Nearly 1000 cows along the river country have signed up for the unit.

Arthur Purvine, son of the veteran breeder, T. B. Purvine, has taken charge of the purebred Jersey herd on his father's ranch in Sonoma county. At the present time he has 15 cows on semi-official test. Several daughters of his herd sire, Fairy Boy 4th, are doing exceptionally well.

The first carload of casein to be shipped from California to the East left Modesto Nov. 29, from the plant of the Milk Products Corporation of Delaware for the paper mills at Cumberland, Maine. The car will contain 45,000 pounds of sacked casein valued at \$10,000. Since beginning operations Oct. 2, three carloads of casein have been manufactured.

State Veterinarian Chas. Keane reports satisfactory progress in the tuberculin test work being conducted by his office in compliance with the new dairy law. His records for the first month's work indicates that 10 to 12 per cent of all cows tested are reactors. The percentage is larger in the bigger herds than in the smaller ones.

There is a sharp breach in San Francisco between the producers and distributors of milk, and the directors of the Associated Milk Producers are planning for direct service of their commodity to customers. The trouble is the result of the refusal of the producers to contract with the dealers for the coming year at four and an eighth cents a quart, the price paid last year. It is believed delivery of milk to San Francisco households will begin within a week.

Following table gives the names and records of the cows in the Gridley Cow Testing Association which have produced more than 45 pounds of butterfat during the period of 30 days ending Nov. 30th, 1916: R. E. Fields (Biggs), Speiss, Holstein, 48 lbs.; R. E. Fields, (Biggs), Molly, Shorthorn, 50.1 lbs.; S. A. Mealey (Gridley), Beauty, Holstein, 72.2 lbs.; S. F. Bonner (Gridley), Bob, Holstein, 45.8 lbs.

BEEF CATTLE.

State Veterinarian Chas. Keane reports heavy importations of feeder cattle into the State at present.

Del Grieve of Yolo county recently received two carloads of Hereford cattle from Texas, finding a ready sale for the bulls as soon as they arrived.

The Barco ranch of Hollister was recently offered \$5000 by visiting Eastern folks for the white Shorthorn bull, Hallwood Villager, calved Oct. 15, 1915.

The stock yards at Kansas City have been quarantined against the foot and mouth disease. Everything about the stock yards, including the dining rooms of the employees, is being fumigated.

The Southwest Cattle Loan Co. are receiving heavy shipments of

feeder cattle from Utah for winter feeding in Imperial Valley. The same concern is also shipping some sheep into Imperial county.

What is perhaps the largest shipment of range bulls for the year is a trainload of Hereford bulls, being made by Miller & Lux from Texas. They will be used on the company's large herds of grade cows.

H. L. & E. Murphy have just arrived from the Middle West with four carloads of purebred Shorthorns, the first of their 1916-17 shipments. Included in the lot were 18 head for the Butte City Ranch in Glenn county, which will be used in founding a purebred Shorthorn herd on that ranch.

W. F. Holt of Los Angeles, who has acquired considerable wealth in the Imperial Valley, has just purchased of W. H. Stephens 5000 acres of land in Ventura county six miles southeast of Fillmore. It is fenced and cross-fenced. Purchase price, \$50,000. Mr. Holt plans to stock it with 5,000 to 20,000 grade Hereford cattle.

The Hayes & Devany Livestock Company will take over a ten-year lease for 47,000 acres of land in Merced, Stanislaus and Santa Clara counties at an annual rental for the first five years of \$20,000 and for the last five years of \$22,500. An agreement with the Howard Cattle Company calls for the purchase of 2500 head of cattle at the price of \$42 per head.

A dispatch from the International Livestock Exposition at Chicago, dated Dec. 4, says: "The University of California farm may have the honor of furnishing the grand champion steer at the International Live Stock Exposition. The judges of cattle today picked University of California Jock, a two-year-old Aberdeen Angus steer, as the best of several hundred shown in that division. California cattle competed against the cornfed stock of Illinois, Indiana, Ohio and, in fact, almost every State in the Union. The grand champion steer is picked from the champions of each division, which include Shorthorns, Angus, Herefords, Galloways, Red Polled, Polled Durham and cross breeds. 'California Favorite,' a yearling Hereford-Shorthorn cross-bred steer, took first prize in that division. This steer will also have a chance at the grand championship."

HORSES AND MULES.

T. F. McFarland of Oxnard purchased a carload of young mules and colts and a few broke horses in the Livermore valley last week.

Mr. Bowers of the firm of Ruby & Bowers is enlarging his barns at Davis to make room for more horses. He reports the sale of several stallions and jacks during the past month. The firm are making a show of their drafters at Portland this week.

SWINE AND SWINEMEN.

This year the Oakdale output of hogs will exceed \$100,000 in value.

J. P. Williams of Brawley, Imperial county, received a purebred Duroc boar from a breeder at Logan, Iowa, the past week.

Otis Linn of Modesto reports that he has recently secured a new herd boar to head his registered herd of Poland Chinas. The boar was sired by Big Joe of the Kemp herd.

According to Frank Brush of Santa Rosa the two Berkshire sows, Kintyre Elspeth and Kintyre Masie, purchased by him at the State Fair, are developing into good show prospects for next year.

Homer Hewins of Napa county reports that he has recently purchased two registered Berkshire gilts and a

REGISTERED BERKSHIRES—For sale, bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Nevada, Cal.

ROSE CREST BERKSHIRES—Rivals Champion Best blood. Open and bred gilts. Service boars. F. L. Hall, Perris, Cal.

30 REGISTERED BERKSHIRES—Boars and gilts for sale. J. H. Benedict, Lemoore, Calif.

BERKSHIRES—Carruthers Farms, Mayfield, Cal. Second annual sale, August 2, 1917.

HOPLAND STOCK FARM—Registered Berkshires. Prices on application. Hopland, Cal.

REGISTERED BERKSHIRES—Young stock for sale. F. W. White, Elk Grove, Cal.

CHAS. GOODMAN—Breeder of high-class Berkshire Swine. Williams, Cal.

Duroc-Jerseys.

DUROC JERSEYS—My hogs won highest honors at State Fair, taking first prize herd, first prize sow, second prize boar. Were the largest of their age exhibited. Stock all ages for sale. Prices reasonable. Breeding and satisfaction guaranteed. Haden Smith, Route 1, Box 540, W. Modesto.

RANTHO RUBUS DUROCS—About closed out. A few extra good sows, choice July gilts and weanling pigs, both sexes. Your last chance for high-class stock at common prices. Remember breeding stock will be scarce next year. Elmer Lamb, Ceres, Cal.

REGISTERED DUROC-JERSEYS—Service boars from prize-winning stock are money-makers. They grow faster. New England California Corporation, Ripon, Cal.

REGISTERED DUROCS—Service boars and open gilts from High Model, Defender and Crimson Wonder stock. River Bend Farm, St. Helena, Cal.

DUROC JERSEYS—Herd boars. E. M. Colon and Tulare Boy. Sweepstakes winner at Fresno, 1915. Choice breeding stock. J. P. Walker, Visalia.

REGISTERED DUROC-JERSEY SWINE—Both sexes. Big-boned type. B. F. Kendall, Hanford, Cal.

REGISTERED DUROCS of guaranteed breeding. All ages. Weaned pigs \$10. H. M. Boudier & Son, Napa.

HEAVY BONED DUROCS—A few service boars for sale. Ormondale Co., Route 1, Redwood City, Cal.

REGISTERED DUROCS—Crimson Wonder stock. Young stock, both sexes. L. D. Collins, Denair, Cal.

WINTON DUROC-JERSEY FARM, Winton, Cal.—High-class pure-bred hogs, both sexes, any age.

DUROCS—Defender Cantic B and Golden Model strain. The big type. Allen Thompson, Tulare.

REGISTERED DUROC JERSEY MALES—Three months old, \$10. H. J. Schell, Atwater, Cal.

DOS HERMANOS REGISTERED DUROCS—Duveneck & Pickersgill, Ukiah, Cal.

CURTIS DUROCS of either sex at all times. E. C. Curtis, Napa, Cal.

REGISTERED DUROC JERSEY SWINE—Frederick M. Johnson, Napa, Cal.

REGISTERED DUROC-JERSEYS—S. S. Southworth, Napa.

Yorkshires.

LARGE YORKSHIRES—Choice spring boars, gilts, and weaned pigs from Champion sow P. I. E., or from breeding of champion boar and sow, Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

LARGE YORKSHIRES—The ideal hog for the progressive farmer. Young stock for sale. A. L. Tubbs Co., Calistoga, Cal.

Chester Whites.

BILLIKEN HERD OF CHESTER WHITE SWINE—Registered and Cholera Immune. 4 bred gilts due to farrow the latter part of January. 10 young boars of service size. 20 open gilts that will be bred to suit the buyer. Write for the booklet "Chester Whites" and find out what the breed is and what they are doing. This herd represents the very best blood lines the breed produces. C. B. Cunningham, Mills, Sacramento County, Cal.

REGISTERED IMPROVED CHESTER Whites—Grizzly Bear Ranch, East Auburn, Cal.

Essex.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

Hampshires.

FOR SALE—Purebred registered Hampshires; any age; either sex. Registration free. H. E. Richardson, E. F. D. No. 1, Chico, Cal.

DAIRY CATTLE.

Holsteins.

REGISTERED HOLSTEINS—Herd sire King Kordyke Hengerveld Ormsby 7th, 86623. His full sister, as Junior 8-year-old, made 32.04 lbs. butter in 7 days. The record of his sire's dam averaged 30.98. George Kounias, Modesto, Cal.

REGISTERED HOLSTEIN BULL CALVES—Sired by Lorena Kordyke Alcantara, whose dam made 29.75 pounds butter fat in seven days as a four-year-old. J. M. Campbell, Escalon, Cal.

FOR SALE—Purebred Holstein Bull—"Sur Captain"—under 3. Three-quarters black. Healthy. Good-tempered. Sure stock-getter. Price \$150. H. P. Rosenberg, Box 640, Mill Valley.

REGISTERED HOLSTEINS—Grandsons of King Segis and of world's record cow Creamelle Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

REGISTERED BULLS by King Kordyke (Pontiac) and out of A. B. O. cows. A splendid selection old enough for service. Write or call. J. H. Hartigan, Woodland, Cal.

TULARE GUERNSEY AND HOLSTEIN Farm is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Higdon, Tulare, Cal.

A NICE YOUNG SON from El Prado Wayne Colantha and from a 24:26 lb. dam. J. W. Benoit, Breeder of Registered Holsteins, Route C, Modesto, Cal.

THE MCCLLOUD RIVER LUMBER CO., McCloud, Cal.—Highclass thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

THE HENDERSON CO.—Breeders and importers. Registered Holsteins. Sacramento Bank Bldg., Sacramento.

BREEDERS OF REGISTERED HOLSTEIN cattle and Berkshire pigs. Whittier State School, Whittier, Cal.

REGISTERED HOLSTEINS—A. W. Morris & Sons, Corp., Importers and Breeders, Woodland, Cal.

CREAM CUP HERD—Registered Holsteins. Pontiac bull calves. M. Holdridge, Modesto, Cal.

BREEDERS OF REGISTERED HOLSTEIN CATTLE—McAlister & Sons, Chico, Cal.

SUNNYSIDE HERD—Registered Holsteins. R. F. Guerin, R. 3, Box 58, Visalia, Cal.

CHOICE HOLSTEIN bulls for sale. No females. Millbrae Dairy, Millbrae, Cal.

REGISTERED HOLSTEIN BULLS for sale. Sunnybrook Ranch, Willits, Cal.

REGISTERED HOLSTEIN BULLS for sale. C. L. Morse, Route B, Modesto, Cal.

REGISTERED HOLSTEIN BULLS from A. R. O. dams B. F. Anderson, Modesto, Cal.

REGISTERED HOLSTEIN BULLS, \$50 to \$150. Giorietta Stock Farm, Woodland, Cal.

HOLSTEIN COWS for sale with records. Dr. Stetson, Napa, Cal.

REGISTERED HOLSTEIN CATTLE—E. E. Freeman, Route B, Modesto, Cal.

A. R. O. HERD OF HOLSTEINS—Alex Whaley, Tulare, Calif.

Jerseys.

JERSEY BULLS AND BULL CALVES—Sons and grandsons of 2 and 3 lbs. cows. None better. Cheap for quality. N. H. Locke, Lockeford, Cal.

REGISTERED JERSEYS—Herd established 1868. Young bulls from best cows. Rancho Dos Rios, R. 2, Modesto.

VENADURA HERD OF JERSEYS is now offering the heifer calves from register of merit cows with official yearly record. Guy H. Miller, Route 1, Modesto, Cal.

JERSEY BULLS—Serviceable age. Sons of Gertie's Lad, who has two daughters that made over 600 lbs. butter as two-year-olds. A. A. Jenkins, Tulare.

BREEDER OF REGISTERED JERSEY CATTLE—Duroc Swine. Young stock for sale. W. J. Hackett, Ceres, Cal.

JERSEY BULLS AND HEIFERS from Register of Merit Cows for sale. C. G. McFarland, R. 2, Tulare.

YOUNG REGISTERED JERSEY BULL CALVES at reasonable prices. O. J. Ames, Oakdale.

REGISTERED JERSEYS—Young bulls and bull calves. T. B. Purvino, Petaluma, Cal.

JERSEY BULLS from Register of Merit cows. C. D. Haworth, Modesto, Cal.

Other Breeds.

PACIFIC GUERNSEY HERD—Cattle selected from best imported and Advanced Register Stock. Now offering choice bulls. C. S. Rasmussen, Lodi, Cal.

EDGEWOOD FARM GUERNSEYS—First in the show ring and in official records. Few animals of either sex for sale. Edgewood Farm, Santee, Cal.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain. Choice young stock for sale. John Lynch Ranch, Box 321, Petaluma, Cal.

INNISFAIR DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, Cal.

AYRSHIRES—Registered; all ages. E. B. McFarland, 412 Claus Spreckels Bldg., San Francisco.

BEEF CATTLE.

SCOTCH AND SCOTCH-TOPPED SHORTHORNS—We have the largest herd of straight Scotch cows in California. Foundation stock of both sexes for sale; also a choice lot of range bulls. Barco Ranch, Hollister, Cal.

REGISTERED YEARLING SHORTHORN BULLS—Heavy-boned, thick-meated Scotch and Scotch-topped breeding. Ormondale Co., Route 1, Redwood City, Cal.

FAIR OAKS RANCH WHITTS, Cal.—Young registered Shorthorn bulls for sale. Sired by Landseer 379318, grandson of Imported Villager 295884.

REGISTERED AND UNREGISTERED Shorthorn Bulls and Percheron Horses for sale. Falcines Ranch Co., 320 Sharon Bldg., San Francisco.

CROLEY'S CALF FEED with skim milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

HOPLAND STOCK FARM—Registered Shorthorns. Prices on application. Hopland, Cal.

SIMON NEWMAN CO., Breeders of Registered Herefords, Newman, Cal.

REGISTERED HEREFORDS—H. H. Gable, Diamond G Ranch, Eureka, Cal.

GEORGE WATTESON—Breeder registered Herefords, Bishop, Cal.

SHORTHORNS—Carruthers Farms, Mayfield, Cal.

SHEEP AND GOATS.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and Importers of Shropshire, Ramouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

KAUPKE BROS., WOODLAND, CAL.—Breeders and Importers of Hampshire sheep.

BISHOP BROS., SAN RAMON, CAL.—Breeders and Importers Shropshires.

CHAS. KIMBLE—Breeder and Importer of Rambouillets, Hanford, Cal.

HORSES AND MULES.

REGISTERED SHIRES—Black Hawk Stock Farm, Importers and Breeders, Easton & Ward, Proprietors, Burlingame, Cal.

boar from H. C. Harpending of Dundee, New York, to further strengthen his herd of Berkshires.

The Napa State Hospital has between 40 and 50 head of registered Berkshires among the 600 head of garbage-fed hogs which are maintained by that institution. Mr. Duffey, manager, states that the purebred herd will be still further increased.

Mr. H. C. Carr of the First National Bank of Porterville has purchased a good many bred gilts to be put out among the boys in his community. If the best results attained by these boys could be shown at the Sacramento fair, and there was that added fillip of prizes and competition with the boys of other sections, it would go far toward increasing the interest and demonstrating the profits in swine growing.

Pig clubs are organized among the farm boys and girls by the U. S. Dept. of Agriculture and the State Agricultural Colleges in co-operation. There are now 10,000 pig club members. The members are taught how to raise pigs and earn and save money. For further information see your county agricultural agent, or write, or have your parents write, to your State Agricultural College.

SHEEP.

Twelve thousand head of sheep, brought in from the ranges, are now in Visalia and will be fattened there on alfalfa and beet pulp for the San Francisco market.

H. Beckwith of Bethany has recently purchased 20 Shropshire ewes from the Meacham Estate. It is his intention to establish a small flock of purebreds in order to clean up the farm wastes profitably.

California is represented at the sheep show at the Chicago International Livestock Show this year by Bishop Bros. of San Ramon and the University of California. Bishop Bros. have sent 15 head, and it is expected that they will make a creditable showing in the Shropshire classes. The sheep exhibited by the California School were awarded the blue ribbon.

The order removing the sheep quarantine in the state of Colorado and in the California counties of Tehama, Glenn, Colusa, Sutter, Marin, Napa, Calaveras, and Mariposa, became effective Dec. 1. The quarantine still stands with respect to the San Joaquin counties and as to Mendocino and Sonoma counties. It is believed that because of the brushy nature of the country, which prevents taking up all the sheep so they can be dipped against scab, that Sonoma and Mendocino counties will be the last to be freed.

HORSES FOR SALE—All or any part 170 head. Imported Percheron stallion. 50 grade Percheron mares. 30 three-year-old colts, broke and mated; \$250 to \$300 per span. 30 two-year-olds; 30 one-year-olds; 30 nine months old. S. L. Skaggs, Madera, Cal.

STOCKTON PERCHERONS again winners at Sacramento. Get next, brother farmer. H. G. Learned, Producer, Stockton.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT CO., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office 219 Underwood Building 525 Market St. San Francisco.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 531-637 Brannan St. San Francisco.

THOROUGHBRED SCOTCH COLLIES—All bred from our noted prize-winners. Have a few 3 months old puppies—very choice. Write us what you want. Browndale Kennels, Redwood City, Cal.

STOCK RANCHES AND FREE RANGE—Different counties. Write for free booklet. Joseph Clark, Sacramento.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES elite bred to 900-lb. boar. Ed. E. Johnson, Turlock, Cal.

MISCELLANEOUS.

An appraisal of the value of livestock in San Joaquin at this time is \$5,000,000.

On account of the Stanislaus Livestock Show and Exposition held last September being such a success, steps are being taken toward establishing permanent county fair grounds by the Rural Modesto Chamber of Commerce.

We regret to state that an error was made last week in the advertisement of Geo. A. Smith, breeder of Holstein-Friesian cattle and purebred Poland Chinas, announcing his forthcoming sale. The date of the sale should be Wednesday, December 13, instead of Wednesday, December 15. See advertisement elsewhere in this issue.

Depredations of predatory animals accompanied by outbreaks of rabies among them in parts of Oregon, California, Nevada, Idaho and Utah resulted in the shooting, trapping and poisoning of over 11,000 coyotes during the last fiscal year by hunters in the employ of the Biological Survey of the U. S. Dept. of Agriculture. Altogether over 15,000 noxious animals, including wolves, coyotes, mountain lions, and bobcats, were destroyed.

SWINE BREEDERS' MEETING.

Everything is progressing favorably towards a successful meeting of the California Swine Breeders' Association to be held at Los Angeles, January 18 to 19. Within the past few days the following committees have been appointed to make arrangements for the meeting and look after the visiting stockmen:

Entertainment Committee—Frank M. Hauser, Herbert Newcomb, Charles F. Hardy, N. R. Vail, Herman Janss and S. R. Dixon.

Reception Committee—B. A. Benjamin, O. B. Fuller, Stoddard Jess, Harry Chandler, A. T. Brant, and H. J. Hauser.

Attendance Committee—Frank H. Thomas, Mr. Hall, LeRoy Holt, A. L. Hobson, Roy Farr, and F. E. Peck. Executive Committee—H. J. Hauser, chairman; S. R. Dixon, J. C. Good, John A. Woodward, N. Russell Vail, Herbert Newcomb and J. E. Maurer.

The program as so far mapped out is:

Thursday, January 18—Business session, followed by address, The California Swine Breeders' Association, by president C. B. Cunningham, Mills. Feeding, Growing and Marketing Hogs, by Leon L. Hanson, Holtville. The Breeding Herd and Purebred Business, William Bernstein, Hanford. Discussion: Feeding Problems and Self-Feeders. Luncheon.

After lunch the following papers will be given: Why Prices of Hogs in California are Lower than in Oregon or the Middle States, representative of one of the packing houses; Why Strictly Grain-fed, Milk-fed, Alfalfa-fed and Acorn-fed Hogs all bring about the same price in California, representative of one of the packing houses; What is Being Done and What Should be Done for the Good of the Hog Industry in California, D. O. Lively, San Francisco.

Friday, January 19—Killing demonstration at Cudahy Packing Company, in the morning, followed by curing display at Wilson & Co.'s packing house; then inspection of plant, and luncheon at Hauser Packing Co.

GOOD GUERNSEYS FOR CALIFORNIA.

Two exceptionally fine Guernsey bulls were received last week from New Jersey by J. W. Henderson for the Bella Vista Guernsey herd. This herd has been headed by Imp. Lord Kitchener, whose heifers are now freshening, one 2-year-old giving 42 pounds milk. It is for use on these heifers that this new blood has been secured.

The older of the two bulls is Glenburnie Boy, whose dam, Glenburnie Girl, has a butterfat record of 684 pounds as a 3-year-old. Her

dam has a 654-pound butterfat record. The dam of the younger bull also has a 654-pound butterfat record.

Both were sired by Sir Elsax, and are grandsons of Ne Plus Ultra, whose daughters brought the record price at the Hope sale recently. The dam of Sir Elsax, Elsie 2nd, holds the highest one-day record for her age—3.7 pounds butterfat. Both of the young bulls are direct descendants of King Masher 11084, who is regarded as probably the greatest Guernsey bull. No other bull has two daughters in the list of class leaders and none has averages so high for every daughter yet in milk. Eleven daughters average 12,495 pounds milk and 664 pounds butterfat. This includes four 2-year-olds averaging 10,565 pounds milk, 525 pounds butterfat, and four 3-year-olds averaging 11,982 pounds milk, 635 pounds butterfat. The four best records average 14,564 pounds milk and 750 pounds butterfat. Such blood should show its effect in this herd.

According to Professor M. E. Jaffa of the department of nutrition at the University of California, wheat at its present price is altogether too expensive to feed to chickens. Cereals which cost considerably less may be fed with as good or better results. A mixture of barley and oats will prove a good substitute and cost much less, he says.

Mrs. Van Pelt—If you work for me, Bridget, you will have to wear caps. I suppose you do not object. Bridget—Sure not, mum. I can borrow wan from me cousin. It has ear tabs and a 'possum tail on top.

The 400,000 hens wanted from Southern California before the new Weinstock marketing plan is put into execution seem assured.

Breeding Cows on a City Dairy.

[Written for Pacific Rural Press.]

Producing market milk under conditions as they exist in southern California, with the exception of Imperial Valley, at this time calls for the most intelligent kind of management if the venture is to be profitable. This is largely attributable to land and feed values, which are, on the average, higher there than elsewhere in the State.

It was with a thorough understanding of this situation that S. A. W. Carver started, four years ago, to establish a whole-milk dairy run on practicable and profitable lines, on 200 acres in the Artesia district.

At the start Mr. Carver recognized that good cows were fundamental factors on a dairy. He further understood that such cows could not be bought in large enough numbers to supply his need at a low figure, but must be bred and raised; for it was evident to him that no dairyman who has spent time and money in breeding up a high producing herd of cows cares to dispose of them under normal conditions.

But cows for the foundation herd had to be secured and by using discretion in buying and afterward weeding them down with the Babcock test and the scales, the average production came well up to the 220-pound per year standard that had been decided on for mature cows.

As heifer raising was not the common practice on dairies in that part of the State, the possibility of buying heifers and raising them appealed to Mr. Carver, and as a result continual buying of heifers from the best cows from dairies all over the country was practiced, the custom being to pay \$8 to \$12 a head for them at weaning time. The cost of raising these heifers to freshening

time, after the poor ones are culled out, has averaged \$60 per cow.

After feeding these calves on skim milk for a while at the dairy they were turned onto hill pastures, located some 15 miles from the dairy, which had been rented for young and dry stock.

In purchasing both cows and heifers it was the object to secure about one-third Jersey and Guernsey cattle and the balance Holsteins, the object being to produce a high testing milk. This was carried out further by the purchase of registered Holstein and Guernsey bulls out of high testing dams.

With the freshening of the heifers have also come butterfat standards for the different classes of cows, a two-year heifer being expected to produce 150 pounds of fat or better with her first calf, a three-year-old 185 pounds of fat, and a four-year-old or better 220 pounds of fat.

These standards are adhered to by the weighing and testing of each cow's milk twice a month, the weighing being done in the milk barn; and the testing at the Los Angeles plant of the Crescent Creamery where a composite sample of the two milkings is sent in small milk bottles.

Now after four years of culling, 265 cows are being milked, half of which are heifers with their first calves. The daily production of this herd in August was 700 gallons of milk daily, having an average test between 4.1 and 4.2 per cent, or an average fat production daily of about .90 pound. From experience to date, however, it is evident that this will be materially increased as the work of breeding and selection continues.

Brood Sow Ration.

To the Editor: What is a good ration for brood sows before and after farrowing?—R. L., Winton.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

Just what constitutes a desirable ration for a brood sow depends upon a number of factors, prominent among which are the age of the sow, her condition, and what sort of succulent feeds, if any, are available.

Gilts bred for the first time need to be kept growing, which means that a grain ration is absolutely essential. If pasture, either of alfalfa, rape, or some similar crop is available, they should be allowed the run of it so long as the ground is in fit condition to be pastured.

Bred sows, young or old, must

have an abundance of exercise.

The grain ration for a gilt will be heavy or light, depending on her condition; and barley, corn, or milo maize will make up the bulk of it. Some alfalfa meal may be added to cheapen it, but should not be used in sufficient amounts to make the ration excessively bulky.

If skim milk is not available, tankage should be kept in a self-feeder. At this time of the year if alfalfa is gone, some sorghum or pumpkins or mangels might be fed for succulence.

A similar ration is desirable for the old sows, but if they are in good vigorous condition, they will need less grain in proportion to their size than the younger gilts.

WHEN AND HOW BEET-FEEDING PAYS.

[Written for Pacific Rural Press.]

The growing of beets for dairy cows should receive more recognition in most all sections of California than it does, as it is particularly advantageous to have them for a succulent feed during the winter months when green alfalfa is not available.

In the dairy districts of San Benito county the beet which has proved most satisfactory is half mangel and half sugar beet, this variety

yielding heavier than the sugar beet and containing more food value than the mangels.

On the recently established dairy of Dr. Obannon planting of beets is done any time after January 1, sometimes as late as March or April. On his ranch the high land does not require early digging, but in other locations where the land is low, fall digging and storing is practiced. These can then be fed out as required during the winter months.

Heavy shipments of hogs and cattle are being made to San Francisco from Oakdale.

ENGINE FITNESS

Inside and outside, COMMERCIAL ENGINES are as near perfect as inventive genius, skilled workmanship and the best of raw material can make them. They are PARTICULARLY BUILT FOR PARTICULAR PEOPLE—they are so good that we back them up with an ironclad written guarantee.

Strength, Power, Simplicity and Economy in Operation—these are the points you should consider when buying a Pumping Engine. COMMERCIAL ENGINES combine all these features in the highest degree besides other exclusive and important features, which you will find fully explained and illustrated in our handsome new catalog. The Business of Selling Purebred Hogs.

[By F. R. Steel, Grants Pass, Ore.]

The last and, from the money standpoint, the most important phase of the purebred breeding business is the selling of the output. There are ten breeders who can raise a good pig to every one who has the business ability to sell the output properly. Steady and intelligent advertising in the farm and stock journals is the standard way of selling your output. About 10 per cent of the gross receipts for stock for the year is ordinarily about the right amount to spend for advertising annually in the papers.

Another necessary feature of the selling campaign that every successful purebred breeder must conduct is the showing of his animals at some of the good fairs. The money that the exhibitor wins in premiums at these shows is only important as a means of reducing the cost of showing; but the awards won are of paramount importance as advertising ammunition. Ninety per cent of the purebred hogs sold go out on mail orders to buyers who have never seen them. These men will buy quickly and pay good prices for the produce of show record animals, when they would not either buy so quickly or pay so much for an equally good individual whose sire and dam lack the proof of excellence as given by a show record in some strongly contested show. They figure that a breeder may be prejudiced in favor of his own animals in describing them, especially when trying to make a sale; and more-

over may not be a competent judge. On the other hand they have confidence that the judge at the fair was not prejudiced; and was competent as well. In other words, the animal described as good by the owner may or may not be good, but the show winner has proved his or her excellence by the winning.

The matter of a catalog should be taken up at once by all purebred breeders. No business firm trying to sell 90 per cent of its output by mail would even think of not having a catalog, neither should a breeder do so. A four-page pamphlet describing your herd can be gotten out, not including cost of cuts, for around \$12.00 per thousand copies. Every breeder should have at least this much of a catalog. Printed stationery should also be used. It costs little more and pays well. Type-written letters of which carbon copies are kept, are happily becoming the universal rule with breeders doing any considerable business. Certain and prompt mailing of registration papers and pedigrees after animals are sold, together with an absolute guarantee of satisfaction to the purchaser, are necessary factors in building up a large and continuous business. It cannot be done in a day, or a month, or in one year; but continuous, intelligent, and conscientious effort will build up a purebred breeding stock business that will pay the breeder, will strengthen breed he uses, and help the community in which he lives.

Grain to Precede Corn for Silage.

[Written for Pacific Rural Press.]

The curious thing about silos in California is that they seem to keep their owners continually thinking ahead of their present feed needs, which is by no means a bad trait where permanent animal husbandry is practiced.

With most of the silos already filled and corn-planting time several months away, the stock farmer may believe that his silo problems are over for the time being; but that is not the California way to get the most use out of the land, particularly if the farm is an irrigated one.

Before corn-planting time, most experienced silo owners will have

harvested a crop of grain or grain hay; and it is to prepare for that crop that thorough plowing will be needed at an early date. December is the usual month for planting either barley or oats on the silage ground, experience showing that in many locations these may be allowed to ripen for grain, when water is available early in July for irrigating the land before the corn crop is planted.

Older silo owners will not need this warning, but those who were late fall purchasers or those who contemplate being silo purchasers next year, will do well to heed the advice to "be prepared."

RICE AND RICE STRAW FOR HORSES AND OTHER LIVESTOCK.

To the Editor: I take the liberty of writing you relative to some of our experiences in this neighborhood with the feeding of rice and its by-products, as we feel that few farmers in the State realize their feeding properties. Several farmers in this locality are feeding rice straw and rolled barley to their working stock and claim that the stock are standing up famously. The Butler boys have fed rice straw for two seasons and get the straw for the hauling. The largest feed house in Petaluma has purchased the last ten days 15,000 sacks of rice for chicken feed. One of the large stockmen of this locality is rack-feeding rice straw to stock cattle. Contractors who were

working here this fall harvesting rice had rice rolled with barley in the proportion of 50 per cent and claim they prefer that to feeding rolled barley straight, and the same time effecting a big saving by getting thrasher-cracked rice at \$5 per ton. Peterson and Campbell of Maxwell, large sheep dealers, are running several thousand sheep on rice stubble and will bring over this week 1500 head of hogs. Mr. Petersen turns the hogs onto the rice stubble for about five weeks and then drives them to the corral and stall-feeds them broken rice, claiming that he prefers it to corn.

When we can buy rice straw and cracked rice for feeding at prices far under the price of all other feeds, we should "boost California rice," the only food that today is for sale cheap. W. E. Barnard.

MORNING GLORY SEED FOR FEED.

To the Editor: What is the value of meal made from morning glory seed? Our stock are crazy for it and

it is cheap, but seems very rich. Is there any danger of overfeeding?—C. N., Sebastopol.

We don't know, but hope it is good for something. Let's hear from our readers.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. F. I. E. 1915; Sacramento 1916.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished. Young Stock, \$30 Up.

Improving Soil With Dairy Cows.

[Written for Pacific Rural Press.]

When M. Fiscallini of San Luis Obispo county purchased his present ranch of 180 acres five years ago, it was in a badly run-down condition owing to excessive cropping to grain hay and a lack of livestock.

Having always been a dairyman and believing that a system of pasture rotation would improve the soil, he established a small dairy on the place and began selling his milk to the retail trade of San Luis Obispo.

The system that has been in use and the one that will be continued is to plow up about a quarter of the ranch at a time for field crops and pasture the balance of it. Oat and barley hay, small white beans, some Indian corn and sorghums are the usual crops grown. New ground is not plowed each year; but instead about every four years, thus providing 12 years of pasture in the 16. The benefits resulting from this are already apparent in the crops harvested the past year from land that had been pastured previously.

Without a silo, it is necessary to cut and feed green during the summer months when the pasture is poor in quantity and quality. Then it is that the corn and sorghums are chiefly used, these being fed in connection with a concentrate ration of beet pulp, alfalfa meal, rolled barley, and coconut meal at the barn.

Starting in September or October, according to the year, the barley and oat hay which have been previously

stored in the may mow are fed; but the concentrates are still used. This hay and grain ration is fed through the winter till the hill pastures on the ranch are good, which generally occurs between March 1 and April 1.

Bean straw, when available, is used as feed for the dry stock and calves, replacing the grain hay. Experiments are also being made with sudan grass and other dry climate forages in an effort to have a continuous supply of succulent feed during the dry summer and fall months. A silo would meet this requirement and would have been erected before this time but for the expense of machinery for filling purposes.

Sanitation.—Not alone in feeding does Mr. Fiscallini's practice differ from most other dairymen in the district, but also in the matter of sanitation around the milk house.

This is attributable to the concrete milk-room that has been erected, having a well-drained floor and ample light and ventilation. The milk-cooling and bottling room is spacious in size and entirely separate from the sterilizing vat.

After cooling to as low a temperature as possible with a coil cooler through which well water is run, the milk is bottled and stored in a concrete walled refrigerator, having a cork-filled space between the two walls. Here the milk is held at a low temperature by the use of ice until delivery is necessary.

Oleomargarine Interests vs. Cal. Butter.

[Written for Pacific Rural Press.]

That the campaign of the oleomargarine manufacturers and dealers, to cast reflections on the cleanliness and quality of butter and other dairy products is to be continued along lines similar to those started some time ago by them, seems evident from the following letter, recently received by Prof. E. J. Lea, Director of the Pure Food Laboratory of California, from C. S. Ashcraft of the Interstate Cottonseed Crushers' Ass'n of Alabama.

He writes:

I wish to call attention to the dishonest methods prevailing largely in the dairy business, whereby butter makers (being uninspected) often take advantage of their opportunity to get into their plants low grade, uninspected oils and fats which they churn into their butter, and then by means of artificial coloring and artistic wrapping, etc., they sell millions of pounds of this compound as and for butter.

These unprincipled people are able (with small chance of detection) to practice the most unfair competition with legitimate oleomargarine makers and with legitimate butter makers. The injury to high-class butter indirectly injures our meal market.

Do you advise taking up the fight when Congress meets? Will you take up this matter with your Congressman while he is at home?

If all of Mr. Ashcraft's attempts to secure letters of vification from prominent experts in the various States are no more successful than this one to Prof. Lea, his supply of so-called expert advice on the manufacture of impure butter will be of little availability to him, for below are extracts from the letter sent him

by F. W. Andreason, Sec'y of the State Dairy Bureau, to whom the correspondence was referred:

There is no tax on cottonseed oil in this State unless it is mixed with butter in such manner that it can be sold to unsuspecting purchasers for pure butter.

Prof. E. J. Lea, Director of the Pure Food Laboratory of California, writes me that his department has no evidence that foreign fats have been mixed with dairy products in this State. You may rest assured that Prof. Lea's Department would have found and prosecuted any manufacturer of dairy products who would make such attempt. The factories of dairy products and the products are inspected both by the Pure Food Laboratory of California and by the State Dairy Bureau. In addition, the United States Revenue Department is very active in examining butter to ascertain whether any foreign substance has been added to it. Where such is found the offender is not fined \$25 as is customary where inferior articles are added to other food products to increase their weight or bulk, but he is compelled to take out a license which costs \$600 a year and is taxed 10c per pound for every pound he manufactures.

In a few instances manufacturers have either willfully or accidentally allowed more than 16 per cent of moisture in the butter. They have been promptly fined or they have been compelled to take out a license and pay the tax.

Letters like the one from Mr. Ashcraft, we are informed, are being sent to bakers' unions, prominent fraternal organizations, etc., to give added weight to the oleomargarine interests at Washington, where a determined effort is to be made to lower the present oleomargarine tax.

JERSEYS FOR RIVERSIDE.

[Written for Pacific Rural Press.]

The Riverside Jersey Breeders' Association, new and aggressive, have sent a representative East with J. M. Roberts, Field Agent in California for the American Jersey Cattle Club, to bring out to California a shipment of high-class animals characteristic of the breed.

This newest purebred breeders' organization is composed of alert and progressive business men of Riverside who are going to place their community and Southern California out in front and keep the balance of the breeders hustling to keep up. It is the result of the Field Agent movement planned by the American Jersey Cattle Club.

The importance of the right kind of foundation stock has convinced the Riverside Jersey Breeders' Association that the importation into California has a great value to every breeder of purebred Jersey cattle in the State. The plan is to visit the

States of the Middle West and bring out only the very best of foundation animals.

The Jersey Special for California should arrive at Riverside about December 25.

ALFALFA SEED.

To the Editor: What is the outlook for alfalfa seed? There is quite a quantity around here.—E. W. H., Dos Palos.

Some of the big dealers report full supplies; but growers with some for sale could dispose of it with a little ad. in Pacific Rural Press, which reaches more than 22,000 California farmers. An absolutely fair sample of it should first be tested by the University for purity and germination. The outlook seems good, considering the high prices of the past year which will encourage planting. The heaviest demand will come in the spring.

Every livestock feeder should be equipped with cutter and grinder.

University Wins Grand Championship.

[Written for Pacific Rural Press.]

University of California Jock has been made "Reserve Champion" at the International Livestock Show at Chicago. As a yearling Jock was awarded the following prizes at the Panama-Pacific International Exposition:

Aberdeen-Angus steer 18 months and under 24, \$30.00.

Champion Aberdeen-Angus steer, \$75.00.

Champion steer one-year-old, any breed, \$50.00.

Grand Champion steer of the Show, \$100.00.

At the Pacific International Livestock Show at Portland the same year he was first prize Aberdeen-Angus yearling, bringing \$50.00.

At the California State Fair, 1916, he was first prize Aberdeen-Angus, two-year-old, \$25.00, and Champion Aberdeen-Angus steer, Gold Medal.

"California Favorite," a cross-bred Hereford Shorthorn calf, has been made Grand Champion at the International Livestock Show. California Favorite was shown for the first time at the State Fair this year where he was the first prize steer calf, the champion grade or cross-bred steer, and the grand champion

steer of the show.

These two steers have won the highest awards for steers that it is possible to obtain.

When the animals left home "University of California Jock" weighed 1880 pounds, more than any two-year-old steer that has been grand champion at the International. When "California Favorite" left Davis he weighed 100 pounds more than any of the three calves that have been grand champions. "Jock" is an unusually smooth animal for his age and weight. In "California Favorite" is an extreme illustration of early maturity.

The wethers exhibited won the highest honors in the College Class.

The showing made by these animals in the heart of the greatest livestock section of the country will surely awaken in the minds of the corn-belt farmers the wonderful opportunities for engaging in the pure-bred livestock business in California.

This is the first time that a University has bred and fed a Grand Champion steer at the International Livestock Show. The two steers above mentioned were both bred and fed at the University Farm, Davis, California.

Getting Large Litters.

[By A. L. Nelson, California Polytechnic School.]

There is no one question concerning hogs on which so much importance is placed by people writing to us as the one regarding the size of litters. The question is of no small importance in the profitable production of pork. In fact, the size of the litter and the care given by the mother and the power to make rapid growth, are the main points in profitable pork production as far as the powers of the hogs are concerned. If these points are possessed by any strain of hogs, the remainder of success rests with the management.

The reason for different breeds is that they should not only have the three things above named, but, in addition, put on flesh of such a nature and in such places on their bodies as will give the largest net return in bacon or on the block, and at the same time have the points of beauty which attract the eye.

These things can be brought about only by long years of care and good management. But one will say, I have bought purebreds which have been poor mothers or have had small litters. It may happen that not all breeders are as conscious of their duty as they ought to be. In fact, when a man comes to a breeder and does not require the whole truth concerning the power of a sow to produce large litters of well-shaped pigs, he may let the matter slip by as you might yourself if you were in his place. You can see the size and shape, get their age; and then, if it be a sow you are buying that has had a litter, inquire as to the number of pigs in the litter, and judge whether she is a good mother by the number she raises. Look at the man's herd. If the hogs have not been culled, and are all uniformly of good size and shape, you

may expect the same type of hog with the same management. Don't be afraid to ask how many pigs this sow had, and this one, and how many they raised and where you can take a look at their shoats. Do so. By this you can judge the hog you are buying.

Put Breeding Animals in Condition.—At this time of the year, there is just one little item that should be mentioned regarding management. Nearly every breeder or hog raiser has found that at breeding time it pays to have the sows and boar in a decidedly thriving condition. A large number of strong ova are produced and fertilized when in this condition. This means larger and stronger litters.

The feed best adapted to do it is rich green or succulent food with some grain. Take special care of the boar. In breeding, two sows a day are enough for one boar, one in the morning and one in the evening. In this way one boar will serve fifty sows during one season. Men who are going into the hog business should be looking into this matter.

CAREFUL INBREEDING.

[Written for Pacific Rural Press.]

While inbreeding is not generally practiced or advocated by successful livestock raisers, but is more usually discouraged, the experience of George Farmer of Kings county with grade Guernseys shows that improvement may be accomplished by intelligent inbreeding.

Mr. Farmer started to improve a grade herd of scrub cattle by the use of Guernsey bulls 16 years ago at a time when it was difficult to purchase purebred animals of that breed in this State. As a result of this scarcity he was compelled to take the best-looking grade Guern-

EMPRESS LASS 21846,
Grand Champion Washington, Oregon,
California and A. Y. P. Exposition.

sey bull he could find

The heifers from this bull proved to be good producers as well as an improvement over their dams in dairy type, so instead of securing an untried bull they were bred back to their sire. The result of this close inbreeding seems doubtful in most cases; but in that and subsequent instances, the heifers have been better producers than their dams and have also maintained strong constitution and good dairy type.

Since then two other bulls have been purchased, the last one a registered animal out of an A. R. O. dam. Fortunately each animal has proved prepotent in both production and type; and while there have at times been cows that didn't cross back well, the nick in most cases proved good. When a cow has been found that did not cross back well she has been sold.

As a result of those years of concentration of type, this herd is as uniform a lot of cows as one could imagine, being large, vigorous animals with a pronounced dairy conformation.

As the success or failure of this system lies entirely with the sire's breeding qualifications and characteristics, Mr. Farmer exercises great care in the selection of his bulls. He believes in a good straight-backed animal, having a large heart girth and a good middle. In fact his present bull could be rightfully called a show animal, except that he is not so fine boned.

Back of this conformation Mr. Farmer prefers to select from a family having heavy-producing females in order that the chances for heavy production may be greater. The continued selection for these qualifications among both the bulls and the cows has enabled him to secure a 300-pound butterfat average in his herd. It should be explained, however, that had his bulls been faulty in type, production, or prepotency the concentration accomplished by inbreeding would have been as detrimental as it has so far been beneficial, for it would have established undesirable characteristics instead of desirable ones.

The most destructive field fire in California this year was one in Glenn Co., which destroyed over \$64,000 worth of grain. The most extensive fires were in Butte Co., where over 77,000 acres of brush and range were burned over.

The success that has attended California fruit co-operative organizations has induced the fruit men of Oregon, Washington and Idaho to consider the scheme of copying the California plan.

Wine grapes and table grapes brought an aggregate of \$3,550,000 in San Joaquin county; \$1.40 per crate is the average price received for Tokays.

637.1 Pounds Butterfat in 301 Days.

has been produced by Empress Lass under dairy conditions. Still working. Her sons and grandsons are from big producers of show type. Prices right.

Here's a Real Herd Header

On his dam's side, all his sisters (4) are in the A. R. class. So is his granddam and great-granddam. In fact, every female in the BELLA VISTA HERD is either in the A. R. list, or qualifying for same. The last to enter has made as high as 42 pounds milk as a 2-year-old.

IMPERIAL LORD KITCHENER has left some good males and females, and to continue the good work of production a young bull has been secured to use on his daughters. This bull is GLENBURNIE BOY, whose dam as a 3-year-old made 13,559 pounds milk and 684 pounds butterfat, and her dam 654 pounds butterfat.

Consumers are becoming more and more critical daily about their milk. Color, quality and flavor are the requirements, and the Guernsey sire has no equal in transmitting these qualities. To be a success such a sire must be a producer and from a line of producers. BELLA VISTA Bulls have this breeding. Address for this line of breeding, or for Hampshire swine.

Veterinary Queries and Answers.

[Answered by Dr. H. B. Winttingham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

SOW HAS NO MILK.

To the Editor: A week before farrowing, a sow refused to eat and lay around on her stomach. Six pigs came in the forenoon. Two came at night, mixed in the after-birth. Pigs all alive, but the sow has no milk. She ate fairly well the day after farrowing. Then discharged a substance like afterbirth and refused to eat again. She was constipated. Drinks very little water, walks around, and notices pigs.—T. P., Chico.

The trouble is congestion of the udder. Hot compresses and camphorated oil well rubbed in are of benefit in these cases when taken fairly early.

URINE DRIBBLES.

To the Editor: A three-year heifer came up from the Valley in spring time and didn't shed her hair. She calved late in spring. In July we took the calf away from her. We fed her alfalfa hay at night and green alfalfa pasture in daytime. The last two or three weeks she seems weak in the back and her urine dribbles all the time. We gave her a number of simple remedies.—C. E. S., Murphy.

This is inflammation of the bladder. Give one dram doses hexamethylamine three times a day.

SCUM ON EYE.

To the Editor: Do cows have pinkeye? Mine have been troubled in one eye. A scum comes over it and they don't seem to see for a couple of weeks. It then goes away except a small spot. They seem to suffer, keeping the eye closed at the worst stage, and it waters a great deal. The younger they are the worse it seems to affect them.—W. D. C., Laton.

There is a disease of cattle resembling pinkeye; for this use a few drops several times a day of a 25 per cent solution argyrol.

DOG HAD SORE MOUTH.

To the Editor: My dog died a few days ago. While sick, he would sneeze several times, especially after lying down. One day he had very loose bowels, and when I noticed he was not well, I found some white thick slime in his mouth. There was matter between the lower gums and the lining of his mouth. I swabbed it with boric acid and gave him a physic. He would not eat but drank much water. He was perfectly gentle while sick.—S. T. Puyallup, Wash.

This was Black Tongue or Infectious Sore Mouth. A cure is questionable in these cases.

HOGS LAME BEHIND.

To the Editor: Female hogs of different ages become lame in hind quarters, seem in great pain, have good appetites but growth retarded. No swellings, hips slightly sunken. Feed tangle, rolled barley, and alfalfa.—H. E. M., Yucaipa.

This is rheumatism. Give 10 grains of each of the following in the feed twice a day: hexamethylamine and sodium salicylate.

CALVED TOO SOON.

To the Editor: A cow lost her calf Nov. 6. She was due to calve Nov. 24. The calf when it came looked as if it had been dead two or three days. The cow did not clean at all and is giving only two quarts per day. She is young healthy, and in

good condition, has alfalfa hay and runs on green pasture. She bloated once about six weeks ago. She used to give over six gallons per day.—C. T. M., Hughson.

This was infectious abortion. Have her vaccinated for this. Give her as a tonic one tablespoonful Fowler's Solution and one teaspoonful fluid extract nux vomica twice a day.

COW PASSES BLOOD.

To the Editor: My young cow eats freely and does not appear sick, but her bowels are rather loose and she passes quite a quantity of blood with each evacuation. She is fed oat and barley hay mixed, beats middle of the day or pumpkin with a mash mornings and evenings consisting of 2 parts bran, 1 part soy bean meal and 1 part alfalfa meal.—J. E. B., San Lorenzo.

This is Johns Disease. Try giving four 30-grain sulpho-carbolate tablets three times a day.

SWELLING ABOVE EYE.

To the Editor: I have a cow that has a large lump from her horn to her eye, about three inches long. It seems hard and has been lanced once with little blood and no pus. She eats well but seems a little droopy, gives fair amount of milk. The lump seems hard and is affecting her eye to some extent. Has been there about three months.—A. E. C., Los Angeles.

Have this tumor removed.

HOG DOES NOT FATTEN.

To the Editor: One of my hogs does not get very fat and vomits what looks like ashes. Seems to eat all right. I feed acorns and rolled barley with middlings.—S. R., Morgan Hill.

Try feeding barley without acorns to this pig.

SWELLING ON JAW.

To the Editor: A heifer has been fed alfalfa with some foxtail. A lump under the jaw is now swelled on one side up to the ear. She has been fresh about three months and has failed from three gallons to about one gallon of milk per day.—G. M. N., Henleyville.

Have this abscess opened.

LAST CUTTING ALFALFA FOR HORSES.

To the Editor: Several of my neighbors refuse to feed the last cutting of alfalfa to horses, claiming it will sometimes kill them.—G. M. H., Ripon.

Will have no bad effect if dried and fed the same as other cuttings.

COW'S TAIL PARALYZED.

To the Editor: My cow has lost the use of her tail. Her calf is two months old. The tail has been paralyzed about a month.—T. B. M., Seeley.

Rub in tincture of iodine daily on the tail head for one week.

SHEEP NASAL DISCHARGE.

To the Editor: My sheep have a discharge from the nose.—R. T. W., Lodi.

Probably lung worms. Consult the State Veterinarian, Sacramento:

WHITE DISCHARGE.

To the Editor: A heifer 1½ years old comes around about once per week, at the same time discharging

a white substance.—W. D. C., Laton. This looks like abortion. Better have your herd vaccinated and avoid future trouble.

KAFFIR CORN CONSTIPATING

[Written for Pacific Rural Press.]

Kaffir and brown Egyptian corn constipate stock and poultry but milo and the white sorghums do not, as determined at the Kansas Experiment Station according to Prof. B. A. Madson of University Farm, California. No experiments on this line have been closely watched at Davis except that Prof. J. E. Dougherty has found kaffir constipating to poultry. Therefore more laxative feeds should be given along with kaffir.

Woodland stands a chance of being selected as the site for the fourth plant of the Utah Condensed Milk Company.

Most Wonderful Milking Machine Made To-Day.

Most durable, most practical, most economical and most sanitary method for milking cows. Big success from the start. Pays 100 per cent on the investment the first year. Great labor saver. No more plant for your dairy. Increases the milk yield. One milking time in two. This machine milks like the human hand. Perfect method of suction; suction gradually increases; cows like the milking action, as there is no strain on teats or udder. The milker has no complicated mechanism; only two moving parts; no vacuum tanks or pipe lines; no metal pipes to freeze or become foul; no vacuum in part; low working parts; easy to keep clean; simple in construction; boy or girl can operate; low cost of upkeep; little power needed to operate. Write for free catalog which tells the whole story. Address **C. F. DANIELS & SON, 2311 Prince St., Berkeley, Cal.**

Raising Poultry for Profit

POULTRYMEN IN POMONA JOIN THE STATE ORGANIZATION.

[Written for Pacific Rural Press by
Susan Swaysgood, Pomona.]

Things are happening in the south lately among poultrymen. First the Van Nuys Poultry Association holds a strictly utility show in Los Angeles just to show what a small colony of people can do when they get together. There were some very good birds in the show, too, and some of them were good from a fancier's standpoint, yet all had been judged by the Hogan system as utility birds. One man claimed to have a couple of Reds that laid two eggs in one day and a Leghorn man made the same kind of a claim, and both claimed they were not boosting either.

Then on Tuesday of this week we had Colonel Weinstock in Pomona to talk on the organization proposed by the State Market Director. Everybody present, and there was a good meeting, seemed to be in favor of organization after Mr. Weinstock explained matters. A good number of those present joined. Those who did not join then have it under advisement, and will join later. We can't afford to be slower than our northern brethren in the poultry work; and the Colonel told us that in the northern part of the state they had a million and a half hens signed up. If we can reach all the people engaged in raising poultry in this part of the State I feel sure we can sign up for just as many hens as the north; and that will sure make "some egg market."

If something of the kind is not done in all states the poultrymen may just as well quit and be done with it. With all kinds of feed going up and the egg market falling five cents at this time of year, things can't be held even. Organization and proper distribution of the products will do away with these unreasonable attempts on the egg and poultry markets made by women who do not know the first thing about the cost of production. All they know is to attack perishable food for their own selfish ends. There are times when I hate to acknowledge being a woman, for the bulk of women have about as much reasoning powers as a ten-year-old boy. If they must boycott things why don't they tackle the feed question—flour and such things? A real good fast might do some of them good; anyway they would know how the fellow feels that fasts from necessity. At present prices for feed it costs more to produce eggs than it is possible to get for them at regular market quotations, and give the labor for nothing. With wheat at normal figures the producer would make more money with eggs at twenty-five cents, because he would not have to count the kernels. It takes feed and lots of it to produce winter eggs, and if these meddlesome women were forced to eat stale eggs for a few winters, just as formerly all had to do, they might be able to appreciate the value of a fresh-laid egg. My advice would be to stop producing

winter eggs until people do learn to appreciate them and are willing to pay for them. To carry hens over the winter without trying for eggs means a great reduction in the cost of wintering. Of course they must be fed and kept in condition, but this can be done with coarser foods that do not cost so much as the feeds necessary for molting and egg production.

But we will hope for the organization to go through and help solve our problems, as I feel very sure it will do in this state.

BRITISH COLUMBIA RE- QUIRES MARKING.

The British Columbia Government recently passed what is known as the Egg Marks Act, governing the sale of eggs in this Province. The act provides in part that infertile incubated eggs must be sold as "cooking eggs." Wherever they are displayed, a card bearing those words in 4-inch letters must be placed on the receptacle holding the eggs. Any and all eggs which have been preserved in water glass, lime water, salt, bran, or anything except cold storage must be "stamped" plainly with the word "preserved." The word must be in Gothic lettering.

When provincial fresh eggs are sold they must have four-inch lettering on a card attached to the receptacle with the words "B. C. Fresh." Provincial cold-storage or preserved eggs must also be carded "B. C. Cold Storage" or "B. C. Preserved." If the eggs come from any other Province, they must be placarded "Alberta (or Saskatchewan) Fresh" or "Alberta (or Saskatchewan) Cold Storage"; if from the United States, "U. S. Fresh" or "U. S. Cold Storage."

All poultry keepers or dealers selling eggs at wholesale are required to mark true descriptions of the eggs on the outside of the receptacles. This marking, however, need not be 4 inches high. The same words must be used, as "B. C. (or Alberta) Fresh" or "B. C. (or Alberta) Cold Storage." All Chinese eggs must be stamped in Gothic lettering. All stores or shops using Chinese eggs for food or manufacturing purposes must have signs printed and displayed in 4-inch letters: "Chinese Eggs Used (or sold) Here."

All poultry keepers selling eggs at wholesale in dozen cartons must mark the cartons in plain lettering, with the words "U. S. (or Alberta, or B. C.) Fresh" or "U. S. (or Alberta, or B. C.) Cold Storage." Eggs not fresh enough for boiling purposes are to be sold as cooking eggs.

PICKING FEATHERS FROM DUCKS AND GEESE.

[Written for Pacific Rural Press by
W. D. Guthrie.]

The only quick way to get the feathers off from a duck or goose, according to Joe Diar of Placer county, is to dip it in hot water like you would a chicken. Then wrap a gunny sack around it, and let it steam five minutes. Then you can pick off the feathers and down together.

California Poultry Practice

A Practical Treatise on Poultry
Raising in California

By Mrs. Susan Swaysgood

Writer and Breeder
Of Utility Poultry.

160 pages of text, besides many
full-page illustrations.
Cloth bound.

This Book Will Help You in the
Many Details of
POULTRY RAISING.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

Coulson Co. Petaluma Cal.

Fish Meal for Poultry.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The feeding of fish meal to stock and poultry is not of such recent date as many suppose. As early as 1864 a mixture of fish and meat meal was made along the Atlantic Coast and was used very freely in Maine, though at that time there was no method of getting it on the market while fresh and clean. A great deal of the fish used was just awful offal that had been allowed to partially decompose before being used at all. This naturally got fish meal in bad repute; and it is only during the last few years that with improved methods of manufacture, fish meal has been at all popular on this Coast. About four years ago I made a test of two sacks furnished by a San Francisco firm; and found that it gave an increase of eggs over beef-scrap; in fattening broilers it made a gain of half a pound with each bird over beef-scrap; and it did not make either eggs or meat of the poultry taste fishy. I wrote the firm that it was very satisfactory and if they kept up the high standard it would be a boon to poultrymen. As freight rates on animal foods of all kind are quite high from San Francisco I naturally bought what I needed in my home town. But of late fish meal has been so improved in quality owing to newly discovered methods of handling, that it is not any trouble to get a good brand now almost anywhere. The only fault I find is that with increased facilities for using up all waste fish while it is fresh and wholesome, the prices keep up just as high as beef-scrap, or as fish meal when it was not being used in quantities.

If manufacturers could only be made to see that now, when the prices of all feeds are so high, is the opportunity for them to make fish meal a standard poultry food by lowering the price, they would be doing themselves and the poultrymen a good turn.

Just as long as the prices are about the same, a poultryman argues that he is nothing in pocket by using a food with which he not so well acquainted. There is, however, one advantage the poultryman overlooks in this matter, and that is the digestibility of a food. Good beef-scrap, free from hide and hoof and other filling, is about on a par with good fish meal in its digestibility, but poor grades of beef-scrap, and there is more of this kind on the market than the good kind, is very hard to digest, and the fowls pass it through them without having received any benefit. It is not what a hen eats, but what she digests that goes to nourish the body and produce eggs. Fish-meal has also one other thing to its credit; it does not cause so much liver trouble with fowls as does beef-scrap.

The best way to do is to combine the allowance of animal food, making it half fish-meal and half beef-scrap; this is specially so when the hens have been fed all beef-scrap for animal food.

If a poor brand should be fed too freely it would affect the flavor of the eggs, but with real good pure fish there is not so much danger; at any rate if a man is feeding ten per cent of animal food, he can safely make it half fish meal and gain by the change. If the protein contents of the fish-meal and beef-scrap total 75 per cent, ten per cent of this will make a fair percentage of animal food, and you never need be afraid to use that much animal protein; the balance will be gotten from the grains and will figure as vegetable protein. Among vegetable proteins none stands higher than alfalfa and soy bean meal; so these must not be fed in large quantities, except when the alfalfa is green, as it then contains a great deal of water. In the dry form, it must be fed in reasonable amounts and always with other feeds.

POULTRY TROUBLES.

[Queries answered by Susan Swaysgood.]

Hens Look Droopy.—My chickens had diarrhoea about seven months ago, look droopy and pale and have scaly legs and feet; once in a while one dies.—Mrs. B. V. W.

I would not be surprised if your hen house is afflicted with mites. When hens are pale and droopy and have scaly legs and feet it is suggestive of gross neglect somewhere. Mites suck the blood of hens at night and naturally the hens look pale afterward; and it's just as natural for them to die when all the blood has gone.

Begin first with your hen-house; clean up all refuse and burn it, then get some good commercial spray or crude oil and carbolic acid and spray the house thoroughly twice at least; put ten drops tincture of iron to one quart of water once a day in the drinking water for the hens and feed them as liberally as you can. For the scaly legs, wash them off with good hot soapsuds, then mix a little lard and sulphur together and rub on the legs and feet; but unless you keep the house clean it is no use doing anything else. This is a case where cleanliness will just about

make the quickest and best cure you ever saw.

Hens Laying Poorly.—I have one hundred R. I. Red hens. I feed dry mash, rolled barley, middlings, and whole wheat in the morning, two gallons; at night, same quantity of soaked oats and cracked corn. Is that enough food for the number of fowls mentioned? I give all the green feed they can eat at noon; keep pens and all surroundings clean and get only about 7 eggs a day. The hens are still molting. Am I feeding enough, and why don't they lay?—A. F. R.

Your morning feed is rather a mix-up, or I fail to understand. Rolled barley, middlings, and whole wheat don't fit in at all. You had better change off and feed your cracked corn and whole wheat together for the evening meal, when two gallons would be plenty to give the hens something to grind on till morning. Then you could feed your soaked oats and barley which should be soaked too, and mix your middlings in. If you drain the water away there will still be moisture enough to cause the middlings to adhere to the grains. Yes, I think you are feeding enough; perhaps a little extra bone would help your hens through the balance of the molt. I don't know anything about the mash you mention; but molting hens require more protein and ash than laying hens. There is another point to consider; and that is the age of the hens. Old hens take a longer lay-off during the molting term than young ones; so that we can't reckon anything on that; but get some granulated bone from the feed store and put it out where the hens can help themselves and they will be much benefited in a short time.

OAKLAND POULTRY SHOW.

The annual poultry show held in Municipal Auditorium at Oakland last week was the largest and best attended of the many this association has given. All poultry classes were well filled and the pet stock department was also well represented and full of interest to the younger folks.

The large number of new exhibitors was a matter of comment, showing that the industry was claiming new interest among outsiders. Our friend W. A. French of Stockton was on hand, showing in several classes the kind of birds that drew many firsts and seconds.

The Oakland show has for years been one of the best in the State and this year more than held its own.

Poultry Breeders' Directory.

ROODEN RANCH CHICKS—January will soon be here. Book your orders now for early delivery. Barred Rocks, B. I. Bred, Black Minorcas, Brown and White Leghorns. Quality chicks from first-class breeding stock hatched right and shipped right—at right prices. By the dozen or thousands. We can fill it if you book in time. Circular for the asking. Rooden Poultry Ranch and Hatchery, Campbell.

BARRED PLYMOUTH ROCKS—COCKERELS—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog. Chas. H. Voden, Box 396, Los Gatos, Calif.

BABY CHICKS NOW READY—Hatches every week. R. I. Bred, Barred Rocks, White Leghorns hatching now. Brown Leghorns and Black Minorcas later. Place Spring orders now, and be sure of getting them when you want them. Send for circular and price list. Campbell Poultry Ranch, Campbell, Calif.

WANTED—A number of hot water incubators, Jubilee preferred, 200 egg capacity or over. 220-egg type, Hoganized, S. C. White Orpingtons and Sicilian Buttercups, cockerels, hatching eggs and chicks. All information gladly furnished. M. S. Woodhams, San Mateo, Cal.

INCUBATOR CHICKS—Thoroughbred White Plymouth Rock, \$25.00 per hundred; White Leghorn, \$12.50 per hundred. Highest class of stock bred to standard and to lay. Awarded all first prizes at California State Fair 1916. Mahall Farm, P. O. Box 597, Sacramento, Cal.

CROLEY'S DRY MIXED INFANT CHICK Feeds for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by Geo. H. Croley Co., Inc., Poultry Supplies, San Francisco.

McFARLANE STRAIN White Leghorn Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50 per 1000; chicks, 12c each, until March 1st, then 10c. Big plant, lowest prices, best stock. Catalogue free. Newton Poultry farm, Dept. 1, Los Gatos, Cal.

DANISH S. C. W. LEGHORNS—If you want to increase the size or vigor of your stock or the size and number of your eggs, use one of our cockerels. River Bend Farm, St. Helena, Cal.

THE SANTA CLARA VALLEY HATCHERY solicits your orders for Fall and Spring delivery in 8 breeds of baby chicks. Order early and get the best. Jos. A. Bihn, Lincoln Ave., San Jose, Cal.

HATCHING EGGS from our "Bred-to-Lay" S. C. White Leghorns. Season opens Dec. 1st. The early hatch lays the early winter egg. Booking now. R. H. Dickinson, Dept. IV, Los Gatos, Cal.

DAY-OLD CHICKS—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

BARRED ROCKS—Grand lot of high-class breeding males and pullets for sale. Satisfaction guaranteed. G. E. Tobin, St. Helena, Cal.

WHITE WYANDOTTES—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. R. W. Stawski, Route 2, San Jose, Cal.

HIGH GRADE ANCONAS—Fancy and utility. Settings, \$3.50. Fertility guaranteed. I. R. Bell, Livermore, Cal.

SILVER-SPANGLED HAMBURG—Hens, Pullets, Roosters. Entire flock. None better. Thos. J. Nissen, Elk Grove, Cal.

EASTMAN'S BRED TO LAY Barred Plymouth Rocks Chicks Eggs, Cockerels. Fairview Poultry Farm, Fairview, Cal.

CHICKENS, DUCKS, GESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St. Stockton, Cal.

TURKEYS, DUCKS AND GESE.

BOURBON RED TURKEYS and Eggs for hatching. My birds won all the honors in the Alameda County Poultry Exhibition in Oakland, 1914, and just as fine this year. A. E. Balmer, Alhambra Valley, Martinez, Cal.

THOROUGHbred WHITE HOLLAND and Bourbon Red Turkeys. Toms \$5; Hens \$2.50. Old White Holland Toms, \$7.50. Pearl Guinea, \$1 each. E. A. McKinley, R. D., Ukiah, Cal.

HART'S BRONZE TURKEYS AND EGGS—Large reduction in price of stock. Order now for fall delivery. Free Circulars. Albert M. Hart, Clemente, Cal.

San Francisco California

Mrs. Best's Letter.

Dear Friends: With Christmas just around the corner, those of us with families (and I hope that includes all of us) are very busy with thoughts of Christmas giving.

For the little people of the household, there are so many inexpensive toys and games that the problem of making them happy at not too great an expense is easily solved.

The stores show wonderfully attractive doll bedroom sets made of pasteboard and covered with cretonne that could be worked out at home to advantage, and at almost no expense.

The doll houses that sell from \$25 upwards can be copied at home by using dry goods boxes, and odds and ends of materials for wall paper and curtaining and the making of the furniture could be an evening's task for one of the big boys of the family.

The knitted or crocheted tam-o'-shanter caps and scarfs in bright colored yarns make attractive and useful gifts for both little and big girls, and a scarf of plain color is very useful for a man. If desired for dressy use make it of white silk, to be worn as a protector for the dress shirt.

Hand-made sweaters in soft colors are having a great vogue, but they need to be carefully made, or they stretch out of shape. Many of them are almost sheer and dainty enough to seem like baby sweaters—these are for wear in the house for a little extra warmth.

If you have a baby to remember, the quilted satin padding makes very warm as well as handsome crib or carriage covers—it comes in light grounds with flowered patterns, and needs only to be lined and bound with ribbon, and is then ready for use.

The painted flower-pots are being shown in the gift shops, and most attractive ones can be made at home. You use the ordinary pot or jar, and apply one to three coats of paint of a bright, attractive color. If you use yellow, stripes of black are most effective, or a conventional design can be drawn on one side. After the painting is done, a coat of varnish is an addition.

A most charming gift is a potted hyacinth—the color of the hyacinth being carried out in the pot.

The ordinary white cloth glove with the gauntlet, which can be furnished for ten cents, can be made into a festive article by covering the gauntlet with gay cretonne. This makes an attractive gift for a dainty bride, who does not even dust with bare hands.

Cretonne has so many uses that I could talk on indefinitely. It is lovely for pillows and for trimmings in dresser scarfs and bed covers.

A very new use for it is the covering of tin boxes for either candy or cookies. Usually a striking design is chosen, preferably with black lines, and the boxes range in size from a marshmallow box to a soda cracker box. This last size, filled with goodies, would be a lovely gift for a girl away from home at school.

One of the newest things of the winter, and quite the most popular, are the beaded bags. These come in the stores and can be duplicated at home at much less cost. Heavy silk

is usually used, and if you are not clever at original designing, you can have stamping done at any art store. The sewing on of the beads is simple, and the finishing is also easy. The bags are usually lined with a contrasting color, and many times have no bottom set in—just drawn together snugly at the bottom, and finished with a tassel of beads. Ribbon of the same color as the outside silk is used to draw the bag together.

Rosabella Best.

MAKING PEANUT BUTTER.

Editor Home Circle: Please give me a simple recipe how to make peanut butter.—Mrs. E. W. S., Santa Rosa.

With the aid of a small meat-grinder, anyone can make good peanut butter for home use. The peanuts may be roasted before or after shelling, but in either case the oven should be only moderately hot, and the nuts should be stirred frequently. After roasting, rub off the skins and screen out the small hearts. In grinding, use the finest plate on the grinder. If the pulp is too coarse after one grinding, it may be run through a second time. It is not necessary to add anything, but a little salt to the butter; but if desired, it can be thinned by the addition of a little olive oil. It keeps beautifully if put in glass jars, and sealed with either oiled paper or paraffine.

WHY DOES JELLY SOUR?

Editor Home Circle: Replying to the question, "Why does my jelly sour?" I have to say that I find from the experience of the many housekeepers whom I meet in my work that this trouble comes from keeping jelly in a place that may be more or less damp. I remember distinctly one lady who for years had trouble with her jelly becoming sour. Then she decided to put it in a closet near the chimney. This was thoroughly cleaned and fumigated, and the jelly placed on the shelves. She was no longer troubled with the jelly becoming sour. I wish the lady who asked this question would try covering her jelly in the following manner: The moment the sterilized glasses are filled with the boiling jelly, pour over them melted paraffine, which has been heated to the smoking point. Pour this on till it comes up to the top and just over the edge of the glass. I tried this last season and am delighted with the way my jelly is keeping.—Lillian D. Clark, Agricultural Extension, University of California.

THE HOME CIRCLE

CANE OR BEET SUGAR.

Editor Home Circle: Replying to your inquiry regarding the use of beet sugar or cane sugar in cooking, I have to say that the experience of successful and thoughtful housekeepers shows that the results in the use of either kind of sugar are the same. The process of making the sugar from either cane or beet is similar. I heard Professor Isabelle Bevier of the University of Illinois state that she had carried on many experiments testing out these same questions. A lady in Sonoma county, who had made large quantities of very fine jellies, decided to test out this question of cane and beet sugar. To do so she sent to a refinery, making only beet sugar, buying a 100-pound bag, and used this in making her jellies. She could detect no difference whatever between the beet sugar and the cane sugar.—Lillian D. Clark, Agricultural Extension, University of California.

EFFICIENCY IN THE KITCHEN.

A little intelligent thought, without the expenditure of a dollar, on the arrangement of the kitchen can greatly lessen the work in the farm home.

A kitchen as a work-room should have three centers; the cooking center, the mixing center, and the work center. The stove is the chief article of the cooking center, and all pans, kettles, etc., should be as near as possible. This group should be very near the sink, which is the principal feature of the work center. Here should be found paring knives, dish pans, cleansing materials, and the like. The mixing center should have near at hand the mixing bowls, egg-beaters, measuring cups, rolling pin and kneading board, with the staple supplies used in cooking, as flour, sugar, and the like.

Having these three centers furnished with all the necessary articles of each kind of work, will save many unnecessary steps and many minutes in the course of a day.

MEAT SUBSTITUTES.

Often for dietary reasons, as well as expense, the meat allowance must be cut down. Substitutes which lend variety and produce the same energy-producing qualities are the following: whole wheat flour, dried beans, peas, lentils, walnuts, peanut butter, oatmeal, cracked wheat, cheese, eggs, olive oil, macaroni, and rice. These are some of the many foods which simply, or in com-

bination, make a wholesome diet. Dried fruits and nuts are valuable additions to a well-balanced diet.

FARMERS SELL OWN TURKEYS.

[Written for Pacific Rural Press.]

A distinctively new method of selling turkeys has been practiced this season by O. L. Linn, Marketing Agent for the Stanislaus County Farmers' Union.

A small room on one of the business streets of Modesto was rented as an assembling point, where all of the farmers could leave their turkeys, either alive or dressed. Each farmer's fowls were separately tagged when received, for identification purposes. If dressed, a memorandum was made of their weight; if alive they were killed and dressed by men employed especially for that purpose, at so much a bird, and weights recorded on each tag.

Each morning before Thanksgiving, the turkeys received the day previous were displayed and sold to buyers from San Francisco, at prices which varied according to the quality of the bird and the market in San Francisco. These prices, however, were much higher than would have been received had the buyers been compelled to go by auto through the country districts to do the buying. Also those farmers who raised the best turkeys received the most money as the quality of each bird was clearly in evidence when dressed.

It is quite likely that as a result of the success of this venture it will be practiced again during the Christmas and New Year's marketing season.

PUFF PASTE.

Half a pound of flour and one-half pound of butter. Wet the flour with about one-half cup of cold water; work it smooth, and roll it about one-third of an inch thick. Wash all the salt from the butter, working the water well out, and make a cake of it 7 inches long and wide; put in a cool place while preparing the flour paste. Put the butter in the middle of the paste, and fold it all over the butter. Roll it out 3 times one-third of an inch thick, folding it like a sheet of paper. Make in a cool place.

AUNTIE'S JOB.

"Now we'll play zoo," said Willie, "and I'll be the elephant."

"That will be fine," said Aunt Mabel; "but what will I be?"

"Oh, you can be the nice lady what feeds the elephant with peanuts and candy," explained Willie.

SPICE OF LIFE.

Better late than never—Husbands.

It is not safe to judge a man's courage by the tone of voice he employs when he speaks to the office boy. Wait until you hear him address his wife.

Mr. Jones—I move that Mr. Smith's resignation be accepted. The Chairman (surprised)—What resignation? Mr. Jones—The one he ought to send in.

Mr. Tozer (sadly)—Nothing equals the skepticism of married women. Mrs. Tozer—You're mistaken, my dear; there is one thing. What is it? The credulity of the unmarried ones.

Genuine Army Shoes for YOU

Made from the strongest and very finest prime calfskin leather on earth—genuine Indian tan—Goodyear welt—heavy soles and bellows tongue—soft and velvety feeling to the feet. These shoes are made over the lasts and patterns designed by Edward Lyman Munson, A.M., M.D., of the Medical Corps of the United States Army, and approved and adopted by the War Department. This is the shoe on which we were awarded a contract for making 150,000 pairs for the Government. This is a real outdoor shoe for farmers, stock raisers, fruit growers, hunters, hikers, campers and general outdoor service; made for perfect comfort and long wear. Our name is stamped on every pair. Order No. 202 R Tan Army Shoe.

Only \$6.00

If not sold by your dealer, order direct from us. A new pair or your money back if they do not fit.

BUCKINGHAM & HECHT, San Francisco

EARTH'S LAST PICTURE.

When Earth's last picture is painted, and the tubes are twisted and dried,
When the oldest colors have faded, and the youngest critics have died,
We shall rest, and faith, we shall need it—lie down for an aeon or two,
Till the master of all good workmen shall set us to work anew.

And those that were good shall be happy, they shall sit in a golden chair;
They shall splash at a ten-league canvas with brushes of comet's hair;
They shall find real saints to draw from—Magdalene, Peter and Paul;
They shall work for an age at sitting and never get tired at all!

And only the Master shall praise us, and only the Master shall blame,
And no one shall work for money, and no one shall work for fame;
But each for the joy of the working, and each for his separate star,
Shall draw the thing as he sees it, for the God of things as they are!

—Rudyard Kipling.

ONE, TWO, THREE.

"One, two, three, four, five, six," recited Jerry, proudly. Jerry was six, and had been to school a week.

"I wish I could count like Jerry," said little Richard to his mother. "If I could just count to three, because I'm three years old!"

"Why, of course you can learn that," said his mother. "It's very easy to learn to count three."

"How, mother?" asked little Richard.

"This way it goes—one, two, three," said his mother. "See, your tricycle has one, two, three wheels. Now run out to play and see if you can find anything that has one, two, three parts."

"That will be hard, I think," said little Richard.

"Just you try it," said his mother.

So off frisked little Richard in his little blue rompers and his big blue hat and his warm blue coat, for the days were cool.

Down the meadow lane he scampered first. "One, two, three," he said to himself; "one two, three," but he did not see anything that he could say "one, two three," about. The tall stalks of golden-rod along the way were brown from the nip of Jack Frost, and the dry grasses rustled by the stone wall, that was all.

Little Richard began to climb the bars at the end of the lane into the meadow, and that very minute he discovered something.

"One, two, three!" he shouted. "The bars are a one, two, three." And sure enough there were one, two, three wooden bars across the lane that led into the meadow.

Over in the meadow there did not seem to be any one, two, three's at all. There were just green grass and clover leaves.

"Oh," said little Richard, "I think Bunny would like some of this nice clover."

So he picked a great big handful of clover leaves for Bunny, and that very minute he discovered something.

"One, two, three!" he shouted. "The clover is a one, two, three."

And, sure enough, there were one, two, three little round green parts to every single clover leaf.

Just then a brown chipmunk ran along the stone wall, and began to chitter, chatter.

"I know," said little Richard, "you don't want me to get any nuts. But I know where the nut trees grow as well as you do."

Over the wall went little Richard into the woods where the hickory-nut trees and the butternut trees and the chestnut trees grew. There stood a big chestnut tree. Its branches were dotted with green burs like prickly round balls, and the ground beneath was sprinkled thickly with brown and green burs. Most of the brown burs were empty, for Jack Frost had nipped them open before they left the tree, and the nuts had tumbled out. Little Richard began to hunt among the fallen leaves for the little brown chestnuts, but he looked and he looked, and he could not find one.

"Greedy little squirrels," he said, "you have taken them all. I must come out earlier to get ahead of you."

He was so interested in hunting for chestnuts that he had forgotten all about one, two, three. But that very minute he discovered something.

"One, two, three!" he shouted. "The chestnuts are one, two, three."

And, sure enough, there were one, two, three brown, glossy chestnuts all nestled snugly side by side in a half-open bur with a lining like brown satin.

So he picked up the bur very carefully in order not to prick his fingers, and started for the house to show his mother the one, two, three clover and the one, two, three chestnuts, and to tell her about the one, two, three wooden bars.

On his way he stopped at the barn

The gift that cheers

For Xmas—or any other time—there's nothing more pleasing or useful than a good oil heater. Nine hours of solid comfort from a gallon of PEARL OIL. Good-looking, dependable, durable.

Prices: \$3.75 to \$7.75

LIGHTING SYSTEM

to feed Bunny the clover. Close by the door-sill lay a yellow wasp, numb and nearly dead from the chilly fall air. Richard bent to pick it up, and that very minute he discovered something.

"One, two, three!" he shouted. "The wasp is a one, two, three."

And, sure enough, the wasp's little body was divided into three parts just as if a thread had been tied around it in two places.

Little Richard ran and gave Bunny his clover, and on his way out he tumbled over the milking stool. And that very minute he discovered something.

"One, two, three!" he shouted. "The milking stool is a one, two, three."

And, sure enough, the milking stool had three legs.

And before he had hardly picked himself up, he heard a little faint "mew, mew," from the hayloft.

"What's that?" said little Richard. "I think it's my kitty cat calling me."

So up the narrow stairs climbed little Richard into the great, dim, dusky haymow full of sweet-smelling hay.

"Mew," he heard again, and he stumbled over the hay to the place where the sound was.

"Oh, oh!" cried little Richard. For there was Mrs. Kitty and three dear little kittens.

Richard could hardly wait 'till reached the house. "O mother," he called, "come and see the new kitties." And he forgot all about one, two, three.

But a little later when Jerry came home from school and began to count so proudly, little Richard remembered.

"I can count three," he said. "O mother, lots of things are one, two, three."

Then he showed her the clover leaf with its three little green parts, and the prickly chestnut bur with its three little brown chestnuts, and the yellow wasp with a body in three little parts, and he told her about the three wooden bars, and the milking stool with three legs.

"That's just fine," said his mother. "And I know another one, two, three that you saw in the barn up in the hay."

"Oh, oh, yes," cried Richard. "I know one, two, three little new kit-

tens, the little black one and the little striped one and the little gray one."

And, sure enough, there were one, two, three little kittens up in the bay with old Mrs. Kitty.

"It was such fun, mother, to learn to count one, two, three," said little Richard.—Emily Rose Bent, in the Mother's Magazine.

CARE OF THE HANDS.

As the cool days come on, more care of the skin is necessary if it is to be kept in good condition. An inexpensive lotion, composed of one ounce each of alcohol, glycerine, rose water and witch hazel, with half an ounce of bay rum, is excellent to use. These ingredients should be put in a bottle, and the juice of a lemon added. It is fine to use after the weekly wash, when the hands are dry and shiny from soap, as the acid of the lemon kills the effect of the soap, and the other ingredients are healing.

There are hand ailments where this lotion is more of an irritant than a comfort. Sometimes a deep crack comes near the nail and refuses to heal. For this, nothing is better than camphor ice, and it can be made at home. Take one ounce of gum camphor, two ounces of mutton tallow, and one ounce of vaseline; melt the tallow over the fire and add the crushed camphor, stirring constantly to prevent burning until the camphor is melted. Remove from fire and add the vaseline. Stir well and put in small jars or glasses with covers. When applying, rub well into the skin.

CIDER IN GOUT.

A bulletin issued by the Academy of Medicine, Paris, reports eight cases of gout in which cider was used with decided benefit. It is said to reduce the frequency of the attacks and modify the intensity of the pain. A mild cider, well made, but not too hard, was used.

Good Health.

[By H. E. Pastor, M. D.]

The Dope Habit.

Doping has come to be a necessary part of our daily existence, it seems. Temperate, rational living is too tame in this strenuous age. The monotony of life must needs be relieved. Those among us who count ourselves abstemious dope up with coffee and newspaper excitement in the morning and sooth our wrought-up nerves with strong tea, or a pipeful of tobacco at night, and, mayhap, take a mild sleeping potion before the sweet restorer, Sleep, brings oblivion. In extreme cases our men load up with alcohol in various seductive forms through the day and try to offset the effects with "bromo" or worse at night; while women fire their imaginations with lurid motion pictures of things that never happened, and then hasten home to quench the conflagration with copious draughts of tea, etc.

We are rapidly becoming a race of neurotics, surfeited with excitement-seeking, or with the pleasures of gormandizing and guzzling, and the befogged brain and worn-out nervous system seek relief by dosing up with Doctor Bunk's Headache Powders. Now, there isn't a headache powder on the market that doesn't contain one or more dangerous drugs. Nearly all are heart depressants, products of coal-tar distillation, as phenacetine, antipyrine, or perhaps acetanilid, or perhaps all combined. These drugs undoubtedly remove pain, but do so by lessening the reflex action of the spinal cord and deadening the sensibility of the sensory nerves. If acetanilid, for instance, is taken in overdoses, as it is sure to be if this drugging habit is long-continued, it breaks down the haemoglobin (red coloring matter) of the blood and thus destroys its oxygenating function, or may even cause death by overdepressing the heart's action. The more you take of these drugs the more you have to take to get the desired effect—and the last state is worse than the first.

Don't become a victim to drugs—drugs of any kind. True, drugs have a place in the treatment of disease, but they are not the whole thing, as many unsophisticated people seem to think. They are not even the important thing in correcting bodily derangements. Let drugs be the last thing you think of instead of the first. Headache powders especially are a delusion and a snare. Their labels and literature are utterly misleading. If you are troubled with headaches ascertain the cause and remove or avoid it. Don't become a drug fiend.

The Prune Has an Inning.

This is prune week, which should interest everybody, for everybody should eat prunes whether they grow them or not. People generally would be much better off physically if they ate more prunes and less of some other things too numerous to mention. As a nutritious article of diet the worth of the prune is recognized wherever people are civilized enough to know a good thing when they see it. Its medicinal value, of

which only it is permitted the writer to speak here, is that of a mild but efficacious laxative, and in this respect the prune is second only to the fig as a natural fruit laxative. Its bland and palatable qualities admirably adapt it to cases of constipation in children, even babies being benefited by occasional teaspoonful doses of the juice, which may be alternated with like doses of the juice of the orange, of which some mention was made in this column a few weeks ago. Wholesome as the prune is generally conceded to be, it should not be partaken of too freely, as, eaten to excess, it may induce

flatulent colic, owing to the indigestibility of its skin. The prune has recognition in the U. S. Pharmacopoeia, serving as an ingredient of the "Confectione Sennae," of which it forms 7 parts in 100, to 10 of senna. Chemically speaking, the prune contains sugar, malic acid, pectin (the "jelling" principle), albumen, and certain salts. But, after all, read reader, the benefit you will derive from the prune depends more on eating it regularly, though in moderation, than on a whole volume of technical verbiage. Pay homage to the prune by placing it on your menu every week in the year.

Do It Electrically

ELECTRIC APPLIANCES in the household, not only add to the convenience of all members of the family, but they are economical and time-savers.

ELECTRIC APPLIANCES include CHAFING DISHES, COFFEE PERCOLATORS, VACUUM CLEANERS, ELECTRIC IRONS, and every other appliance that is needed in the modern home, not forgetting ELECTRIC FANS.

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads are actually free to Settlers and Other Land Sold at from \$15 to \$20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get

near \$2 for wheat and raise 20 to 45 bushels to the acre he is bound to make money—that's

what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax.

Mixed Farming in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Write for literature and particulars as to reduced railway rates to Dept. of Immigration, Ottawa, Can., or to

BEANS.

The new crop is moving out of growers' hands with unusual rapidity, notwithstanding the firmness of prices, and buyers have so far been more concerned about supplies than the price paid. The car shortage greatly hampers shipments, and the movement would otherwise be even larger. Whites appear to have reached the top level, at least for the present; but the advance on the colored varieties continues, first-class red kidney beans having jumped sharply, while smaller advances are noted in pink and cranberry beans. Tepary beans have not advanced, and are extremely cheap as compared with other kinds. It looks as if some educational work would be required to get them started with the trade.

HAY.

Arrivals on the city market have dropped off again, owing to the impossibility to get cars; and most of the hay accessible to river transportation has already been moved. The same condition affects consuming markets in the country, where there is a very good demand, with great difficulty in making deliveries. Locally, the larger dealers are unable to get anything like the quantity normally required; and while the demand here is limited, the shortage has caused another rather sharp advance in prices. POULTRY.

Demand from Eastern markets took up much of the stock usually shipped here for Thanksgiving, and local values were very firm up to the close, all attractive stock going at 30c. Late arrivals, however, found a slump, and prices now are too irregular to quote, as there is little demand. Chicken prices are unchanged, though Eastern hens are lower. Supplies are comparatively large, as feed prices are causing growers to cull their flocks very closely. This will no doubt result in lighter supplies of both poultry and eggs later on.

Special Livestock Market Report.

San Francisco, Nov. 30, 1916.

No changes are indicated this week in our livestock quotations. The cattle market is strong, with most of the supplies from Northern California, Oregon, and Nevada. The best dairy cows go at the price of Number 2s. Sheep arrivals are mostly from packers' own feed lots, though a very few small lots are still being picked up. The hog market is firm, the supply liberal, and the quality good. Wool is practically all out of growers' hands except small lots of spring and fall wools in the San Joaquin Valley, some of which are moving at the prices quoted. Nevada wool is cleared up and next crop is being contracted at 27 cents.

[Prices paid for stock, live weight off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

CATTLE: A very good demand was had the past week for all good to prime beef steers and fat cows and heifers, and the tone of the market was firmer. Under the influence of stronger markets East, feeders were offering cattle less freely and killers had to bid up full quotations to get

DECIDUOUS FRUITS.

Huckleberries are about cleaned up, and strawberries are becoming rather scarce. Casabas also are practically gone. Persimmons are in very fair supply and easier, being rather more of a feature than usual in this market. A good many pears are moving from storage. The northern apples have been slightly damaged by frost, and large shipments are being sent this way instead of to the Eastern markets, causing an easier feeling. California apples, however, continue quite firm and in good demand, and the average quality causes buyers to be very critical. Most of the stock is now in cold storage, less than 100 cars being left in growers' hands, and the storage stock is comparatively small. Strawberries, chest\$6.00@9.00

DRIED FRUITS.

The market in most lines is growing rather uninteresting from the growers' standpoint, as the bulk of the crop is now in the hands of the trade. The general shortage, however,

ers apparently can be found almost regardless of price. Apples have taken another little jump, and are getting very closely cleaned up; while apricots are bringing as high as 16c, with practically nothing left in the country. All offerings of white and Calimyrna figs have been absorbed, and packers' holdings are running very low; while black figs are rapidly cleaning up. The prune situation is stronger than ever here, with only a very small tonnage left in growers' hands in any California producing districts. While the active buying season in the East is over, it is evident that there will be very little stock to meet the spring and summer requirements. Lake county pears are cleaning up well, bringing as high as 12½c; and peaches show a further advance.

[Net to growers, bulk basis, f. o. b. shipping point.]

GROCERIES.

Flour has dropped a little north, but is unchanged here as yet. Hams have jumped ¼ to 1c per lb. Factory price on crackers has advanced. Low-grade canned salmon is advancing. Macaroni, spaghetti, etc., have been marked up a little.

LOS ANGELES.

Los Angeles, Dec. 5, 1916.

BUTTER.

Receipts of week ending Dec. 5, 1916—228,100 lbs.
Receipts of week ending Dec. 6, 1916—294,675 lbs.

A lower market was had the past week and trading only moderate. Receipts were only fair, but under a marked falling off in the shipping demand dealers on 'change were inclined to go slow and the day after Thanksgiving the market broke 2c and has ruled that much lower ever since. The home consumptive demand holds up fairly well, but it was not sufficiently strong to overcome the falling off in the outside movement. In San Francisco the market broke 1c on Friday, recovered ¼c on Saturday, but has remained steady ever since. Chicago declined 3c during the week on extras and New York 2½c under a boycott inaugurated against high prices in those markets.

EGGS.

Receipts (railroads) for week ending Dec. 5, 1916—695 cases.
Receipts (railroads) for week ending Dec. 6, 1916—610 cases.

With the Thanksgiving demand passed and eastern markets lower under a boycott against high prices, the market here since our last review has been both quiet and weaker. Receipts were light, but as there were more hen eggs and fewer pullet eggs coming in, dealers on 'change were inclined to hold back and do little. The high prices continue to affect home consumption, while speculation is out of the market. In San Francisco the market ruled fairly steady during the week up to Tuesday. Wednesday San Francisco broke 3½c and the market here 4c and no buyers on call at this reduction. Chicago continues steady with a week ago, while New York is off a cent.

We quote fresh ranch case count, 47c
Pullets, 38c, Candle 2c, and selected 2c over quotations.

POULTRY.

Since Thanksgiving the market has quieted down perceptibly. There has been a dropping off in the receipts, however, as well as the demand and prices in consequence show no change. The tone of the market, however, is

rather weak than otherwise. Broilers and fryers, as well as roasters and turkeys and ducks have been selling slowly the past few days.

Broilers, 1 1/2 to 2 lbs.23@24c
Fryers, 2 1/2 to 3 lbs.20@22c
Hens, over 4 lbs.18@19c
Ducks17@18c

Roosters, 3 lbs. up. (soft bones) 18c
Turkeys, heavy, 12 lbs. and up. 23@24c
Turkeys, light21@22c
Squabs, live, per doz\$1.50@3.00
Dressed3.75@4.85

BEANS.

There was a more quiet tone to the market the past week. The approaching holidays and the coming of the new year making buyers more backward. The snap to the market noted heretofore being absent the past week. Holders, however, continue firm in their views. Hence the lighter trading.

Limas\$7.00@7.25

HAY.

The market just now is in a very

unsatisfactory condition. The scarcity of cars caused a number of shipments to come in the past week on open cars and they got caught in the rain and the hay damaged. Such receipts were very hard to move while real choice hay, under light offerings, met with a fair demand at old quotations.

MISCELLANEOUS.

REBUILT GAS ENGINES from 3 to 50 h.p. Thoroughly overhauled and guaranteed. We handle only high-grade engines. Write us your requirements. Motors, Gas Engines bought, sold and exchanged. Mechanical Installation Company, 181-89 Second St., San Francisco.

EVERY SIZE WROUGHT IRON WATER Pipe and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a Square Deal. Weissbaum Pipe Works, 160 Eleventh St., San Francisco.

SECOND HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHETER PIPE WORKS 306-8 Howard St., San Francisco.

AGENTS—Take orders for raincoats. Big commissions. Easy profits. Cooper made \$314 last month. We deliver and collect. Sample coat free. Comer Mfg. Co., 13 Cable St., Dayton, Ohio.

APPLES DIRECT FROM PRODUCER—Fancy grade, bulk pack. Per box: Newtown Pippins, 85c; Missouri Pippins, \$1; No. 2 grade, 60c. Edward A. Hall, E. F. D. 1, Watsonville, Cal.

FOR SALE—In Fernley Valley, 80-acre dairy farm, well stocked and improved. Price, \$14,000. Address O. P. McGarr, Fernley, Nevada.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds, \$3.00 delivered. Order with remittance. WM. J. SCHROTH CO., 112-B Market St., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

"HOW TO LIVE ON LESS"—a guide to cheaper living. Wholesale catalogue free. Pacific Co-operative, A236 Commercial St., S. F.

TO REDUCE THE HIGH COST OF LIV-ING, send for our Wholesaler to Consumer Catalog. SMITHS' CASH STORE, 108 Cal St., San Francisco.

SEEDS, PLANTS AND TREES.

STRICTLY FANCY SEEDS—Alfalfa, Scarified Sweet Clover, Red Clover, Timothy, Rye Grass, etc. Free Bulletin—"Sweet Clover in the Northwest." Write for samples and prices. Ralph Waldo Elden, Central Point, Oregon.

FOR COVER CROP—Seed Horse Beans for sale at \$4 per 100 lbs. I. O. b. Oceano, San Luis Obispo county. Samples free. Send cash with order. Oceano Trading Co., Inc., Oceano Cal.

SUDAN GRASS SEED WANTED—This year's crop. Send sample and amount you can supply to J. P. Cundell, Lathrop, Cal.

MISSION OLIVE TREES—Raised from my own bearing trees. This is the only sure way to get what one wants. W. A. Hayne, Box 461, Marysville.

CELERY SEED FOR SALE—Dwarf Golden Heart variety. Produced from seed purchased from C. C. Morse & Co. Strictly fresh and clean. Price, per pound, \$1.50. James Mills Orchards' Corporation, Hamilton, Cal.

WALNUT TREES—Franquette, Mayette and Mammoth on Black Root; also Grafting Wood and Black Seedling Trees. Lowest prices. Mammoth Walnut Nurseries, Watsonville, Cal.

QUALITY TREES—Seedlings, 5c. Prunes, 10c. Walnuts, 30c. Cash Nurseries & Seed Store, Sebastopol, Cal.

WANTED.

WANTED—Young men and women to attend the Western Normal Courses—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A," Western Normal, 524 E Market St., Stockton, Cal.

PRUNING WANTED—By a thoroughly competent pruner; work on vines or trees. Address P. W. Brodt, 2150 Center St., Berkeley, Cal.

COUNTRY LANDS.

STANISLAUS FOOTHILL COUNTRY—After extensive search over California I purchased a year ago excellent 300 acres bench land bordering Stanislaus River, very attractive scenically on main highway S. F. to Yosemite. Soil and climate adapted to fruits, oranges, almonds and alfalfa—we are specializing on almonds and alfalfa. Tract watered by gravity ditch. Brother and self developing portion for own holding. Practically all balance sold to parties doing same. Will sell the three or four fine remaining tracts to desirable parties at very reasonable price and long time. Bank references. George S. Henry, C. E. Oakdale, Cal.

HUMBOLDT STOCK RANCH of about 1600 acres. Good family orchard some tan bark and fir. 200 acres can be farmed. 4 miles from N. W. P. R. E. A good stock ranch that will stand investigating. In order to settle an estate and to compromise litigation, this property has been placed in my hands to sell at \$8.00 per acre. C. E. Robertson, 105 Montgomery Street, San Francisco, Cal., or Bridgeville, Humboldt County, Cal.

WANTED—Reliable party with \$1,000 to \$1,500 for development purposes. Money secured. Have 95 acres bean, beet, and rice land. Can reside on property if desired. Plenty of water. H. Beckwith, Bethany.

ASK JOSEPH CLARK, Sacramento, about your nine rights. Information—reverted State and Government land. Any county. Booklet free.

HUMBOLDT STOCK RANCHES—CATTLE—Cattle correspondence solicited. C. E. Robertson, 105 Montgomery St., San Francisco.

40 ACRES choice level land. Improved. No alkali. Bargain price. Might trade. John Buck, Chowchilla.

Special Citrus and Deciduous Report.

Los Angeles, Dec. 5.

Shipments of oranges from Southern California from Nov. 1, to Nov. 27, 572 cars, and lemons 428 cars. Shipments for the same time last year 421 cars oranges and 319 cars lemons.

Shipments of oranges from Central California from November 1 to November 26, 607 cars and lemons 84 cars. Shipments the same time last year, 439 cars of oranges and 39 cars of lemons.

Shipments of oranges from Northern California from November 1 to November 26 were 353 cars of oranges and no lemons. Shipments the same time last year were 73 cars oranges and no lemons.

A fairly good market was had at the East the past week for oranges, but lemons were dull and market lower. The approaching Christmas holidays helped the orange market; then, too, a number of cars of new navel were in and the fruit coming to market was good, and being cheaper than Valencia as they attracted buyers. But with fewer offerings a weaker market may be looked for. Locally the market shows little change from a week ago. Few navels are arriving more freely and have crowded Valencia's pretty much out of the market. Local packers are paying now no more for them than new navels. New navels are being bought at 2@3c per pound in the grove and grapefruit 2@3c per pound at the grove. Both in very good demand at these prices. The fruit coming in is well colored and is testing

well. It will be noticed from the shipments that the early oranges are being marketed much more freely this year than last and so far prices are fairly satisfactory.

EASTERN AUCTION MARKETS.

New York, Dec. 4.—Five cars Valencia's, five cars California navels, two cars Arizona navels and three cars lemons sold. Valencia's higher, navels firm and lemons unchanged. Weather cloudy. Valencia's averaged \$2.20@7.30. Navels averaged \$2.25@4.05. Arizona navels averaged \$1.75@4.55. Lemons averaged \$2.25@3.00.

Boston, Dec. 4.—Market easier on Valencia's, but unchanged on lemons. Valencia's averaged \$3.30@4.30. Navels averaged \$3.80. Lemons averaged \$2.75 1/2 @ 3.25.

Philadelphia, Dec. 4.—Three cars sold. Market weaker on lemons. Lemons averaged \$2.15@2.35.

DECIDUOUS SHIPMENTS.

The final comparative statement of deciduous fruit shipments issued Dec. 2d, 1916, by the California Fruit Distributors, covering the last two seasons is as follows:

Dormant Deciduous Fruit Pruning.

Winter-prune deciduous trees to produce good crops of good fruit every year, to support those crops, and to distribute fruit and leaves for maximum sun and air.

[Written for Pacific Rural Press.]

WHY should trees be pruned at all? It is contrary to Nature and does not Nature know best? Well, after all, Mother Nature provided mankind to prune and cultivate her orchard trees in order to bring out their greatest possibilities. And if mankind fails in Nature's plan, the tree sends up a wealth of spindly sticks with weak fruit buds. The outside sticks do some pruning by smothering the inside ones; and protect themselves by growing up out of reach. They set a multitude of fruit buds, and produce only flowers or small-sized fruit. With the stone fruits, this draws severely on the trees' energy to make a superfluity of pits. The tree in attempting to mature such an overabundance of small fruit, neglects to make fruit wood for the next year. So under Nature's plan, if unaided by man, we get irregular or alternate crops. And when we get the heavy crops the trees break down, partly because their framework has not been built strong.

Reasons for Pruning.—So one reason why we prune is to regulate the crop next season so we may get one the following season too: by reducing Nature's overabundance this year, we enable her to make fruit of greater size with a larger proportion edible and therefore more valuable.

But with proper pruning, a full crop does not break down the tree, because the pruning has been done from the first to make the tree stocky and strong, to balance it, and to expose the greatest potential fruit-bearing area to the sun and air, enabling leaves to digest the food sent up by the roots and add the most important ingredients of the fruits we eat.

The pruning of the trees' early years has spaced the branches, and made them grow diagonally upward and outward for greater strength and less inconvenience in cultivating than if they shoot horizontally from the trunk. Instead of allowing the tree to go unlimbitedly into the air, inviting wind damage and smothering the lower branches, the intelligent pruning produces strong fruit wood from the head up, and all within convenient reach. Instead of having an outer blanket of fruit wood over the tree, we get fruit all through the tree also.

Use Energy for Fruit.—A primary consideration in pruning a tree of bearing age, is to prevent its wasting its substance in riotous wood growth which has no value, costs much to remove, and takes many times more soil plant food than the same weight of fruit which would have money value.

An old tree or one weakened by injury, disease, or bad soil conditions, produces proportionately less wood growth and more fruit wood than a

younger or more vigorous tree, which had not been so weakened.

Prune According to Vigor.—So the first thing to note in winter pruning is the vigor displayed during the previous season's growth and to determine on a severe or light cutting back, accordingly. The heavy cutting back produces more new growth. The amount of this desired is determined partly by the increased fruit desired when it shall bear, and partly by the intensity of sunshine in summer which must be prevented, by sufficient twig and leaf growth, from sunburning the bark of the limbs.

Unless the cut is made close above a vigorous branch which will take the sap pressure, several new shoots will come from close to the cut. All

but one or two of these must be removed later. These shoots do not support themselves at first, but draw on the elaborated food supplied from the old leaves, either during the current season or during the previous season, having been stored in the tree during the intervening winter. This food might be supplied to fruits if the luxuriant new growth did not take it away from them. From many standpoints excess wood growth seems worse than useless.

To avoid getting it on a tree where it grew last season, cut back less. If wood is too thick for the good of inside and lower fruit wood, thin it out by cutting it off at its junction. We have the word of observant growers that thus you will get considerably less total length of new wood, but what grows will be stockier.

Regulate Fruit Wood.—Enough wood growth must be made each year to set and mature all the fruit buds needed for the future crop. This is true whether the buds are borne on new twigs or old spurs; and it is generally true in both cases that one year is consumed in making the fruit bud which is to bear the following year.

Apples, pears, plums, etc., bear partly on terminal or axillary fruit buds, and partly on spurs, which are themselves simply very short-jointed twigs on which annual growth must be made, often while maturing fruit, to bear the fruit bud for next year's crop.

Peaches, etc., bear on the longer jointed twigs which make fruit buds the year they grow. New twig growth on apricots has buds which produce spurs the following year, which produce fruit the year after that, and each year thereafter.

So each kind of fruit has its own habits of fruit bud location and formation which must be known before the tree can be pruned intelligently. And often, the different varieties of the same kind of fruit require notably different pruning. This is especially true of peaches and plums.

Reduce Disease by Pruning.—An important purpose of pruning not mentioned above, is to reduce damage due to disease and insect pests. Aphis eggs are quite largely pruned off in winter and should be burned. Certain other worms, etc., which live far out on the branches are cleared off by this means. Blighted twigs of walnuts, pears, peaches, etc., can be pruned out, and we know one grower at least who uses pruning to reduce pear thrips. It certainly allows better work for spraying where

CALIFORNIA VICTRIX.

OF COURSE the University Farm "victory" at Chicago is not the only pebble on the California beach, even though we do amuse ourselves by rolling it around on a later page of this issue. The sweep of the Bishop Brothers' San Ramon Shropshires through the field of garlands hung up for that breed at Chicago is as significant as the rush of Professor True's steers because it demonstrates that notable victories belong not alone to institutions with battalions of State-aided instructors and students, but can be reached just as well by private breeders who put in money enough to get first-class foundation stock and then handle it right, under the favoring natural conditions of California. Californians will not be true to themselves nor to the State if they do not follow up these victories. What has been done this year will cause this country and the world at large to sit up and take notice. In the future these great geographical bodies should be shown what California really can do through the whole gamut of pure breeding, whether its masterful creations be decorated with hair, wool or feathers. A single charge has put our rivals on the run: it will be our own fault if they are not kept going.

We make this prominent mention of these Chicago victories, although details are given fully elsewhere in this and last week's issues, thus hoping to penetrate the consciousness of some readers who have formed the habit of going to sleep in the middle of this page and of dropping the paper into the fireplace before which they are dozing. Of course they ought to know that the later pages of each issue are not as soporific as this one, but judging by the chestnuts which readers shake down in questions, etc., they are slow to learn the truth. It would be reasonable to put editorial comments on the last page where they might have a soothing effect on minds uplifted by the stirring facts and experiences which our associates describe, but the last page is the best-seller we have, and all stuff which does not pay has to be put inside and disposed of as soon as possible. And so, right here, we exalt the Chicago victories and exhort readers to study well their dimensions and significances. It is surely not necessary for the reader to fall asleep in the first column.

WHAT PRUNE GROWERS SHOULD BE DOING.

THE organization-preliminaries of the Prune and Apricot Growers' Association seem to be going on very satisfactorily. Forceful exhortations and demonstrations are resulting in wide consent to membership, as they should. It is therefore timely, perhaps, for us to suggest that signing contracts and subscribing for stock does not complete the growers' duty to the success of the effort. In all districts there should be either formal assemblies, or informal discussions among signers, to determine how their interests may be best represented in the association which will soon be taking on final form. It is expected that signing representing more than \$500,000 capital

stock will be secured this month. This fact will justify organization and continuation of efforts for completing requisite capitalization by March next. As soon as the fact is announced each district will be called upon to select its representatives on the board of trustees. These trustees are expected to represent the best knowledge and conviction of their district growers as to how the organization shall be equipped with officers and with policies of operation. Manifestly each district, to get recognition for its convictions, should select its best men to secure such recognition. They may be the largest growers or they may not, for it is a choice of men, not of tons of prunes. They should be quick-seeing, broad-minded and clear-speaking men who can fitly represent district points of view. They must of course be prune-growers, members of the association and residents of the district, but beyond that they should be able men among men. There are seven districts and each district has two trustees, except the Santa Clara district (Contra Costa, Alameda, Santa Clara and San Benito counties) which, by virtue of its proportion of the crop produced, has twelve. This district has 79,000 out of the 132,000 acres of bearing prunes and apricots in the State. The board of trustees has entrusted to it the formative influence of the organization because it is authorized to appoint a board of 13 directors who shall select the officers and supervise their operations. These directors may be chosen for their business ability and knowledge of cured fruit conditions, situations and trade. They need not be growers and each of them needs to hold but one share of stock, which may be issued by the trustees for purposes of legal qualification, and they need not be district residents. This explains why the districts should lose no time in considering what men they desire for trustees. They constitute the last chance the district has to embody its particular views and interests as a district, if it has any which are particular. After the movement passes the trustees its only point of view will be the good of the whole producing interests of prunes and apricots, though of course it may be expected to remain alert for important considerations from all sources just as any controlling business agency ought to be. We have to suggest then that each of the seven districts, if it has not already done so, should begin at once, by public assembly or otherwise, to decide for itself who are best qualified in various ways to act as its representatives on the board of trustees. It should not be left to a hurried getting-together and action after the formal call for choice of trustees shall be issued by the organizers.

RECRUDESCENCE.

THIS old world is surely sorely disappointing many of its recent admirers who, a few years ago, did not hesitate to proclaim it jogging along quite fast toward spirituality. They used to expend much profound sympathy upon the primeval man who had to devote most of his time chasing food rather than emotions, and in picturing the fast approaching moment when mankind would give no thought to sustenance because it could swallow tabloid meals between great drafts of esthetic ecstasy. Instead of realizing this blissful state we see rich and poor, bond and free, struggling against each other for the time-honored ailments of their grandfathers, like a lot of slum-kids at a fresh-air picnic, and all popular journals treating food questions as most favored sensation. Instead then of rising above the spiritually debasing activity of primeval man we find the present generation plunged into a recrudescence of it. No one can tell what will come of it. It bids fair to revolutionize the science of economics, the art of government, to swamp universal literature and almost to constitute itself a new religion for those "whose end is destruction and whose God is their belly." For it really does seem to us that the end and purpose of much of the current agitation is destruction and, in the long run, not calculated to appease the hungry god whom these agitators worship. For what will be the ultimate effect of arbitrary embargoes, price-fixing, food dictators and the like? We can see only one, which may be lasting, and that is the discouragement of food producers and the reduction of production. The way to get plenty of food for the world is to make

farming a good, profitable and inviting business. Many apostles of these new food-cults seem to think that farmers will of course go on producing; that they are a sort of perpetual motion in that line and need no external moving force. Such a notion is the blindest blunder in the world. All the farmer has to do to starve the world is to do nothing. It is very dangerous to place the farmer in sight of that operation. And the farmer is the only person in the world, except the hunter and the fisherman, who can starve every one else and live himself, because he is the only producer who can eat up his own product and keep alive upon it. All popular attitudes and legislative acts which rob the farmer of proper incentive to production are suicidal to all who cherish them—remotely, perhaps, but surely: with acceleration dependent upon degree of reduction in the incentive. And, when you get a certain distance along that road, personal struggle will arise between the starving food-seeker and the food-grower for his own subsistence, and primeval man will again live upon the earth.

PROPER ATTITUDE TOWARD THE FARMER.

IN THE mass of economic nonsense which food agitators, regulators and prohibitors are crowding into the columns of popular journals it is encouraging to find the words of a wise man who knows the attitude on the part of the public which will lead the farmer to the production of incalculable amounts of food supplies—lead him perhaps even to overproduction and his own embarrassment through unprofitability, but still lead him where no regulation can possibly drive him. W. B. Farley, who is described as "one of the oldest produce merchants in the San Francisco wholesale produce section," gives the Bulletin this gleam of profound truth:

"The farmer is at last getting a fair compensation for lean years. Prosperity for the farmer will eventually mean prosperity for the entire country and the kind of prosperity that counts. It means many things for the farmer to have a prosperous year, such as the present one has been. He will at last be able to pay off mortgages, invest in new machinery and to put more enthusiasm in his work than ever before.

"The big manufacturing States are calling for an embargo on foodstuffs. Before we talk of an embargo on farm products, let us talk of an embargo on steel, leather, lumber, farming implements, fertilizer and clothing. The big manufacturers have been busy selling steel products and all kinds of manufactured goods abroad for high prices. Now that the farmer is getting a price for his output in foreign markets they call loudly for an embargo. No one can say absolutely that a food crisis is facing the country. After all these years of debts and mortgages, why not allow the farmer at least a short time in which to balance his accounts and get ready for a new and better start?"

That is the stuff which the public ought to be fed upon until it gets strength enough to see straight. Be glad the farmer is making some money. Clear the track to markets where he can get more of what belongs to him. Make capital available to him for less than the pawn-broking to which he has always been subjected, has exacted. Make farming business more profitable than it has been and you will get more producing capital in it, more men and effort in it and more food out of it. Rastus! yo' heah muh, chile?

WELL, WHAT IS THE MATTER?

OF COURSE justice to the farmer does not mean injustice to anybody: it means justice to everybody. It is very possible that in current discussions some one is trying to make the farmer the scape-goat to cause the public to load upon him the sins of others. We are not discussing that question: we are merely insisting that unfairness to farmers which may embargo or dictate them out of business is no way to get more food. Farmers are not to blame for higher prices: so far as they are getting them, they are needed and deserved. The gouge upon consumers does not profit the farmer: it may hurt him before the season is over. He has no interest or sympathy with the gouging. As we write it is telegraphed from Washington that information gathered by Government officials conducting nation-wide inquiry into high cost of living points to the conclusion that soaring prices of certain necessities of

life were due, in part at least, to the manipulations of speculators who combined to force quotations upward. These combinations are believed by the Government investigators to have been criminal in character, rather spasmodic and rather short-lived. If this is the case, legislation can outlaw and proscribe them. They are an outrage on the

farmers as they are on all other people. So far as higher prices are due to natural and economic conditions they are incurable by legislation except that which enables them to operate without hindrance. There is only one safe way to get more and cheaper food and that is to help the farmer make more money!

ing water for a few seconds and allowing it to dry before closing up again in the cans. Or you can use carbon bisulphide—packing the cans in a tight chest, putting a saucer-full of bisulphide on top and a cover over the chest. When the liquid has vaporized spread out the fruit in the air (where no moth can reach it) until the odor disappears. Do not have any fire within reach of the fumes.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address

Killing Fungus in the Oak.

To the Editor: In connection with the fungus in the oak, which seriously endangers fruit trees planted on oak clearings, I wish to ask if it is possible to introduce some solution into the circulation of sap that will reach every root and branch to kill the fungus so that the roots will have no more effect on the soil surrounding than ordinary decaying wood? By boring, slanting holes into the center of oak tree could a solution of concentrated lye or strong nitrate of soda be introduced so it would get into the circulation strong enough to kill the tree and roots both, inside of a year, by a sort of slow poisoning process? Large amounts of fine land are unsuited for many orchard trees because the effect of oak roots persists for years after the tree has been burned up. Do the roots still act, throwing oak sap into the soil; if so, will nitrate of soda counteract it? The idea is to use sap circulation to kill everything pertaining to the tree and by doing it slowly perhaps reach every part more effectually. Can you suggest any chemical that could be used for the purpose better than concentrated lye or nitrate of soda? How strong a solution is needed and what time of year should it be put in, or should it begin with the growing season and last until leaves have fallen, keeping holes filled often with whatever solution is used?—F. F. Britton, San Jose.

When such an idea comes into the mind the test of it is not reached through theoretical discussion, but through an effort to do the thing thought of. Many things have been found practically possible which have theoretically been pronounced otherwise. Therefore we suggest a few things without attempting to answer the main question of our correspondent.

First: There would probably be nothing gained by the effort to get into the center of the tree. The central wood is relatively inactive in sap movement. The chief upward movement is just beneath the bark in the early part of the growing season. The chief downward movement is also near the outer rim of the stem and forms the layer of "new wood" in the latter part of the growing season. In the case of a deciduous exogenous tree, these movements are more definitely seasonal than in an evergreen. Theoretically, then, the poison should be brought into contact with the wood just beneath the bark: in the spring to reach the top: in the late summer to reach the roots.

Second: It has been shown by experiments that by removing a piece of bark and keeping a killing solution in contact with the wound (by contriving a container against the tree and keeping it supplied) a part of the top of the tree can be killed: Theoretically the same could be done for the root by application to the downward flow of sap, but we do not know that it ever has been. Possibly it might be automatically prevented, because if you kill the top quickly there would be, theoretically, no downward flow. It would be a puzzle perhaps; for if you could kill the root first there would be no upward flow and the top might have to die for the lack of sap and not from poison, which would leave the joke on you with no chance for repartee. This shows that any amount of discussion could give you nothing but a "working hypothesis" for trying to do it. Therefore you must put your questions practically to the tree—which will probably have more to say about it than we have, because it knows more.

Third: The substances which are perhaps more offensive to growing cells than those you mention are bluestone, potassium cyanide, and white arsenic. We doubt if the solutions should be very strong, for if they are the tree would be able to sacrifice a few million cells around the point of your attack and thus check your offensive because dead cells would preclude movement. Thus again the tree might leave the joke on you.

Fourth: It is not a matter of oak sap. The injury is done to following fruit trees by a specific fungus (*Armillaria mellea*) which causes a parasitic disease of the oak itself and subsists on old roots left in the ground until they are completely decayed—thus lying in wait to attack any fruit-tree root which penetrates to its sphere of influence.

What Fruits to Plant.

To the Editor: I contemplate planting an orchard this spring. The land is best adapted to apricots, almonds and figs. Which would you advise planting? My idea, of course, is to plant the tree which will be most profitable in future years.—Subscriber, Esparto.

We print the question chiefly for the opportunity of saying that we do not undertake to answer queries of its type. Readers must carefully consider all that we are able to get for them from week to week about the actual behavior of the different fruits in the orchard and market experiences of those whose testimony we are able to secure. An intelligent reader should sift the testimony and decide for himself how he will invest his money or his life. He should no more ask us what fruit he should grow than what girl he should marry. He has to live with both, not we. We know well enough what fruit we would plant and what kind of a girl we would marry, but we will not allow you to put over on us your risk of insolvency and the divorce court. How do we know but what you will deserve both, and we are inclined to think you would if you should be content to follow our advice. And now, lest this should make you mad enough to stop your paper, we will say: "Plant apricots and God bless your union!"

Growing Globe Artichokes.

To the Editor: What kind of soil and climate are best adapted to the artichoke and what is the best variety to plant for profit? Will they grow on red soil which is well drained?—E. W. M., Marysville.

Although globe artichokes can be grown with good market-gardening conditions anywhere in our valleys and foothills for a local supply, the conditions which the commercial growers choose are a good, cool, foggy climate for summer growth and a mild winter temperature so the plants will bud when the buds are highest-priced, and that is during the winter months. For this reason the shipping supplies are chiefly grown near the coast in central and southern California. For such free vegetation as they require to bear profitably, a strong loam amply reinforced with stable manure and a good water supply to push growth are considered requisite. Such upland as you probably indicate would need much mellowing with manure and water always ready to keep the plant growing. Your dangers would be too dry summer heat. Plant a few in your garden and see how they act before going farther. You also need to see if you know how to handle the plants: there are some smart tricks in it. The Large Green Paris is chiefly grown.

Worming Dried Fruit.

To the Editor: I have dried figs, peaches and raisins for home use. They are in the hinge-top 5-gallon tin cans. How can I keep worms from getting into them? I found some small moths in them a few days ago. Can I use carbon bisulphide? If so, how?—E. B. H., Woodlake.

If the moths you found were of the right kind, as they probably were, the fruit will soon be crawling around. It does not matter what you put it in if you do it after the moth has had a shot at it. You must kill the eggs and worms already hatched. You can do this by heating thoroughly in an oven, not hot enough for burning, or by dipping in boil-

Rate of Sowing Grasses.

To the Editor: How much will it take of either seed to one acre of land as follows: timothy and clover and redtop: of each or all together as a mixture?—I. M., Sierraville.

It depends upon the condition of the ground and of the weather. A common rating, for each by itself, is timothy 20 lbs.; clover, red 15 lbs., white 10 lbs.; red top 40 lbs. Red top is seldom sown by itself; with timothy it is usually put in at the rate of one-fourth as much as of timothy. A mixture of the above per acre might be timothy 12 lbs., red top 5 lbs., clover 5 lbs. You cannot hit it exactly; whichever way you do it, you will think you might have done better with a little more of this or that, and this will depend more on how good the seed is and how good the conditions for a catch than on a little difference in the quantity. Readers will notice that the enquirer lives in a mountain valley. Neither timothy nor the clovers will be worth sowing in lower situations without irrigation—except near the north coast.

More Important Than Price in Beans.

To the Editor: Which are the two best market beans to plant as to price and yield—one white and one brown, say the Red Kidney?—W. C. Watsonville.

As our market reports have shown, the Red Kidney and the large and small white have led the price list notably for some months and are usually ahead. When it comes to growing beans it is however rather more important which beans give the best crop on your locality than which make the best quotation. Therefore it is important that you should get pointers from some one who knows beans under your particular conditions of soil and climate. Make friends with an experienced grower in your neighborhood.

Perennial Rye Grass Will Do It.

To the Editor: I have a field that gets very wet in winter; it has got good drainage, but drains do not do much good for water will stand on it in a few feet from a drain for two or three days after a rain. It is light red poor soil. Is there any grass that would stand this and do for cow hay? I tried timothy, but it dies out in the summer. We have very dry weather from the last of June until the middle of October.—A. H., Garberville.

The conditions are particularly unsuited to timothy. Sow perennial rye grass. It will endure the soggy soil and overflow and on such land will probably find enough moisture to hold life through your drouth, which is not a very long drouth for California. The grass would not be offended if you take up the drains and see if they are filled up or are water-trapped by sags on the grade.

Nuts on Orange Land.

To the Editor: Is there any reason why walnuts and almonds should not do well on land near Lindsay, which is suitable for oranges?—A. B. G., Lindsay.

Probably not. In some citrus districts at the south almonds seem to be upset by temperature conditions which interfere with their regular deciduous periods of rest and activity and do not bear well. So far as we know, the conditions north of Tehachapi favor more regular periods of activity and dormancy for both deciduous and evergreen trees.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., December 12, 1916.

Fruit Trees Planted Last Season.

[Written for Pacific Rural Press.]

A table of the number of acres of each kind of fruit in each county was published in our issue of May 6 with corrections of the almond acreage in the issue of June 17. These did not include last season's planting, which is given as nearly accurate as possible from estimates made for Pacific Rural Press by county horticultural commissioners. Those omitted did not report, for one reason or another. The estimates of fruit planting are usually made on the basis of nursery trees

inspected by the horticultural commissioners under the horticultural laws. Complications arise where nursery trees are shipped into a county and then out again—also where many fruit growers raise their own trees, also where nurseries ship to substations in other counties and burn all trees left over at the end of the season. There is also no feasible way of determining how many are planted in old orchards where occasional trees have been taken out.

We have expanded Napa Horticultural Commissioner J. J. Fox's suggestion of estimating 100 trees per acre except as noted below, where the estimates came to us in number of trees. This probably makes a conservative average allowance for distances and replants. We have also figured on 25 fig and walnut trees per acre, 700 grape vines, and 2000 berry vines. Where only "citrus" trees were reported, the figures were credited to oranges. These assumptions lead to certain errors, but form a fair relative basis. Note that figures for non-bearing acreage cannot be compared with the rest.

*Reported as acreage. N—non-bearing acreage. †Approximations made by estimating what proportion of imports and nursery stock raised in the county were planted there. ‡Imported trees and vines on the acreage basis as noted.

Whose No. 1 Prune is It?

To the Editor: The great interest in the "No. 1 prune" mentioned in your issue Nov. 25 leads me to seek to straighten out the tangle, into which it is getting as to name. Two nurserymen claim the origination and name; one under "—'s No. 1," another under "Improved French No. 1." As a matter of fact the several original trees in Suisun valley cannot be traced to any nursery now known. Why you call it "Sharpe's No. 1" is a mystery to me as I never heard that name in connection with it, and it bids fair to stick.

It is no more French than it is Imperial, Clairac or Robe de Sergeant, the French prune of commerce being Petite d'Agen (smaller than 60s to 70s) and a larger strain either Prune d'Ent, or Pymirole. I thank you for your good opinion of samples I sent. Frank Owen. Napa.

[We perhaps merely added to the confusion over the identity of the variety which Mr. Owen sent us by calling it "Sharpe's No. 1." We knew it came from the Suisun-Vacaville district and M. Sharpe's "No. 1" was the only one we knew of that number in that district and tried to make the mention more definite by treating the fruit as that variety. That may have been a serious mistake on our part. Perhaps if you interest your horticultural commissioner, Mr. Fox, in establishing the identity of your strain as related to others with which it is getting confused, a definite settlement can be reached. Mr. Fox of Napa and Mr. J. W. Mills, Farm Adviser of Solano county, can get together all the facts and give us a decision.

It will hardly do to make the term prune d'Agen only apply to small prunes. "Petite d'Agen" is

a name which never existed except in California. A selected French prune which is large may be just as true prune d'Agen as an unselected one which is small. And a selection from the French prune does not, by fact of size, become Imperial, Clairac, etc. The matter ought to be taken up seriously and the identity of all these prune varieties straightened out and kept straight hereafter. —Editor.]

MIXING FRUIT VARIETIES.

To the Editor: Would you advise planting a different variety of pear for a pollinizer in a large block of Bartlett's? Is it advisable to plant mixed varieties of trees in large blocks?—J. C. B., Sebastopol.

The Bartlett needs no pollinizer. Many varieties of other fruits do. In selecting varieties for interpollenization, pick those that bloom at the same time and one of which produces plenty of vigorous pollen. Except for this purpose and for soil and drainage differences, mixing varieties is not economical. Trees are much more conveniently pruned, sprayed, cultivated, and fruit harvested, in solid blocks of one variety. Where interplanted for pollenization do not alternate single rows, but pairs of rows or only one row of the pollinizer per two or three of the desired fruit, or graft a branch of the pollinizing variety into the trees.

PICKING LEMONS GREEN.

To the Editor: I have some lemons; want to keep for home use. Tell me how to care for them to keep

them from getting dry and hard. Should they be gathered while they are green or after they have turned yellow?—H. W. L. R., Fresno.

Pick your lemons before they begin to turn from the dark green to the silvery tone, and do not let any of them turn yellow on the trees.

Keep them in a uniformly cool temperature in the dark where there is more or less ventilation. A lemon is nearly dead when it has turned yellow on the tree, while it is full of life if picked absolutely green; and will develop acid, flavor, and a thin, beautifully yellow, pliable skin, if kept as suggested.

Commercially, they are laid onto trays, each tray holding one layer of lemons so that the air can circulate over them. They are kept either in ventilated basements or under canvas which can be raised at night.

YOUNG PRUNE PRUNING.

To the Editor: I am coming back to you again for information on pruning the two-year-old French prune. I got instructions through you last year on the first pruning of my orchard and it has proved more than satisfactory.—R. T. M., Los Molinos.

Your object still is to make a sturdy tree. Cut back half to two-thirds of the new growth according to the vigor shown. Make cuts just above a strong lateral, but leave no stubs. Thin out to balance the tree, aiming to leave about twice as many branches as before, sloping diagonally upward. If the trees are especially vigorous do not cut back so heavily and let them bear a little fruit next summer if they have the buds.

Quick Citrus Organization.

[Written for Pacific Rural Press.]

Thirty-four citrus growers near Redlands organized the "Crown Jewel Groves Inc." Oct. 18, 1915. On January 6, 1916, after their new packing house had been running some time, they held a formal opening which was attended by officials of the California Fruit Growers' Exchange through which their fruit is marketed, of the Pacific Electric on which the house is located, of the Southern Pacific, and the Redlands Chamber of Commerce.

Practically all the members had been shipping through concerns outside the Exchange. They had appointed a committee of growers to determine whether the Exchange was bringing better returns. Finding that the Exchange houses were really paying the growers about 15 cents per hundred pounds more than the independents, they quickly signed up about 505 acres. Stock is issued to the growers in proportion to the fruit they ship, but no stock can be sold. It is a non-profit corporation of growers. The fruit from about 55 acres besides that signed up was shipped through their new house during the past season and a total of 540 acres are signed up for the forthcoming season.

The plant cost \$15,000 and will have a capacity of five cars per day when another sizer is installed.

To Basement from Orchard.—A distinctive feature and a most valuable one where there is no pre-cooling plant, is the concrete underground store room, for fruit as it comes from the orchards. It is unloaded onto gravity conveyors which carry it into the basement where it is distributed by roller conveyors, which are themselves movable on casters. These enable the boxes to be placed in piles with just one little lift. The storeroom is ventilated at night and may be closed in daytime.

When fruit is to be held before packing, it does not suffer the hot changing temperature as it does in most packing houses, and shows correspondingly less decay. There is storage room for 9000 boxes of fruit and six or seven carloads of shook, besides the box-making machines.

While packing goes on on the main

floor over the storeroom, a truckman downstairs sets the boxes of fruit onto an inclined conveyor from which the boxes load themselves into a continuously running elevator. This is a self-dumper, emptying the fruit into the washing tank. All fruit is washed by soaking awhile in a tank whence an apron belt carries it out and dumps it onto several cylindrical brushes all turning in the same direction under continuous jets of fresh water. The brushes slope, and the fruit is helped along by auger projections of the bristles. Thence it is run through canvas towels onto roller aprons and through a series of eight hooded driers through each of which air is forced by large fans. This dries the fruit; and it is sized, packed, and loaded as usual.

The packing house is exceptionally light, having 36 windows each 3x3 set into a vertical offset in the roof facing north, besides the open sides. The hardwood floors are easily kept clean. Conduits protect electric wires for lights, etc. Its location in the center of its members' orchards saves much hauling, and the Exchange takes the worry of marketing. J. D. Langford, one of the leading organizers of the M. O. D. and the leading salesman of that organization for the past five years, has been appointed manager of the Crown Jewel Co. for the season of 1916-17, and will market the fruit from his 100-acre orange grove through the Crown Jewel Co.

No one knows better than Mr. Langford the value of co-operative marketing. For five years he fought the Exchange in the San Francisco market and opened it to the M. O. D. with the sale of 254 carloads of oranges in a single season, but in that long fight he found the Exchange, with its overwhelming supply of fruit, its immense advertising strength, its well-trained corps of salesmen and its ability to keep its customers well supplied with the very best fruit at all seasons of the year, so manifestly the soul of the citrus sales department of California that he was forced by the logic of the sales situation to cast his fortune with the Exchange.

Strongest Grape Canes Pruned Longest.

[Written for Pacific Rural Press.]

In pruning Muscat and Malaga grapes, the strongest canes should be left longest. If they happen to be all on the same side, that side will overbear next year, while the other side catches up in vigor. Cutting strong fat canes short reduces fruit possibilities, for it does not help whatever weakling spurs are also left and it throws the strong sap flow into fewer buds causing coulure. Cut the fat canes long for fruit and then if there are not enough for renewal spurs also, the slender canes may be used.

Enough fruit wood should be left to use the vine's energy in producing fruit rather than in producing useless watersprouts and cane growth. Judge this by last year's performance and the treatment the vineyard is to get the coming year. Get the desired amount of fruit

wood on many spurs rather than on a few, for if too long they may get knocked off in cultivation and then there might not be enough left. Save an equal number of renewal spurs of one bud each, as you have of fruit spurs, so there will be sure to be enough to leave at next pruning.

Such is the philosophy of Frank Henry, whose instructions A. B. Cate of Fresno county followed to get 18,300 trays of Muscats from 37 acres about 30 years old. For that crop, he pruned the weaker vines in February, leaving the stronger ones till March so they would bleed some and be held back from excessive sap flow to the blossoms. He left 8 to 15 fruit spurs per vine and an equal number of one-bud renewals, with the remarkable result in production here stated.

Training Thompson Vines.

[Written for Pacific Rural Press.]

If Thompson grapes have enough water at the right time, they should be spread out to get maximum air and sun. Since Thompson, rightly pruned and cared for, will bear a good bunch at almost every node, it is an advantage to have a few canes well spread out, rather than more shorter ones more bunched up. To get the maximum air and sun, a fan-shaped training on two wires is proving best and most generally practiced. Those who permit their Thompson trunks to get tall lose some of this advantage. Where the vines are consistently headed near the ground, the shoots may be spread with considerable precision.

Spindling canes should always be either cut off entirely or cut off for renewal spurs, if there are enough strong fat canes left. There should be enough of these to set enough fruit so that all the vine energy will be devoted to fruit rather than to watersprouts. In Mr. Schlueter's vineyard, many vines were left with a dozen canes, filling all space between vines, which are 10x12 feet apart.

The easiest, quickest system of tying and untying Thompsons that we have seen is practiced by J. A. Schlueter and a number of others in Fresno county. No strings are used, yet under a 6000 tray crop on 8½ acres in 1916, not a tie pulled out even when the wire trellis broke down under weight of crop.

Last season, two No. 14 wires were used, being stapled to the sides of the stakes. Wires all over the vineyard broke in two, while lots of the staples were pulled out. This season, the top wires will be replaced by No. 11, stapled on tops of the stakes, and the No. 14 used for lower wires in young vineyard.

The tie used was figured out by Frank Henry. It avoids need of strings, may be quickly put up and quickly taken down at next pruning, yet never loosens.

If the vine has been trained right from the start, it will have three or four shoots left to grow in the second season. If they made good growth 5 to 6 feet long, two of them are left in pruning for the 3rd year, while one or two are cut back to two buds for renewal spurs. The two left are cut back to two feet long. This severe pruning is designed to encourage growth of a crown of large diameter not over six inches from the ground. A two-inch pipe will carry more water than a one-inch pipe. So a trunk of large circumference can carry more sap than a smaller one.

The two canes two feet long will bear as much crop as if they were four feet, according to Mr. Henry, for the roots can support only so much. If the canes were left four feet long, the top buds would grow leaving the others dormant and useless. At the end of this third season, these two canes should be cut back for renewal spurs and three or four canes left from the renewal spurs for fruit the following season.

At this pruning for the fourth season the wires should be run along the stakes, the first wire about three feet high, the top one perhaps five

feet above ground. The fruit canes will be carried diagonally to the top wire past the lower wire on the side against which each cane will naturally press and tied to the top wire. The "Henry tie" consists in bending the end of the first cane back toward the top of the stake, over the wire and under it, letting it rest on top of the stake or against its side. It is cut off just beyond the stake. The second cane is treated the same way from the opposite side of the stake.

Before there is any weight of crop to pull it loose, shoots will have grown over the wire in such a way as to hold the canes in place.

The third cane is cut considerably longer than the first and second so it may be run out to the wires at an angle about 45 degrees, then bent back over the top wire and under it so the end of the cane will catch against the bend of the second cane.

On mature vines, with as many as a dozen canes, the angle at which the intermediate canes are evenly spaced from crown to wire, so that the outside canes on mature vines will meet their neighbors at the centers of the top wire is about 45 degrees if the vines are 10 feet apart and the top wire 5 feet high.

At the winter pruning, canes which have borne are cut back to renewal spurs or to the crown. They are easily taken down from the wires by cutting the season's growth off, and loosening the ends of the canes. Then the canes that grew from the renewal spurs are "tied" in the same way.

DORMANT DECIDUOUS FRUIT PRUNING.

(Continued from first page.)

pruning can be done, and it opens up the trees so certain fungous diseases find little encouragement.

When to Prune.—It is generally believed that pruning late in the dormant season has some effect in preventing early growth which is undesirable in frosty locations. Late pruning is also desirable from the standpoint of early healing to prevent rot and dying back, especially in soft-wooded varieties and in large wounds. The latter, however, should always be covered either with lead-oil paint or asphaltum, the latter probably being safest. Some people delay pruning till the buds swell to indicate those which have wintered well and are most likely to produce strong bloom.

With some fruits, notably the apricots, much pruning is done before the leaves fall. This is claimed to strengthen the fruit buds, if it does not induce new wood growth. It has the advantage of all early pruning that it is sure to get done, while weather and ground are good, and before winter spraying.

Use of Shears.—A horticultural commissioner lost his reputation with a wide-awake grower in California, because in attempting to give him a pruning lesson, he set one jaw of the shears in the crotch and made a bad bruise, a ragged cut, and a stub. Wherever possible, even at the cost of convenience, the jaws of the shears should be applied to both sides of the branch to be cut, with the handles beneath. And even at the cost of much energy and time, no short stubs should be left, but the cuts made close to junctions. This prevents loss of many of the most fruitful years of the tree's life.

P. J. S. Montgomery, who owns a big orange grove near Porterville, claims to have found a remedy for June orange drop. He has submitted his findings to the horticultural authorities at the State University at Berkeley, and they have agreed that he is right. He says that the drop is caused by a peculiar fungus growth at the stem of each tiny green orange, and that sunshine, following a period of dampness, is the cause of the fungus. Last spring he treated a part of his orchard with a fungicide, and later in the season sprayed it again. On these trees thus tested, he says, practically every orange remained.

STUART PRUNE

ORIGINATED BY J. F. STUART, RIPON, CAL.

Twenty-seven dried prunes to the pound.

This prune is a cross of the French prune and the Tragedy prune into the Silver prune—the Silver being the mother-prune.

The market price of this prune is 12½¢ per pound.

The University test is 53.5 per cent sugar. It drops from the trees and processes like the French; has a very delicious flavor; is black when dried; the wood is hard like the French; is a prolific bearer and dries down very heavy. Small pit.

We are exclusive owners. 5000 budded trees in stock for sale this season. Also plenty wood for grafting.

A large and fine stock of Almond, Pear, Peach, Apricot and Prune trees for sale. Write for prices.

RIPON NURSERY AND IMPROVEMENT CO.

NOTES ON INTERPOLLINATION.

[Written for Pacific Rural Press.]

Many varieties of fruit bloom but do not set fruit because they do not pollinize themselves. They need other varieties of the same kind of fruit nearby so that the pollen may be blown by wind or carried by insects to their blossoms. Locality and climatic conditions have something to do with this. We do not attempt to deal with the subject fully here, but give random notes picked up from our travels. Varieties to be useful for interpollination must have blossoms open at the same time.

Almonds.—While the Nonpareil often pollinizes itself, a block on the James ranch in Sacramento county never bore for six years. A graft of Ne Plus was inserted into each tree of every third row, and thereafter they bore heavily, according to Elmore Chase. The Texas Prolific is one of the best pollinizers, according to J. P. Dargitz of San Joaquin county, though most of its bloom there comes two weeks later than Nonpareil.

Prunes.—It is very advantageous to graft Robe de Sergeant into Imperial prune trees to make the latter bear, as experienced by Wm. Grant of Vaca Valley.

Cherries.—E. H. Goepfert of Vaca Valley has recently planted 1000 Chapman and Burbank cherry trees in alternate pairs of rows of each variety for pollinization because the Chapman in his experience is a heavy bearer and the Burbank light. He has been growing cherries many years. The Rockport is the best pollinizer he has found, and he expects to graft that variety into all shy-bearing trees which bloom about the same time. A block of 300 Rockports always gives him a heavy crop; and the cherry trees next to them always bear well. H. A. Bassford, who has one of the biggest orchards in Vaca Valley and has been raising cherries for 30 years, regarded alternate rows of different varieties a great secret of regular bearing of good crops. Republican, Bing, and Royal Annes work well together.

Plums.—Wickson seems a shy bearer in some districts, but M. Sharpe of Vaca Valley has a block of 600 trees surrounded by pears which he told us a year or two ago had borne consistently, and as well in the center as at the edge. A crop of 2400 crates had been taken from them. His neighbors, also, had some big blocks of good-bearing Wickson plums. In Placer county where Wickson does not generally bear well, Climax and Santa Rosa are good to help. Mr. Bassford regards the Apple plum, one of the old introductions of Burbank, as a fine fertilizer for Wickson, also the Satsuma. Dukes and Diamonds work well together for him; also Formosa and Santa Rosa. C. V. Freed of Placer county believed that grafting Clymans into Tragedy made the Tragedy bear. He also found that Hinori mixed with Tragedy made the Tragedies full.

So far as can be learned the heavy and almost Statewide frost did not injure the lemon and orange crops at Santa Barbara.

Roeding's Page

ON TREES

PEARS

PROF. WICKSON, in his book on "California Fruits," makes the following introductory remarks about the pear:

"The oldest deciduous fruit trees in California are pear trees, as has been stated in the account of fruits at the old missions, and some of the trees are still bearing, though it is a century and a third since their planting."

It is very gratifying, indeed, to have this encouraging statement from Prof. Wickson. Strange as it may seem, there is not a single line of fruit growing which has been attempted in California, no matter what the obstacles may have been in the beginning, or which may have arisen as the industry has been successfully launched, that has not gone on developing just the same, in spite of any deterrent influence which might have had a tendency to make the business unprofitable.

Climatic Advantages.

This is accounted for through the fact that California, with its great variety of climate and soil conditions, offers advantages which are not found in any other state in the Union.

Scientific methods of control and the fact that in practically all the coast counties no serious results have been apparent from the attacks of blight, probably accounts for the building up of the pear industry, in spite of the very serious obstacle that has menaced it. Another factor which has

caused the grower to take such a deep interest in pear culture, has been brought about by the fact that possibly in no other place outside of the Pacific Coast states does the grand old standard "BARTLETT PEAR" reach such perfection.

Heavy Bearers.

The trees bear enormously, and they seldom suffer from frost damage, due to late blooming. The fruit is harvested, depending on

the localities, from July to October, and the tremendous demand for it for shipping and canning and its delectability, even when dried, all combine to make it an all-around pre-eminent fruit.

True, there are other varieties, such as the Doyenne du Comice, Glout Morceau, Howell, P. Barry, Winter Bartlett, Winter Nells, and several others, all of which have their place as market varieties in the fresh state.

Is it any wonder when year after year the exceedingly high prices which are paid for fresh pears on the Eastern market, the prevailing satisfactory prices paid by the canners one year with another, and the ready sale of dried pears at very remunerative prices in localities where they cannot be marketed fresh, due to unsatisfactory transportation facilities, that the interest in this industry has never waned?

No Over-production.

In the year 1900 California, according to a statistical report, produced something over 7000 tons of dried pears. This gradually fell off from 1000 to 1500 tons per annum until the year 1911, since which there has been a steady increase, and the output at this time is something over 5000 tons annually of the dried fruit alone.

Lack of space on this page forbids further mention of varieties, planting, pruning, etc., but we will be glad to correspond freely with interested growers.

True Trees

How California Could Help Colonization.

[Compiled for Pacific Rural Press.]

[In the issues of this journal for November 11 and 18 outlines were given of original investigation into the methods and results of recent private and corporate efforts at land subdivision and settlement in California. These results were attained by joint undertaking of the State Commission on Rural Credit and Land Settlement, the Agricultural College of the University and the Commonwealth Club of San Francisco—the last-named furnishing funds to meet expenses and the others the services of the investigators and interpreters. The results of the inquiry will be published in detail by the Commonwealth Club and by the State, in the form of a report of the State Commission to the governor, which will soon appear. From advance sheets of this document we compile an outline of what the State is recommended to do, through provision by the incoming legislature. The members of the State Commission whose report we are abstracting are Dr. Elwood Mead (chairman), Harris Weinstock, David P. Barrows, Mortimer Fleishhacker and Chester Rowell. D. N. Morgan is secretary of the Commission.—Editor.]

A State Need.—The colonization and development of the unpeopled farm lands of California is of such importance to all the people of the State that it should not be left to the separate action of landowners, but should be shaped in part by the carefully thought out, purposeful action of all the people. This means that the State should have a land settlement policy and deal with this matter as a public problem.

By regarding colonization and the creation of rural communities as a trust, we may create agricultural colonies filled with people who will make this a State where the best people in this country will want to live. We may only do this, however, if the diversion of our rivers, the selection of land for colonies, and the methods of development are planned and directed by the best thought and intelligence of the time. We shall achieve nothing by leaving these things to blind chance.

State Supervision of Settlement.—It is believed that every interest which needs consideration would be benefited by providing for state supervision of colonization. There is some difficulty in accomplishing this because it ought not to embrace ordinary sales of land from one person to another, but only include those enterprises which assume sufficient magnitude to have public importance and in which settlers who are unacquainted with local conditions are sought from the outside or from a particular neighborhood. Such supervision should aim to accomplish the following results:

1. To provide that adequate attention has been given to water supplies and drainage in irrigated areas.
2. That the land is suited to the purposes for which it is being sold.
3. That there is no misrepresentation in the advertising.

It should also aim to aid those engaged in colonization by pointing out features in the plan they are following which are likely to lead

to failure. Such state supervision would in no way hamper development, but by preventing misrepresentation and giving new colonization enterprises the benefit of a wider experience would protect them from mistakes and also safeguard the settler.

It would promote development by strengthening confidence in our advertising statements abroad, but it will not of itself lead to the adoption of the best features of the land settlement systems of other countries.

In the past settlers and land settlement have been helped by the large increase in land prices which accompanied development. This made it possible to borrow money for improvements or to sell a part of the original purchase for nearly the first cost of the whole area. This aid can not be relied upon in the future and we must replace it by a more generous personal credit system and by introducing more efficient and cheaper methods of preparing farms for intensive cultivation.

The experience of other countries and of some colonization enterprises in this country indicates that it is cheaper for an organization having ample capital to level and seed the land and finance the building of houses than to leave the work to the individual settler.

Longer Terms for Payment Necessary.—The experience of other countries is to the effect that a longer time in which to pay for farms than has been given in California is desirable. The tendency in Canada is to make the payment period not less than twenty years. In European countries it varies from thirty to seventy-five years.

The following suggestions are made as to the future financing of settlers in California:

1. Give twenty to thirty years' time in which to pay for land.
2. After the initial payment require no further payment on principal for the first two years, but stipulate in the selling contract the character of the improvements which must be made.
3. Have the payments of land amortized and the amount of the annual or semi-annual payments equal throughout the entire period.

It also seems desirable that the State should aid colonization by establishing one or more offices in the State where information regarding land in approved colony enterprises could be obtained.

Colonization by the State.—It is believed that over a considerable part of this country the different States will soon have joined other enlightened countries in making colonization a public matter. In the East it will be done to lessen tenant farming and improve agricultural practices; in the West as the best method of rapidly settling unoccupied and uncultivated land. The tendency towards the adoption of this policy in the West is shown by the decision of the United States Reclamation Service to level and improve farms before offering them for settlement.

A Demonstration Desirable.—The immense area of land in the large estates of California would make

progress too slow if it depended entirely on action by the State, but the State can do more than any other single influence to promote the adoption of right policies by making a demonstration in colonization for the purpose of showing how superior carefully thought out development is to that where only local or immediate benefits are considered.

The State which blazes the trail in scientific colonization will secure a prominence and establish a moral leadership that will be of great value in attracting desirable settlers. No State has more to gain from such leadership than has California. If the State were to purchase, subdivide, and settle 10,000 acres, its action would be watched by the whole world. It is entirely feasible to make this educational demonstration commercially profitable. It can be made to pay its way, so as to cost the taxpayer nothing. Such result has been achieved in the countries whose State systems have been held up as examples; there is no reason to doubt our ability to be equally efficient and successful.

How It May be Had.—An area of about 10,000 acres is suggested, because this area can be more economically and effectively managed than a smaller one; and its results would be of more general value. A larger area is not advised because of the cost.

Out of such an area there would have to be deducted, let us say, 300 acres for roads, canals, schoolhouses, and recreation grounds; 100 acres for farm laborers' allotments and a few small orchards and gardens. This would leave 9,600 acres, or enough for about two hundred farms varying in size from 20 to 100 acres.

The value of this demonstration would be increased by restricting settlement to qualified applicants between the ages of eighteen and thirty, men of experience and training, no one to be eligible who owns farm land elsewhere in the State, nor who has not had at least one year's farming experience, and who can not within six months become an actual resident and cultivator of his farm.

In planning colonies the State should follow the main working features of the plans which have succeeded best elsewhere. We believe that if the plans included the following, the results would be entirely satisfactory:

The land to be sold on thirty-six years' time, with an initial cash payment of 5 per cent, with interest payments of $4\frac{1}{2}$ per cent and amortized annual payments of principal of $1\frac{1}{2}$ per cent beginning at the end of the fourth year, the settler to pay for his land and have a clear title in the payment period by paying $4\frac{1}{2}$ per cent on the cost the first four years and 6 per cent on the cost of the remaining thirty-two years. Each settler should be required to have capital enough to pay, in cash, one-fourth the cost of all improvements made by the State; payment of the remainder of the cost of improvements to be amortized and bear the same interest as the payments on land. With these terms of payment for land and improvements it is believed that existing financial institutions can give whatever credit is necessary in buying equipment, including dairy cows.

Selection of Colonists.—The selection of colonists should be entrusted to a board, the subsequent business management to be in the hands of a single competent superintendent reporting to this board. The State Agricultural College should make systematic provision for giving advice and information regarding farm management and cultivation. The superintendent would give advice about buying livestock and equipping farms. The State should, by contract, build houses, level land for irrigation or loan money to settlers on insurable improvements carried out under the direction and to the satisfaction of the authorities in control, a conservative maximum limit to be fixed.

The prices of farms after subdivision should be so adjusted as to pay for land lost in roads and canals, also interest on the cost of the land between time of subdivision and time of settlement and all other incidental expenses. In Australia 15 per cent was sufficient to cover the above items.

The selection of the land should be entrusted to an expert committee, the purpose being not to enhance or depress prices, but to buy land at its productive value. If this were understood, it would be a guarantee to settlers that they were getting their money's worth. The character of various State commissions shows that there will be no difficulty in the appointment of one in whom the public would have implicit confidence, and who would see that a price was paid for land which would be fair to landowners and settlers alike.

Making settlement a public matter and using the wisdom and experience of the world in shaping our methods and policies will not only attract people here, but will do more to make California a desirable place to live in and secure a better use of our resources than can be accomplished in any other way.

DO YOU KNOW YOUR YEAR'S RECEIPTS?

A farmer is sometimes disappointed with the results of a year's work because the cash receipts for that particular year are low. A careful inventory of capital on hand will often show him that he has done very well. Records gathered from about 700 Missouri farms show that about 25 per cent of the total receipts from these farms was from increase in young stock, feed, crops held for sale, and other items of farm capital.

The record of a young Missouri farmer who is keeping cost accounts in co-operation with the Agricultural College, showed a total capital of \$5577 on March 1, 1914. His inventory showed he owed \$4000 of this. March 1, 1915, his inventory showed a total capital of \$5526.96, but he owed for only \$2410 of this. He was worth \$3116.96 March 1, 1915, making a gain of 1539.96 for the year.

A new Government Station is being opened at Martinez which is to work on cereals and forage crops. Messrs. Urban and Packard have been transferred from the South Pasadena station, which has been discontinued, to have charge of the new work.

TALKS ON Nitrogenous Fertilization

Number 3

GRANTED that you need a nitrogen fertilizer on your orchard or plantation or farm. Why should you use

SULPHATE OF AMMONIA

In the first place, because it is the least troublesome. You buy a definite compound, 25% ammonia, under guarantee, and you get it in good shape. It is ready to put on at once, without grinding or sieving, or if you have to keep it a month—or six—it is just as good then. No loss by absorbing water, no damp floors, and no fire risk.

In the second place, it does the work. It is 100% soluble, and dissolves promptly even when the soil is only moderately moist. Results can be seen in the deep green color of an ordinary field crop in two weeks or less. As it is so high in ammonia, the freight and distribution costs are a minimum.

And finally, it is a home-made, native American product, which is being produced on an increasing scale from our own bituminous coal, and is an essential product of our great steel industry. It is an aid to the conservation of our national resources.

Possibilities of Rice Flour.

[Written for Pacific Rural Press.]

"We have 50 salesmen on the road soliciting orders for our goods and most of them report a heavy demand for rice flour from retail dealers and bakeries. This demand has been increasing so rapidly that we are preparing to manufacture rice flour in large quantities."

This was the statement of district manager of a large milling company, when asked as to the commercial aspects of rice flour, which is exciting no small amount of interest in rice-growing districts of the State at this time.

"Our original idea in making what we term 'rice bread' was to supply our customers with a novelty—consumers always want something new—and we thought it would soon run its course, but instead we find a steadily increasing trade for it. From the start we have had a big run on it from our farmer trade, every rice grower apparently deeming it good business to eat rice bread."

The second speaker was proprietor of a bakery in Yolo county, who continued: "So far there has been no economy to us in using rice flour, as we have had to use flour of last year's milling, bought early in the fall when wheat flour was cheaper than it now is, but we hope to get it for less money, as soon as the new crop is milled, than the present price of wheat flour."

"We can only use a relatively small amount of the rice flour though, from 14 to 20 per cent of all the flour used in bread-making, as larger amounts make the bread soggy. It is more difficult to make 'rice bread' than wheat bread and it takes some practice to get used to it. The chief advantage of 'rice bread' is its moisture-keeping qualities. It does not dry out nearly so fast as wheat flour bread and we

have a nice trade from families where the children have to carry their lunches to school. A number of customers also buy it exclusively for breakfast toast, as it browns nicely on the outside, yet remains soft on the inside. We expected that our 'rice bread' sales would cut in on our other sales, but find this is not the case. We sell as much wheat bread as ever."

The history of rice flour in this country seems to be a short one and therefore it is difficult to tell its economic possibilities. So far as the writer has been able to learn, a California miller was the first one to manufacture it in commercial quantities, using broken rice known to the trade as "screenings" and "brewer's rice" and putting it through the same milling process as wheat.

Ordinarily its price will be little if any less than wheat flour, according to our miller informant, for the reason that there is usually a market for the broken grain among the brewers. There are on the average 10 per cent of screenings and from three to four per cent of brewer's grain in each 100 pounds of paddy. At the present time these broken grains have a market value to the brewer of about three cents a pound, while rice flour has been quoted this fall at \$3.90 a cwt. This difference of almost a dollar a hundred makes it profitable for the mill to turn the product out as flour at a price which in ordinary times corresponds very closely to that of wheat flour.

In view of these conditions and the further fact that commercial rice is too expensive to use in flour-making as a competitor to wheat flour, it seems evident that any great success in the promotion of rice flour will result chiefly from the creation of a taste for it among consumers who prefer it to wheat bread.

Uncle Sam Potatoes.

To the Editor:

Where can I get pure seed potatoes of the Uncle Sam variety? I have had great success with them in Contra Costa county, but the last seed proved to be something else, probably a mixture. Would like to plant in March or not later than mid-April, and dig in June or not later than August. The soil is silty sediment, twelve feet underlaid with water-bearing gravel. The Uncle Sam potatoes cook up dry and mealy, so much so that I have received many inquiries for that sort. Several others proved to be poorer bearers, some of them running very much to tops, and making long, stringy potatoes.

[Answered by W. V. Shear, State Inspector of Certified Seed Potatoes, Stockton.]

This variety, under this name, is grown only in a very limited way. It is, to all intents and purposes, the same as the Gold Coin and Green Mountain, the latter name being the proper one as it is the oldest. I have a very fine lot of this seed grown in Contra Costa county and which will yield about twelve tons per acre this year. They are now (Dec. 7) being harvested and I intend planting a good many of them myself for medium early crop. They are a standard variety of exceptionally good quality and good yielders.

They are not extra early, but their greater productiveness over the earlier varieties make them a profitable kind to use.

I shall be pleased to co-operate with you in the matter of good seed potatoes. The question of varieties is such a complicated one—a single variety often being sold under several different names—that it is very difficult for any one but an expert to make anything out of potato varieties.

NOTES ON OLIVE PRUNING.

[Written for Pacific Rural Press.]

In pruning olives, if there is lots of new wood, thin it out and cut it back so there will not be too much crop. An overheavy setting of fruit means not only small fruit but also not enough wood growth for following year's crop. These principles are pointed out by Horticultural Inspector Elmore Chase of the Fair Oaks district of Sacramento county. This is especially necessary with Manzanillos, according to T. J. Meader of the same district. G. L. Camden notes that olives do not mature to good quality if there is too heavy a crop. For young olive trees,

E. K. Carnes believes in leaving all the brush on the first year, to make the framework stocky.

The preliminary report of the Department of Agriculture at Washington shows that the total crop of sugar-beets of the country this year

was 6,671,000 tons against 6,150,293 tons last year. Average price this year \$6.17 per ton against \$5.67 per ton last year. Of this amount California raised 1,433,000 tons against 1,249,111 tons last year and growers received this year \$6.44 per ton for their beets against \$5.86 per ton last year.

United States Fertilizer Investigations.

The annual report of the Chief of the Bureau of Soils, U. S. Department of Agriculture, announces that the fertilizer investigations of that bureau have been established as a separate administrative unit. The work of the division is divided along three lines which deal respectively with the three fertilizer ingredients—potash, nitrogen, and phosphates.

Potash.—A plant will be erected on the southern Pacific coast to experiment on a commercial scale with the problem of extracting potash from kelp. This experimental plant is made possible by a special appropriation of \$175,000 for this purpose. The bureau also is co-operating with cement mills and blast furnaces to determine by analysis whether the potash now lost warrants the necessary expense to recover it. It is investigating the question of extracting potash from wool scourings and is making an effort to get in touch with companies in the country which are engaged in cleaning raw wool on a large scale. The bureau also has published a number of alunite determinations dealing with various methods of treating alunite for potash.

Nitrogen.—The bureau has equipped a laboratory at Arlington (Va.) Experiment Farm, with apparatus for testing the different methods proposed for fixing atmospheric nitrogen; and contracts have been let for much additional equipment to extend this work.

In connection with the work on phosphates, an electrical furnace has been in operation working on the problem of volatilizing phosphoric acid and fixing nitrogen in one operation. Apparatus has also been installed for experimenting with the Ostwald process of oxidizing ammonia for the production of nitric acid. Both these projects are attended with technical difficulties and no important results can yet be announced.

Investigations on city wastes have been continued and an apparatus and processes for rendering garbage and other similar wastes have been devised, which it is believed will prove superior to those now in use for this purpose. A full report on city wastes is now in course of preparation. Some work also has been done in determining the availability of various nitrogenous fertilizer materials when applied to the soil, and this work is being continued.

A study of the subject of ammonia from the by-product coke ovens has been made and published.

Phosphates.—At the Arlington laboratory an electric furnace has been installed and work on the volatilization of phosphoric acid from phosphate rock has been begun. A Cottrell precipitator was installed and while minor adjustments remain to be made, the essential fact that phosphoric acid may be economically collected in this way has been demonstrated.

A process for producing sulphuric acid has been perfected and patented which gives promise of being much more satisfactory than the process now in use.

General.—The problem of producing concentrated fertilizers containing all three fertilizer ingredients or

any two of them has been attacked from several directions; and methods have been worked out in the laboratory for producing ammonium-potassium-phosphate, potassium-phosphate, and ammonium-phosphate by processes which are new and very promising. Patents on all these processes, for the benefit of the people of the United States, have either been secured or have been applied for.

FORMALIN TREATMENT FOR POTATO.

To the Editor: In your book, "Second Thousand Questions," you say to use formalin for soaking seed potatoes to prevent scabbing in very rich ground. How do you use the formalin and where can I get it?—M. McD., Schad.

Get it at your drug store. Soak the whole potatoes for two hours in a solution of 30 gallons water per pint of formalin. Then cut and plant; or dry the tubers if they are to be kept long before planting. It is not poison, and will prevent scab

if the soil has not been infected within two or three years and if the potatoes are not re-infected by using old boxes or sacks, etc. Scabby potatoes fed raw to livestock will infect the soil through the manure.

POWER

Plow deep if you want to increase the fertility of your soil. Subsoil, if you want to break up the hardpan. Build gopher ditches if you want to drain. But you must have POWER—unusual power—for this heavy work.

You can't do such work with horses. You can't do it satisfactorily with other tractors. With the Caterpillar you CAN do it. The Caterpillar has the POWER for heavy work, the dependability that makes the work run smoothly, saves delays, at a minimum cost for operating and upkeep.

Holt construction explains why the Caterpillar wins out in competition—explains why the Caterpillar saves money for the farmer by doing more work at less cost—explains Caterpillar endurance—explains why the Caterpillar

was awarded the Grand Prize at both California expositions.

Catalog 343 tells you the things you want to know about tractors and about the Caterpillar in particular. It tells how the Caterpillar tracks prevent soil-packing, prevent waste of power from slippage. It tells about the famous Holt engine, the simple, easily understood and cared-for construction throughout—in fact the things that have made the Caterpillar the leading tractor in the United States today. Write today for Catalog O 343.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

LAND CLEARING METHODS.

[By Thos. Cunningham, Farm Manager for Western Fuel Co.]

There is on each acre of land a given quantity of wood to extract from the ground and burn. There is also a given quantity of soil to handle in grading and leveling the ground to make it suitable for farm implements to do their work on. All this work requires power to accomplish, whether it be machine power, horse power, manual labor or explosive powders. We cannot get away from these facts.

Methods of Stumping.—Stumping may be divided into five distinct methods: (1) By burning in the ground; (2) destroying by chemicals; (3) digging out by manual labor; (4) by blasting and then burning; (5) by pulling the stumps and then burning.

Burning in the ground has been advocated and experimented with in several ways, the principal ones being "the charpit method," the "forced draft method," and the "air-tight dome method." The charpit method requires much preparation in the way of gathering sufficient small wood to give the fire a proper start and also in banking with dirt. Again, not all soils are suitable for use in banking with dirt. There must be sufficient clay in the soil to allow it to bake, otherwise it will fall in and smother the fire. Also, it is only in the very dry

considered as a practical proposition.

Pulling and Blasting Combined.

—In an experience gained by clearing some four hundred acres of land I have come to the conclusion that a combination of pulling and blasting is the only practical way to clear land. That is to say pull out the smaller stumps whole. Then blast the larger stumps and pull out the remaining portions, if any, and burn.

powder manufacturers.

Stump Pullers.—Gasoline and steam donkey outfits have their use in sections where labor is not easily procurable, but the cost of the outfit is heavy. Their bulk and weight makes their transportation from one point to another extremely costly. The operating gangs of such outfits are high-priced men.

The cost of upkeep in the way of cables, blocks, etc., is high. When the power is suddenly applied to a heavy inert mass, such as a stump, the sudden jerk places a tremendous strain on ropes, blocks, etc., causing many breakages and delays. Delays with a high-priced gang mean additional cost. Theoretically, there

12 feet up the tree. I took hold of the lever and pulled the tree down myself in eight minutes. I bought the machine on the spot and have pulled the stumps from 30 acres of land with it since, the machine costing nothing for repairs.

While pulling a stump I keep a man with a mattock knocking the dirt from the roots as the stump is raised and allowing it to fall back into the hole made by lifting of the stump. By doing this the ground is left nearly level and requires very little grading afterwards. The slow traveling movement of the pulling cable allows time for the roots to worm themselves clear of the soil, and thus make a clean extraction.

and resinous stumps that the fire will follow the roots below plow depth. I have seen demonstrators of the forced draft on green fir stumps give up in disgust.

The air-tight dome method is similar to the charpit method, only that instead of banking with dirt an air-tight dome made of sheet metal is placed over the stump.

Destroying by chemicals has been advocated. A hole is bored in the stump and equal portions of nitric acid and sulphuric acid are poured in. Then the opening is tightly plugged. It has been claimed that this method will destroy a stump in the course of two or three months, but I understand the U. S. Department of Agriculture has investigated this method and met little success. Digging out by manual labor is too slow and costly to be even

Blasting.—In preparing to blast a stump, dig well under the body of the stump, taking care to have the powder placed under the point of greatest resistance. In case the center of the stump is weak leaving a foot to eighteen inches of soil between the powder and the body of the stump distributes the energy created by the explosion of the powder more evenly over the root system and tends to prevent breaking of roots in the ground. Another very helpful plan in blasting is to wind a piece of old wire cable round the top of the stump before blasting. This holds the top of the stump together and gives a cleaner upward lift. In blasting stumps do not use high percentage quick-acting dynamite. Use stumping powder, or lower percentage dynamite which is manufactured by all responsible

is no necessity for a sudden jerk with these engines, as they are supplied with a friction gear, but did you ever watch the sudden slam and then the quiver of the suddenly tightened rope on a donkey engine?

Horsepower pullers are not subjected to such strains when the team is handled carefully; they produce tremendous power, and the team is handy to move the outfits.

One hand-power stumping machine we have in mind weighs about 171 pounds and can be wheeled around like a barn truck. It is built on the double-action pawl and ratchet principle. I heard about this machine last fall and traveled twenty miles to see it, very skeptical as to the stories I had heard about it. The agent attached it to a standing tree (fir) about 36 inches in diameter, placing the cable about

THE LATEST VINEYARD TRACTOR.

[Written for Pacific Rural Press.]

The latest in tractors, a machine that will not be on the market for twelve months, is the 1700-pound wheel type made by R. Hamilton, an orchardist of Sonoma county.

A high-speed motor is mounted between two wheels about 2 1/2 feet in diameter and 3 feet apart. All gearings are in oil. On the rims of the wheels, sharpened U bolts with legs eight inches long are fastened for grousers. These are kept from plugging up with mud by a fixed arm which cleans out mud, if any collects. Bands may be quickly bolted over the grousers for road work, but its purpose is for 5- and 10-acre vineyards and its speed only 1/2 to 2 1/2 miles per hour.

On the back of its frame is a quarter-circle cog in which the steering gear works. The steering gear and the driver rest principally on two smaller wheels and "the tail wags the dog." The plow is raised and lowered by the engine operator from his seat while running. There are four axes for the tractor and its plow to turn on, thus keeping a more even traction on the turns, and enabling the machine to turn in a very small circle. The wheel base is just about four feet.

Mr. Hamilton showed his machine in public for the first time at the State Fruit Growers' Convention, Napa. It pulled two 10-inch moldboards easily in the orchard demonstration and did not get stuck in the artificial mudhole made in the field to show that it "did not need web feet." He claimed it would pull two ten-inch plows up a 10 per cent grade in dirt such as ordinary fruit growers consider in condition for plowing. He had worked this machine satisfactorily for six weeks.

GASOLINE MIXED WITH KEROSENE.

the cap was not tightly screwed down. How can I determine the condition of the oil?—M. G., Lincoln.

By the gravity and flashpoint tests, one of which requires a special instrument which you might borrow from a garage, and the other of which requires an accurate thermometer and lots of care. Heating the oil to the point where its gasoline would be evaporated, stirring it, and not exposing it to the flame but doing the work well away from any buildings, would make the kerosene safe to use, but we would let John D. do it. To use this oil as you now have it, on a tractor, would require a special carbureter which would have to be specially adjusted.

A CONVENIENT FEED TRUCK.

[Written for Pacific Rural Press.]

Some of the most practical and convenient equipment we have ever seen on ranches was home designed and home made. Such is the case with the hog-feeding and mixing truck on the S. G. Owens ranch in Madera county.

This truck closely resembles the old-fashioned push cart, having two iron wheels from which are extended on either side a one-inch pipe. This pipe forms the underneath support of the truck and extends out from the axle, being bent at the ends so as to form a handle, behind the truck bed.

On top of this framework has been fastened a galvanized iron tank, 18 inches high, four feet long, 20 inches wide across the bottom and 26 inches across the top, with the top edges bent over to give it strength.

This holds three sacks of feed and is water-tight so that mixing can be done any place as well as feeding, it being narrow enough that it can be wheeled down between the farrowing pens, and large enough that all of the grain ration for each feeding can be mixed and loaded at once.

BRIDGE RAILINGS.

To the Editor: Is there no law to compel railings on bridges which are 4 to 8 feet above ground?—J. D. P., Laton.

State Highway Engineer A. B. Fletcher writes: "We know of no statute requiring the construction of railings on bridges. There may be county or local ordinances.

TRACTOR POINTERS.

Be careful not to get too much priming in the cylinders.

Too much oil collects dirt, but too little oil makes big repair bills.

Spend as much time per week overhauling your tractor as you used to spend per day harnessing horses.

Gas savers give manufacturers lots of work reboring cylinders and making other repairs; but when they do it they plug the hole drilled for the gas saver and solder it. The extra air admitted through the gas saver overbalances the carburetor adjustment and makes a lean mixture which heats up the cylinder and gives you "the quickest boiling motor." If air is leaking in and the motor overheating, it must be quickly remedied.

Gaskets at the intake to the cylinder must be absolutely air-tight or your explosive mixture will be di-

Layne & Bowler PUMP

A Dependable Water Supply

You cannot afford to gamble an entire season's crop against an uncertain pump. You must be insured against water shortage and keep things growing, by using a dependable pumping system. The Layne & Bowler Pump has demonstrated under all conditions its ability to produce more water economically than other systems. "If there is any water in the ground, the Layne & Bowler Pump is sure to get it." Built to meet all conditions—to overcome every pumping difficulty; constructed to produce more water at less expense.

Write for Catalog No. 25. It gives complete information.

luted with uncontrollable air. Test them by putting oil over them and, then turning the motor over.

If there is a whistling noise at

the butterfly valve in the intake it indicates a leak which must be stopped. All air should go in through the carburetor.

General Agricultural Review.

FIELD NOTES.

On January 1, 1917, there will be a Tournament of Roses in Pasadena.

Turlock shipped 1,340 carloads of cantaloupes during the past season.

The barley supply this season in Calif. is reported to be much below that of last.

Prices of celery are the highest ever known in that industry, ranging about 40 cents per dozen.

Rice culture has extended into the southern section of the San Joaquin valley.

A new packing and shipping house will be established in Placerville by the Pioneer Fruit Company.

Frank Vegar of Lordsburg is exhibiting a pumpkin vine in the Chamber of Commerce at Pomona that is 90 feet long.

It is said that eight large plants have been erected in Southern California for the extracting of potash from kelp.

The Department of Commerce, Bureau of Census, reports that 14,707 bales of cotton had been ginned prior to November 14, 1916.

Italian rice is said to be best adapted to San Joaquin conditions according to Farm Adviser Frank F. Lyons. The Japanese variety does not thrive well.

Oakdale farmers have started plowing again, though some of them are worrying about the extra fifty cents an acre the seed is costing. Seed barley is selling at \$2.40.

The Spreckels' Sugar Company at Salinas had a record season. It was a fortunate one for the beet farmer as the rains did not interfere with the harvesting of the beets.

One hundred and ninety thousand sacks of early rice were produced on the 5,000 acres of the Dodge Rice Company's ranch, between Chico and Butte City, this season.

Asparagus experts have found that there is a large area of low land, sub-irrigated, in the Turlock District, which is suited to the production of asparagus.

George P. Weldon, Chief Deputy

State Horticultural Commissioner, is at work on a pure-seed measure which will be submitted to the next Legislature for enactment into law.

It is announced from China that the American Beet Sugar Company there has advanced the wages of its laborers 2½¢ per hour, making an increase of \$1.50@1.80 per week.

The San Fernando Valley bean crop this year is said to have been the largest ever raised and it was sold at good paying prices. It is put at 2,580,000 pounds.

The marketing of Milo Maize from the Imperial Valley has started in earnest. No less than thirty-seven cars were shipped from Brawley last week.

Porterville appeared in the State markets for the first time this year as a commercial producer of beans. First shipments of 2,000 sacks of the tepary variety, raised west of here, were made to San Francisco.

It is said that the largest sugar beet crop ever raised in the San Fernando valley has just been harvested—163,469,715 tons. Plowing has already been commenced for next year's crop.

Chico farmers are agitating for an appropriation by the State with which to conduct an investigation of the yellow star thistle, which is thought to be too large a problem for the individual farmers to solve.

Eighty-six sacks of pink beans, bringing him exactly \$571.76, or \$95 an acre, was the harvest reaped by Joe Glines, an Oakdale rancher, from six acres on the old T. F. Snedigar place in Langworth, this season.

Potatoes have been a source of wealth in Humboldt county this year. C. W. Travis, who was the first superintendent of the old Visalia-Tulare railroad, says one neighbor of his sold \$1,600 worth of potatoes from eight acres and kept seven tons for seed.

Farmers of the Pixley district, encouraged by the present war-time price of barley, are planting this grain heavily. The Farm Lands Investment Co. are sowing eleven hundred acres, Hazleton & Manley five hundred acres and A. D. Cooksey four hundred acres.

On the first of December there were in the warehouses at Stockton, San Francisco and Porta Costa, 58,577 tons of barley, as against 85,331 tons on the same date last year. Stocks of wheat also show a shortage this year, there being something over 14,000 tons on hand, as against 23,000 tons on the same date a year ago.

Officials of the Farm Loan Board at Washington announced a week ago that more than 50,000 farmers have applied for mortgage loans aggregating approximately \$150,000,000, or more than seventeen times the amount of money which will be immediately available for loans upon the organization of the twelve farm loan banks. Most of the applications have come from the South and West.

An offer from the Sterns-Roger Manufacturing Company of Denver, which has established several sugar mills in Colorado and Utah, to erect a beet sugar factory in Riverside, providing 10,000 acres of beets can be signed up under lease of several years to insure it an adequate supply of raw material, has stimulated widespread interest in the project at Riverside.

It was stated at the recent meeting of hop growers in Sacramento that New York hops have been selling for a price of 55 cents per pound while the California product is being sold to dealers at 10½ cents and 11 cents. The reason advanced for this condition was that the dealers, during the present year, want to encourage the New York growers with large prices so that they may con-

tinue in business, thereby holding them in competition with California growers.

DECIDUOUS FRUITS.

The prospects for a season of heavy tree planting are not good around Stockton.

The prune men of Healdsburg are falling into line in good shape in support of the Prune and Apricot Growers, Incorporated.

Spraying and pruning in the orchards are now in progress, and the outlook for the next season's fruit crop is good.

The work of organizing the prune and apricot growers is progressing satisfactorily in the face of opposition offered by the packers.

There has been shipped from Vacaville this year 100 tons of dried apricots, 225 tons of dried peaches and 3,000 tons of prunes. Good prices were obtained.

Farm Adviser Niles P. Searles has completed arrangements for a series of field and pruning demonstrations in Yolo county, beginning Monday, December 18, and lasting through until Friday, 22.

The Government Station at Walnut Creek, which has done good work in the past in thrips investigation, has been discontinued. A. L. Nougaret of the station will go to Fresno to make further investigation of the mealy bug.

Absence of pear blight is pointed out by C. W. Beers, County Horticultural Commissioner, as a reason for the encouragement of pear-growing in the vicinity of Santa Barbara. Mr. Beers says that the present high price of pears warrants the planting of pear trees in any district where no blight is found.

CITRUS, NUTS, SEMI-TROPICAL.

The Olive Products Company of Oroville began crushing olives in its new plant last Monday.

Mayor Frank Clinton of Ontario, a well-known orange grower, died last week, aged 61 years.

Two cars of Lindsay oranges were turned back from Barstow because they did not come up to the 8-to-1 test.

Shipments of oranges from Porterville, despite the shortage of cars, had reached 1046 cars up to December 3.

Riverside went through the coldest night of the season with no damage whatever to citrus fruits; though the thermometer touched 27 degrees for a brief period in some sections.

Orland oranges are among the finest in northern California, both in color and flavor, according to one of the expert packers who are handling the local crop.

The warehouse of the Santa Barbara Walnut Growers' Association in Carpinteria has handled approximately one hundred and fifty tons of walnuts this season.

Orange growers on the Orland project have organized the Orland Citrus Association which will work with the California Citrus Exchange, through which organization the output of this district is marketed.

Oregon Stock Hill selection as follows:

Burbank, High-Top Burbank, White Star, Multnomah, Snow.

Several hundred acres of the 3,500 acreage of the Italian Vineyard and Wine Company, at Wineville, and on the eastern outskirts of Cucamonga, will be planted during the next few months to walnuts.

Almond nursery stock is in such demand that the price of the trees has jumped several cents during the past week. They are being set out in large numbers in Butte and Colusa counties.

Frost is said to have caused some damage to oranges in the section around Porterville and Lindsay. The damage in most cases was in orchards on the lowlands, the fruit in the higher section of the foothills escaping.

The recent rains were general throughout Southern California and are said to have done much good. The citrus fruit trees were given new life and the oranges and lemons washed of dust and the late oranges and lemons rounded out by the increased moisture.

State Horticultural Commissioner George H. Hecke has issued a formal order exempting Arizona from the quarantine established by California on the citrus canker, Arizona having adopted rigorous preventive measures to rid the State of the pest.

Word comes from Oxnard that the first shipment of lemons from Pleasant Valley, near Camarillo, was made last week by W. P. Daily. Mr. Daily has had lemon trees in his yard for over twelve years, which have never been hurt by frost. The big freeze of 1913 did not touch the trees, and this first caused the belief that in Pleasant Valley was a new frostless belt for lemons.

The first carload of Sunkist (8-to-1) Navel oranges sent East this season were shipped on November 9 from Thermalito, one of the most northerly orange-growing sections in the State. This carload and the three others which followed from Thermalito on Nov. 12, and Nov. 14, were all sold at \$4.35 for the "Gold of Ophir" brand (fancy) and \$4.00 for the "Table Mountain" brand (choice)—three of them at Omaha and one at Albert Lea, Minn.

The 7th national orange show, to be held in San Bernardino Feb. 20-28, will conduct an extensive automobile and industrial display. Additions to the industrial features of the orange show have been brought about by requests from citrus fruit sections all over the State. The citrus fruit section will contain nothing but the millions of oranges and lemons in competition for the world's prizes. California this season will ship close to \$50,000,000 in citrus fruits, it is estimated.

GRAPES.

Prof. F. T. Bioletti will visit Hanford December 20 to instruct growers in methods of pruning. He will give practical demonstration of vine pruning.

J. W. Jeffreys, the viticultural expert, has been sent by the Viticultural Commission to Dinuba. Very little of the new disease has as yet appeared among the vineyards of that section, but inasmuch as the new disease has appeared in vineyards of the valley, a careful investigation will be made by Mr. Jeffreys there.

MISCELLANEOUS.

The car shortage is being relieved and crops are moving rapidly to market.

PASADENA, CALIFORNIA

Farmers of San Joaquin county have already made application for \$215,000 from the Federal farm loan banks, it is estimated.

The Winters Canning Company of Suisun packed over 60,000 cases of fruit and about 15,000 cases of tomatoes, all of which is under contract for sale for good prices.

The balance of \$750,000 due on the famous Fair ranch, near Knights Landing, and several thousand acres of land adjoining, which was sold in 1913, has just been paid.

The cost of making sales of government timber on the National Forests in California was cut from 39 cents to 31 cents a thousand feet recently.

Over 5,000 letters of inquiry have been received by the U. C. Horticulture-Pomology division and as many answers returned to the questions sent, says the Univ. Farm Agrícola.

The State budget board, consisting of three members of the Board of Control and State Controller John S. Chambers, has tentatively agreed to include in the budget to be submitted to the Legislature bills calling for \$300,000 to erect a fireproof main pavilion for the State Fair and \$62,500 for the purchase of additional grounds for the State Agricultural Park, in Sacramento.

Ventura county thinks the office of county farm adviser does not produce results commensurate with an annual maintenance outlay of \$2,000, according to the county supervisors, who have abolished the position, effective January 1. Ventura is the first county in the State to drop this new feature of government. The work of the bureau will hereafter be handled by Horticultural Commissioner Brock.

That the landowners of the Orland Federal Project may have an equal opportunity to take advantage of the rural credits act with the rest of the farmers of the country, a petition is being circulated by the local Farm Loan Association asking Secretary Lane, the Federal Farm Loan Board and Congressman Kent to use their influence in amending the act. The law was passed so that Federal projects are barred from loans inasmuch as the project was built with Federal bonds.

ALPAUGH IRRIGATION PROGRESS.

The farmers of Alpaugh a little over a year ago united in forming what is now known as the Alpaugh Irrigation District for the purpose of bringing water from Smyrna, a distance of ten miles, to be used for irrigation purposes on their respective farms. At Smyrna they have eight electric pumping plants, of which five are ready for business and the other three should be very soon.

The main canal banks have been reinforced and the 70,000-gallon tank completed. Four-fifths of the pipe is laid and pumps and engines are being installed at their domestic station. The entire system is scheduled for completion by Dec. 15. At the last monthly meeting which was held Dec. 4, the District farmers seemed enthusiastic over their enterprise.

TULARE COUNTY CITRUS FAIR.

The Tulare County Citrus Fair opened at Visalia on Wednesday of last week. President Wilson at the White House pressed a button which switched on the lights in the big tent that holds the exhibits from the various sections of the county. These exhibits, made up not only of citrus fruits, but deciduous fruits and farm products in general, were very artistic and of real educational value as well.

The livestock show, though an afterthought and hurriedly gotten up, was a credit to the breeders of the county and especially to the promoters, Arlington Smith and John P. Walker. A full description of this feature, together with awards, will appear in next week's issue. An excellent showing of poultry was another interesting feature.

R. D. Robertson of the U. S. Dept. of Agriculture, investigating the rice industry in this State, reports the acreage devoted to that cereal in 1916 was as follows: In Sacramento valley 64,000 acres, and in the San Joaquin 3,200 acres. The prospects are for a considerably larger

acreage in the Sacramento section next season, possibly 75,000 acres will be seeded. The marketing association planned to handle this season's crop did not materialize, owing to the fact that Orientals having leased land refused to sell their rice through the exchange.

Livestock Facts and Fancies---XII.

[By the Editor.]

The sweeping victory of University of California Farm exhibits in their classes at the Chicago fat stock show was set forth by this journal in its last issue. This fact is very sig-

nificant in many ways and we expect to draw many lessons from it, from time to time, as they seem pertinent. Just now it occurs to us to write a little about its general significance as manifesting, the triumph of the educational effort which has been put forth in this country, during the last two or three decades, for the development and advancement of the livestock industry. We undertake no analyses of causes, agencies, methods and effects. Such effort belongs to some profound specialist. It is for us merely to glance at the fact through the eyes of a common observer.

We remember the tumult which followed the first victory of a student-fed steer at a fat stock show in competition with farm-fed entries. If our memory is accurate it was the students of the Iowa Agricultural College who put over this outrage on the practical men and the latter surely did raise much of a rumpus. "It is unfair," said they, "for a lot of kids coached by a lot of visionary professors to pick a 'feeder' and feed stuff which the State paid for, to invade the domain of practical men who had to buy feed and pay taxes. What was the college for, anyway? Was it to help the farmers or beat them out of their boots?"—and much more like that. Of course the issue raised against academic freedom in selecting ways and means of instruction was really laughable, but it blinded a lot of people for a time. Then, gradually a few things dawned upon the intelligence of the practical men of the Middle West. It occurred to them that they had tried at first to impeach college instruction in agriculture as "theoretical" and "scientific" and had threatened to choke the public funds out of it because it was not "practical." They remembered that the educators had replied: "If you will give us money

stormed the legislatures to get the money to show farmers how they could make more money. Finally they had the vision to see that they

were now proclaiming unfair the very thing that they had demanded from the college, viz.: a demonstration that instruction could come through with practical results. The first student-fed prize-winning steer was the concrete evidence that the college not only knew how, theoretically, but could do things, in knowledge and handling of animals, which could beat the knowledge and practice of the men who were doing the business the best they knew how at that date. They saw that if the science of the college could not beat them, it would not be worth the money they had paid to get it; and they realized also that the only way such science could demonstrate its power was to let it get into the ring with them and knock them out. And, as the record of creation says: "It was so."

The first student victory in selection and nutrition of feeders, and the last one by the University Farm (which is said to be the broadest victory of its kind ever attained) are the ripe fruit of college effort in research and instruction in the

principles and practices of animal industry, but it is not the only fruit which has been borne upon this tree of special knowledge. The effort to which it belongs has created a splendid American literature of domestic animals and their profitable breeding, feeding and care. It has through books, bulletins and farm papers, made the reasons and methods of better animal industries familiar to all reading farmers and has modified and improved all their operations with livestock. It has illuminated dark places and made crooked ways straight for the advancement of livestock production which superior profits invite and which increasing consumption demands. It really constitutes a condition of preparedness which will enable American agriculture to embrace its opportunity and do its duty with farm animals and their products. We doubt if this qualification of the American farmer could have advanced so fast and so far, in fact we doubt if his attitude toward such advancement would have been so eager and masterful as it is today, if the early students had not led their proud product into the show ring and challenged the attention of the public by their unique victory.

In this writer the achievement of the University Farm students awakens many memories. We have spoken of the early opposition of practical men to placing University products to commercial test as though it were peculiar to the Middle West, but it

instruction in milk handling with text books and laboratory outfit alone, but must have cows, and so bought a few and started a small dairy in the Berkeley hills. When it had cows properly tested, fed and massaged it got a lot of milk which was certified, pasteurized or whatnot and offered for sale on its own delivery route at a price considerably higher than other local dairies charged so that no complaint for underselling could be made. An Oakland lawyer, scenting fees from a scrap, charged the local milk-sellers \$20 per, for a co-operative effort to enjoin the University from selling, and the case came into Court. The University contended that the proper way to handle and sell milk was an important part of its dairy instruction—was, in fact, the only way to determine that its instruction was complete and practical. The judge held that the University had an incontestible right to carry on and carry out its courses of instruction as it desired and chucked the lawyer and his case out of court. A little later, when the University Farm, provided by the legislature of 1905, was equipped with a commercial creamery, in order that dairy instruction might be complete, there was objection raised by adjacent creameries that the State ought not to compete with them in buying milk and selling products. This objection did not reach to the court house because an argument was made that the University Farm could not buy milk to play with, but must use it on a commercial basis to make its instruction complete. This satisfied the objectors and dairy producers generally. They had previously contended that the dairy instruction was not practical, and they soon recognized the fact that they must take the risk of making it practical and withdrew their objections to the University running a real creamery, as it has done ever since that time. Then the question of showing the University Farm stock at State fairs arose, and

California Favorite, Grand Champion Fat Steer International Livestock Exposition, Chicago, 1916. Sired by the Hereford Prince Lad 11th and out of Glenbrook's Marvel, a Shorthorn. Dropped October 15, 1915. Weight over 1400 pounds. Won again 223 entries from U. S. and Canada. Sold for \$1980, or \$1.75 per pound, the highest price ever paid for a prize steer. Was Grand Champion California State Fair, 1916. Bred and raised by University of California.

Fourteen prizes, including a grand prize, were awarded to sheep from the Bishop ranch of San Ramon, at the International Livestock Show, of Chicago. The grand prize was awarded to five yearling rams competing with entries from Great Britain, Australia, South America, Canada, and nearly every State in the Union.

has its history in California also. More than a decade ago the College of Agriculture at Berkeley decided that it could not give practical in-

"University of California Jock," Reserve Grand Champion Fat Steer, International Livestock Exposition, 1916. Purebred Aberdeen Angus, two years old. Weight, 1850. Was P. P. I. E. Grand Champion. Bred and Raised by University of California.

they were shown at first as "for exhibition only." But this was soon seen to be child's play, for there was no test as to actual, comparative character of the exhibits and the State Board of Agriculture ordered them into the regular classes and declared them entitled to all the money they could win from the judges—"and it was so."

And so we came to have in California "academic freedom" in agriculture, a little later but in the same

way as they have it in the Middle West. And so we came also to the brave and reasonable conclusion, on the part of private breeders, that the "perfessers" and the "kids" of the various farm schools shall have perfect right to carry their jobs to their logical conclusions, even if they should wax the ears, horns and tails off from all the privately owned stock they come up against. And that seems to be about what the University Farm stock did last week in Chicago.

Shorthorns Invade Race-horse Home.

[Written for Pacific Rural Press.]

Exit the race horse; enter the Shorthorn cow and Duroc hog. Such is the brief history of the Ormondale company's 1400-acre ranch in the heart of the millionaire colony a few miles west of Stanford University.

In the height of the race horse's popularity Ormondale Farm was known around the globe for its superior quality of horses. Of course that is all over now; but Superintendent Jas. MacDonald believes that there are certain characteristics of the race horse that are comparable to beef cattle.

He believes, for instance, that the feeds grown on the low rolling hills, supplemented with corn silage and other irrigable crops which can be grown on the level lands of the ranch, will develop good sound bone in cattle as it did in horses. Of course there is a difference in the required size of bone but this is a matter of breeding. That was considered when the foundation herd of registered Shorthorns was founded a year ago from the herds of Frank Brown and A. D. Dunn in the Northwest and the T. B. Gibson Est. of Yolo county.

Heavy-boned, thick-meated cattle of Scotch breeding were the kind selected, the herd sire, Golden Goods Jr., a grandson of Choice Goods, weighing 2500 pounds and capable of carrying more flesh for show purposes.

To further strengthen the bone and size qualifications of their herd Mr. MacDonald believes that good care should be given the calf; for unless an animal is given a chance to develop when a youngster, it is pretty apt to be undersized later. With that idea in mind one of the old horse barns has been made into a comfortable cattle stable, having a well-drained concrete floor and mangers, and steel stanchions. Here the breeding cows are fed silage and chopped oat hay and the calves given an opportunity for rapid development on mill feeds as a supplement to their mothers' milk.

In clear weather this barn is not used, the cattle being allowed the run of the various paddocks that formerly served the same purpose for horses. Here troughs are provided for silage.

What this system accomplishes is shown by the bone and growth of the yearling calves now on the place. Almost without exception they are growthy, heavy-boned, straight calves that show a liberal response to past care.

While not so extensively interested in Duroc Jersey hogs as in cattle, it is the intention to breed and feed for bone and early maturing qualities with them also. As with the Shorthorns, the hogs were selected for bone and size as well as type and these qualities will be perpetuated by further selection and good feeding.

From a standpoint of both its present and past history the operations on this ranch are of interest, as it indicates the disposition of men with land and means to do constructive breeding of livestock, a factor which will play an important part in California's future prosperity.

LAST CUTTING OF ALFALFA FOR HORSES.

To the Editor: Several of my neighbors refuse to feed the last cutting of alfalfa to horses, claiming it will sometimes kill them.—G. M. H., Ripon.

Last cutting alfalfa has no injurious effect if dried and fed as the other cuttings, according to Dr. H. B. Wintringham of Petaluma. Mr. Hamlin, who feeds the horses at University Farm and had three years' experience with blooded horses in Nevada, says that no damage comes except scouring where the alfalfa was immature when cut, or improperly dried, due to the poor drying weather so late in the season. The scouring seems to do no particular injury. But be careful about pasturing frosted alfalfa.

REMCO Air-Dried Redwood

PIPE For Irrigation—Water Supply—Power. Sizes 2 inches to 12 feet. For pressure up to 400 feet head. Guaranteed for 100 per cent overload.

Live Stock and Dairy Notes.

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

THE DAIRY.

A. A. Jenkins of Tulare advises us that he has recently sold to E. D. Whaley, a Jersey bull sired by Gertie's Lad and out of Victor Lady Carolyn.

E. A. Noyes, a farmer and stockman of Sutter City, recently received from Omaha two thoroughbred milk cows with which to improve the general grade of his herd.

The herd of imported Guernseys acquired during the past year by B. Nixon for his Revada Farm in Napa county is growing in size, a nice lot of heifer and bull calves having been dropped during the past few months.

The directors of the Exeter Creamery have declared a dividend of eight per cent, after paying off a balance of more than \$2,000 since the first of the year. The monthly business now exceeds \$16,000.

The Northern California Milk Dealers' Association will embrace thirteen counties; namely, Amador, Butte, Colusa, El Dorado, Glenn, Placer, Sacramento, Solano, Sutter, Tehama, Yolo and Yuba. It is proposed to contract for the production of at least 30,000 of the cows.

To the long list of records already to the credit of the dairy herd of A. W. Morris & Sons of Woodland has been added a State record for production of butterfat in an official seven days' test. The new record holder is a splendid young cow, Aaggie Acme of Riverside 2nd.

This State is not buying tuberculosis cows, is the warning issued by Dr. Charles Keane, State Veterinarian, who says that self-styled agents of the State have appeared at several places and have attempted through misrepresentation to bargain with dairymen for cows condemned under the tuberculin test.

The Modesto Creamery has taken the lead in sharing profits with its patrons by announcing a reduction in interest rates on loans to ranchers from 8 to 7 per cent on all loans now outstanding and on all new loans. The creamery has now at loan \$100,000 among the ranchers, which has been used in building up dairy herds.

The cow-testing association organized by the Imperial County Farm Bureau is the largest in the world, according to the Bureau of Animal Industry of the United States Department of Agriculture. The Federal Department says the largest association in the United States of which it has record has 2,500 cows on test. The Imperial Valley Association has approximately 4,000.

Harold McAlister of the firm of McAlister & Sons informs us that he has secured a son of Winnie Korndyke Cornucopia De Kol, the cow owned by the J. S. Gibson Co. of Williams who recently broke the 300-day milk record by producing 27,079 pounds of milk and 1020 pounds of butter. Mr. McAlister states that they are breeding this young bull to their best heifers.

Alexander and Kellogg of Suisun report the recent purchase of 11 cows and a bull of the Dairy Shorthorn type from Frank Pear of New York. These cattle were the tops of a recent importation from England, five of them under six years old having milking records of 9,000 pounds or more and two four-year-olds having records of better than 7,000 pounds of milk each. The bull is a yearling with exceptionally good records on both his dam's and sire's side.

BEEF CATTLE.

Wm. Bond of Alameda Co. has secured a new herd sire from C. A. Saunders, Manila, Ia.

W. Mayo Newhall has recently purchased in the East two Shorthorn and two Hereford bulls. These

bulls will be used on his highly graded herds of Hereford and Shorthorn cows.

A. E. Noyes and Son of Sutter City have just received two three-year-old registered Hereford cows from the East to add to their foundation herd of Herefords.

Careful observation of the Nebraska cattle reported recently in the Kansas City stockyards as suffering with sore mouths has failed to reveal certain typical symptoms of foot-and-mouth disease.

D. A. Vaughn, a pioneer cattleman of the Visalia district, has received lately seven thoroughbred Hereford bulls from Iowa and Nebraska. Owing to the strong movement in the cattle business toward thoroughbreds, they are increasingly hard to get.

Recent sales of registered Shorthorns by H. L. and E. H. Murphy of Sacramento county include nine head of females to Jesse Bennett of Chico and five head of bulls to cattlemen in Modoc and Merced counties. Their last importation from the East contains a lot of good thick-meated, heavy-boned range bulls.

W. M. Dunlap has recently returned from the East with a mixed lot of 62 head of Shorthorn and Hereford cattle to fill orders for the following: W. Bemmerly of Yolo county, Stanford University, W. Mayo Newhall, Frankenhimer Bros., Stockton; Howard Tilton, Gilroy, and Cutler Bros., Visalia.

Frankenhimer Bros. of Stockton have just received a shipment of 12 registered Shorthorn cows and a Shorthorn herd sire from the East which will be added to their present herd of Shorthorns. The herd sire is of straight Scotch breeding and the cows are Scotch topped. None of the shipment is over six years old.

Chas. Hawkins, manager of the Pacheco Cattle Co., has just returned from an extended tour through the Middle West where he purchased a carload of registered Shorthorns to add to his already large herd. Included in the lot were two heifers and a bull from the Thompson herd and four heifers from the Bellows herd.

California Favorite, awarded the grand steer championship of the International Livestock Exposition at Chicago, was sold at auction Dec. 7, to a Detroit packing firm for \$1,960. The price is declared to be the highest ever paid for beef. The price per pound was \$1.75. The steer was raised by the University of California State Farm, Davis.

T. S. Glide of Davis recently purchased a yearling Shorthorn bull from C. A. Saunders, Manila, Iowa, and also last week bought at Portland a Canadian bull of straight Scotch breeding. This animal topped the sale, bringing \$1350. The bull from Saunders was sired by Cumberland Type, dam was sired by Villager and second dam by Bapton Diamond. Two fine animals to help improve his already fine breeding herd.

W. Bemmerly of Yolo has just received the yearling Hereford bull Bonnie Brae 96th from the herd of Wm. Andrews and Son of Morse, Iowa. This youngster is a half brother of the \$11,000 bull Bonnie Brae 3rd, owned by O. Harris and Son. An own sister of this bull has been shown by the Andrews in their aged herd this fall. Mr. Bemmerly also purchased a four-year-old cow from the Andrews herd, a half sister to his bull.

The winning of the sweepstakes prize last week at the International Livestock Show in Chicago by a yearling Hereford-Shorthorn steer bred and fed by the University of California carries with it an impor-

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 800 head, both sexes, all ages, reasonable prices. Some fine bred sows and gilts, and top young boars. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, B. H. Whitten, Route 5, Box 647, Los Angeles.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfield, Arlington Station, Riverside, Cal.

REGISTERED POLAND-CHINA BOARS of serviceable age. A Wonder and Chief Picture breeding. Every animal guaranteed. Price \$25. Bar N. Ranch, E. A. Noyes & Son, Props., Sutter, Cal.

tant lesson to the cattle men of this State. This steer was fed barley instead of corn in fattening and it proves that corn is not essential in making choice beef and that other grain if properly fed can be made to take its place. It also confirms something that was known before to cattle feeders of the Central West, that cross-breeds make better beefs than purebreds. This was demonstrated at the Kansas City Fat Stock Show in 1885 when a cross-bred Galloway-Shorthorn steer bred and fed by M. R. Platt carried off the sweepstakes prize in a hotly contested and good-size ring of Herefords, Shorthorns, Galloways and Aberdeen-Angus and cross-breeds.

SWINE AND SWINEMEN.

Allen Thompson of Tulare county states that he has just sold four bred Jersey gilts and a boar to Fitz Ranch and a boar to C. E. Thornton.

Allen Thompson of Tulare reports the following sales: To the Fitzwilliam Ranch, Burrell, Calif., four bred gilts and one boar; to C. E. Thornton, Visalia, one bred gilt.

A recent addition to the Berkshire herd of Homer Hewins at Calistoga is a gilt, sired by Laurel Champion. This gilt was purchased from Winona Farms, Grants Pass, Oregon.

William Bernstein of Hanford has just shipped one of his purebred Poland-China hogs to Honolulu, where it will head the herd of John T. Baker, a prominent Hawaiian hog breeder.

J. L. Dickenson, Duroc breeder of Tulare county, exhibited a registered sow Cherry Girl by name at the Visalia Fair recently, that farrowed 56 pigs and raised 44 of them between Jan. 27, 1914, and Sept. 26, 1916.

The Berkshire sow, Miss Villa, purchased by Frank Brush of Sonoma county from D. D. Warnock, during the State Fair at Sacramento, is being bred to Grand Leader second, grand champion Berkshire at the Panama-Pacific, having been shipped to Grapeville Farms at Escalon during the present month.

A. B. Humphrey, Berkshire breeder of San Joaquin county, announces that he contemplates turning off about 500 head of purebred Berkshires a year for pork in the future.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and Importers of Shropshire, Rambouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

REGISTERED IMPORTED PERCHERON Stallion for sale cheap. Hewitt & Hewitt, Dixon, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office 319 Underwood Building, 525 Market St., San Francisco.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

STOCK RANCHES AND FREE RANGE—Different counties. Write for free booklet. Joseph Clark, Sacramento.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES sired by 900-lb. boar. Ed. E. Johnson, Furlock, Cal.

FIRST RURAL PRESS PRIZE FOR BEST COWS AWARDED.

Just as we go to press we are advised by Prof. F. W. Woll of the University of California that the Pacific Rural Press monthly prize of \$25 for the best five grade cows entered in the California State Dairy Cow Competition has been awarded to the Napa State Hospital at Napa, for the month of November. This was made possible by securing an average monthly production for the five head of 1276.8 pounds of milk and 46.587 pounds butterfat. Full details as to breeding and feeding methods at this institution will appear in these columns next week.

With that end in view he is fattening a carload of choice Berkshires at the present time and is constructing a modern fattening barn.

Manager Owen Duffey of the Napa State Hospital states that buildings have recently been completed at that institution which will allow for the curing of the hams and bacons of all the hogs grown by them. As these hogs are grown entirely on garbage and refuse from the institution, they represent a direct saving of many thousands of dollars to the State annually.

W. H. Browning of Woodland has made recent sales of registered Poland China hogs to the following: six bred gilts and a boar to Dr. G. L. Stevenson of Sacramento, four sows and two boars to Peter Sax and Sons for exportation to Panama, and four bred biltis and a boar to Scott-Magner-Miller of San Francisco. Mr. Browning says that his fall litters sired by a son of Model Major are the best lot he has ever had.

Arlington Smith of Visalia has recently added to his already choice herd of registered Berkshires the sow Clementina, champion aged sow at the Alameda, Stanislaus, Fresno and Kings county fairs and second in her class at the State Fair this year. She was purchased from H. L. and E. H. Murphy of Perkins, Sacramento county. Mr. Smith also purchased a choice show gilt secured by Messrs. Murphy at the National Swine Show at Omaha.

Murphy Bros. of Perkins, Sacramento county, have recently sold a registered Berkshire service boar to Calaveras county and a sow to Yolo county. In their recent importation from the East they brought a senior yearling service boar second prize winner at the National Swine Show. This boar was bred by Iowana Farms and will be used as herd sire on the 15 outstanding brood sows which are now included in the H. L. and E. H. Murphy purebred herd.

HORSES.

The Belgian stallion owned by Ruby & Bowers, who have California headquarters at Davis, repeated his previous performance at other 1916 livestock shows by winning grand championship at the Pacific International Livestock Show at Portland last week.

Four hundred and thirty separate Percherons were entered at the International Livestock Show at Chicago, the exhibits coming from 15 different states. This is the largest number of entries from the East that the Percheron Show at the International has ever had, and indicates an awakening interest in draft horse breeding.

SHEEP.

Sheep prices made further advances in Portland when a mixed load of yearlings, lambs and ewes brought \$8.50, an advance of fully 25 cents.

Most of the older and larger sheep breeders report that they are sold out of service bucks for the season, one large breeder stating that he has but ten head left at this time.

John Zalud of Porterville and Henry Gardner of Fresno have just brought 3,000 ewes into McFarland from El Paso, Texas. Twenty-four cars were used in transporting the lot. The ewes will be kept on range at McFarland until after lambing.

While in the East last week W. S. Guilford purchased for the Butte City Ranch 75 head of purebred

Shropshire sheep. These with the over 40 head of purebred Shorthorns just secured, and the Berkshire hogs already there, places the Butte City ranch in the list of fine stock farms.

Kaupke Bros. of Woodland report a larger demand for Hampshire sheep than they are able to fill. They say the demand elsewhere is equally as heavy and that it is impossible to secure purebreds for importation at prices that most sheepmen in California are willing to pay.

Huston and Hammond of Yolo county are establishing a flock of registered Shropshire sheep on their ranch four miles north of Winters. The foundation flock was secured from the Howard Cattle Co. and Knollin and Finch, and numbers about 150 head of females at this time.

Bean growers in Yuba county are finding sheep a profitable market for their bean straw, one farmer stating that by stacking his bean straw for summer feed and using volunteer green feed for winter he is able to keep a flock of 100 head of ewes. It is becoming a common sight to see a small flock of sheep on general farms in some of the districts adjacent to Marysville.

The Nevada sheep business is looking up. W. H. Moffatt and H. E. Humphrey of the Union Land and Cattle Company of Reno and the H. Moffatt Company of San Francisco, have bought the Big Smoke ranch, sixty miles north of Reno, the reported price being over \$2,000,000. The purchase includes 50,000 sheep at \$7 a head and unborn lambs at \$5 a head.

Land that has been harvested is not safe for sheep unless great care is exercised to see that they do not eat too much of the cereal, says the Chico Enterprise. Sheep that were recently turned in on some rice land died to the number of thirty. There was too much rice handy for them. A large quantity had not been harvested because it had been blown down. The sheep ate this greedily. It is claimed that in a well-harvested field, where the stock had to forage for the rice, it is impossible for them to eat too much.

Better Crops by Cattle Breeding.

[Written for Pacific Rural Press.]

To market the products of their land in the finished stage and return fertility to the soil which many years of grain farming had taken from it, was the intention of the J. H. Harlan Company when they established a herd of registered Holstein cattle on their 480-acre ranch in Yolo county several years ago.

How well they have succeeded is demonstrated by the average increase in the grain yields, which amounts to 10 sacks an acre more now than previously and to the fact that they now market a large part of their annual crops by selling purebred Holstein cattle and milk.

The cows have, of course, been the controlling factor in the improved yields as they have furnished an immense amount of fertilizer, also they have called for alfalfa, which in itself has done much good in the soil-building process.

This may be seen by a field of 50 acres which was seeded to alfalfa, but which was plowed up four years ago. Since then it has been planted to summer crops, having been seeded last winter to barley, which was harvested in July and which yielded 34 sacks of grain to the acre. As soon as possible the land was irrigated, plowed and planted to Indian corn. After planting the corn was irrigated once, before it became too large to prohibit further cultivation; and while planting was too late to allow of perfect ripening, the field was expected to furnish plenty of

silage to fill the two 200-ton-capacity silos which are on the ranch.

Formerly this late corn would have been of little if any value, but with the herd of Holsteins on the ranch to consume it in place of green cut alfalfa which is fed during the summer seasons, it will be converted into butterfat and registered bull calves, both of which find a ready market.

But increased yields of field crops would not alone solve the problem of efficient management if it were not for the producing ability of the cattle.

In this respect the company has been fortunate in either owning or having the use of herd sires such as King Meade of Riverside, King Korndyke Pontiac and Prince Gelsche Walker, all bulls of well-known quality among Holstein breeders of the State. To further strengthen this breeding, Prince Butterboy Walker, a son of Prince Gelsche Walker and King Meade Zampa, a son of King Meade of Riverside, are being used as herd sires.

Next in importance to breeding is the official testing, on this ranch, about half of the female herd having A. R. O. records and all of them to be tested eventually. It is the practice to test all cows that freshen in the fall, winter and spring months under conditions much the same as those in use on the well-maintained dairy rather than under the forced methods of some breeding farms.

Self-Oiler for Hogs.

[Written for Pacific Rural Press.]

Crude oil will perhaps always be used more extensively than anything else in California by hog raisers for lice and fleas because of its cheapness and availability.

When used on rubbing posts or poured on the wallow it is effective; but both of these methods of application have been improved by Dr. Crawshaw of Kings county, breeder of Poland Chinas, who has a home-made rubbing post that is both unique and useful.

This is made with two pieces of well-casing and a substantially-set fence post. The smaller piece of casing is six inches in diameter and about three feet high, fitting closely over the fence post.

The larger or outside casing is eight inches in diameter; and when in place extends above the top of the inner casing about two inches. This outer casing is perforated with small holes.

When both casings are in place the inch space between them is packed solid with cotton waste, up to the top of the inside casing on top of which is set a lard bucket filled with crude oil and having perforations in the bottom that will allow the oil to drip from the bucket onto the cotton waste.

When completed, the waste is saturated with oil from the top and a bucket of oil set in position. The perforations in the outside casing allow the oil to trickle down the outside and the constant rubbing of the hogs against the casing further squeezes the oil out through the perforations. When once saturated

the slow dripping from the bucket furnishes all of the oil required and only needs refilling once in a while.

HORSE BEANS FOR COWS.

To the Editor: Does feeding green horse-bean plants to dairy cows have an injurious effect on the flavor of milk or butter?—P. H. T., Gualala.

[Answered by W. J. Hanna, Gilroy.]

My experience is that green horse-bean plants are beneficial. Several years ago I broadcasted a mixture of horsebeans and barley in my young orchard. It made good growth, and before plowing in the spring I cut and fed it. The cows cleaned it up well and increased their milk. We noticed no bad effects on the milk or cream. I have noticed that both the cows and the hogs prefer the green barely or alfalfa to the green horsebeans.

The same time I fed the horsebeans I put part of it in the silo with a filling of alfalfa. But did not find any difference when I fed it out. I believe the horse beans green would make good silage. The cured horse beans are fine grain for dairy cows. They will increase the milk flow and the quality of the cream.

I should like to know Mr. Teck's opinion after he feeds the horse beans.

Among the bull calves born during the past few months on Nevada Farm at Yountville, Napa county, are several likely show prospects for next year. Most of them also combine the blood of high record Island dams and bulls.

50c BUTTER

Makes Imperative the Use of an Improved

DE LAVAL

CREAM SEPARATOR

WITH the certainty of the highest prices ever known for butter this winter, no producer of cream can afford to run another month without a modern De Laval Cream Separator.

This is true whether you have no separator, or an inferior make of machine, or even an old model De Laval machine.

The waste of butter-fat is relatively greatest in winter, either with gravity skimming or a poor separator.

At present cream and butter prices, a new De Laval machine will almost surely save its cost within three months, and go on doing so thereafter.

There can surely be no good reason to delay the purchase another week, and if it may not be convenient to pay cash it may be purchased on such terms that the machine will easily pay for itself.

See your De Laval agent immediately, or, if you don't know him, address the nearest De Laval main office as below for any desired particulars.

STATE DAIRY COW COMPETITION.

As has been previously announced, the State Dairy Cow Competition conducted by the College of Agriculture opened November, this year. Nearly 250 entry blanks were sent out during the month in response to requests from 26 different dairy farmers. Entry blanks for 40 cows had been returned last Wednesday by 10 farmers, five of whom have never had their cows tested before. Twelve of the farmers who requested entry blanks and four of those who have entered their cows so far, are owners of grade herds, which is a very hopeful sign. No conclusion can be drawn from the figures given in regard to the total number of entries that there will be in the Competition during the coming months or by the time entries close. It is evident, however, that the opening date of the Competition (November 1), did not come right for many of the best cows owned by some of our breeders, and also that the largest increase in entries will come in the spring when the cows of most dairy farmers in the State freshen. As entries are open until May 1st, next year, these farmers will be amply able to enter their cows in the Competition, and a very large participation may be confidently expected by the time entries close.

IDENTIFYING GRADE COWS.

[Written for Pacific Rural Press.]

The identification of grade cows in a large dairy herd is a source of annoyance that is usually hard to overcome; and such was the experience on the Crescent Creamery's dairy in Los Angeles county before the present system of chain-and-brass-tag was put into use.

Previous to that, ear tags of various makes were used but were being continually lost, also they were disliked because one must be close to them to read the number.

As all cows in this herd of 265 head are kept close track of because of the monthly weighing and testing of milk, it was necessary that some scheme be devised that would insure sure and easy identification.

Finally, round brass tags were secured on which the number of each cow is stamped with a set of steel dies; that is kept at the milking stable. If the cow be a Holstein an H is placed in front of the number, if a Guernsey a G and if a Jersey a J. By this means the breed of the cow can be told at the main office in Los Angeles with ease.

This tag is then hung on a light but stout chain which hangs around the cow's neck, the tag always being in plain view both in barn and corral. Since they were put in use there has never been a case of lost identification, according to Mr. Carver, manager of the dairy.

What is probably one of the greatest Duroc Jersey boars ever imported to California from the Middle West is the senior yearling boar Uneeda Wonder, jointly owned by Haden Smith of Woodland and H. P. Slocum and Son of Willows. He is a grandson of Crimson Wonder and has a good show record in the East himself. He is the kind of an animal that thorough inspection fails to find a hole in and should have a big influence on the Duroc breed of the State.

California's Longest Milk Route.

[Written for Pacific Rural Press.]

Probably the longest milk route in the West is the one maintained by the Peacock Dairy of Kern county whose distributing system is spread over New Mexico, Arizona and California and for the most part the destination of every can shipped is a desert railroad station.

For a great many years the milk from this dairy has been sold to the Harvey Company who operate railroad eating houses along the line of the Santa Fe railroad, and it is needless to say that their requirements as to richness, purity and sweetness have at all times been stringent.

For that reason the methods employed on the dairy are of unusual interest, especially to the dairyman who finds it difficult to get his product even to customers in adjacent towns without complaint, in the summer months, of sour milk.

Richness.—Supplying a particular trade as they do, it is necessary to have a high testing milk and for that reason purebred Jersey bulls have been in use on the ranch for a great many years. Of the 125 head practically all are highly bred grade Jerseys, three bulls being in use at all times.

As a result of this continuous breeding the average herd test is 4.2 per cent all of the time and sometimes runs higher. The milk flow is also heavy, due to the fact that for years it has been the practice to select large, vigorous herd sires who have transmitted, in the majority of cases, both size of body and quantity of milk. With 40 heifers in the herd of 145 that were being milked in August, the average daily milk flow per cow was 20 pounds, thus making an average herd production of a pound of butter a day.

Sanitation.—Cleanliness is an important consideration here, for dirty milk could never be shipped such long distances with any degree of success.

The milking stable is built along sanitary, but economical, lines, having a well-drained concrete floor and good rain-proof roof. Except for low side walls made of common lumber there is no other attempt at enclosure. In fact the chief consideration was to have plenty of air and light and this is amply provided by the open sides.

A brine cooler for the milk to run over as soon as drawn from the cow and plenty of steam and hot water provided by an oil-fired boiler, constitute the main points in the milk room, for thorough cooling and perfect sterilization are essential factors in long-distance shipments of milk.

Shipping.—The matter of transporting the milk from farm to eating house deserves special emphasis in this firm's operations, for it is the one point on which the long route's success is founded.

The brine cooling is the first step in the shipping process. Then it is aerated and the animal heat taken out. From the cooler it runs into milk cans of various sizes, according to the size of the order to be filled. These cans are then placed in a re-

frigerator room where they are held till delivery to the railroad is made.

It is at this point in the shipping operation that the owners of this dairy have used their ingenuity profitably. Iced bottle shipping would at first seem the only feasible way of marketing milk under their conditions, but instead can shipping is the rule.

This is accomplished by equipping the can with what is known as an ice filler. These fillers hold about two gallons of cracked ice and extend from the top of the can to within about five or six inches of the bottom, at which point they taper into a sharp point.

In constructing them, the inner top of the can top is cut out, and the filler soldered to the inside surface of the can top sleeve, thus making them a part of the can top proper and removable only by the removal of the can top. No covering is used for this filler, which simplifies re-icing as the need arises.

As the cans are taken from the refrigerator cracked ice is poured into these fillers and the cans are again re-iced at the railroad station before shipment by express. For extremely long shipments the cans are re-iced at various points along the line, but always enough ice is contained in the filler to insure the milk being cool when it reaches its destination.

The amount of ice required by this method is not nearly so great as it would be if bottle shipments were made, and the expense of bottling and breakage is entirely overcome.

Naturally the quality of the milk and the manner of handling and shipping it necessitates the securing of a good price per gallon and this is received. In fact the price has been so satisfactory to all concerned that all of the Santa Fe eating houses on the western division have been using Peacock Dairy milk for something like ten years.

HOGS HALF PROFIT.

[Written for Pacific Rural Press.]

Although hogs are a profitable by-product on any large diversified ranch, one should not expect them to be all profit, according to D. B. Harris, manager of the Sierra Vista Vineyard in Madera county, where 200 to 300 market hogs are turned off each year.

On this ranch the hogs do a variety of cleaning-up jobs, being turned onto the grain stubble to clean up the waste grain after harvesting and also doing a good job of cleaning up the cull grapes left on the 1,000 acres of wine grapes after picking by hand is finished.

In both instances the pork put on is mostly profit; but at other times they have to be run on alfalfa pasture and fed grain in self-feeders and that lessens the profits about 50 per cent on the whole, according to Mr. Harris. He figures on making about 50 cents profit on every dollar's worth of pork sold.

The Self-Feeders on this ranch are constructed differently than most in that they have a wedge-shaped piece of lumber that fits into the space through which the grain

runs into the outside trough. This wedge is simply laid lengthwise of the feeder, and prevents the grain falling down unless it is pushed up by the hog. In this manner the hogs work down as much grain as they want by rooting with their nose against the wedge, but do not waste any, as a surplus is seldom left in the outside trough.

WHITEWASH IS HARMLESS.

To the Editor: Some of my neighbors say that to whitewash the trunks of peach trees will liven the bark and make the trees healthier; while others say it will close the pores and injure them.—E. C. K., Fresno.

Whitewash protects the trunks from deadening by sunburn and enables them to "liven" their own bark and make themselves healthier. It of course fills what pores there may be, but this has no effect on the tree; for orchard trees breathe through the leaf pores, and not to any extent through the bark, even of the green twigs.

California

Marketed His Own Hogs.

[Written for Pacific Rural Press.]

That the farmers of California pay an exorbitant price for the marketing of their hogs is well known by everybody who has had experience in raising market hogs.

Just what this would amount to as a whole is difficult to even guess; but from the experience of George Peters of Kern county it constitutes a much heavier toll than it should.

During the past summer, Mr. Peters had a carload of well-finished hogs, weighing on the average about 200 pounds. The local buyer offered seven and a half cents a pound, f. o. b. Bakersfield.

Noting a difference between this and the published quotations in Los Angeles, a packing concern was asked for quotations, with a resulting offer of eight and three-quarters cents per pound f. o. b. Los Angeles.

With the belief that he could save money by doing his own shipping he loaded his hogs into a 36-foot car for which the railroads charged him \$47. The shrinkage on the way to Los Angeles averaged 10 pounds per head or 900 pounds on a loaded car of 90 hogs, which was worth at eight and three-quarters cents a pound, \$78.75. Altogether the shrinkage and freight charges amounted to \$125.75.

The difference between the Bakersfield buyer's price and the Los Angeles price was one and three-quarters cents a pound or \$225 for the car. Subtracting the actual freight and shrinkage charges of \$125.75 we find that Mr. Peters received almost \$100 for his trip to market, or a little more than half a cent a pound.

In recounting this experience, however, the fact should not be forgotten that these hogs were grain-fed from the time they were weaned, which accounted for the good price to a large extent.

Alfalfa, barley, tankage, and pumpkins constitute the main ration used by Mr. Peters, the barley being soaked before feeding and the alfalfa being fed in the form of pasture.

These feeds, with plenty of shade and clean running drinking water, supplied fresh from the pumping plant, combine in making the 10-month-old hog average 200 pounds,

the desirable size and quality from the packer's viewpoint.

PORTLAND SHORTHORNS AVERAGE \$411.

[Written for Pacific Rural Press.]

The Shorthorn event of the Pacific Coast for the year just ending was the annual consignment sale of Shorthorns held at the Pacific International Livestock Show at Portland last week.

The 67 head sold brought a new high average for these sales of \$411, bulls averaging \$425 and females \$398. The top price of the sale was made by T. S. Glide of Davis, Cal., when he purchased the yearling bull Count Amaranth, consigned by Frank Brown, for \$1350. W. J. Townley's bid of \$1320 for the two-year-old cow Diamond's Gladys was the top on females. Buyers were present from all over the Pacific Coast. Sales of \$400 or over follow:

Bulls.
Double Goods, calved Nov. 10, 1915, consigned by Frank Brown, George Russell, Prineville, \$575.

HOLSTEIN SALE BREAKS COAST RECORD.

[Written for Pacific Rural Press.]

That Holsteins bred by Bernhard Meyer of New Jersey and especially those sired by Spring Farm Pontiac Cornucopia are popular in the West was evidenced at the recent auction sale at Sacramento when his get topped the sale, but now comes word from Portland that the junior yearling bull Finderne Mutual Fayne Valdessa, sired by Spring Farm Pontiac Cornucopia and out of the

world's record two-year-old Finderne Mutual Fayne, sold for \$21,500 at auction last week during the Pacific International Livestock Show.

Six of the most prominent breeders in the Northwest were bidders for this startling calf, till the bids reached \$15,000, after which it settled down to C. W. Holmes of the Carnation Farm and John von Herberg, owner of a Holstein herd at Kent, Wash., the latter finally securing the calf at the above figure.

A total of 90 head were sold at the sale at only moderately good prices with the exception of the bull noted above.

NEW HOLSTEIN STATE RECORD.

Another new high seven-day record for aged cows has just been completed for California by the cow Aaggie Acme of Riverside 2nd, owned by A. W. Morris and Sons of Woodland. During the seven days she produced 35.36 pounds of butter from 627.3 pounds of milk. She is a daughter of King Meade of Riverside and out of the high record cow Aaggie Acme of Riverside. Mr. Frank Morris informs us that she is now on a 30-day test and that he expects her to break the State record in that division also. Another cow in the herd which has just made a high two-year-old record is Aralia De Kol Pontiac Meade, a daughter of the 1916 State Fair champion bull Segis De Kol Pontiac Burke.

WORLD'S CHAMPION STEERS.

There have been 15 grand champion-of-the-world steers. Ten of these have been Angus, 2 Herefords, 1 Shorthorn (calf in 1907) and two crossbreds (A Hereford-Angus cross in 1903 and the Shorthorn-Hereford cross of this year). Ages have varied from 13 months to over three years and weights from 975 to 1870 pounds. Thirteen of the 15 grand champions have been sold on the block after the show. Prices ranged from \$1.50 per pound to 18 cents. (This year the price was \$1.75 per pound.) Eight grand champions were purebreds, two crossbreds from purebred sires and dams, and five grades sired by purebreds. T. C. Judkins, Jr., in University Farm Agrícola.

REDWOOD TANKS — SILOS.

Thirty-five years in this business in Stockton.—A 500-gallon tank, \$8.00. A tank 6 ft. x 2 1/2 ft., \$7.50. Other tanks equally cheap. I deal direct with the consumer, saving 10% to 25%. All sizes in stock. Clear, dry redwood direct from the mill. Write for price today.

Latest improved machinery. Doors, Windows, Frames, Mouldings.
R. F. WILSON, STOCKTON, CAL.

Here's a Real Herd Header

Dam **GOLDEN STATE BEAUTY**—her family 4 daughters and 2 sons—a 4th and last daughter ending a successful A. R. test, a bull taking first premium at the Cal. State Fair, and this fellow (by Imp. Lord Kitchener), which is for sale, age 20 mos. Another from an A. R. daughter by same sire, age 15 mos. and some classy calves of same breeding.

Is this breeding good enough? It evidently was good enough for Mr. Geo. Farmer of Hanford, a report of whose herd appeared last week in the columns of the Pacific Rural Press, page 655, under "Careful Inbreeding." The purebred bull used there was from my old cow, Clementine Mabel, and was a full brother of Golden State Beauty above referred to. Am sure the same can be done in your herd. The best time to do it is NOW. Send for description and prices, or better—see them.

Hampshire swine the best breeding, any age or sex cheap today.

San Francisco

IMPORTANT ANNOUNCEMENT

We have recently bought at the International Show in Chicago and elsewhere in the East, a carload of Shorthorn cattle, a carload of Shropshire sheep, and a number of Shetland and Welsh ponies. An International prize-winning ram is at the head of the Shropshire flock. A son of White Rock, one of the best sons of the great Whitehall Sultan, heads the Shorthorn herd. Included among the Shorthorns are a number sired by the \$10,000 Prince Imperial. And in the International show many of the championship and first prizes in Berkshire classes were won by animals closely related to individuals in our herd.

We have Shorthorns, Berkshires, Shropshires and Ponies for sale now.

WILLIAM LYNN,
Santa Ysabel Hot Springs, Paso Robles, Cal.

More Butter and Better Butter

YOUR HERD should average at least 500 lbs. of butter per year. A good Jersey herd will do even better—600 lbs. per year, and the butter will be of the finest flavor, texture, and color. There are many individuals of this breed producing 1100 lbs. They make good use of every ounce of feed, do not require fancy feeding, mature early, thrive in any climate, are steady producers, are beautiful and gentle. They pay big dividends on the highest priced land.

Our latest freebook, "About Jersey Cattle," tells all about the development of this hardy breed. Send for it—now. You'll be glad you did.

Shorthorn Breeders Organize.

[Written for Pacific Rural Press.]

With an attendance that was surprising to even the most enthusiastic supporters of the breed the Shorthorn breeders of the State held their organization meeting at San Francisco on Monday of this week and organized what is to be known as the California Shorthorn Breeders' Ass'n.

Their object as set forth in the constitution and by-laws will be to encourage and extend the influence of Shorthorn breeding and safeguard the interests of its membership by creating better trade opportunities and, as far as possible, operate to their general advantage and profit; to promote closer relations between the membership and to stimulate the greater activity among them. Also to arrange for public sales, if conditions are favorable, to which members may consign their salable stock; to provide for a careful selection of said sale entries that a creditable offering may be assured and to arrange for exhibits at local and other fairs, as may be agreed upon, and where necessary, selections of individuals be made from several herds in order that groups may represent the best of the association's herds.

The by-laws committee agreed upon an annual due of \$5.00, which amount was decided upon by the membership, but it was the opinion of many that this might reasonably be increased if circumstances demand it.

The following officers were elected for the coming year: A. W. Foster, president; Chas. Hawkins, vice-president; David J. Stollery, secretary-treasurer; J. A. Colcomb, T. S. Glide, Prof. Gordon H. True, F. Elberg, directors. The regular annual meeting was set for the second Monday in December.

Aside from the organization work there was much good discussion as to the work that may be accomplished by the association, it being the contention of all speakers that there is a vast amount of interest in Shorthorns here at this time and that California breeders must act collectively if the greatest amount of good is to result to the breed and breeders.

Much discussion was given to the auction sale idea, Mr. Elberg, manager of the Gibson Estate, who has been a contributor to the Shorthorn sale at Portland, stating that we have as good cattle here as can be found in the Northwest, but believing that attention must be called to the fact by the auction sale and livestock show method.

Jas. MacDonald of the Ormondale Co. favored the consignment sale, stating that it is exceedingly difficult to assemble foundation herds here at this time for lack of a centralized selling point. Mr. A. W. Foster, who presided at the meeting, while favorable to the sale plan, was averse to the establishment of extremely high prices, preferring to see reasonable prices and lots of new breeders. Mr. Chas. Hawkins, who has just returned from the Middle West, was positive in his statement that prices in California are too low and that a campaign of education must be promoted which

will familiarize people here with conditions as they exist here and elsewhere at this time.

The proposal of holding a livestock show in San Francisco next fall was favorably thought of by all present, but it was decided that direct action for such an undertaking should come from San Francisco commercial interests rather than from the breeders. It was agreed, however, that the association would co-operate in all ways possible toward the promotion of this show next fall and Mr. Foster gave it as his opinion that such a show would become a reality.

The practical working out of a definite program for the coming year was left in the hands of the board of directors, who will hold a meeting shortly to outline methods of procedure.

TANKAGE AND OILMEAL CHEAPEN COST OF FATTENING SWINE.

Hogs on a full feed of corn [or barley, milo, etc.,] should have tankage or linseed oil meal to balance the ration.

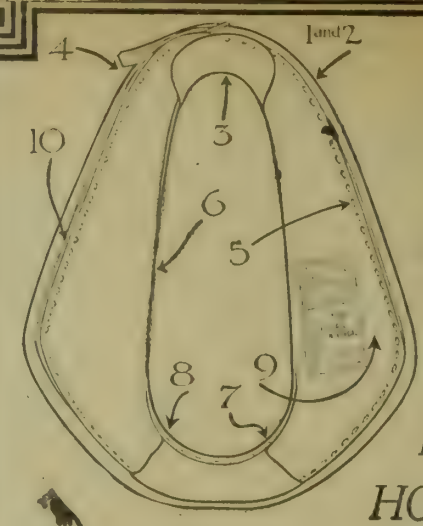

In "hogging down" corn, hogs should have access to tankage in a self-feeder. In this way they balance their own ration and save the labor of husking the corn and the feeding of tankage by hand. Even when fed by hand, hogs should have a supplement of tankage or oilmeal in order to stimulate the secretions and digestion and build framework and muscle as well as make fat. Tankage or oilmeal may be fed in a slop or dry in a trough. Either way is satisfactory. About one part of tankage to ten parts of corn will make a balanced ration, while one part of linseed oil meal to every six parts of corn will balance a ration. Young pigs and shoats need more protein than older hogs. As the hog grows older and fatter, the protein supplement may be decreased somewhat and good results secured.—Missouri College of Agriculture.

RICE FOR HOGS.

To the Editor: What is the feeding value of rice middlings and whole rice as compared with barley or milo for fattening hogs?—S. H. S., Delano.

Whole hulled rice contains slightly more digestible carbohydrates and considerably less protein than barley. Rice polish and rice bran contain more protein than whole rice, the polish being $\frac{1}{8}$ less valuable for carbohydrates, and the bran being less than $\frac{3}{4}$ as valuable as the whole rice in that class of nutrients. Whole rice should be ground and soaked. Rice middlings we presume is a mixture of ground bran, polish, ground broken rice, etc. In the recently completed experiment at University Farm, hogs fed rolled barley, tankage, and alfalfa pasture gained a trifle less per pound of barley than the lot fed a similar ration with milo instead of barley, but these feeds seem of about equal value.

Twelve hundred hogs were recently consigned from Hanford to Los Angeles and San Francisco markets.

TEN REASONS WHY YOU SHOULD BUY FELT FACE HORSE COLLARS

1. Home-made, from straw to finish.
2. Genuine oak-tanned leather.
3. Extra heavy sole leather cap.
4. Billets and caps thonged on, not riveted.
5. All hand-thonged throughout.
6. Big frame-room.
7. Extra large rim.
8. Gall-preventing pattern.
9. Heavy draft at shoulder.
10. Facing of felt under the leather.

Raising Poultry for Profit

SEASONABLE POINTERS FOR POULTRYMEN.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

We have just had such a nice rain down here so that in spite of high priced feed, everybody, the poultryman included, carries a broad smile. Rain was badly needed and we got it; now the green feed is growing for both hen and animal. Those who do not have alfalfa in this section rely mostly on green barley, but while barley is sweet and tender, and some think it makes a better egg, I think we ought to try a little rye for winter use. Rye contains more heating units than does barley, and I believe if a test was made it would be found to be equally good as an egg maker, while furnishing a little more heat energy than the barley. Our hens might not take to it just at first, but they would soon come to it, and as a purifier of dirty yards I know it is A-1. There seems to be some element in rye that absorbs plenty of fertilizer; it is a grosser feed than barley. One of our neighbors sowed some about two years ago and by starting it early and irrigating once he had plenty of green feed all winter and it was the feed that produced plenty of eggs. At least it would pay to try a small patch as against the same size in barley. I don't believe in being tied to any one thing. A variety in greed feed is just as good as in any other kind of feed, and the royal way to knowledge is to experiment.

Barley makes an egg that is not watery, and the same stands good of any of the grains that are sprouted. Sprouted oats are not only dry greens but they are strong greens; they make for strength in the hen, in the germ and in the chick, but at the same time a little green feed of another variety is a good addition to the daily ration.

Mustard is a very good green but should not be fed in excess, but in moderate quantities young green mustard is a great help to digestion and an appetizer, as well as being warming to the blood. And that is where rye comes in as a winter green—it is warming or heating to the blood. We all know that in cold climates the folks like buckwheat cakes in winter—buckwheat is heating. Russians that live in Dakota always plant rye for their winter's bread in preference to eating wheat flour.

Where the hens have range you will notice they help themselves to a little of everything, showing that "variety is the spice of life" for them in green feed. A variety of grains, too, is better than just one kind, no matter how good it is.

Stop Leaks in Roof.—This is a good time to find out if your poultry house roof is leaking, and if it is, resolve to make the necessary repairs as soon as possible. Wet or damp poultry houses often start mold spores in the litter that later will cause trouble. There is not anything in the whole category of chicken ailments that can't be started from some slight case of neglect,

and leaky roofs are a menace to the whole flock. Mold spores cannot be seen with the naked eye when they start, and after they have made some growth, perhaps the litter dries up and there you are: hens get to scratching and the mold spores get in the nostrils, eventually working their way to the lungs and death is the outcome.

Most any kind of a house will do in this section, if it has a good roof, and that is the least thing anyone can do for his chickens if he hopes for returns from them.

If your houses face the storms, change them for the winter, even though you move them back in summer. Let the closed sides and back face the storms and have a good roof and your flock will be comfortable in winter and free from mold or dangerous drafts.

QUESTIONS AND ANSWERS.

Rats or Animals, Which?—Something is killing my chickens, or rather hens; they kill them and partly eat the carcass. Seems to commence at the vent, but never finish one up clean nor carry one away. —Mrs. S. C., Santa Rosa.

It is rats all right, though there is very little difference between the method of a rat and a skunk. But, as if in pure wantonness, the skunk always kills several and just nibbles a little from each. Rats do carry them away but not always, but a rat always commences at the vent. A good trap is the surest cure, but a rat is very cunning and the trap would have to be buried. The next best thing is poison, and here again it needs caution, for if you ever touch the meat with your hands, Mr. Rat will smell it and leave meat and poison strictly alone. But if you will raise your houses about 18 inches from the ground and set them on blocks, then nail five gallon oil cans around the blocks the house sets on, the rats cannot get into your chicken houses. All poultry houses should be built high enough for a cat or dog to get under and that soon discourages the rats so that they leave your buildings and go to new quarters. We used to have to put all our houses on redwood blocks, and tack tin cans around. That prevents rats from climbing up the blocks and finding a way in by way of the roof or any loop-hole. The poultryman has to sharpen his wits to match the cunning rats, but he can do it and beat the rat at his own game.

Turks Breathe Hard.—A short time ago one of my hen turkeys died. For two days before she died the symptoms were those of an animal gasping for breath. She was able to walk around, but with every breath she would open her mouth and breathing was a great effort. The first day we noticed her we dosed her with castor oil, and as she seemed no better the next day we tried coal oil, and she only lived a few minutes after that. A post-mortem examination showed that her lungs were dotted with yellow spots about the size of split peas, the substance of which resembled curd or cheese. I think the case may have been pneumonia, but would like your expert opinion. —A. H. S.

Your diagnosis is correct, though

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from 1/2 inch to 1 1/2 inches then 20 inches of 2 1/4 inch mesh, topped by 4 1/2 inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

California Poultry Practice

A Practical Treatise on Poultry Raising in California

By Mrs. Susan Swaysgood
Writer and Breeder
Of Utility Poultry.

160 pages of text, besides many full-page illustrations.
Cloth bound.

This Book Will Help You in the Many Details of POULTRY RAISING.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

WHITE HOLLAND TURKEYS—Old and young Toms and pullets. Prices reasonable. Alice Merriam, Route 2, Pomona, Cal.

MAMMOTH BRONZE TURKEYS—Mrs. H. B. Kimball, Farmington, Cal.

LOS ANGELES POULTRY SHOW.

[Written for Pacific Rural Press by Harold Walthew, President of Poultry Breeders' Assn. of California.]

It is barely a month before the Los Angeles Poultry Show, Jan. 3-9. All who expect to exhibit should get busy with their birds and get them into first-class condition. This show will, from all indications, be the largest and strongest in quality of any show ever held in Los Angeles.

The Black Minorca Club of America are holding their club show in conjunction with us, and we anticipate some 300 or 400 will be penned.

The Rock Club are making great preparations, and all those interested in all the different varieties of Rocks will find them there in numbers and quality beyond their fondest dreams.

The Orpington Club are also making special efforts to pen a large display, particularly in the Whites and Buffs. Then there is the Partidge Orpington, and originated by a Californian. These birds should really be taken up more by the public. They are most excellent layers and a fine table fowl.

The Wyandotte Club expects to make a strong showing of this fine utility fowl. The string of Whites for quality and quantity is expected to far exceed other years.

The Rhode Island Red Club as usual is putting forth that surplus energy for which Red Men are noted to make the Red alley the alley of the show. This grand utility fowl is still forging ahead, and the color of them is getting more and more uniform each year.

The exhibit of turkeys is sure to be strong. Last year we had the finest exhibit ever held on the Pacific Coast.

Rabbits. — All rabbit breeders should attend the Los Angeles Poultry Show. The Pet Stock Association of California are having their show in conjunction with us this year, and around 400 rabbits are expected. Write at once for entry blanks to Walter M. Ross, 224 West Colorado St., Glendale, Cal.

POULTRY NOTES.

A Monrovia poultryman says, "The more a hen eats the more eggs she will lay and the more time she has in which to eat, the more food she will consume and the more eggs she will lay."

The 400,000 hens in the Southern California district have been signed up for the new marketing plan proposed by State Market Director Weinstock. The Central California Poultry Producers' Association will control 1,200,000 hens.

It has been found that during seven and a half months 307 hens kept in yards with a yard space of 39 square feet per fowl laid 1200 more eggs than 307 hens kept closely confined, says a University of California experimenter.

With barley selling at \$2.40 a hundred, and wheat at more than three cents a pound, rice which is bringing the growers only about \$1.75 a hundred, is about the cheapest feed for chickens that can be found anywhere, it is claimed.

It has been proved by a three-year feeding test at the University of California Farm at Davis that great

savings in cost in feeding chickens may be obtained when 7.7 per cent of animal proteids are balanced by 15 per cent of vegetable proteids, this giving as good results as feeds containing 30 per cent of animal proteids. This is important, because animal proteids cost from \$56 to \$80 a ton, while those from vegetable sources range from \$36 to \$40 a ton.

Many valuable publications on poultry matters have been issued by the University of California. Among recent publications which may be obtained free by writing to the College of Agriculture at Berkeley are "Practical and Inexpensive Poultry Appliances," "Suggestions to Poul-

Professional Directory.

SET YOUR OWN PRICE

That's what every man does who owns Properly Irrigated, Ditched, Tile Drained or Terraced Land. And if you don't want to sell, your increased yearly profits are just like turning waste land into cash. Progressive land owners in every State and practically every county in the Union have discovered that the only way to bring their land up to the desired state of production is to get a

Bostrom \$15 Farm Level

and make spare days the most profitable days. Also fills the bill for Grading, Road Building, Foundation Work, etc.

The Bostrom Farm Level has been on the market over thirty years, the latest improved having a Telescope with Magnifying Lenses which enable you to see the cross on the Target a quarter of a mile away. Man Size Tripod, Leveling Rod, Target, Plum-Bob and full instructions included. Weight, 15 pounds. It is used and endorsed by Agriculture Schools and U. S. Farm Demonstration Agents, and you will endorse it, too, after using it—if not Your Money Back, including express both ways. Write today for description of Level and Telescope, details of our Money Back Guarantee, and names of Jobbers in San Francisco, Sacramento and Los Angeles who carry it in stock.

Mrs. Best's Letter.

My Dear Friends: With Christmas only one short week away, we will all of us be as busy as bees, with the final shopping and the finishing up of gift making to attend to.

I hope some of you are making the painted gift boxes this year. These boxes are of tin or wood and require absolutely no skill to decorate. The stencil design is transferred to the box by means of transfer paper. The background may be of any shade and the design worked out in harmonious contrasting colors.

The only requirements for the work are two small cans of enamel paint—one of white and the other of black—and a few tubes of oil paints with a child's paint brush. By combining the white enamel with the oil paint in the tubes any desired color may be obtained. The interior of the box should be painted also.

These boxes make such attractive receptacles for candies, nuts, fancy cakes, choice figs, plum pudding or glasses of jelly and can be utilized afterwards for work boxes.

The brown Japanese baskets, with covers, decorate very artistically with designs in soft colors painted on one side, while the baskets with handles will often have a stippling of gold paint along the edges and across the handle with a bow of ribbon to give the finishing touch. These baskets are usually filled with home-made candies.

The stores are full of pretty things in wearing apparel for girls and women and nothing is nicer, especially for a young girl, than some garment her heart has longed for.

The skating sets are equally good for motor use and are wonderfully becoming to youthful faces. One pretty one has a white Angora tam, with a Scotch plaid bandeau brim and a button and tassel on top. The scarf is of white Angora, having wide border stripes of the plaid, at the ends and deep white fringe. White mittens with gauntlet wrists complete the set.

The crepe-de-chine underwear makes very dainty gifts and can be purchased in white and soft colors and is beautiful for dainty wear.

Negligees of all sorts from the Japanese hand-embroidered kimonos to simple saques of albatross, can be had at all prices and in all colors.

But perhaps the thing that will appeal to the average girl most is jewelry and the two most desired articles are rings and necklaces. In rings particularly, there have been marked change and a ring may be as badly out of style as an old hat. The new rings are light and graceful and the old style prong setting has entirely disappeared. Silver and white gold are being used

extensively and many rhinestones are being used. In happy combinations, these rings can hardly be distinguished from real stones set in platinum, so cleverly are the better rings copied.

The new form of solitaire ring has the center stone set round with many other stones in artistic designs.

In necklaces, silver is used as a substitute for platinum and the semi-precious stones are small and surrounded by a gallery setting, which makes a very good effect.

Rosabella Best.

A SET OF PLACE-CARDS.

A clever set of turkey place-cards seen in a stationer's store could be copied at home to use for the Christmas dinner. There were 12 cards and on each card a different question that must be answered by the person at whose place the card was put. The hostess holds the key to the answers. Use plain white cards to write the questions on and either draw or paste a cut-out picture of a turkey on each one. Following is the list of questions:

1. What part of a turkey is used in music?
 2. What does the dressmaker do to the turkey?
 3. Why has the turkey five reasons for being sad?
 4. When is a turkey like a small boy who has eaten too much?
 5. What feathers find a place on my lady's dresser?
 6. What part of a turkey is part of a sentence?
 7. What part of the turkey is an Oriental?
 8. What part of a turkey appears on the field of battle?
 9. What part of a turkey opens the front door?
 10. What part of the turkey assists my lady in making her toilet?
 11. What part of the turkey is a story?
 12. When the turkey is cooking, in what country is he?
- The answers, which should be written on a separate card and furnished the hostess only, are as follows:
1. Feet.
 2. She bastes it.
 3. He gets it in the neck.
He gets a roasting.
He is much cut up.
We all pick on him.
And after all this, he is in the soup.
 4. When he is stuffed.
 5. Pinfeathers.
 6. Claws (clause).
 7. First part, Turk.
 8. Drum stick.

THE HOME CIRCLE

9. Last part, k-e-y.
10. Comb.
11. Tail (tale).
12. In Greece.

CHRISTMAS CANDY.

The foundation of many delicious candies is fondant and the following are rules for making it: To 5 cups of sugar, add 1½ cups water and ¼ teaspoon of cream of tartar. Stir until sugar is dissolved. Cook slowly to the soft ball stage. Wipe down the crystals from the sides of the vessel with a damp cloth wrapped around a fork. When done, pour the syrup on a platter. When cool enough to allow the fingers to be held in it, stir with a wooden spoon until it creams. Then knead until smooth. Wet and wring a small towel, place it over the fondant, and allow it to remain there for an hour. This is called the curing process. Fondant improves with age and can be made into a variety of candies; plain creams with nuts on top, stuffed dates, chocolate creams, fruit centers, after dinner mints and so on.

For chocolate creams, mold the cold fondant and dip into melted unsweetened chocolate to which a piece of paraffine has been added. Melt the chocolate and paraffine over hot water.

For plain creams, in addition to walnut meats, blanched almonds, candied cherries or glazed pineapple make a nice variety.

To make Tutti Frutti loaf, the fruit, consisting of candied pineapple, candied cherries and walnut meats, should be added to the fondant syrup as soon as it is taken from the fire. When cool, it should be beaten and kneaded and then formed into an oblong loaf. When ready to use, cut in half-inch slices and wrap in paraffine paper.

CHRISTMAS DECORATIONS.

Here in California, where evergreen shrubs and red berries are so plentiful, there is no excuse for not having an attractively decorated home for the Christmas holidays.

Trailing vines of smilax and plumosas are dainty and combine beautifully with the red of the paper Christmas bells. These bells only cost a few cents apiece and can be used for years if put away from year to year.

The holly wreaths can be made either of cedar, or the green holly and the red berries can be tied on at appropriate places. A heavy wire makes a good foundation to which to tie the green foliage and a big bow of red ribbon gives a cheerful effect. This bow is equally effective if made of red crepe paper. The paper can be purchased in rolls the desired width or by the large roll and cut in strips. It improves the appearance of the paper bow if the strip is pulled along the edges, giving a ruffled effect. The work of decorating and making of wreaths is very much enjoyed by children and they should be encouraged to help about it. In many homes, each front window has a wreath hanging in it and of late years, they have been

also placed on the outside of the front door.

BURDETTE ON CHRISTMAS.

To me it seems—and it isn't my fault that the sunset is fairer and lovelier than the sunrise—that there was something more Christmasy about Christmas when I was a boy. Its pleasures were simpler, its gifts were heartier. At least, I cannot remember to have read, save in these later years, articles in family journals and magazines bewailing the burden of toil and worry and expense in the planning and making, or purchasing of Christmas presents. "Krismus gifts" we called them when I was a boy. It didn't and doesn't have much refinement of culture in the spelling and sound thereof. But the people who made them didn't rush into the papers to tell how much it cost them, and how tired to death it made them, and how glad they were that it was all over for another year. But last year and the year before I read such articles in print. So did you. Wherefore it seems to me that we killed Kris Kringle a full century too soon. We have more currants in our Christmas cake under the reign of Santa Claus, it is true. But we have also more flies in it.—Robert J. Burdette.

The Christmas-Tree Wood

Ho, little fellow, if you will be good
Some day you may go to the Christmas-Tree Wood.
It lies to the north of the Country of Dreams,
It glitters and tinkles and sparkles and gleams;
For tinsel and trinkets grow thick on the trees,
Where wonderful toys are for him who will seize.

You go by the way of the Road of Be-Good
Whenever you go to the Christmas-Tree Wood,
And when you draw near you will notice the walls
That rise high about the fair City of Dolls,
Whose entrance, unless you are wanted, is barred
By Tin-Soldier regiments standing on guard.

It's over in Candy Land, there where the shops
Forever are turning out peppermint drops;
Where fences are built of the red-and-white sticks
And houses are fashioned of chocolate bricks,
Where meadow and forest and sidewalk and street
Are all of materials children can eat.

You sail on a ship over Lemonade Lake
And drink all the waves as they quiver and break,
And then, when you land, you are under the trees
Where Jumping Jacks jump in the sway of the breeze—
But only the children most awfully good
Can ever go into the Christmas-Tree Wood.

—From "The Land of Make-Believe,"

by Wilbur Nesbit, issued by Harper & Bros.

A LITTLE PEACEMAKER.

"I don't see how I can be bothered with him," gasped the Lady Who Runs Things. "Why did you bring him, John?"

"Oh, please, mother, please," pleaded the Only Little Daughter. "Uncle John brought him because he knew I needed a dog. Didn't you, Uncle John? Down, Captain, down."

Captain, "part black-and-tan and part—just dog," aged four weeks, had not yet learned English. Four inches was about as far "up" as he could get. So perhaps it was unreasonable for her to expect him to "down." The Lady Who Runs Things heaved a resigned sigh, and said, "Well." And the Only Little Daughter picked Captain up in her apron and hurried down to the kitchen. She cleared out her second-best doll house, and made it ready for the new tenant. Captain had come to stay.

Next morning when the lady hustled into the kitchen with forty things on her mind, "Wow! wow!" came from the second-best doll house, and suiting the action to the word, Captain came sprawling across twenty feet of oilcloth, with tail and ears and all four legs working simultaneously, though not in unison.

The Lady glanced at the hall door to see if any one was coming. Then she stopped and patted the sleek forehead that bulged over two wide-set, shining eyes. "You cunning little nuisance," she murmured, and poured the top off the milk into the little basin. The Lady Who Runs Things had capitulated.

A few minutes later the sound of common-sense shoes was heard on the back stairs. It was the Angular Lodger. She always found time to report, before going to business, if the two Silly Things in the side room next her giggled after the lights were out at ten, or if the Old Maid upstairs had watered her plants and spattered water on her (The Angular Lodger's) windows. She and the Old Maid had not spoken for seven months.

"I think you ought to know," she began. "Why, what's that, a

puppy? A black-and-tan puppy! I used to have the dearest little black-and-tan puppy," and she forgot to report, and let two cars go by, while she cuddled Captain.

In the course of the forenoon the Old Maid came down to the laundry to do a bit of washing. "Wow!" remarked Captain gently and experimentally, for her face looked very "set" and unpleasant. She was wondering if the Angular Lodger had entered a complaint that morning. But when she saw those eager, inquiring eyes, her expression changed so suddenly that Captain wondered if he had been mistaken in fancying she looked cross. "You funny little duck," she cooed, and the Lady Who Runs Things looked in amazement to see the stately Old Maid down on her knees before the doll house talking baby talk.

Thus Captain's entourage grew apace, and when after countless efforts, he succeeded in sitting down, in real nonchalant dog-fashion, without tipping over, the whole force of lodgers came down to see him do it. Cheerfulness was Captain's native element, and sociability his meat and drink. None could resist the atmosphere which he created.

But just before Christmas Captain was suddenly taken sick. Every lodger in the house prescribed persistently. Yet he grew worse. He no longer vaulted from the second-best doll house and scurried across the oilcloth to greet his friends. He could only cock his silky ears and wag his absurdly little tail in welcome. After a while he did not even do that. Then the Only Little Daughter came and hid her tear-stained face on her mother's lap, and whispered, "Instead of buying me Christmas presents, take the money and pay a doctor to cure Captain."

So Captain was taken by his little mistress to the dog doctor. He patted the dull little head, and said, "Leave him with me, my dear. Come again tomorrow. He may come running out to meet you." But he did not that day, nor the next, nor the next. The suspense became very hard to bear. At last the news came. Captain was better.

Everybody, from Dad Down, Gets Better Wear, Comfort and Looks

No matter whether it's Dad, who plays havoc with socks—mother and the girls who want good-looking hosiery—or the children who require sturdy, wear-proof stockings, Durable Durham Hosiery will give everybody better wear. Durable Durham Hosiery is made strongest where the wear is hardest. The heels, soles and toes are heavily reinforced and the tops are knit on securely. The children's hose has triple reinforced knees that make them wear and tear-proof.

DURABLE DURHAM HOSE

FOR MEN, WOMEN AND CHILDREN

is backed by an unlimited guarantee to assure satisfaction. Mothers, take advantage of this chance to cut down darning and knitting, by buying this high quality hosiery that sells for the low cost of 10, 15 and 25 cents. If your dealer doesn't carry Durable Durham Hosiery, tell him to stock it.

Christmas morning dawned. The Angular Lodger came down early into the kitchen. "Wow! wow!" came from the second-best doll house, and a thin little shape scurried over the oilcloth.

Just then the Old Maid came down. "O-o-o-h! He's back!" And then those two looked at each other across Captain's little head as it bobbed this way and that while he tried to lick their faces impartially.

"I had a fine Christmas box from my sister down East—turkey and all the fixings," stammered the Angular Lodger. "I'd be pleased to have you take Christmas dinner with me."

"I'd be delighted," chirruped the Old Maid.

"And I think," continued the Angular Lodger, "that I'll invite the Silly Things. I know they were going out to a horrid dining room."

And it came to pass that there was a merry party that Christmas day in the Angular Lodger's sunny square room. And down in the kitchen Captain held court and kept open house.—M. L. U. in Our Dumb Animals.

Good Health.

[By H. E. Pastor, M. D.]

Health Preparedness.

The State Board of Health of Calif. has been the target of much criticism for some years past, mainly at the hands of people incapable of understanding the Board's duties or appreciating its importance. The fact is, the average layman, with his smug and opulent ignorance of the subtleties of disease, especially disease of an infectious or contagious character, never wakes up to the importance of erecting barriers against its inroads until too late, and he and his are in its grip; and so the Board receives a support so niggardly as to defeat the purpose of its creation, and is then denounced for an impotency that the critics themselves have brought about. It is now proposed to enlarge the present functions of the State Board of Health by introducing a bill at the next session of the Legislature providing for the division of the State into six health divisions, each division to have a State Health officer in charge, also to have ten sanitary inspectors for active work all over the State, instead of one, as at present, in case of disease outbreak or other emergency. On the face of it the plan seems proper and necessary, and such a health administration, if kept free from the blight of politics, can accomplish a good far beyond the expense of its maintenance. Matters of health which threaten the public welfare cannot be left to private judgment, for "what is everybody's business is nobody's business."

Do a Little Figuring.

A. E. Perkins, dairy chemist at the Ohio Experiment Station, has been doing some figuring on the results of his professional investigations and their bearing on the high cost of living. He thinks that milk is not less wholesome than other foods because it is cheaper. He says that a quart of milk is equal in food value to three-fourths of a pound of beefsteak, eight eggs, 15 pounds of oysters, two pounds of fish, six

"Hurry, children—I've got a real treat for you."

Ghirardelli's Ground Chocolate

Why Put Up With the Unsanitary Outhouse?

KAUSTINE CLOSET SYSTEM

Not a mere chemical commode—but a practical, permanent tank installation and the most sanitary method of sewage disposal in existence. Endorsed by health authorities all over the country and extensively used in public service.

No cesspool—odor—water—sewer—plumbing! Costs only a fraction over a cent a day to operate. Any one can put it in—no attention required after except to empty tank twice a year. Kills all germs—protects your health. Ideal for farms and village homes, schools, churches, factories, etc. We are the originators and patentees of the Kaustine underground tank system—don't accept a substitute or imitation. Write for particulars.

Or Call in Person.

OFFICES AND SALES ROOM:

KAUSTINE BLDG., 467 6th Street, OAKLAND, CAL.

pounds of tomatoes, or three pounds of apples; and milk is the most digestible of all—oysters not excepted. Mr. Perkins says, too, that cream is not the only nutritious constituent of milk, but asserts that the skim-milk contains about half the food material of the whole milk. Digestive disorders not infrequently follow excessive eating of fat, and for this reason the whole milk is much more wholesome than the cream taken alone. But do something toward solving the high cost of living by carrying a little farther the calculations of Mr. Perkins, comparing the present cost of milk with the present cost of the other articles of food enumerated.

An "Old Wife's" Remedy for Rheumatism.

Rheumatism is an intractable disease, and is rarely benefited by medi-

cation. The writer recently had this "old wives'" remedy called to his attention. He has never tried this, but gives it for what it is worth. It was contributed by Sir Lauder Brunton to the London Lancet. He had prescribed a standard formula for a chemist's wife, who suffered severely with rheumatism. His prescription had failed to give her relief. A friend told her to powder the inside of her stockings with sulphur, and wear them all night. In a short time, the doctor relates, the sufferer was entirely cured.

A Good Deodorant.

In country districts where there is no modern system of sewerage, a valuable, practical and cheap deodorant can be provided by adding a pound of unslaked lime and copper sulphate to ten gallons of water and thoroughly stirring.

SAN FRANCISCO.

San Francisco, Dec. 13, 1916.

WHEAT.

The Eastern drop due to peace talk is not reflected here, and is not likely to be for some time. Stocks in warehouses are much lighter than last year, with little left in farmers' hands; and as the market depends on Northern supplies, which are coming slowly because of car shortage, values are firmly held, though business is slow.

BEANS.

Stocks of beans in California warehouses Dec. 1 were much larger than at the same time last year, the movement from growers' hands having been much more rapid; though there has also been a large movement to other markets, and a great deal has been sold that is still to be shipped as cars are available. The greater part of the crop is now believed to be out of growers' hands. Values show some further advances, limas being much higher, with supplies cleaning up in many districts. Tepary beans have also been marked up, and Mexican reds are slightly higher. The market in general is much less active than for the last two months, the change being attributed entirely to the normal holiday influence, as grocers have covered their needs and are concentrating on seasonal goods. There has been quite a large movement of tepary beans, owing to the high price of other lines; but they find little favor, and some large dealers refuse to handle them. It is complained that they have an earthy taste, contain lots of green beans and refuse, and do not cook up like white beans. However, they are apparently getting an introduction, and their cheapness is strongly in their favor.

HAY.

Arrivals continue below current needs in this city, and the local market is very strong, with occasional sales at a premium over the prices quoted, especially on fancy grades. The cheaper grades also are in strong demand, and everything is readily disposed of, although local business is unusually quiet. If current needs were up to normal the situation would be serious, as it is practically impossible to get cars. Country consuming markets also are strong, and strenuous measures have been used to get the necessary cars. Alfalfa is coming fairly well from the river districts. Demand for straw is active.

DRIED FRUITS.

Prices have not changed during the last week. The market throughout

the country seems to be a little disturbed at the moment by the peace talk; packers here state that a sudden end of the war would bring an enormous demand for dried fruit from Europe, which would cause increased firmness in many lines. The outlook, however, is too uncertain to warrant much speculative buying, while holders are perhaps a little less anxious to sell. The business now is mainly a matter of trading between packers and jobbers, as there is little fruit left in the country. Pears have had considerable attention since other lines have been cleaning up, and there is little desirable stock now left. Only a few lots of prunes remain in producing districts; and most of the apples have gone out. While sales of raisins for the holidays have been very large, it is stated that because of the car shortage it will be impossible to make full deliveries for the season.

[Net to growers, bulk basis, f. o. b. shipping point.]

HOPS.

Values show no further change. A number of sales have been reported recently, both in Oregon and California, but buyers are not taking hold with any eagerness, and the market is rather weak, with brewers holding off and no foreign movement. A sale of Mendocino hops was made this week at 11c.

Sacramento9@10½c
Mendocino10@11c

HORSES.

A large lot of heavy drafters and chunks have been put on the local market this week, including quite a number of really attractive animals. The offerings brought out a little more interest than has been manifest for the last few weeks, but hardly as much as was warranted by the class of the stock; and considerable difficulty has been experienced in getting satisfactory prices. As an indication of the tendency of the market, a large part of the offerings were from a large local concern which is putting on motor trucks.

Drafters, 1700 lbs. and up.\$ 250
Drafters, 1550 to 1650 lbs.150@200

GROCERIES.

The local price of flour continues at \$9 to \$9.40. Sugar has dropped again, being now quoted on the basis of \$7.40 for granulated.

LOS ANGELES.

Los Angeles, Dec. 12, 1916.

BUTTER.

Receipts of week ending Dec. 12, 1916—270,830.

Receipts of week ending Dec. 12, 1915—205,000 lbs.

There was a further break in the market the past week. Receipts were

somewhat better than the week before and showed a marked increase over the same week last year. The boycotting of butter in the Eastern markets, owing to the unusual high prices, had a sympathetic influence and cut off all Eastern demand that was had heretofore. The market here broke 2c during the week and in San Francisco 1½c, while Chicago is 2c lower and New York is off ½c. Still even at these declines the market is 6c higher than a year ago and the home consumptive demand is holding up fairly well.

We quote extra creamery34c

EGGS.

Receipts (railroads) for week ending Dec. 12, 1916—931 cases.

Receipts (railroads) for week ending Dec. 12, 1915—673 cases.

A steadier but quiet market was had the past week. Receipts were a little better and showed a fair increase over the arrivals for the same time last year, but as cold-storage stocks here are less than this time last year and Christmas demand approaching the better receipts failed to influence prices. The boycott now going on in the Eastern markets failed to influence prices here, but at the same time made buyers more cautious and backward. In San Francisco the market closed the same as a week ago and the same may be said of this market. Chicago, however, is 1½c lower while New York remains the same as at the close of our last review. Receipts by rail here for the week were 931 cases and estimated receipts by truck 600 cases, making a total 1531 cases against 1273 cases by rail and truck the same time last year.

We quote fresh ranch case count. 40c

Special Citrus Market Report.

Los Angeles, Dec. 12.

Shipments of oranges from Southern California, from November 1 to December 7, were 1417 cars, and lemons 520 cars, against 664 cars of oranges and 469 cars lemons the same time last year. Shipments of oranges from Central California, from November 1 to December 6, were 1,852 cars and 93 cars of lemons, against 1,590 cars of oranges and 49 cars lemons the same time last year. Shipments of oranges from Northern California, from November 1 to December 6, were 543 cars, and lemons none, against the same time last year, 245 cars of oranges and no lemons.

The market continues to hold up fairly well. The early crop is going forward freer than a year ago and the trade is taking the supply at fairly good prices. The oranges from Central and Northern California are well colored and are testing up well. In Southern California it is rather early yet for choice fruit. Still some very nice oranges are being marketed from here, though they are not very sweet as yet. The new navels have the call over old Valentias and can be had

for less money. Locally both oranges and grapefruit moved very well, but oranges were lower under more liberal receipts. Local packers are paying 1½c per pound for new navels in the grove and 1½@2c per pound in the grove for grapefruit. Lemons continue dull and weak. Local packers paying 1½@2c per pound in the grove for the best of them, but poor stock has to be sold for what it will bring.

EASTERN AUCTION MARKETS.

New York, Dec. 11.—Twenty-three cars California navels, one car Arizona navels and three cars California lemons sold. Navels about 20@40c lower; Arizona 25c lower. Lemons unchanged. Weather cloudy. California navels averaged \$2.35@3.90. Arizona navels averaged \$2.35. Lemons averaged \$2.15@3.00.

Boston, Dec. 11.—Thirteen cars sold. Market weak on oranges and lemons. Navels averaged \$2.70@3.50. Lemons averaged \$2.50@3.00.

Philadelphia, Dec. 11.—Market higher on lemons. Averaged \$2.45@2.90.

Special Livestock Market Report.

San Francisco, Dec. 13.

CATTLE are stronger in price but this is of little interest to growers as most everything is already contracted for by killers for delivery in Jan., Feb. and March.

HOGS continue to arrive in satisfactory volume and prices remain unchanged. Statistically it does not seem probable that any rise in price will be warranted as stocks of cut meats, Dec. 1 at the principal packing points were 29,662,000 pounds more than a month ago and 100 million pounds than a year ago. Lard stocks, however, have decreased and exports of all provisions have increased considerably. Announcement is made by the Western Meat Co. that they expect to take over the business of the Nevada Packing Co. Jan. 1 and that they expect to enlarge the pork packing business of that plant. No effect on California markets is expected from that source.

LAMBS are now being purchased on a pound basis. Otherwise there is very little doing other than previously noted.

WOOL is at an absolute standstill as a result of the peace talk which came early this week. It seems probable that a declaration of peace would have a tendency to strengthen, rather than lower present quotations but at this writing uncertainty prevails among the wool trade all over. Some scattering lots are reported to be still in the growers' hands but previous to the peace bulletins the trading in this market was largely between dealers.

Prize Fat Stock—At the Pacific International Livestock Show held at Portland last week the Western Meat Co. purchased fat stock as follows: Reserve G. C. steer, wght. 1520 pounds, \$14.50 cwt., 2nd prize Angus heifer, wght. 1470 lbs., \$10.50 cwt., 16 Herefords 2nd prize lot, av. wght. 1350 lbs., \$12 cwt., 16 1st prize Shorthorn lot av. wght. 1240 lbs., \$10.25 cwt., 16 1st prize St. yearling Herefords, av. 1050 lbs., \$9 cwt., 50 1st prize Durocs, av. 196 lbs., \$12 cwt., 40 3rd prize Poland Chinas, av. 176 lbs., \$10.60 cwt. This stock was purchased for the fancy holiday trade.

[Prices paid for stock, live weight off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

Los Angeles, Dec. 12.

CATTLE: There were more cattle in the past week and the tone of the market hardly so firm. California and Arizona furnished most of the supply and some very good grass and beet fed steers. Killers were all in the market and made very fair purchases, though refused to bid up prices in spite of the firmness in the Eastern markets.

Publisher's Department.

Here are two letters from subscribers which will serve as a peg upon which to hang the tail:

Mr. Gibbs of Tipton writes: "The reading is equally as good now as when the paper was glazed."

Mr. Tinker of McFarland writes: "Could hardly get along without the Press, and don't say another word about the paper it is printed on—it's good, a-plenty."

And now for the tail. When the high price of paper struck us early in the fall, we decided not to push so much for new and larger circulation, but to consolidate those we had. To that end we have been cutting down on exchange and complimentary copies and getting list into a paid-in-advance condition. At this time we have near-

Quotations f. o. b. Los Angeles:

Beef steers, price 1000 to 1100 lbs.\$7.00 @ 7.75
Stockers and feeders5.50 @ 6.00
Prime cows and heifers6.25 @ 6.50
Good cows and heifers6.00 @ 6.25

HOGS: There was a very good supply of hogs in the past week from California and a few shipments from Idaho. Most of the arrivals were of light weight and showed lack of finish and that they were being sent to market before their time to save high-priced feed. Killers were all in the market and made fair purchases at last week's prices, though the tone of the market was weak.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 250 @ 300 lbs.9.25 @ 9.50
Mixed, 200 @ 2509.25 @ 9.50
Light, 175 @ 2009.25 @ 9.50

SHEEP: A good demand and a firm market was had for all arrivals the past week. Arizona, Utah and Idaho all had a few sheep and lambs in the past week and they met with ready sale at full quotations. Killers were all in the market and wanted supplies and more could have been sold if here. The high markets East favored holders and enabled them to demand full quotations for everything.

Per head f. o. b. Los Angeles:

Prime wethers\$7.00 @ 7.25
Prime ewes6.50 @ 6.75
Yearlings6.50 @ 7.00
Lambs6.50 @ 7.00

CALVES: A steady and firm market was had the past week under light offerings. Prices, however, not quotably higher. We quote at \$8.50 @ 9.50 per cwt.

North Portland, Ore., Dec. 11.

CATTLE: Today's run of cattle was the smallest Monday's run for many months, less than 600 head. The market was in general firm with a large demand from butchers who bought freely. Call from packers was light, prices on the best grades are steady to 25c higher, while the large end of the run, which was of common quality, sold steady with slow demand.

BEEF STEERS: The best loads of steers sold readily at steady to 25c higher. One load of prime steers brought \$7.55 from butchers with other loads at \$7.25. The quality of the beef steers was very poor, fair to good grades brought \$6.50 to 6.75.

COWS AND HEIFERS: The supply of good cows and heifers was very light, with a fairly good demand. Best cows sold at \$6.25 with a few at 6.00; with ordinary ones at \$5.00. Prime or best grades were a good 10c higher while the common grades found slower sale.

BULLS AND STAGS: There was a good supply of bulls this morning and prices were on the same basis as a week ago. Best offerings sold up to \$5.00 while Bologna bulls sold from \$3.25 to 4.25.

STOCKERS AND FEEDERS: A good time was made on all feeder stock today, prices being well in line with last week's close. Best valley feeder steers brought \$5.60 to 5.75; with fair to good ones around \$5.00. Stock cows and heifers brought from \$3.00 to 5.00; while choice feeding heifers and cows ranged from \$5.00 to 5.50.

HOGS: Today's run was a good deal lighter than a week ago, although it was a good-sized total of 4000 head. Prices were on about the same basis as last week, although some sales made in the later trading looked 5 to 10c higher. A number of loads brought \$9.70 to 9.75 with the bulk again selling at 9.60. Pigs and half-finished stock were here in large numbers, bringing \$3.00 to 8.50.

SHEEP: Supply of sheep continues very light, the only offerings coming are from small lots of valley sheep each day, but valley lambs made another 10c advance, bringing \$9.60. No east of the mountain sheep have been received to test the real strength of the market. Valley yearlings sold up to \$8.50 with good mutton ewes at 7.00.

ly accomplished what we set out to do, so that by the end of next week there will be no delinquents on our books who are a year in arrears. Every subscriber who has not paid since 1915 will be cut from the list, and we will be sorry to drop any who want the paper, but have for some reason not remitted. We have no alternative, however, under the federal regulations.

Every friend of the Rural Press could make us happy, and at the same time help one of their neighbors, if they would secure for us one new subscriber and send the name in before the first of the year. The cost of getting new subscribers, together with the high cost of paper, is taxing our finances pretty heavily and our readers can help us make a better paper by sending in new subscribers. The

money thus saved will be spent for better editorial service.

In less than ten days you will wake up on Christmas morning, and we wish you a very merry one, and want to suggest that you help some one else have a good time. One of our agricultural books would make an ideal present. Send us your orders at once and we will mail the book to reach you or your friend before Christmas day.

MISSION OLIVES

EARLY RIPENERS.

THE EHMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.

Mr. W. A. Hayne, Box 461, Marysville, Cal.

Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Fogg grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners.

We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know. Yours very truly,

(Signed) E. W. EHMANN.

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive trees, and, like the Fogg trees, they are all propagated from the large size cuttings. W. A. HAYNE.

Box 461, Marysville, Cal.

FOR ORCHARDS

*The King of
Tractors in
soft soil. Absolutely
does not pack the soil.*

HORSES EAT 365 DAYS IN THE YEAR
WHETHER THEY WORK OR NOT. THIS
TRACTOR "EATS" ONLY WHEN IT WORKS!

Pays for Your Horses

Then Pays for Itself by Doing the Work of Six Horses at the Expense of Two,
and Doing Better Work in Your Vineyard or Orchard. Makes its own Traction.
"Gees" and "Haws" Like a Team. This Great 6-Horse Tractor is PATENTED. No One Else Can Make One
Like It. No Other Works Like It.

Giant traction with only 2650 lbs.
weight, perfect efficiency and perfect
economy! That's the wonderful **BEAN**
TrackPULL 6-12 Tractor!

Every team your own costs you about
\$225.00 a year, **just to keep**. If you own
three teams that's \$675.00 every twelve
months! Do your teams work every day?
No! But you **pay** them in keep every day.

You can buy this tractor almost for
what four healthy teams eat up in a year.
The tractor "eats" only when IT WORKS!
No other tractor **now does or ever did**
what this one does, and no other tractor
with such advantages as these **ever before**
sold for such a low price, and you can

buy it on terms!

This tractor **pulls** itself over the ground
instead of pushing itself. When you hit
soft spots in plowing, it doesn't dig itself
in so you have to use horses to pull it
out. You simply **turn the whole front**
end to right or left as you would swing
and pull out just as you would with a
team. Hard to turn? Well, it's almost as
easy as **turning a team**. Fact is, this
tractor is more like a team than anything
that actually **isn't** a team that you **ever**
saw.

It is so strong that it easily pulls a big
six-horse load, yet so light it absolutely
doesn't pack the **loosest soil**. It pulls

almost as hard in loose ground as on
tough sod.

No other tractor will **turn clear around**
inside a 10-foot circle! No other will get
into the corners like this one! No other
can plow within an inch of your vines as
this one does **without breaking off young**
shoots! No other can **pass under tree**
boughs only four feet off the ground! And
no other can pull as much on the **same**
amount of fuel! Where else can you get
as much in a tractor?

Get our big folder which tells the whole
story.

The Great Money Saving---2650 Pound BEAN TrackPULL--6 Horse Tractor

The **BEAN TrackPULL Tractor** is so simple and sturdy in
construction that it lasts a lifetime. Famous Hyatt Roller or
New Departure Bearings throughout. Not a plain bearing in
the entire tractor. Power goes through only four **big gears**
and simple **friction clutch**. Patented track needs **no oil or**
grease. Easier to drive than any automobile, and easier to
take care of. Motor has larger bearings and larger crankshaft,
otherwise it's the regular 4-cylinder automobile motor that

you know all about.

You can take off grousers and wheel flanges and run on the
boulevards. A pulley permits you to operate stationary ma-
chinery and thus use the motor when tractor isn't plowing,
harrowing or discing. There's hardly a more useful machine
than a tractor—and this is the **little king** of tractors! Don't
fail to get full information about it!

Send No Money, Just Mail This RESERVATION Coupon

Don't wait till all these tractors are gone. There's a big demand now for
BEAN TrackPULLS, and as more and more farmers are finding out
about them the demand is getting bigger every day. We are making
as many as our factory can turn out and **ALL WE CAN MAKE WILL**
SOON BE SOLD at the present rate.

If you want a BEAN TrackPULL—and it's the tractor you **DO**
want—send in this coupon today! Sending the coupon doesn't
obligate you to buy at all. It simply **RESERVES** one for you for
a reasonable time. If you don't buy then the tractor is sold to
some one else. We'll quote you prices and easy terms, and
send you the big folder with the complete BEAN Track-
PULL story—also name of nearest dealer, and where you
can see a demonstration—in reply to a postcard or when
you send the coupon. Get in touch with us now before
all these great little machines are sold.

Orchard, Cows, and Corn Combined.

Corn, Vetch, and Oats are Grown in the Orchard to Make Silage for Cows, Whose Manure is Put Back Onto the Orchard. The Cows Utilize a Small Bermuda-infested Corral.

[Written for Pacific Rural Press.]

A 25-ACRE walnut orchard interplanted with apples, and these interplanted with corn, for the silo, to feed the fine herd of Jerseys kept in a small corral, sets a fellow to thinking as he passes G. A. Brown's place in Los Angeles county. When you talk to Mr. Brown, you find that the orchard ground plowed up in great hard chunks when he came to the place three years ago, but it works up fine now. The first year, he put 158 manure-spreader loads of about 1½ tons of manure previously produced on the place, onto the 12 acres east of the house. It hadn't been manured before. That 12 acres has been covered with manure 10 times in the three years. The 8 acres west of the house and corrals has had more manure than that.

The trees are 5 or 6 years old, the walnuts 60 feet apart, the apples of several varieties interplanted both ways originally. Mr. Brown pulled out the rows one way across, to make room for intercrops.

The ground is subirrigated anyway, so that a number of trees have died from overwatering. The problem is whether to drain and save the trees or leave it moist for cow feed and make the orchard into a dairy farm. We would like to see it drained, and the mutual helpfulness of cows and orchard continued for cash from both.

Alfalfa and Corn Intercrops.—There were some grade cows when Mr. Brown bought the place. To feed them he grew alfalfa between the trees for two years; but Bermuda grass and lack of drainage spoiled that. Vetch and oats were grown on the 12 acres last winter. This fall, the corn being harvested, the ground will be disked both ways and sowed to vetch and oats which will be siloed in the spring, so he won't have to buy so much feed next summer as he did since last April.

Last winter's crop on the 12 acres was cut in June, and the ground plowed a foot deep in centers, but shallower next to the trees, with a one-horse plow. It was crossplowed later, thoroughly worked down until neighbors thought he was "buggy," and planted to corn June 25 and 26. This corn, seen late in September, averaged easy 12 feet tall, fully tasseled and well eared out, with a splendid stand. About 13 rows were planted in each center, about 2½ feet apart, leaving a 5-foot clearance each side of the trees. The corn undoubtedly benefitted the

trees by absorbing much of the excess moisture. It was expected to yield 20 tons per acre of green corn, and the Bermuda was very scarce.

Less Cultivation—More Bermuda.—The 8-acre piece was plowed early last spring, was left 2½ months to dry out the Bermuda, then disked and plowed before planting the corn July 7 and 8. It was less mature in September, a much poorer stand, and the Bermuda was thriving as it was not on the 12 acres. A small two-acre piece beside the corral was plowed, disked and harrowed, springtoothed, and raked last spring and three tons of Bermuda grass hauled off, but it choked out the corn this year so that it will be included in the corral next year.

Silage is not new here. Corn was bought last year and the 14½x32 foot silo filled before Oct. 22, running a ½-inch stream of water in with the corn all the time, though it was not dry. Mr. Brown started feeding

Intercrops in the Orchard Add Income and do no Damage if Irrigated sufficiently When the Trees Need It, if the Intercrops are Fed to Livestock and the Manure Returned to the Orchard.

at once, so he "didn't lose two wheelbarrow loads." This silage was fed to 25 cows until April 22. From then till fall, not having had a winter silage crop last year, feed was bought in large quantities and stored handy in the big barn.

Feed.—Cows when seen in September were being fed all the alfalfa hay they would eat in the barn, and outside racks were filled once per day. They were at that time milking only ten of the cows, feeding them in the evening about 50 pounds of alfalfa meal mixed with about 25 pounds of beet pulp, soaked from noon till feeding time, as shown us by H. A. Sanders who was doing it. The heaviest milkers and those in whom

HOLIDAY ACTIVITIES.

IT IS the week before Christmas and 'holiday activities are reported beyond all precedent in volume and variety. All metropolitan stores which can be prospected for gifts are crowded to their doorways. The people seem to have plenty of money and are restless to get rid of it. But one cannot canvass the shops for measure of the movement: it must be sought at the transportation marts. The express companies are being rushed, and though their business is largely increased by innocent-looking parcels of gin to individuals in neighboring states which are measurably dry or coming so, they are doing higher-class gift-sending as never before. The local parcels post, however, gives most definite measure of holiday activity. Even now, a week before Christmas, the San Francisco postoffice is sending out over 40,000 parcels a day and expects to reach 125,000 a day by the end of the week. In parcel work alone there are 500 men at work. Doubtless at all other postoffices in the State, Santa Claus is proportionally busy.

Quite Like California.

All this is quite characteristic of California. Her disposition to rejoice and to celebrate is getting its place in literature. The most recent token of recognition in this line is found in the writings of Kathleen Norris in the American Magazine, who sketches a State portrait, which all will recognize, in these words:

California has a definite personality, a personality unmistakably courageous, hospitable, broad-minded and independent. She is unbound; she welcomes innovation; she holds an imported convention guilty until it is proved innocent. She rises to the horrible emergency of earthquake and fire only a little less buoyantly than she turns her energies to the creation of a record-breaking exposition. And when the fair was over, California was not tired, nor discouraged, not even in debt. She found that her fair was the first that had ever paid for itself, and so she had another celebration for that.

She celebrates everything, does California. And so tenacious is her loyalty, and so eventful her history, that scarcely a week passes without its anniversary and its jubilant commemoration. Ocean fogs pour over her from the blue Pacific, trade winds sweep up and down her coast cities, and she has a fair rainfall, but somehow her sons and daughters think of her as always sunshiny, always warm and serene and welcoming, a gracious figure of hospitality and of giving, between the great desert and the deep sea.

Of course Californians see more in California than others do: it is always that way with lovers and the objects of their adoration and "all the world loves a lover," for all that. And so we need not be abashed if we too are filled with the emotion which Kathleen Norris joys to feel and of which she fitly writes: "The very name, the very word 'California,' falls upon my ears with an exquisite appeal; it is like a strain of familiar and poignantly touching music." And so, whether we throng the marts and help keep 5000 men rushing parcels of Christmas joy into mail bags, or whether we withdraw alone to the verdure of California Christmas meadows, brightly starred with golden poppies, the emotion is the same. Next

to the transcendency of heaven's gift to all mankind which Christmas commemorates comes the assurance that the greatest earthly gift to the Californian is California.

SOMETHING ELECTRIC ABOUT IT.

ALTHOUGH there may be sharp and wide differences of opinion as to whether the world is going forward or backward by the free use of dynamite in Europe, there can be no doubt that America is progressing rapidly by the rival propulsive power of electricity. And there seems to be reason to believe also that California is moving more rapidly, in general development and in efficient working and satisfactory living, with this promotive agency than other States are. This reflects credit upon the enterprise and intelligence of the people and it is a fit appreciation of the natural adaptation of the State to the cheap generation of this new lighting, heating and working force. The old lamentation that the Creator had overlooked California in the distribution of coal, and thus handicapped her in industrial development, is now but evidence of the blindness of the elders who could not see the resources of petroleum products which seethed beneath their feet nor feel the incalculable power in the falling, rushing water in the mountains, which for nearly a thousand miles enclosed long, narrow valleys to facilitate the shooting of light, heat and power back and forth across them in short circuits of electrical transmission. In the newer life of California this force, of which the pioneers dreamed not, is giving the State unforeseen comforts in living and working and justifying us in claiming distinction for the amount and variety of its employment. Dr. Thomas Addison, Pacific Coast Manager for the General Electric Company, gives Californians unique positions as lightning conductors. He recently said:

The individual Californian, on the average, uses electricity more generally than the people of our other States. This is surprising when one considers that our State has barely 3,000,000 population, whereas in some of our Eastern States the principal cities alone have nearly an equal population. Our poorest people have electricity in their homes, a condition not to be found elsewhere. In New York city the poor use the old kerosene lamp, with now and then a gaslight in evidence, but never the electric.

And then, wholly apart from lights, the prevalence of electric appliances enforces California's prosperity and the lightening of woman's burden in the home. Dr. Addison estimates that about 40,000 such appliances are sold annually in this State and they range all the way from flat-irons to wash-tubs and cook-stoves. And then, taking a broader view, another authority says that a report of eighty-four manufacturers shows that over 9,000,000 such electrical household appliances have been manufactured and sold since this industry started in the United States.

But these figures, interesting as they are, do not include the great industrial work of electricity. In California we have relatively greater use of it than other States, in proportion to our manufacturing interests, while in farming uses we have as marked a lead as we have in household appliances.

A NOVELTY UNDER THE SUN.

IT IS seldom that a man lives long enough to see the whole of a thing. He usually gets only a wink at the middle, but it is some satisfaction to remember that one does not have to be very old to have seen at least the front end of this thing. In the latter '70s the electric light bulb was about as big as one joint of a peanut and a flashy youth would wear it as a scarf-pin—twinkling it on and off in wondering eyes. About a decade later electric light bulbs were hanging from trees or from street-spanning wires in many of our mountain towns, taking their juice from little generators grafted on to the flow of mining ditches, and about the same time the tall mast at San Jose lifted its crown of lights into low-flying clouds. A little later the wonderful long-distance transmission line was erected from Folsom to Sacramento, carrying light the incredible distance of twenty miles! Everybody expected the juice to get away before arrival! But the early electric lights in the

mountain villages always appealed to us as most surprising and beneficent. Larger towns had lights of some kind, but the hamlets had only the moon and the stars to lighten their inky darkness in which lurked many dangers. What a transformation the electric bulb worked in such places! We remember starting out from Marysville toward the foothills, groping along the south bank of the Yuba river in that density of darkness which precedes the dawn. Soon we saw a strange glow among the trees and later came into a wide circle of well-lighted dust in the highway. Lifting our eyes in inquiry we saw the glowing bulb above and then, seeking features of the environment, discerned the ancient legend "Yuba Dam," faintly on a board, in disintegrating paint, and we felt the curse as sharply as did the receiver of irreverent information on the same spot forty years before. It produced a strange sensation to remember the story and to see the marvellous light. As we plodded our eastward way the sun gilded the Sierra summits and when we came in daylight to the hamlets, with names famous in mining days, there were the electric lights above the streets still faintly glowing in the face of the sun. Asking a man, who was out to relieve an early-rising thirst, why they did not shut off the lights, we were told: "They just nachully let 'em run: it costs too much to keep turnin' on 'em off and on." And so there came first to the upland villages of California, where it is the chief business of water to run down hill, a fullness of light which, like the light of the sun, is too cheap to limit by switches: a light which is in real truth sunlight, for its creating agency is drawn by Old Helios from ocean depth to mountain crest and set free to seek again its birthplace. And then as it enters upon its downward flow, man takes from it energy and flashes light, heat and power onward, prophesying and preparing for undiminished service as its slower movement fills irrigation reservoirs and navigable streams. The pioneers glorified California for her vivifying streams threading fertile but thirsty valleys, and they did well. They did not know that from flowing water could be taken that which robs it of nothing, but which multiplies incalculably its service to the work and life of man, even hundreds of miles beyond the touch of it. And it is the front end of this marvellous achievement which has appeared to this generation.

CALIFORNIA TURKEYS.

ALTHOUGH the holiday celebrant has to pay rather high for his feast this year there will be some satisfaction in knowing that the money will go to California turkey growers and encourage them to greater exertions for a larger supply next year. It has been depressing in the past to find that so much of our money has gone for prairie production and the superior excellence of our own product has not been adequately recognized. Whether it was the high price of corn or the scarcity of grasshoppers or the flush times at the East which checked shipments to California this year, we will leave it for the inquisitive to figure out. The fact seems to be that no Eastern turkeys have been shipped to San Francisco this season, and none is scheduled to arrive. As a matter of fact, the East is short of turkeys this year. Texas, which is usually a large contributor to California turkey-eating, shipped all available birds for the Thanksgiving trade to the East, and since then has been shipping there for the Christmas holidays at higher prices than they could get in this market. And the Imperial Valley of California also did something eastward to the neglect

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., December 19, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data		
		Seasonal To Date	Normal To Date	Max'm	Min'm	Mid'm
Eureka	.08	7.76	14.00	52	34	43
Red Bluff	.00	6.99	8.24	68	32	50
Sacramento	.00	3.59	5.57	78	26	52
San Francisco	.00	5.69	6.23	82	42	62
San Jose	.09	3.30	4.73	84	28	56
Fresno	.00	2.21	2.84	75	40	57
Independence	.00	1.12	2.75	60	30	45
San Luis Obispo	.00	6.58	4.73	74	30	52
Los Angeles	.00	4.27	3.74	78	48	63
San Diego	.00	1.38	2.25	76	48	62

of Los Angeles. However, there will be plenty of turkeys in California at good prices for the grower of good turkeys—a point which should receive

more attention. San Francisco is expected to dispose of 250 tons of them during the holidays this year.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address

Cotton Growing in Central California.

To the Editor: There has been no discussion, so far as can be learned, of the reasons why cotton should not be extensively grown in central and northern California. Soil and climate are both favorable as I have learned from several years' observation both here and in the heart of the cotton growing states. Much the greater part of the crop is produced in a colder climate than this. The nights are warmer there and the atmosphere more humid, but these differences are of no consequence as shown by the results in Imperial valley. Heavy land that would produce large crops of wheat was selected for cotton.—G. C. A., San Francisco.

You are quite correct in your conception that the natural conditions over great areas of our interior valleys are well suited to cotton growing. There are ample records of experience to justify that conclusion. Over 40 years ago a ship load of San Joaquin valley cotton was shipped from San Francisco to Liverpool. But suitability for growing cotton is not the secret of getting a profitable cotton crop. It is the gathering of the crop which determines that. What California has done during the last fifty years to meet that difficulty is a very interesting story which we may try to tell some day. The fact is that California has no cotton-picking population and the frantic efforts which some have made to install such a population are interesting to remember. Perhaps the Japanese could be taught to pick cotton, but the wages they have to be paid precludes such an experiment. The Imperial valley growers started in with the expectation that plenty of Mexicans and Indians would settle their picking problem, but they were only partly justified in this hope, for they have had to bring in many women cotton pickers from Texas, Oklahoma, etc., and they had to marry a lot of them to keep them. Labor supply, willing and able to pick at wages which the traffic will bear, is the key to profitable cotton growing.

Growing Castor Beans.

To the Editor:—What can you tell us relative to castor beans for oil purposes and the quantity of bean seed it takes per acre, etc?—L. C., Stockton.

Although the common ornamental castor bean plant, which grows almost like a tree, is not the species used for oil making, the oil species is quite a large plant and should not stand nearer than three feet apart in rows six feet apart. This would require about 12 pounds of seed. But this is not the important question—which is whether you should monkey with castor beans at all. A few castor beans were grown in Los Angeles county forty years ago, but the crop was abandoned as unprofitable in competition with imports from India. One trouble in California is that the clusters of beans ripen successively and require too much hand-labor in picking, drying and popping out. In the Mississippi valley they have a shorter season and ripen more evenly, but are now considered unprofitable and being abandoned. The high cost of living does not seem to help out castor oil. If, however, you wish to try the crop be sure you get the right kind of seed from an oil manufacturer and a contract for the crop also, for no other buyer on earth has any use for castor beans, which are poisonous. A case was reported the other day of a man who tried to reduce expenses by eating the beans instead of buying the stuff in a bottle, and they put him beyond the reach of castor oil very quickly.

From Alfalfa to Vines.

To the Editor: What is the best way to prepare an alfalfa field for grape planting during coming three months? Which way should I plant grapes: 8x12 or 10x12? The vines are to be irrigated.—Subscriber, Live Oak.

It would be rational to get a good grain crop with the alfalfa waste—disking after harvest to clean the land from any surviving alfalfa, or weeds,

and plant vines a year later. However, you wish to go faster. Plow at once as deeply as you can cover well over the green stuff; cross with a pretty straight disk and let the land lie rather loose for rain. Disk or weed-cut during January and February, when there is green stuff to kill and the soil works well. This ought to leave the land fairly clean and in shape for planting as early as you like. As for distances, you do not say what grape you wish to plant. The Thompson habit is pretty strong in your region, however, and probably that is what you have in mind. Growers do not agree on distances. We should say 8 by 12, but you had better talk the subject out with local growers whose experience you have reason to respect. J. A. Schlueter of Fresno county, whose experience with Thompson vines is given in detail on page 670 of last week's issue, and whose vines are 10 by 12, says he would prefer 8 by 12 to save space. A distance of 6 by 12 would increase danger from mildew.

Peach on Apricot and Plum.

To the Editor: Is it possible to graft the peach onto the apricot and plum? When is the best time to do it? What form of graft would be best for putting the peach scions onto limbs about one inch in diameter?—L. R. G., Oakland.

It is possible, but it is not desirable. In Europe the peach is often worked on the plum to meet heavy soil conditions. In California it was tried and abandoned decades ago because it interfered with such free growth of the peach as we desire and which is easy to obtain on the free soils which we choose for the peach, either with the peach or almond seedling roots. The peach makes a better growth on the apricot than on the plum and shows less over-growth of the stock, still we have few peaches on apricot, but many apricots on peach root, where Myrobalan is not necessary. On stock an inch in diameter we would use a side graft.

If you are asking for garden practice we would say go to your proposition and see what you get. If it is a commercial planting of trees now young, we should keep what we have or pull them out and plant new trees of the kind desired. Peach trees come along so fast in California it is usually a waste of time, money and loss of uniform, satisfactory growth to undertake grafting over young trees in place.

No More Pears for Him.

To the Editor: In your issue of December 2 you answer my questions about preparation for replanting fruit trees on land from which I had blown out unprofitable old pear trees. If I said I wished to re-set pears, I surely told you wrong and I am willing to take it all back, chew it all to pieces and swallow it. It is French prune trees that I wish to plant. I am surely sorry that I did not take out the pears a long time ago and then I would not have been putting such looking dried pears on the market as I have. Well, I hope this will find you in good spirits and looking ahead to the holidays. I wish you many good things and a Merry Christmas.—J. M. P., Healdsburg.

Thank you very much: the same to you. The hints we gave about preparation of land for replanting, applies to prunes and other fruits. Of course the failure of the pears should suggest close inquiry as to whether the land is suited to fruits or not. We have seen fair pears on land from which we would not expect much in the way of prune crops.

Sultana or Thompson?

To the Editor: Which would you suggest, Sultana or Thompson, to plant on white ash land and sub-irrigated? I hear that Sultana would be so late that they would stay to sour. The water level is about six feet.—J. G. N., Dinuba.

So far as we know there is not enough difference in the ripening of the two to render Sultana par-

ticularly liable to souring. In your district both grapes are bearing immensely under such conditions as you describe and even with higher ground water than six feet. You should, however, pay attention to the recommendation of the Raisin Association that the increasing Thompson acreage be carefully considered. It seems to us that there may be considerations on the marketing side more important than on the growing side and it might be desirable for you to make your choice on that basis, rather than on the questionable prophecy about the behavior of the vines.

What Killed the Peach Trees?

To the Editor: I have lost quite a number of Muir peach trees after coming into bearing and most of them have borne for four years. The soil is light sandy. I am also troubled with Black Knot; most of it is deep down in the roots. Certain localities around Hanford have alkali. Would it be a good thing for to put out vines where trees have died?—W. A., Hanford.

Trees often die on sandy soil if they strike down into alkali soil or water below. Sometimes they die on a deep sandy soil for lack of irrigation after fruiting. When you see a tree failing you ought to dig down at once and see if the soil is either dry or muddy below. This ought to be done immediately, for conditions may change after the injury is done and you cannot see the cause. It is probable that your trouble is alkali, and to determine that send to the College of Agriculture at Berkeley for a circular giving instructions about taking and sending samples for examination. Knots on the roots "deep down" may exist for a long time and the tree be thrifty and productive. It is when they are massed on large roots near the surface that they shut off growth, and must be removed as soon as discovered; and they should be frequently looked for. If the trouble is alkali there is little use of planting vines. If it results from drying out vines may do fairly well where peach trees would fail.

Sweet Clover Under Hardship.

To the Editor: I wish you would tell me through the paper will sweet clover withstand wet land black and heavy with not too much alkali. I have grown fair crops of small grain on it but of course the yield is hurt by water.—R. E. S., Bishop.

We have never seen sweet clover (*Melilotus alba*) under your conditions east of the Sierra, but Prof. Linfield of Montana, an excellent observer, says of it: "Extremes of heat and cold do not seem to affect the plant. It grows well in the far south and all the way northward including Montana, where it grows well in every part of the State. It can withstand very great extremes of wet or dry soils and it will grow on stronger alkali soil than any other farm crop." Such testimony warrants you in making a trial of it.

Pruning French Prunes.

To the Editor: How would you advise pruning three-year-old prune trees—that is, would you advise cutting back main branches, etc?—M. A. H., Sloughhouse.

If you have the French prune and the trees have made three seasons' growth and have been properly cut back to get good branching in previous years, we would not cut back main branches any longer. If you have too many branches remove some of them wholly from their starting points, also remove or cut back to a proper lateral those which are going in wrong directions for good shape in the tree. Do not clean off short laterals or spurs; they will give you your first fruit.

Redwood Shavings in Manure.

To the Editor: Will redwood shavings, used moderately for bedding in the stable, injure the land on which the manure is used? If so, how does it affect the land and how could the injury be overcome?—Subscriber, Mountain View.

Used as you propose, such shavings might make light land lighter and more likely to dry out. On heavy land the injury might be changed to a benefit. Practically the amount you would probably use would not make any difference either way, but shavings would not increase the volume of available manure as would the use of straw which more easily decays.

The California Olive Outlook.

Lack of markets has recently discouraged olive growers. Small, unripe, imperfectly processed fruit and lack of organized market development were the causes. These are being removed.

[Written for Pacific Rural Press.]

Is the olive business looking up?

Last spring and the fall before, we attended representative olive growers' meetings and found the growers in despair about selling their crops. This in spite of the fact that California grows less than 2 per cent of the olives of the world, and sells only one-fifth of the olives used in U. S. The rest of the world's consumption comes practically all from the Mediterranean countries. Ripe olives were retailing at about \$2,000 per ton in Chicago, whereas a third of that price would give plenty of profit to everybody and \$170 a ton to the grower, besides increasing consumption enormously.

Since then, three important moves have been made, which improve the outlook.

The California Associated Olive Growers Inc. has been organized with one of its directors appointed by the State Market Director to prevent misuse of power or funds. This co-operative movement is not rushing madly into the quicksands of the great problems of the industry; but is building good roads for itself as it moves forward. Its pack this season was small, but is all sold, having been put up as a foundation for future business.

An amalgamation of some of the largest canners has occurred, which will give a better, more powerful and widespread system of distribution, and can give greater chance for uniformity in grading to prevent the discouragements to consumption which are so often met by those who try to use our olives.

A standard of ripeness has been determined by a meeting of packers and representative growers in the State Market Director's office. Not everyone is adhering to this, but the chances are that those who do, and who advertise the fact among prospective consumers, will be able to sell to better advantage.

Ripe Olives.—We speak of the ripe olive alone, for two reasons. Green olives, used as a relish, must never have a limited market as they have in the past, for they have nothing but the taste to recommend them—and this is no recommendation, in many cases. Ripe olives properly cured, not only have a most satisfactory taste to most people, but they have the digestibility and food value also.

The following table, furnished by Prof. M. E. Jaffa of the University of California, shows the relative food and fuel value of ripe olives. Moderate-sized Mission olives were used for this comparison:

	%	Water	Protein	Fat	Carbohydrates	A. B.	Calories
FOOD							
Olives, ripe	69.60	2.00	21.00	4.00	3.10	958	
Olives, green	78.41	2.43	12.90	1.78	4.48	598	
Pickles	93.80	1.10	.40	4.00	.70	110	
Bread	35.30	9.20	1.30	53.10	1.10	1215	
Rice, raw	12.30	8.00	.30	79.00	.40	1630	
Rice, boiled	72.50	2.80	.10	24.40	.20	525	
Potato, edible portion							
Raw	78.30	2.20	.10	18.40	1.00	385	
Boiled	75.50	2.50	.10	20.90	1.00	440	

Large sized ones would show as much as $\frac{1}{2}$ more food value.

By chemical analysis, the fat or oil of the green olive is only 60 per cent that of the ripe olive, and pound for pound, the olives have $\frac{3}{4}$ the food or fuel value of bread. The chemical analysis does not tell all, however, for the nutriment in the ripe fruit is far more digestible than in the green fruit.

Here, then, we have a sound basis for a great food industry.

Why the Market Has Not Been Developed.—That it has not been better developed up to date has been due to several causes. A packer could not afford to develop consuming demand independently, for he would get only part of the benefit after paying all the cost. Until recently, the packers have been unable to get together at all; and yet there are only a few of them in at least two separate associations besides that of the growers. United financial support of a constructive program of market development has not been possible any more than in the case of dried fruit packers.

Small Sizes Due to Orchard Run Buying.—In the mad scramble among packers to buy fruit, for a few years previous to 1915, they were compelled to buy olives "or-

there are on the market many green olives of far lower food value and no particular flavor, which have been artificially colored and labeled "ripe." Missions have freestones when ripe. Have what you eat been clings or freestones?

Converging Toward Highway of Prosperity.—Confronting and knowing these conditions, the highway seems clear and practicable to permanent prosperity for olive growers. Those who would travel that highway are likely to (1) buy [or sell] olives at better prices for large sizes than for small ones; (2) insist on standards of ripeness and processing, packing, and labeling, that will encourage consumption; (3) combine to advertise the food value of the ripe olive and develop markets which will take a regular increasing supply. All interested in the olive industry are traveling roads which lead to this highway of prosperity, and the future seems bright.

Acreage and Varieties.—By the County Horticultural Commissioners' reports last spring, there were 15,842 acres of bearing olives in the State and 11,574 non-bearing. By estimates from the same sources, about 1600 acres were set last planting season, the number being smaller than usual on account of the depressed markets.

Of this total acreage, by far the most are Missions; and the new plantings of Missions have exceeded all other varieties, largely because packers have consistently demanded them. They are easiest to process

BELLFLOWER POLLENIZATION.

"Are Bellflowers self-sterile?" asks a correspondent of the University Farm as reported in the "Agricola," students' publication. "I have a very light crop on a 20-acre block of 8-year Bellflowers, except where the trees are near a Newtown orchard." Prof. W. L. Howard answers: "This variety, like many others, produces far more satisfactorily when there is some other variety nearby to supply cross pollenization. Since the Bellflower and Newtown bloom together, you can very well topwork every fourth row of the Bellflowers to Newtowns."

chard run." This encouraged the production of small olives and lots of them; for the prices were high. In the fall of 1915 the crash came, and packers were accused, more or less reasonably, of combining to reduce the prices. They refused to buy crops, and many of those under contract were notified that fulfillment of the contracts would bankrupt the packers, and therefore they would not be entirely fulfilled.

It was found that a million dollars' worth of the previous year's crop was still on the shelves in Eastern markets, half a million in hands of California packers, and half a million on the shelves of California retailers.

The significant point is that all the large olives had been sold and the holdover consisted of small sizes. These had been canned because the packers had to take them in the "orchard run."

Unripe Olives Labeled "Ripe."—It is notorious, also, that it didn't make much difference how green or ripe the olives were, when picked—all went in together and were cured unevenly, as well as having uneven flavor, texture and food value, due to uneven ripeness.

The figures above, Prof. Jaffa notes, represent the food value of ripe fruit. Unfortunately, however,

ripe, hang on the trees till picked, often recover from frost shriveling, and are not afflicted with dry rot. They contain an average of about 22 per cent of oil, and the flavor is delectable. The fruit grows medium large if trees are properly pruned and cared for and of the right strain. Three to six distinct strains of Missions have been observed in California, and it is well to know where the buds come from.

Manzanillo is easily the second, being oval in shape, two to six weeks earlier in ripening than the Mission and therefore usually out of the way of frost. It requires prompt, careful, early picking and processing, and in at least two localities is afflicted with a dry rot. Its appearance and flavor equal the Mission in the estimation of many when properly processed. Mission and Manzanillo in the same orchard provide a longer season of picking which is desirable from both the grower's and the packer's standpoints.

Ascolano and Sevillano are large-sized varieties, rather low in oil, hard to process by present methods, more suitable for a relish than as ripe processed olives. But quantities of them are being processed, and with better methods, these varieties may acquire wider popularity than they now enjoy.

Declining Lemon Trees Renewed.

[By J. D. Culbertson, Santa Paula.]

In the spring of 1914, the performance of much of the Limoneira orchard was so unsatisfactory, with small sizes, ripens, and the other evidences of decadence, all calling for correction, that we undertook carefully to investigate the merits of heavy pruning as a last resort, and to determine in relation to it:—when it may be done with least sacrifice to present crop; when with least sacrifice to the following year's crop; what effect it might have on the percentage of ripens and small sizes; whether one can prune at such a season that the first succeeding crop will mature its fruit for the summer market, thereby compensating for loss in quantity by increased value; what type of cuts should be necessary and best suited to the purpose, as also how much cutting to do; what the expense would be, and how difficult the task of training men for it; what cautions to observe in an orchard-wide policy of heavy pruning, should it seem advisable later.

In brief, our method was to reduce the mean radius of the tree very little, but to remove all cross limbs, superfluous leaders and out-hanging corners, and relieve top-heavy boughs by heavy concealed cuts, avoiding as much as possible "heading" and the leaving of "holes" in the sides of the tree. The result was a sacrifice of perhaps sixty per cent of the foliage and thirty to forty per cent of the fruit spurs—wood less than one-half inch in diameter. For the experiment we selected the block of Lisbon orchard most in need of rejuvenation. All rows were picked just before pruning. Row 1 was reserved as a check to be given our customary prunings; Row 2 was pruned in May; Row 3 in June; Row 4, a check; then July and August and another check, and so on, one row for each month for twelve successive months, with eight check rows so arranged that each pruned row had a check on one side of it. Records of production were kept beginning January 1, 1914, showing monthly yields from each of the twenty rows included in the experiment.

As to the season when heavy pruning may be done with the least sacrifice in quantity of fruit, it is fairly evident that it should be undertaken as soon as possible after seventy to eighty per cent of the crop has been harvested. In our section this would enable us to begin late in May or early June, extending through July, and possibly August. It appears that the heaviest sacrifice results from winter and early spring pruning during the six months November to April, a season when the trees are laden with a full crop all but ready to gather.

Sacrifice to Get Summer Fruit.—While the data as to seasonal yields following heavy pruning are too incomplete for analysis, yet there are strong indications that the heavy sacrifice of yield resulting from winter and early spring pruning may be quite largely offset by a goodly production of high quality summer fruit. A comparison of the ripens reveals the fact that during the second crop year fruit from the unpruned check rows graded 30.5 per

cent ripe, as against only 16.6 per cent from the first four pruned rows, a ratio of practically two to one.

Where heavy pruning is undertaken we learned that whitewash should be used freely and promptly to prevent serious sunburn of large limbs and trunk. This is very important. Paint with asphaltum all large cuts, fumigate cautiously when the new growth has just begun, and spray with similar care.

Aside from the temporary sacrifice of fruit involved, the expense of making such a pruning is considerable. A good man will hardly prune more than eight or ten trees per day, the cost of hauling out the brush, or cutting it, amounts to several cents per tree, while the cost of painting the large cuts and whitewashing, adds at least another five cents.

Trees pruned later than July or early August are apt to put out a short growth that does not have time fully to mature before cold weather comes. As a consequence, it yellows up considerably during the winter months, but with the awakening of spring, it soon regains a normal color, or disappears beneath the out-pushing free growth of early summer.

Attempting tree renewal by heavy pruning, a small experiment should always be undertaken first, and in every locality at an early date; and the grower should be as sure as he can that the trees do not need food, better or less cultivation, pest control, less water or more. It is doubtful if even the heaviest production will bring a tree to the point of decline before the age of sixteen or eighteen years if it has been well treated and fed.

PRUNING HUNGARIAN PLUMS.

To the Editor: I have 150 Hungarian plum trees four years old next spring, planted among olives, so I want all the fruit as soon as possible. The first two years they were cut well back. Last year they were only thinned and had just a scattering of fruit. Would it be best to cut back one-third to one-half of the two years' growth, getting rid of some of the fruit spurs, or only thin them again this year?—R. L. L., Lindsay.

We have a photograph of some Hungarians belonging to Ed Ames in Placer county which had not been pruned for 12 years after they were as old as yours, except for a little thinning of the brush. They were lolling around a good bit like weeping willows, having been bent to that shape by the weight of fruit year after year. Mr. Ames had taken 680 crates from 197 trees the summer previous, and over 1100 the year before that. If you prune this winter you will get wood growth at the expense of fruit. But if the fruit sets too thick it should be thinned either by cutting out fruit spurs now or picking young fruit later.

Farmers along the Cosumnes river in the northwestern part of San Joaquin county have cut as high as 120 bushels of corn to the acre. These farmers are being paid \$2.30 per cental, or 55 cents above the Kansas City market by the Sperry people, the principal buyers of corn in that market.

TALKS ON Nitrogenous Fertilization

Number 4

WHAT is this SULPHATE OF AMMONIA that is so beneficial as a nitrogen fertilizer? Where does it come from, and how? It is a fair question and shall have a fair answer.

Bituminous coal contains about 1 per cent. of nitrogen. When it is made into coke, extensively used in smelting iron ore into pig iron, a part of the nitrogen in the coal is set free. If the coking is done in the by-product oven or coal-gas retort, the nitrogen can be recovered from the gas by passing it through weak sulphuric acid. The

SULPHATE OF AMMONIA

crystallizes out as a greyish-white salt, containing 25 per cent. of Ammonia, and has only to be drained, dried and bagged for shipment.

Coke is the one best fuel for smelting iron—in fact, it is a necessity—but so far two-thirds of this country's coke consumption is made in the old style non-recovery beehive oven, so the ammonia and other by-products are lost.

Conditions are changing for the better now and many new by-product plants are building, so a constantly increasing supply of Sulphate of Ammonia is assured.

By this modern alchemy the nitrogen stored up by the wonderful vegetation of the Carboniferous Age returns again to the cycle of life and growth, and furnishes sustenance for the human race.

Watching Buds in Peach Pruning.

[Written for Pacific Rural Press.]

Some varieties of peaches bear fruit buds far out on the past year's growth—others bear them near the older wood. In any variety, they are likely to be located nearer the base of the branch if they have not been shaded by too much brush, which should have been thinned out in pruning. If the cutting-back system is practiced, there is a good chance of pruning off all the fruit, if a certain proportion or only a certain length is left as many mechanical pruners are likely to do.

This should be considered in connection with the vigor of the growth. Cutting the most vigorous twigs the least; and with those varieties which have wood buds near the older wood, cut them back still less.

F. P. Gage of Sacramento county, who averaged 11 tons per acre for three years previous to last year on 11 acres of 9-year Phillips, heads back all new growth, leaving the fat twigs 10 or 12 inches long depending on the number of fruit buds such heading would leave.

"Pruning is the life of a peach tree," says he. "If you don't cut back a peach tree after it is 7 or 8 years old, it will die back" in his neighborhood. Possibly judicious thinning would work the same effect.

The man who does J. McKindley's pruning in San Joaquin county emphasizes long pruning on Lovells and Elbertas, but short on Muirs, whose fruit buds are close to the crotch. C. W. Van Gelder of the same county lost two crops of Lovells by heading back too far. Now he lets them grow long and thins out without cutting back.

M. Rusznak of San Bernardino

county, who sold to the canners 9 tons of Tuscan from five acres of dry-farmed 8-year trees, clips every branch, leaving two or three good buds on the slender twigs and three or four on the stronger ones. He clips even the spur twigs, hoping each season to finally have only one peach per spur. He finds his best fruit of both Tuscan and Phillips (of which also he has five acres) on these spurs. This clipping of all new growth reduces the fruit set, helps make it larger, and places it down on the strongest wood where it will exert least leverage. He likes to leave an eye above the top fruit bud to prevent the twig drying back through the fruit bud, if the season should prove too dry.

Spring Pruning.—For three reasons, peach pruning is often left until about the time buds are swelling. The strong buds will show themselves at that time. Most of the blighted buds and twigs will show up and may be pruned out. The soft peach wood can heal soon instead of drying out and dying back as there is a chance to do if pruned earlier. Mr. Rusznak points out the care needed in late pruning, not to knock off or loosen the buds that are to remain.

Fruit Buds.—On the peach, all fruit buds are borne on one-year wood. Naturally, there are two at each "eye" with a leaf bud between. Often one of these fails to develop or is knocked off.

It is not hard to distinguish them, though it takes a little longer to prune with regard to them than to shear off all but a uniform length of growth, but it pays well to observe this distinction.

Fast Orange Packing.

[Written for Pacific Rural Press.]

Anyone can amuse himself half an hour watching the oftentimes frantic efforts of orange packers to do fast work. Usually it is the men, who pack fastest; perhaps because they study to eliminate false motions. Instead of violently shaking every muscle in them, they work smoothly, with a swiftness which cannot be followed by the eye.

One of these, B. E. Gelker, was recently observed working at the Highland Exchange Ass'n packing house. The only motion of his body was a diagonal bend as he picked each fruit out of the bin.

When asked how many boxes he was packing per hour, he explained that he could pack only seven per hour of 288's, because the house requires more careful work than many do. However, each box of 288's or smaller counted as two on the pay check, which is rather unusual. He figured on 15 boxes per hour of 126's and 100's. Of these larger oranges, therefore, he would pick out, wrap, and pack some 1600 or 1700 per hour, or about 25 per minute.

While reaching for an orange with his right hand he would place the previously wrapped fruit into the box with his left and reach for another wrapper.

Never would an orange be placed in a wrapper. With the paper in

left hand coming flatwise toward the right, the orange would be hurled by the latter about a foot, into the wrapper. The impact would almost envelop the orange, leaving the corners of the paper ready to twist together. If it were placed against the paper, a few extra motions would be required to get the corners twisted.

While the right hand was catching up to the orange it had hurled, it would be turned nearly palm down with thumb toward the operator. At the same time the left hand would be turned nearly palm up with thumb away from the operator and the fingers closed around the orange.

When both hands closed over the fruit, they were in position to turn the thumbs with a quick twist toward each other, bringing the corners of the paper into a tight twist. Then the whole operation would be repeated.

With small oranges, two or three would be picked up at once, but always the right hand would be drawn back each time for enough to throw the orange hard into the left.

At 4½ cents per box (½ cent more than usual to compensate for extra care) Mr. Gelker was making well over 60 cents per hour.

A movement has been started looking towards the organization of a "Farm Bureau" in Sonoma county.

We Insure You Trees Free from Disease

Don't gamble on the future of your orchard.

Don't risk the loss of several years of your time and the waste of your money by getting nursery stock that may be infected with crown-gall or root-knot.

If You Buy Our Foothill Grown Trees

they will come to you clean. The foothills lands on which we grow our trees are immune from crown-gall, root-knot and diseases common to other localities.

Our trees are propagated from the best parent trees of their kind. They have those well branched fibrous roots, such as are grown only on our foothill soil and location. These roots are tree insurance—hardy trees—heavy producers of good fruit—profit makers.

For years we have grown nursery stock and have successfully operated 1000 acres of commercial orchard. All our experience in fruit growing and shipping is at your disposal.

If you are in doubt as to what trees to plant—if you are having trouble in your orchard—or have orchard problems—write Bergtholdt.

Our foothill grown trees are in great demand. Many varieties are selling out fast.

If you want disease-free, foothill-grown pedigreed trees, send us immediately a list of your wants for special quotations.

Apricot Vigor Due to Pruning.

Apricot habits of setting fruit wood require intelligent pruning to induce enough new wood each year to provide vigorous fruiting buds. Thin out weak branches and leave fruit laterals on the tree.

[Written for Pacific Rural Press.]

Hundreds of tons of "Moorparks" have been sold from the Royal and Blenheim apricots grown by C. O. Silliman, a pioneer and the largest apricot grower of Pajaro Valley. A "Moorpark" commercially, is the grade larger than "extra fancy"; though the Moorpark variety really has a distinct flavor as well as size.

Mr. Silliman attributes his big fruit to vigor of the trees and to proper thinning. There is no irrigation. The soil is a shaley, gravelly loam not over three feet deep, underlaid by yellow shot-clay interspersed with fine and coarse gravel.

Vigor of the trees is due not only to cultivation and fertilization; for many decadent orchards get much of that, but equally to pruning.

In pruning, he is guided by the growth of the tree. He likes a bearing tree to put on a foot or two of new growth each year. To induce this, he prunes at least annually, for an apricot tends to "bear itself to death." It makes fruit buds and spurs at the expense of new wood. These buds become weaker as the tree grows older, and may bloom; but many will not mature fruit. So, new wood to bear vigorous fruit buds is sought yearly. "I prune light for fruit and heavy for wood," says he.

Where new growth has been only one to six inches the past season, it is cut out entirely or cut back into old wood or not but back at all. Cutting back only into the new growth would reduce the already too little new wood available for fruit buds.

But on that limb will be many branches which have been growing so little that there is room for only one or two fruits on the new wood; and they would likely be weak. Thin out all of these and enough more of the weakest ones to throw sap into the stronger growth remaining, and make it still more vigorous.

Three Growths per Season.—On a young, vigorous tree which has grown several feet in the past season, there seem to be three distinct growths, according to Mr. Silliman. The first will be a bare twig perhaps 16 to 18 inches long. It checks up then. When the second growth starts, a lot of laterals put out from the upper part of the first growth. By the time the second growth is a foot long, these laterals may be of equal length, and they may grow six or eight inches more by the end of the season. Fruit buds develop on these first laterals late in the fall to bear next year. During a third growth of several inches, fruit laterals will also develop from the upper end of the second growth, leaving its lower part bare.

Many people cut back to one of these fruit laterals in pruning. They then have a fruit branch at the end of the limb, which cannot develop the required new wood but will bear fruit; and that branch will soon have blocked the limb's chance to grow.

Mr. Silliman does not want those fruit laterals to block the wood

growth. He cuts to a wood bud above the laterals on the first growth and thus gets both fruit and wood. If fruit is wanted lower on that branch, it is cut off below the laterals so it may next season send out fruit laterals lower down. Often a whole branch is cut off because it has not fruit enough low down.

Watersprouts inside the tree are great opportunities to get the finest quality of fruit. Such a sprout is cut back a few inches, and is likely to put out a leader but not many. It will make lots of fruit buds and

bear fruit which is smoother and better because better protected by foliage from the fogs and bright sun of this coast valley.

WINDBREAKS FOR PEARS.

"Wind is one of the worst things fruit growers contend with here," said E. H. Goepfert of Vaca Valley recently. He wanted to raise some pears. So he planted Wilders and Bartlett's with figs between, hoping that the figs would shelter the pears.

Eucalyptus trees make good windbreaks within two or three years, and if subsoiled as described in a recent issue, would not injure the pear trees at all. There might be some objection to eucalyptus for fruits which require bright color, on account of the shade which tall trees cast early in the afternoon.

FRUIT TREES REGISTERED.

[Written for Pacific Rural Press.]

New Zealand takes its orchard acreage to assist in developing the industry. Everyone owning one fruit tree or more must register and permit inspection and destruction of such as may be too badly diseased. There is no charge for registration and no tax for less than 1 acre. Registration was to be complete before Oct. 26, 1916. This enables the government to control diseases, and furnishes accurate statistics of acreage.

The Northern California Olive Corporation, according to F. Dunning Fowler, principal stockholder, will open up a retail store for its products in New York City, and sell directly to the consumer.

FOR PROFIT ROEDING'S PLANT

TRUE PEAR TREES

Read What One of Many Satisfied
Growers Says About Our
Pear Trees:--

"I want to give you a few particulars concerning the Bartlett pear trees which I purchased from you. Within two years after I had planted my orchard, it had made such a remarkable growth and the trees were so thrifty and free from disease that it attracted widespread attention and caused prominent fruit growers from all over the Pacific Coast to make investments and immediately commence the development of their properties so at this time there are over two thousand acres planted to pears and apples.

"I want to take this opportunity to express to you my appreciation of the advice given me by your Mr. George C. Roeding concerning pruning and general cultural directions. Although I gave the orchard the best of attention, I do not hesitate to say that the actual demonstrations which he made in pruning had much to do with the uniform, shapely appearance which the trees present today. My orchard is located on an elevated plain 4000 feet above sea level where the climatic conditions are extremely favorable, causing the pears to ripen very late in the fall so that they keep in perfect condition for the holiday trade. Experts have pronounced these pears perfect in appearance and exceeding in quality anything which they have ever received from any other section of the country. I have planted several orchards since and I obtained these trees from you. These younger orchards are doing just as well as the first one I planted. I have simply had splendid success with your trees.

(Signed)

"B. M. DENISON, Tehachapi, Cal."

Thousands of Other Planters

will testify to the same concerning Roeding true trees—whether it be pears, apples, prunes, peaches, apricots, olives, oranges, or any other fruit.

Now Ready:---

—our big new illustrated catalog.

We have just received from the printer our 1917 Catalogue, which is the most complete one we have ever issued. It is attractively illustrated; lists and prices over 2000 varieties of fruit and ornamental trees, vines, shrubs and plants. If you haven't already sent for a copy, it will pay you to send us your name and address now. A post-card will do.

Let Us Help You Decide What to Plant

Tell us what you propose to set out, or let us know the nature of your soil and we will gladly advise you as to what is best adapted to it.

Plow and Scraper to Prevent Soil Loss.

"The loss of soil by rains is one of the most serious problems of farmers in this section today. Every rain carries away much of the more fertile surface soil from rolling and hilly land, and if we do not want our farms permanently ruined, we must find a means of stopping this process. In Carroll county we recently installed a system of Mangum terraces at a cost of only \$14 a mile which have been in operation for only a short time, but have already proved that they will be effective," says R. L. Furry of Missouri.

"The plan is based on the fact that anything which makes the water flow more slowly, reduces its power to cut and carry soil from the field, and prevents both the gully, which we all notice, and the sheet washing, which most of us overlook.

"Terracing is not needed on land that has a fall of less than four feet in every hundred and will do no good if the fall is more than fifteen feet in the hundred, but no system can save cultivated soil on such steep land. On land with a slope of four to fifteen feet in every hundred, terraces should be constructed—one for every three to six feet fall. They consist of low, broad ridges about eight or ten feet wide running almost square across the slope of the hill, but allowing a slope of six inches in every hundred feet of ter-

race. The lines should never be run 'by the eye.' A surveyor can do it best, but a farm level in the hands of a man who knows how to use it will do very well.

"The terraces are made by back-furrowing along a line selected until about six furrows have been thrown up on each side. A road grader or drag is then run along the upper and lower sides two or three times, throwing the soil up from below and down from above so that there is a broad shallow ditch above to carry the water away at a low grade that will prevent washing. The terrace is about sixteen feet wide the first year and may be widened to twenty feet the second year by plowing two more rounds and dragging the dirt in with a scraper or drag as before. This makes a terrace so low and broad that it is easy to cultivate over it with any farm tools.

"Gullies across which terraces are to be constructed must be filled and watched closely, especially at first as they are likely to break the terrace and defeat its purpose. If the field is near a road, these terrace ditches should empty into the road ditch, otherwise they may empty into the main ditch in the field or any other convenient place. They should not be more than 1500 feet long or they may break during a heavy rain."

San Joaquin Valley Rice.

To the Editor: In your issue of December 9th I note the following item:

San Joaquin lands have been found unprofitable for rice, according to reports from sections where experimental fields were planted this year.

Which is not true so far as this section of the San Joaquin Valley is concerned. Last March this company leveled and checked 140 acres of land of which 132 acres were actually seeded to the Waterbune variety. From this acreage, 3,522 barley sacks of rice was produced, averaging 100.3 pounds per sack, or 26.7 sacks per acre, which amounts to 2678 pounds per acre. Some of the checks yielded about 42 sacks per acre, and others only about 10, but the average for the entire tract was as stated above.

The crop suffered severely from the depredations of blackbirds; and the rains the latter part of September delayed the harvest fully three weeks, which resulted in a heavy loss from shattering. I believe I am safe in saying that the crop suffered a loss of 15 to 20 per cent from these two causes.

This was our first attempt at rice raising, and was in the nature of an experiment, and without any previous experience in rice culture. With the knowledge gained from our first attempt I am satisfied that our next season's crop will largely exceed this.

J. J. Granville.

San Joaquin.

BUSHEL OF EAR AND SHELLED CORN IN BIN.

To the Editor: How many bushels of Indian corn on the ear, and shelled, in a bin 8 feet 10 inches by 7 feet 6 inches by 4 feet 6 inches?—C. W., Sycamore.

There are 2150 cubic inches in a legal U. S. bushel. Since shelled corn is usually measured in rounded bushels, figure about 2300 cu. inches. For ear corn, Woll's "Handbook for Farmers and Dairywomen" figures 2748 cubic inches in a heaped bushel. Divide the number of cubic inches in the bin by the number of cubic inches in a bushel to get the number of bushels. A bushel of ear corn by volume is figured as making $\frac{2}{3}$ of a bushel of shelled corn. This varies with depth of kernels and size of cobs.

BUG-IMMUNE PUMPKINS.

To the Editor: Occasionally I notice in the Pacific Rural Press a question asking what to do for squash bugs that destroy pumpkin vines. We think we have found a solution of the problem. The first two years we lived here we planted field pumpkins. They were beauties, weighing between 70 and 80 lbs. The third year the bugs took the whole crop except a few cushaws in the garden. Although bugs were here by the hundred they did not trouble them, so we just put in cushaws the next year and every year since. The bugs are still with us, but never trouble the cushaws. The largest, firmest cushaws make the best pies I ever ate, and are just as good for baking. We use them for stock too.

Vetch Succeeds After Failure First Year

[Written for Pacific Rural Press.]

Vetch planted the first fall on 15 acres of R. F. Fisher's Humboldt county hillsides at the rate of 50 pounds vetch per 125 pounds oats, was a failure; though the entire field of 20 acres had been manured. The crop was a ton per acre of oat hay. The next fall the whole 20 acres was planted at the same rate, and 15 acres produced three tons per acre of vetch-and-oat hay, while the five acres not in vetch the previous year was a failure. Mr. Fisher also says that he has succeeded with vetch on unmanured land the second year after having failed the first year on the same piece, not having used artificial inoculation.

Prof. B. C. Lipman of the College of Agriculture says, "In such soils as those of Humboldt county, it is very common for the legume bacteria to be either very scarce or non-existent. For that reason the first planting of a vetch crop without adequate inoculation would mean either partial or entire failure. But the seed of the vetch always introduces a great many legume bacteria; and for that reason a second planting may frequently give fair or good success. You see, therefore, that the matter is simply one of inoculation, and the second year's results would naturally be good, whereas the first year's results might fail."

Rural Sanitation.

To the Editor: Farmers are very careful to save the manure from horses, cows, hogs, sheep and poultry so that it can be returned to the land, but the sewage from the house is generally allowed to run into a cesspool that frequently contaminates the water supply in the well causing sickness and death in the family.

If a cement manure pit was built to receive the solid and liquid manure from the stables, it would be an easy matter to run a drain or sewage pipe from the house to discharge into a separate compartment so that it could be pumped over the manure to prevent firefanging; and the manure would be more valuable for the addition. For many years

we have used the dry earth system instead of the water closet system. The dry earth, if a sufficient quantity is used, deodorizes the deposits and if emptied periodically and thoroughly worked over with a shovel it is absolutely devoid of smell and in appearance looks like so much dry soil.

We have grown beets for stock of an enormous size by giving them a good top dressing of the "poudrette" as it is termed.

As long as the cities waste their sewage the farmers will have to purchase artificial manures. The Chinese and Japanese are wiser than we in this matter, consequently for thousands of years they have kept soil fertility.—S. H., San Jose.

Peruvian Alfalfa.

To the Editor: Kindly advise me as to the relative merits of common alfalfa, smooth Peruvian, and hairy Peruvian alfalfa for planting on good sandy loam in the Chino district, plenty of water.—W. W. C., Ontario.

Safe enough in your soil and district where you have good drainage. We print comments on hairy Peruvian by W. E. Bryan, Plant Breeder at the University of Arizona. He has tried it most extensively:

"Hairy Peruvian alfalfa is somewhat more likely to be winter-killed where frost is rather heavy because of the fact that this variety grows at a lower temperature than the common varieties. Its hairiness does not interfere in the least with its feeding value. We have no data which compares this variety with the so-called smooth Peruvian alfalfa. The lowest temperature at which the hairy Peruvian alfalfa will grow is about 49 deg. F., while the lowest temperature that the ordinary varieties will grow is about 58 deg. F.

"This Peruvian alfalfa will produce 1 to 2 cuttings per year more than the ordinary varieties owing to the fact that it grows at a lower temperature and will grow during the winter months. This results in an annual yield about 15 to 20 per cent greater than other alfalfa.

"It makes vigorous growth and recovers quickly after it has been cut. It is cut while still somewhat succulent, it makes as good forage as any other variety. It has, however, the disadvantage of being somewhat woody when allowed to

grow too long.

"As an all-round alfalfa for the Southwest, where thorough irrigation is possible, and where the winters are mild, it will perhaps prove as good as any other variety that can be secured."

THIS YEAR'S CALIFORNIA BEAN CROP.

To the Editor: How does this year's crop of beans in California compare with the average?—E. M. A., Exeter.

From one of the best authorities, we have the following estimate of this year's crop: Pinks 650,000 sacks; limas 1,800,000; small whites 550,000; large whites 150,000; cranberry 150,000; black-eye 150,000; bayou 100,000; red Mexican and kidney 50,000.

The blackeye crop last year was estimated at more than double the above; limas about the same. In 1914 the lima crop of 1,500,000 sacks was the biggest ever; small whites slightly more; large whites about the same, bayous smaller, pinks the same; and the rest double. The total of the estimate of this year's crop is 3,600,000; 1915, 3,868,000; 1914, 2,905,000; 1913, 1,165,000; 1912, 2,013,000; 1911, 2,825,000; 1910, 1,950,000; 1909, 2,340,000 sacks of 80 pounds each.

SORTING FROSTED BEANS.

To the Editor: Is there any way of separating frosted beans from good ones except by hand picking?—E. M. A., Exeter.

Who knows?

Over 25 Years Experience

Alfalfa Hay Grades.

"Many farmers seem to think that alfalfa hay is just alfalfa hay. But some of the growers have found out to their sorrow the buyer does not believe this. Probably 90 per cent of the farmers who are raising alfalfa could not describe the six grades of alfalfa hay as adopted by the National Hay Association," says a University of Arizona writer. Here are the grades:

Choice—Shall be reasonably fine leafy alfalfa of bright green color, properly cured, sound, sweet, and well baled.

No. 1—Shall be reasonably coarse alfalfa, of a bright green color, or reasonably fine leafy alfalfa of a good color and may contain 2 per cent of foreign grasses, 5 per cent of air-bleached hay on outside of bale allowed, but must be sound and and well baled.

Standard—May be of green color, or coarse or medium texture and may contain 5 per cent foreign matter; or it may be of green color, of coarse or medium texture, 20 per cent bleached and 2 per cent foreign matter; or it may be of greenish cast, of fine stem and clinging foliage and may contain 5 per cent foreign matter. All to be sound, sweet and well baled.

No. 2—Shall be any sound, sweet and well-baled alfalfa, not good

enough for standard, and may contain 10 per cent foreign matter.

No. 3 Alfalfa—May contain 25 per cent stack-spotted hay, but must be dry and not contain more than 8 per cent of foreign matter; or it may be of a green color and may contain 50 per cent of foreign matter; or it may be set alfalfa and may contain 5 per cent foreign matter. All to be reasonably well baled.

No Grade Alfalfa—Shall include all alfalfa not good enough for No. Three.

Veneering Baled Hay.—The U. S. Department of Agriculture is investigating the practice of some shippers of hay of veneering or facing the bales. Veneering consists in feeding to the baling machine an occasional forkful of hay that is of higher grade than the bulk of the lot being baled and manipulating the forkful in such a way that the high-grade hay covers the outside of the bale, making the bale appear to contain better hay than it actually does contain. The National Hay Association has requested the department to co-operate with it in trying to eliminate this practice. Buyers of baled hay are warned to be on the lookout for this practice in order to avoid accepting on a cursory examination a lower grade of hay than they intend to purchase.

Uncle Sam Helps Market Products.

The development during the last fiscal year of a more extensive and more highly perfected demonstration market news service for perishable fruits and vegetables and the performance of work preliminary to beginning a similar service for live stock and meats are described in the annual report of the Office of Markets and Rural Organization of the U. S. Department of Agriculture, which has just been published. The news service for perishable foods and vegetables, established for four products in 1915, was extended to include a number of new crops, an additional number of stations in producing territory, and an increased number of permanent offices in market centers. The service has reached a much larger number of persons than during the preceding year and has, according to reports, been valuable in assisting growers' organizations to plan selling campaigns intelligently; in promoting better understanding among growers, shippers, commission merchants and consumers, and in facilitating efficient marketing operations in other ways.

Grading and Standardization.—

MISSION OLIVES EARLY RIPENERS.

THE EHMANN OLIVE CO.

Oroville, Cal. Nov. 17, 1916.

Mr. W. A. Hayne, Box 461, Marysville, Cal.

Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Fogg grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost which shows that they are early ripeners. We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know. Yours very truly,

(Signed) E. W. EHMANN.

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive trees, and like the Fogg trees, they are all propagated from the large size cuttings. W. A. HAYNE.
Box 461, Marysville, Cal.

The office has continued its studies of market grades and standards for various farm products.

Investigations into the reasons for the economic loss of foodstuffs in transit are being continued, and possible methods of improvement are being studied. Co-operation between shippers and carriers with a view to reducing loss has been stimulated in various instances. Experimental shipments of various products originating on the farm, aggregating nearly 39,000 pounds, were made by parcel post during the year. Results from these and earlier shipments, according to the report, indicate that it is physically possible to ship almost any commodity by parcel post when it is properly packed and handled. The experiments have shown also, however, that comparative returns from other marketing methods must be considered and that it is essential for success in parcel-post marketing for shippers to grade and standardize their products and to use suitable containers.

SWEET OR FIELD CORN AND SORGHUMS DO NOT MIX.

To the Editor: Will sweet corn and Egyptian corn, or wheat, mix? We sowed 5 rows of the Gyp wheat between the rows of fruit trees on an acre of the orchard, and a row of sweet corn in the line of the fruit trees. The Gyp corn grew ten feet high and smothered the sweet corn, but a few of the hills raised and ripened a cob or two. Of these we find the cobs contain a few genuine grains of sweet corn, but the rest of the grain appears to be white field corn. As there is no field corn grown anywhere near us we imagine the sweet corn and the Egyptian wheat have got crossed. We planted a dozen of these grains and they grew all right, but were planted too late to mature seed this year.—S. H., San Jose.

Sweet corn or Indian corn cannot mix with Egyptian. Your sweet corn had been pollinized last year while it was growing, with Indian corn pollen. Or possibly some unknown

agency had carried field corn pollen to the silks of the sweet corn this year; for such a mixture sometimes shows up the season it is made, according to Prof. Madson of Davis.

Six Months Not Enough.

To the Editor: Some time ago you answered in the affirmative a query from a man concerning his getting employment for six months on a ranch for the experience before buying a farm for himself. Your answer is of course correct, but I would modify it by saying that six months is too short a time. In the first place, he would at best get the benefit of two seasons only, and every season calls for a different treatment. In the second place it would be difficult to be sure in six months the kind of farming for which one is best adapted. I would suggest that he obtain work on an orchard farm, a dairy, and a poultry farm. Any small ranch and almost all large ones include these three; besides he might find his talents lie in any one of these specialties. A friend of mine bought, in this neighborhood a small but well-equipped dairy which showed a regular and sufficient income. On taking possession he found he couldn't possibly milk more than four cows. He was forced to hire a milker—the income was no longer sufficient. He sold to an experienced dairyman, who is making better than good. I could relate of my many mistakes that might have been obviated by a little experience. We have farmed our present place for two years and we feel we are just beginning to grasp the situation. At the end of our first six months we thought we were old farmers. Today at the end of our two years' experiences we feel we needn't repeat our mistakes of the past, but we know that we will make new ones, less expensive, we hope, in the future. There is so much to be said to men taking up farming, or rather so much that I could say from the point of view of a man having taken up farming late in life, that I won't attempt it now. It will keep for another story. Worthington Ames.

Yuba county.

[We did not prescribe six months. The querist named that period for himself and we let it go at that because it seemed rather promising. So many beginners do not wish to give six minutes but think they can farm better than a farmer without any experience at all, that we simply took what was offered. Of course much longer training is desirable.—Editor.]

MILO MAIZE.

To the Editor: Please tell me something of milo maize in your paper. I suppose it should be planted in rows, and if so, how far apart on good land? How much seed will it require for an acre of ground? Could I, by stopping some of the holes, plant with a grain drill? I have planted beets that way with good success. Will it stand much frost when young? We plant corn from May 1st without much danger. We sow barley from Feb. 15 on. Will milo stand as early as barley, or should one wait until corn planting time? Is the fodder, after grain is harvested, of much value?—R. E. S., Bishop.

[Answered by Prof. B. A. Madson, University Farm.]

Milo maize, like all the sorghums, is very susceptible to frost and cold weather generally, and should not be planted until the weather is quite warm or until the soil is warmed up thoroughly. In fact sorghums of

this kind require more heat than corn and should not be planted until after the corn crop has been planted.

The usual method of planting this crop is to drill it in rows three and a half feet apart, using five to seven pounds of seed per acre. An ordinary grain drill may be used by stopping up some of the holes, though by this method more seed will probably be put on the ground than is absolutely necessary. However, the cost of the seed is a very small item in the production of the crop. The growing season of milo maize under normal conditions is one hundred and thirty days.

It may be used either as a grain or a forage crop, as the vegetative portion of the plant remains green until after the seed is ripe. If it is desired, the seed can be harvested and the stalks then cut and used for fodder, though, of course, the feeding value of fodder of this kind will be relatively low.

EARLY POTATO VARIETIES.

To the Editor: Which are the best two early potatoes to plant for market, as to appearance, smoothness, and yield? What is your opinion of the "Freeman"?—W. C., Watsonville.

[Answered by State Inspector W. V. Shear, Stockton.]

Perhaps the earliest potato used in a commercial way is the Triumph. This is a round, red, rather deep-eyed potato which matures very quickly and is grown because of its earliness. It never yields very heavily. The Cobbler is the next standard early potato. This is a round, deep-eyed potato, especially when grown in rich soil; is a good yielder but not very well known on the Pacific Coast. The Early Ohio and Early Rose are light red, fairly

early standard varieties, the Early Rose being the better yielding variety. On the Pacific Coast the White Rose is most largely used for an early potato, it being smooth, oblong white potato which looks well when boxed for market and takes well with the trade. It is a good yielder on rich soil. The Freeman is a medium early, round to oblong, white, medium shallow eyes and yields well under average conditions. It can hardly be called an early potato.

Owing to the arrival of raw sugar on the market from Cuba the price of sugar in Fresno fell 25 cents on the 100-pound sacks. Sugar is now selling for \$7.40 as against \$7.65 the first of last week. A further drop in sugar is expected.

SUPERPHOSPHATE
and animal manure make a splendid
FERTILIZER FOR ALL FRUIT TREES.
The Mountain Copper Co., 332 Pine Street, San Francisco.

Price Advance
January 15
1917

THE rising cost of material used in the construction of the Yuba Ball Tread Tractors has reached such a point that we are no longer able to maintain the prices heretofore charged.

It has been our hope that the increased output, the utilizing of improved mechanical devices in the manufacturing, the introduction of greater efficiency, the standardizing of factory practice, would enable us to continue supplying the tractors at the present prices.

But recent sharp increases in the price of steel necessitate an advance of 5% to 6% on each model.

*All orders received
before January 15, 1917, will
be accepted at the
present prices*

Gentlemen:—I have been thinking of buying a Tractor some time—possibly next year—but may decide to buy before the advance.

Please send me your Catalogue. I have.....acres. Yours truly,

.....

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

HOW TO AVOID TRACTOR MOTOR TROUBLE.

[Written for Pacific Rural Press.]

To one who wanted to know how to avoid trouble with a tractor, the lectures at the Gas Tractor Drivers' Short Course at University Farm, Davis, Nov. 13-24, were full of value.

Following are some of the pointers made by F. L. Peterson in one of the lectures Nov. 21.

When you take cotter keys out, stick them back where they belong. This will save time when you need them and will keep them out of the crank case where some have been found.

Get a Dust Remover for the air that goes into the carbureter. When dirt enters via the carbureter, it wears the piston rings and cylinder. It is carried by the oil into the oil of the crank case where it helps wear out the crankshafts.

A man should be intimate with his crank-case. Sometimes baling wire found there would be better elsewhere. The oil well in the crank case should be examined daily and the bearings adjusted while warm. If allowed to get cold and then adjusted tightly the expansion when it warms up may make it stick, and jar things. Be sure you don't get dirt into the crank case from your sleeve.

Stop by Shutting off Gas.—How often the crank case should be washed out depends largely on how you stop your engine. If you stop it by shutting off the spark, there will invariably in a four-cylinder motor be at least one charge of fuel in a cylinder which does not explode. The distillate will then condense and run into the crank case. There it cuts the lubricating oil and makes it feel "chalky."

Changing Crank Case Oil.—How often the lubricating oil in the crank case needs changing depends on its condition. At noon, while it is still warm, put your fingers into the upper inch of the oil. If it feels velvety, it is all right. If it feels chalky, it has been cut by distillate and needs changing. Then feel of the oil in the bottom of the crank case and if it seems thick like well-cooked oatmeal, or jellylike, that means it has broken up into a "sludge" which is of very little lubricating value.

Kerosene to Wash Lubricated Parts.—Kerosene should be used to wash all lubricated parts. Distillate should never be applied to a bearing surface. Lubrication consists of a thin film of oil or grease which fills the necessary space between shafts and bearings, between piston rings and cylinder walls, etc.

Wet a corner of your handkerchief in distillate and rub with one finger across a piston. Then wet another corner in kerosene and rub it across in another place. Then rub a clean finger across both streaks. Where the kerosene was used a "lubricating glaze" will be felt. Where the distillate was used, it will feel rough. If all the lubricating glaze were washed off from a

motor with distillate, 'twould take a week to get the motor back in good condition.

The Best Carbon Remover, after all, is care of the carbureter in the beginning. If the mixture is too rich, the exhaust will throw black smoke. If it does not contain enough gas there will tend to be a "pop back" because it will not explode till so late that it fires the next incoming charge in the intake.

Scored Cylinders and Pistons.—Lack of lubrication, dirt, and lack of effective circulation and cooling are leading causes of scored cylinders.

Lack of Effective Circulation was mentioned as the principal cause of scoring because it allows the engine to overheat. The piston expands and breaks the lubricating film and leaves pieces of metal to grip out the cylinder. Be sure that the pump is working and there is no dirt in the radiator system. One man took two pounds of dirt out of the water-jacket of one cylinder. Water couldn't cool anything through that dirt. Flush the radiator system regularly. Strain the water you use. Watch the lining of the steam hose. You are likely to find it has disintegrated and bits of rubber have rolled up like a ball of chewing gum and stopped the circulation. If you don't know the mineral content of the water you are using look into the teakettle of some one in the neighborhood. If it is considerably scaled up, expect scales in your engine and radiator. They will prevent water from absorbing the heat.

To Remove Scales, completely dissolve 6 pounds sal soda in 5 gallons of hot water, for radiators of over 20 gallons capacity and correspondingly less of each for smaller radiators. Put it into the water tank for a day and then drain the radiator. Take off the hoses and run fresh water through to flush out any scales which may be loosened but not dissolved. This amount of sal soda is not corrosive enough to hurt the machine.

STORAGE BATTERY FOR LIGHTS.

To the Editor: How many kilowatt hours are there in a 6-volt 80-ampere storage battery? Will it light an 8-candlepower 110-volt bulb? If so, will it light five at once? How many hours will the juice last?—P., Kingsburg.

[Answered by W. E. O'Harra, General Electric Co.]

Multiply the volts by the amperes and you have the watts. A kilowatt is 1000 watts. Your battery will handle nearly a ½ kw. load ½ hour when fully charged.

A six-volt battery exerts an electric pressure of only six volts, whereas 110 volts pressure are required to light a 110-volt 8-c.p. lamp. You can get about 110 volts by connecting 18 6-volt batteries in series. If they are 80-ampere batteries, they will light 20 8-candlepower 110-volt lamps for 13 hours. We do, however, construct 2-c.p., 6-volt incandescent lamps which could be used in connection with this single battery.

KILLEFER
QUALITY

Monarch Cultivator

KILLEFER
EFFICIENCY

Our **MONARCH CULTIVATOR** was made to use on bean and beet land in preparing the seed bed and the general use of it for years past by the bean and beet growers proves it to be well adapted for this kind of work. It is the strongest horse chisel made and is able to do extremely deep work without damage to the tool. See your dealer and get your order in early as prices on all of these heavy tools must advance this coming season. If your dealer does not carry them, write to us for prices.

KILLEFER MANUFACTURING COMPANY

HEAD OFFICE, 445 SUTTER ST., SAN FRANCISCO.

Branches in all principal cities and towns of North Central California.

POWER FOR WATER-LIFT.

To the Editor: How much water can I reasonably expect to raise 55 feet with a 20 h.p. distillate engine and what would be a reasonable cost for distillate, lubricating oil, etc.? Could I lift as much at that depth with any of the pitless pumps as I could by having a pit? Should like to raise 450 gallons per minute.

[Answered by Prof. J. B. Davidson, University Farm.]

It is to be noted in answering the above inquiry that the lift includes not only the distance the water is raised above the pump, but also the

NO STUMPS too big. Get the richest, most productive land into crops. Make more money. **HERCULES** on 30 days' free trial. Three-year guaranty. Safe and fast. Send post card for free book. Introductory price offer now. **HERCULES MFG. CO.** 912 23rd St., Centerville, Iowa.

Belting

**That Must
Make Good**

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a free sample of **Test Special** together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy.

Fill out the coupon and mail it to us and we will recommend a belt that we will unqualifiedly guarantee to do your work satisfactorily. We have had seventy years' manufacturing and selling experience.

lift of the water to the pump.

A 15-horsepower engine will lift 500 gallons of water per minute 60 feet, assuming the efficiency of 50 per cent. A distillate engine in good condition on such a load will require 2 to 2½ gallons of distillate per hour.

A quart of lubricating oil per day should be sufficient. The pump must be within 25 feet of the surface of the water in order to be successful, as it is not practical to lift water more than that distance. It is better, however, to have the pump nearer to the water.

WATER LIFT FOR ALFALFA.

To the Editor: How high can water be raised with pump to irrigate alfalfa land and make it pay? How high for orchard land (not receiving so much water as alfalfa)?—R. W. W., Tehama county.

[Answered by Prof. S. H. Beckett, University Farm.]

It is impossible to say how high water can be raised by pumping to irrigate alfalfa or orchard land and make it pay. Such local conditions as market facilities, geographical locations, soil productiveness, local value of the crop, general efficiency of the farmer, etc., all have a direct influence on the maximum profitable lift. As an example, if you are in direct competition with alfalfa growers under a gravity system, other things being the same, fifty feet is generally considered the maximum lift for alfalfa. In other localities where this competition may be lacking and where the alfalfa has a higher market value the limit may extend to possibly 100 feet or more.

[C. W. Woodward of Riverside county paid \$730 for electricity alone for 80 acres of alfalfa, lifting the water about 70 feet, and feeling well repaid not only for this but also for interest on investment in pump, motor, and well. But he gets extra big yields.—Ed.]

WOOD OR DISTILLATE?

To the Editor: Which is the most economical fuel for raising water when 20 h.p. is required, distillate or oak wood, the latter being \$2.00 a cord delivered?—R. W. W., Bend.

If you already have a steam engine with a wood burning boiler, burn wood as long as you can get it at that price. It will not stay at that price long, however, and the labor of firing the engine must be considered. If you figure on buying a steam outfit, you will have to put in an oil burner before it wears out. Steam engines on California farms are relegated to repose in most cases, being replaced by gas engines which in these days require very little attention and are therefore most economical unless electricity is preferred and available. Reliable distillate-burning gas engines are advertised in our columns.

STIMULATES DEMAND FOR FARM MACHINERY.

Reports from the East are to the effect that farm machinery manufacturers are taxed to the limit to meet the demands of holders of large acreages who, foreseeing a continued heavy demand for foodstuffs from the warring nations of Europe, are sowing larger areas than ever to grain. It is said that increases of 5 to 10 per cent are general in the Atlantic States and the Middle West, and that the increase in our own state amounts to over 5 per cent.

DEEP WELL TURBINES

No valves to pack or plunger rods to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

FIELD CROPS.

The Lakeside Land Company of Bakersfield have sown ten sections of land to barley.

R. Callens of Hueneme has sold 1800 sacks of limas to T. W. Spier, representing the Lompoc Produce Company, for \$7.30 per cwt.

At Livingston this year growers are holding their sweet potatoes in cellars because of the Pacific coast and northwest markets being glutted.

Fifteen tons of alfalfa seed were recently shipped from Colusa county to Mexico. The prices paid the growers was from 10 1/2 cents to 11 1/2 cents.

Calipatria aspires to be the long staple center of the United States and 10,000 acres of the Balfour-Guthrie company and Coats and Williamson will be planted to it.

An experimental shipment of Japanese onions to California was not successful. One reason is that onions produced in Japan have not the keeping qualities to withstand a long journey.

The Hamilton beet sugar factory of Hamilton City, Glenn Co., which closed when the new sugar tariff became effective three years ago, will resume operations about July 15th of next year, it is announced.

The State Horticultural Commission and the sugar beet growers will send a scientist to Argentina in quest of a parasite which will check the ravages of the beet leaf hopper, which did much damage to the sugar beet crop of the State in 1914.

Many places along the railroads where hay is stored for shipment to this market still have practically their entire stocks on hand as they seldom are able to get a car to load. As a rule, at this season these points have marketed practically one-half their holdings.

Shipments of potatoes from the Dominion of Canada certified by the shippers to be as sound as is commercially practicable and to contain no more than 10 per cent of tubers showing traces of disease will now be admitted at any port of entry of the United States.

The twenty-five thousand acres of Yolo county land, situated in the Holland Land holdings in the Yolo basin, are now about reclaimed. Fifteen thousand acres of the land will be ready for cultivation next spring, practically all of which will be planted to beans.

The Loma Rica Nursery, Grass Valley, is exploiting a seedling pear which keeps for months. The pear was propagated from a seedling on the ranch of Horticultural Commissioner Hassler, of Placerville. It is picked in November and keeps until January and February.

Carbon bisulphide used at the rate of five to eight pounds to 1,000 cubic feet of space is recommended by the Ohio Experiment Station for the destruction of all insects in

stored grain. The grain bins should be air tight and the temperature above 70 degrees.

The report of the Secretary of Agriculture for 1916, just off the press, says that in the Sacramento Valley the acreage devoted to rice has increased during the last five years and that from 1,400 to 67,000, and places the value of the current crop at \$3,500,000.

California is putting in the largest acreage to cereals of the last twenty years, according to George H. Hecke, State Horticultural Commissioner. He says the high prices received by the grain farmers during the last season—barley selling close to \$50 a ton and wheat around \$60—had caused the planting of every available acre.

As a result of a conference between County Horticultural Commissioner Earle Mills and State Horticultural Commissioner Hecke, a new method of inspecting trees will probably arise. It is proposed that quarantine stations be established, and that nursery stock be delivered to these stations for inspection, and after inspection re-shipped by the consignee.

The production of cotton in the Imperial Valley is making notable strides. From a planting of 324 acres in 1909, and total sales of \$12,810, the industry has grown to a planting of 90,000 acres in 1916, and an income of \$7,300,000. The price in the interim has risen from 14c. per pound to 26c per pound, according to a statement issued by the Wells Fargo-Nevada National Bank.

Some of the growers of rice in Butte and Colusa counties will not sell for less than the actual food value of the rice, and if the rice millers will not pay more than the crop will bring from stock and poultry men, the mills will be cut off from their supply. There are thousands of bags of the cereal in the Sacramento Valley awaiting cars for shipment to the big centers where the rice will be disposed of to cattle and poultry dealers.

CITRUS.

This season the Carpinteria walnut growers turned over 293,504 pounds of nuts.

Pohlman Brothers, on ten acres just north of Porterville, netted about \$10,000 from their orange grove this season.

Owing to heavy shipments made recently the Eastern orange market appears to have been somewhat glutted, and prices have fallen.

The Almond Growers' Association of Banning shipped 240 tons of almonds this season, and independent dealers shipped 72 tons from the district.

The Riverside section is coming more into prominence as a lemon producer, not only by reason of extensive plantings, but by increased productiveness.

Fig growers of the San Joaquin and other sections of the State will meet in Fresno January 12th, for a two days' session, to discuss the best methods of fig culture.

Fig growers of the San Joaquin Valley and other sections of the State will gather in Fresno January 12 for a two-days' session, to discuss the best methods of fig culture.

Members of the Butte County Citrus Association have received a dividend of \$2.64 a box for oranges shipped this year, according to an announcement made December 17.

All the packing companies of Northern California report a good run and good prices, despite the fact that Florida and Southern California have shipped heavily in competition.

Work has been practically completed on processing of the Madera and Delano olives at the Porterville Cannery. The entire output of the

Five books FREE

You will find information worth many dollars to you in the five Giant books. They are written to show Pacific Coast land owners how to *save* and *make* money by using

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Here are the subjects of the books that are sent FREE:

Stumps 24 pages, 23 illustrations. Explains and shows the most effective methods of blasting. Tells you how to get out stumps of any size cleaner, easier and cheaper by using either of the Giant Farm Powders—Eureka Stumping Powder for dry work and Giant Stumping Powder for wet work.

Boulders Shows how to place charges for stone blasting. Gives amount of Giant Powder required to break up stones of various sizes.

Crops No deep plowing or cultivation is half so effective as subsoiling with the Giant Farm Powders. If you believe in tillage you believe in subsoil blasting. Ask for the Giant Subsoiling book, "Better Farm Tillage."

Trees Trees in blasted beds develop twice the root systems of trees in unblasted soil. They have the loosened earth and the food needed to do it. In blasted soil, rains and irrigation water sink down many feet and there is no surface run-off. The Giant Tree book, "Better Orchard Tillage," gives complete direc-

tions for orchard soil improvement.

Ditches You can *blast* out clean, deep ditches with Giant Powders. The sides will be sharp and even. "The Giant Book, 'Better Ditching,' tells how to do it.

cannery for the season has been contracted.

The Board of Supervisors of Tulare county at a special meeting, called on the petition of orange growers, refused to appeal the 8-to-1 orange test ordinance adopted some time ago. A rehearing was set for Dec. 20.

The olive interests of Oroville are agitating the desirability of having a bill introduced at the next legislature asking for an appropriation of about \$10,000 for more extensive experimentation work in matters connected with the olive.

According to the announcement from the offices of the Porterville Northwestern Railroad, rights of way have been secured for a six-mile extension of the Magnolia branch of that line, south to the Grand View Heights citrus district.

Following the receipt of quantities of frozen oranges from Tulare county, orange prices slumped in the East, and fruit from all sections of the State is suffering from the lack of confidence in the quality of the fruit, shown by the buying public.

Goleta walnut growers delivered to the Goleta Walnut House this season 1,511,775 pounds of nuts, according to the secretary of the association. The entire walnut crop was sold three hours after the State Walnut Growers' Association fixed the price.

The district freight and passenger agent of the Southern Pacific railroad reports that while there has been a slight loss of fruit because of the frost, there will be between 300 and 400 more cars shipped from the Riverside and San Bernardino districts than last year, provided another cold spell is not encountered.

W. H. Bacchus, near Riverside, says he has to chase his hogs out of his orange grove. After some oranges were blown from the trees by the wind, the hogs refused the usual pasturage, and, standing on their hind feet, ate all the oranges they could reach. Then some of them began to climb trees. So they had to be excluded from the orchard.

As a direct result of the early construction of the Visalia Electric into the eastern part of the Terra Bella district, comes the announcement of the organization of the Grand View Heights Packing Company. The new corporation will not be affiliated with the Exchange or an independent shipper, but will pack fruit for its members and for outside parties.

During the past few days several orange packers at Lindsay have suspended operations until after the holidays, and others are reducing their output. Several of the leading packing houses have installed water separators by which they will be able definitely to determine which

of the oranges have been frosted, and will only ship those which show no trace of frost.

The Terra Bella irrigation district has signed up with W. A. Kraner, of San Francisco, for the construction of the first unit of the irrigation project, the contract stipulating that the work shall be completed on or before January 1, 1918. The cost will be about \$365,000.

Many of the oranges now on the trees in the lower fruit belt of the San Joaquin Valley have become unfit for the Eastern market by the continued frosty weather according to statements of C. E. Campbell, of the Stewart Fruit Company and others. The Fresno foothill district has lost very little fruit, not suffering any damage worth mentioning. Some San Joaquin growers assert that this loss, which ranges from 25 to 50 per cent of the entire crop, is due to the fact that growers could not pick their fruit because of the 8-to-1 test law.

DECIDUOUS.

Apricot and prune growers discussed organization plans at Hanford this week.

About 100 carloads of fruit were shipped from Auburn through the medium of the Auburn Fruit Exchange this year.

The California Peach Growers', Inc., complain that some orchardists who have sold or leased their peach land have not made provision for the delivery of their peaches according to contract.

GRAPES.

More than 300 tons of raisins were dried at the lumber kilns of the Fresno Flume and Lumber Company this season.

The California Associated Raisin Company is able to deliver only about half the raisins ordered for the holiday trade, owing to the general shortage of cars.

At a mass meeting of Santa Clara county grape-growers, held in the Chamber of Commerce Hall, with a large attendance, a resolution declaring lack of sympathy with saloons was adopted.

Dinuba has been made the headquarters for Cimino & Barbera, fruit buyers of Chicago, who this year shipped forty cars of wine grapes to Eastern grape-juice manufacturers and wineries.

A. H. Hendrickson, professor of horticulture of the Department of Agriculture of the University of California at Berkeley, and Professor Flossfeder of the U. C. Farm at Davis, were to give pruning demonstrations at Winters this week.

Frank Henry, the tree and vine expert, has gone down to Lower California to take charge of Francisco Andenaegui's vineyard, and make a study of soil and vine conditions, so that he can direct the work by correspondence this coming season.

Approximately 300 cars of Emperor grapes, packed in drums with sawdust, were shipped out of the San Joaquin Valley this season to Eastern markets. The general plan of shipping drums of Emperors to the Eastern markets late in the season has proved successful, but grapes damaged by the rains will not hold up any better in sawdust than in crates, and some California shippers, it is said, lost money on drums that contained damaged fruit.

THE ARISTOCRATIC BEAN.

High prices have even hit the hitherto humble bean. Down around Santa Maria, where the fearless frijole stalks on the vine, they have been getting all sorts of fabulous prices—\$10 a sack, and such like.

And into a bar-room in that vicinity, a man walked up to the counter, ordered himself a Thanksgiving drink, tossed off the beverage and reached in his pocket.

From the pocket he drew forth a bean, which he laid carefully on the bar. The bartender picked up the bean, dropped it in the cash register and gave the man ten cents change!—Ex.

Steers with the Track that Pulls. Packs the soil less than a man's shoe when he walks.

The Bean Track PULL Tractor Pulls Itself Over the Ground.

It doesn't use up all its power pushing itself along, but pulls like a team. Has giant traction with only 2650 lbs. weight, and easily pulls a big six-horse load. When you hit the soft spots in plowing, it doesn't dig down—just turn the whole front end to left or right, just as easy as a team, and "Gee" and "Haw" it right out. No other tractor will turn clear around in a ten-foot circle. No other can equal it in getting into the corners. No other

can plow within an inch of your vines like this one, without breaking off young shoots. No other can pass under tree boughs only four feet off the ground. And no other can pull so much on the same amount of fuel. It actually does the work of six horses on the expense of two. So simple and sturdy in construction it lasts a life time—this is the little king of tractors. You owe it to yourself to get full information about it NOW.

MAIL THIS RESERVATION COUPON TODAY.

Don't wait a minute. Our factory is working to its capacity limit to fill orders right now, and the demand is getting bigger every day. Sending the coupon doesn't obligate you to buy. It simply reserves one for you for a reasonable length of time. If you don't buy, the tractor is sold to some one else. We'll quote you prices and terms, and send you the big BEAN TRACK-PULL folder, and tell you where you can see a demonstration. Send the coupon—or a postcard today, before these little wonder machines are sold.

BEAN SPRAY PUMP CO.,
211 W. Julian St.,
San Jose, Cal.

This coupon does not obligate me to buy a tractor, but is simply a request to reserve one for me for a reasonable length of time. Please also send me prices and terms and the big folder with the complete story of the BEAN TRACK-PULL.

Livestock Facts and Fancies---XIII.

[By the Editor.]

The organization of the California Shorthorn Breeders' Association, of which the details were given in our last issue, is likely to prove a moving event in the upbuilding of the animal industries of the State. It is a very significant fact, in our view at least, that in all the talk at the meeting for organization there was much more said about the interest of the State in building up a larger and better animal production than about the interests of Shorthorn breeders as such. It surely was a patriotic assembly. Much more could have been very properly said about the Shorthorn service in advancing the interests of the State, and that will come later of course, but it is very promising, both for the growth of the society and its influence, that the first impulse of the organizers was to do something worth while for California.

The society made a good choice in selecting its president. A. W. Foster is not only a Shorthorn breeder of enthusiasm and resources, but he is a Californian of wide experience and success in general affairs. The society has much to do with the general public. To serve its special objects best it must first command attention and approval as a broad-gauged promotion agency. The fact that its president has successfully battled the public eye with locomotives and the greatest ever of world's fairs will help him to drive Shorthorn bulls into it. His informal address when accepting the presidency showed that he knows that the public has to be rung in the nose and not caught by the tail. He lamented the general, and particularly the metropolitan, ignorance and inappreciation of the livestock industry of the State and declared that it must be overcome by education and the organizations of livestock breeders must be the teachers and not spare the rod. He credited the California agricultural papers with good work, but deplored the blindness of the general press which caused its editors to give a couple of inches of space to the great California victories at Chicago and unnumbered columns to matters of no upbuilding significance. The people of

San Francisco must be aroused, he said, to adequate appreciation of their opportunities for efforts and investments which will develop the State. These people own a large share of the farming land of the State, they have the money for its development and equipment for world-beating production, but they do not know what they should do with land and money and how shall they know if they have no teachers? We imagine our brethren of the general press will have the riot act read to them in some very convincing forms when Mr. Foster and his capable associates on the board of directors of the new association get their megaphones adjusted.

It is to be expected that the Shorthorn Breeders' Association will take a strong hold with other purebred organizations for the holding of a livestock show in San Francisco in 1917 and annually thereafter. Several of the members had just returned from the Portland show and were full of admiration of the successful activity of the people farther up the coast. California with better opportunities is not on the show map at all, except in a local way, and therefore not in it in the demand for purebreds and in valuation of them. Unless something is done in San Francisco next year Californians will have to put their thumbs in their mouths and take their products to Portland for exhibition and sale. President Foster believes San Francisco should put up a fund of \$100,000 to secure a show next year and believes also the people will easily do it if the issue, and the necessity for California leadership in the greatest livestock things, are properly shown to them. It is reasonable then to expect that there will be something doing p. d. q. and that the new Association will punch something pretty short and sharp into the side of the sleeping public.

We have an idea that the fact that "California Favorite," the prize-winning steer at the Chicago fat stock show, was a crossbred offspring of Hereford and Shorthorn may start some people off again on the old notion that there is great virtue in cross-breeding. Sometimes of course

cross-breeding does produce striking results in the first cross, and if one wishes to start a new breed it brings a lot of variations to pick from. If one spends a life-time in subsequent selection he may bring out something notable—if he knows what he is selecting toward and is not merely flopping around. But of course, in subsequent generations of cross-breeds one has nothing fixed—he inherits nothing durable from the past and is not advantaged unless he is out for novelties. Therefore the man who desires to develop an enduring type of value in the stock he is growing, does not take to cross-breeding but grades up and up by the continued use of the breed he has chosen to approach. In this way if he selects good individuals for sires, he is practically sure to get where he wants to be. California Favorite did not win because he was crossbred but because he happened to snatch out of his conflicting ancestry the conditions and capacities which made him a good feeder and the University experts picked him to feed because they recognized these characteristics and not because he was crossbred.

SOAKED GROUND BARLEY TO FATTEN HOGS.

To the Editor: What is the best way to feed ground barley to pigs one year old to be fattened? Are carrots or beets good to feed with it?—H. C., Sonoma.

Beets and carrots are fine for this

purpose if not allowed to decay or mix in filth. Soak the barley about 12 hours for best results. Alfalfa pasture or tankage in self-feeders will make the fattening cost less per pound.

TWELVE MONTHS' GREEN HOG FEED.

[Written for Pacific Rural Press.]

Green feed supplements the ground barley-shorts-tankage-alfalfa meal ration for the small Yorkshire herd of Lloyd & Tointon of Sonoma county. Kale furnishes greens from spring until July when beet digging begins. Beets are dug as needed until just before the fall rains when all remaining are stored for winter use. From this time, pumpkins make the pie for the hogs well through winter. Just before the fall rains, vetch and oats are sown for pasture and what hay there is time to cut.

The Bishop Bros.' sheep won at the International Stock Show, Chicago, the following prizes: Purebred Shropshire sheep—three first prizes for rams and ewes; four seconds for rams and ewes; two thirds for rams and ewes; three fourths for rams and ewes, and two sixths for rams and ewes. The Bishop Farm also won the greatest prize offered for sheep, the grand set for five yearling rams. These sheep were shown in competition with the best in the world; Great Britain, Canada, Australia, South American countries and practically every State in this country being represented.

PASTURING PUREBRED SHEEP ON ALFALFA.

[Written for Pacific Rural Press.]

It is no uncommon complaint of sheep raisers that alfalfa pasture is unsuited for sheep raising because of the loss through bloat; but such experiences have not been encountered by Kaupke Bros. of Woodland, who run their herd of purebred Hampshires on alfalfa continuously except during the winter months, when they are fed hay in buildings. They state that in several years' experience with sheep raised in this manner they have lost but two head from bloat. They are careful, though, in turning the sheep into a field for the first time to see that they are well filled with dry hay and water, and after they have been turned in once they are kept there, instead of changing them back and forth from hay to pasture and vice versa.

Another objection, which Kaupke Bros. have not experienced is the packing of the soil, which many complain of where sheep are pastured on alfalfa. They have their fields subdivided and never turn the flock into an enclosure till the land is comparatively dry after irrigation. While they have been pasturing their flock on the same land for a number of years they do not see any noticeable decrease in the annual yield of hay, when such fields are harvested. This they attribute to the added fertility placed by the sheep on the land.

Grapewild Farms Berkshires

Grand Leader 2nd Again Shows Himself a Wonderful Breeder

At the 1916 California State Fair the following prize-winners were sired by the World's Fair Grand Champion Berkshire Boar:

GRAND CHAMPION SOW (which later sold in the Congress Sale for \$500—the highest price ever paid for a California bred Berkshire).

GET OF SIRE—(The most sought-for prize among breeders).

FIRST PRIZE AGED SOW—FIRST PRIZE SENIOR YEARLING—FIRST PRIZE JUNIOR YEARLING—SECOND PRIZE UNDER-YEAR SOW.

He is also the sire of **PREMIER LEADER**—Champion at the Stanislaus Livestock Exposition 1916.

A daughter of Grand Leader, **ESCALON POLLY**, was **CHAMPION** and **RESERVE GRAND CHAMPION** at Oregon State Fair.

Dairy Industry Exceeds 40 Millions.

[Written for Pacific Rural Press.]

For the first time in the history of California, the annual value of dairy products has reached the 40-million-dollar mark. Such is the information contained in the eleventh biennial report just issued by F. W. Andreason, Secretary of the State Dairy Bureau.

This is approximately six millions more than for the year ending November 1, 1913, six millions more than for 1914 and two millions more than for 1915, the figures showing that the industry is experiencing a steady, healthy growth rather than a boom.

The totals for the various products for the two years, 1915 and 1916, are given as follows:

1915.	
Butter, 67,549,409 pounds ..	\$19,386,680
Cheese, 6,249,775 pounds ..	881,218
Condensed, powdered, evaporated milk ..	1,352,959
Casein, 690,750 pounds ..	34,537
Market milk, cream, ice cream ..	12,000,000
Calves produced on dairies ..	3,000,000
Skim milk and buttermilk ..	1,750,000

Total\$38,405,394

1916.	
Butter, 70,030,174 pounds ..	\$19,181,264
Cheese, 7,745,124 pounds ..	1,203,592
Condensed, powdered, evaporated milk ..	1,488,818
Casein, 1,864,317 pounds ..	503,365
Market milk, cream, ice cream ..	14,000,000
Calves produced on dairies ..	2,500,000
Skim milk and buttermilk ..	1,750,000

Total\$40,627,039

Milk.—That this increased total value has resulted from increased production rather than from increased values is shown with both butter and whole milk, the report stating, in reference to sweet milk: "In San Francisco, milk was delivered at railroad terminals, a few years ago, by the producers for 18 cents a gallon, with the privilege that the amount delivered could exceed the amount contracted for, five per cent during the season of the year when milk was most plentiful and with the guarantee that it should never fall five per cent below the said amount during time of scarcity. From June 1, 1913, to May 31, 1915, the milk was delivered in San Francisco for 17 cents, with similar privileges and guarantee of delivery during the seasons of plenty and scarcity. Since June 1, 1915, the average price paid to the producer delivered at the terminals in San Francisco, has been 16½ cents."

Butter prices up to September 30, at which time the report was compiled, were less than they have been, and cheese has averaged about as in previous year, as shown below:

	Butter	Cheese
1907	30.10	14.02
1908	27.80	12.90
1909	30.00	14.30
1910	31.30	15.60
1911	28.00	14.50
1912	30.77	15.46
1913	32.12	16.06
1914	27.61	15.79
1915	28.70	14.10
1916	27.39	15.54

Butter Production.—In production of butter by counties, the report shows that Stanislaus is still in the lead with almost 10 million pounds, Imperial is second with 6,780,552, and Humboldt third with 5,588,604. Other counties producing over a million pounds are: Fresno, Merced, Kings, Sonoma, San Luis Obispo, Marin, Yolo, Butte, Glenn, Sacramento, San Joaquin, Tulare, and Sutter.

While we have increased our pro-

duction, the market prospects are bright, as trade connections have been established in new markets. This export trade amounted to about four million pounds of butter, shipped to Australia and New Zealand in 1915, and about two million pounds to England and Eastern markets during 1916. Markets are also being developed in China, Japan, the Philippine Islands, and in Java.

It is pointed out that exporters have usually met success, largely due to the fact that nearly all of the cream used has been pasteurized, a more uniform product resulting therefrom. More uniform packing, salting, and containers have also been factors in improving the grade for export business; and this has been further augmented by the stringent rules set down by the Wholesale Produce Exchanges of the State as to flavor, color, etc.

Cheese is also on a more permanent basis, a number of our factories having started the manufacture of cheddar cheese, which compares favorably with that made in other States, and which finds a ready market for either home consumption or exporting purposes.

Condensed milk production has increased as a result of the European war, which takes the larger portion of Danish and Holland milk out of our home markets.

The report deals at length on the new score cards used in inspecting dairies and their use, and also contains pertinent suggestions and illustrations as to economical, sanitary dairy buildings.

During the two years covered by the report there were 429 arrests of dairymen by the inspection department for failure to comply with the State laws. Of these, 404 were fined, 18 had sentence suspended, 16 were dismissed, and nine were acquitted.

A copy of the report may be had by writing F. W. Andreason, Sec'y State Dairy Bureau, San Francisco.

COMMON SENSE VS. SCIENTIFIC PIG FEEDING.

[Written for Pacific Rural Press.]

About the most striking exhibit at the Ventura Fair last fall was a pen of two pigs, litter mates. One was fed by a boy, Newell Snow, the other fed by the farmer from whom he got the pig, in the usual way in a pen. The boy's pig weighed 198 pounds at the end of the test; the other was thin, long-legged, long-nosed, small, and underdeveloped. It weighed just 100 pounds. W. B. Parker, who was then Farm Adviser of ventura county, writes us as follows:

Sweepings,	110 lbs., value....	\$1.10
Rolls barley,	170 lbs., value....	2.25
Tankage,	39 lbs., value....	1.25
Milk,	210 lbs., value....	.42
Corn suckers,	25 lbs., value....	.05
Raisins,	25 lbs., value....	.25
Alfalfa hay,	30 lbs., value....	.24

In his financial statement, which I have divided by one-half because he had 2 pigs, the cost of the pigs was originally 4.00
Caring for pigs at 10c an hour for ten hours 1.00

Total cost of pigs.....\$10.56
Value of the pig at the end of the contest\$15.84
I think you can estimate the value of the other pig from his weight, minus what the butcher would take off for condition.

The University Farm shipped two fine specimens of Hereford yearling bulls to Honolulu last week.

REMCO

Air-Dried Redwood

PIPE

For Irrigation—Water Supply—Power. Sizes 8 inches to 12 feet. For pressure up to 400 feet head. Guaranteed for 100 per cent overload.

Costs less than any other pipe of equal capacity, efficiency and endurance.

Not affected by worms or insects, acid or alkaline soils, electrolysis or roots.

Withstands extremes of heat and cold, dryness and moisture.

Outlasts any pipe except cast iron, and maintains its full flow capacity to the end.

TANKS

For Water—Wine—Vinegar—Oil—Acids—Solutions. For Storage—Mixing—Fermenting—Pickling—Leaching. In all shapes and sizes—500 to 650,000 gallons.

SILOS

For Dairymen—Stockmen—Feeders. Sizes, 25 tons to 300 tons. The STANDARD.

ALL REMCO PRODUCTS are manufactured to your order from CLEAR, AIR-DRIED REDWOOD. Selected from our stock of forty million feet. Their outstanding features are HIGHEST GRADE MATERIAL, SUPERIOR EFFICIENCY, MECHANICAL PERFECTION, MAXIMUM DURABILITY.

Sold direct to users. Catalogs sent on request.

Breeding, Feeding, Care, Win \$25 Prize.

[Written for Pacific Rural Press.]

Besides earning \$80.24 for the month of November, figured on San Francisco butterfat quotations, five cows in the grade Holstein herd owned by the Napa State Hospital, won the \$25 monthly prize of Pacific Rural Press for the best five grade cows, headed by a purebred sire, entered in the California State Dairy Cow Competition.

The average for these five cows for last month is not in itself a fair criterion of their possibilities, for while they averaged 46.587 pounds of butterfat for the month, only two of the lot were in milk the full 30 days, cow number 15 giving 58.35 pounds fat in 27 days; number 30 producing 50.06 lbs. fat in the full 30 days; number 17 milking 17 days and giving 23.52 lbs. fat; number 29 milking 24 days and producing 48.37 lbs. fat, and number 28 milking the full 30 days and producing 49.13 lbs. fat. Number 30 was milked three times a day, but all of the rest were milked twice a day.

each cow, selling off the poorer ones and keeping only the best.

Preparation.—Knowing the value of preparatory work in the profitable handling of a dairy herd, it is the custom to allow all cows in the herd one to two months' rest between lactation periods, most of which time they are pastured on marsh lands. About a week before freshening, the cows are taken to the barn, where they are fed about four pounds of bran daily, and all of the alfalfa hay they will eat. In the case of cow number 30, this was supplemented with 20 pounds of freshly sliced beets daily. All are provided shelter at night and straw for bedding, having the run of a well-drained corral in the day-time, where fresh water and alfalfa hay in racks is provided. Salt is fed in the grain mixture at all times, in about the same proportion as would be used on food for human consumption.

Feeding.—The five cows that were entered in the competition, with the

receiving, except that she was milked but twice a day. Her best day's production last year was 48 pounds of milk a day. This year, with three milkings, she has already produced up to 68 pounds a day, and it is Mr. Heath's belief that she will make 90 pounds a day in another two or three weeks. He attributes this increase entirely to the extra milking and with an average test of 3.24 per cent believes he can demonstrate the practicability of milking all cows three times instead of two times a day.

The actual cost of feed for the cows while on test, figured on a basis of \$14 a ton alfalfa hay, \$440 a ton barley, \$40 middlings, \$32 coconut meal, and \$6 a ton beets, totaled a trifle less than \$55. This leaves a net amount of \$5 per cow over and above cost of feed, and does not include labor, calf, skimmilk and manure.

J. W. Campbell, Holstein breeder of Escalon, reports the sale of bulls to F. L. Green, Escalon; Chas. Popp, Escalon; Edwards Bros., Atlanta, and C. H. Hardeson, Fillmore, Ventura county.

eral opinion of recent literature on the subject points to immunization as the possible relief for this dreaded disease; but according to such literature, the preparation of vaccines has not reached sufficient refinement to warrant their being classed as sure cures, such as might be inferred from the answer given. It might not be out of place to say that the only definite methods of determining contagious abortion are by the complement-fixation and agglutination tests of blood samples of the subjects and the finding of the abortion bacillus. The fact that a cow gives birth to a calf prematurely should be looked upon with suspicion, but should not be taken as absolute assurance that she has contagious abortion as the writer intimates.

L. E. Cline.

U. S. Dept. Agr., Fallon, Nev.

FEEDING COWS \$16 HAY.

[From San Joaquin Farm Bureau Monthly.]

Considerable San Joaquin County hay has been sold to the Humboldt County Farm Bureau this fall. The Humboldt Dairymen pay \$15 to \$16 a ton for this hay at their nearest railroad station. With this hay they feed green corn fodder in the fall and beet pulp and coconut meal in the winter, along with pasture. While hay is scarce in Humboldt county, and some of the dairymen find it necessary to buy this high-priced hay, a great many of them buy it although they could get along without it. Few dairymen will lose any money by buying this hay and most of them will make good by it. Most of the San Joaquin county dairymen would not continue in the dairy business and pay \$16 a ton for hay. The cows would be sold before such a price would be paid.

The Humboldt county dairymen who are buying this San Joaquin hay are not thinking of selling their cows, as they are paying them good money. There is a reason. The knowledge obtained from six years of testing in the Humboldt County Cow Testing Association, along with the use of good purebred bulls, is the Reason.

The Goodyear Rubber Company has gone into the culture of cotton on a 6000-acre tract in Arizona, the product to be used in its automobile tire factories. Five carloads of mules were shipped from Woodland to work on this plantation. This company has disbursed half a million dollars from Woodland during 1916 for mules and horses, the stock being bought all over Northern California.

Twenty-five and no/100-----DOLLARS

PACIFIC RURAL PRESS

State Dairy Cow Competition

Frank Honeywell

(Fac-simile of the first check awarded by Pacific Rural Press to entrants in the California State Dairy Cow Competition for the highest average production of butterfat by five cows in a grade herd, headed by a purebred sire. Fifteen more checks of the same amount will be awarded during the next 15 months.)

Breeding.—While too much emphasis cannot be given the feed and care these cows received, it is important to know that they have been consistently bred for production for a number of years.

Originally the foundation cows at this institution were Durhams, of the type commonly found and bred in most sections of the State some years ago. These cows were crossed with a registered Jersey bull, the progeny showing an improvement in persistency of milk flow and butterfat content. It also tended to reduce the size of matured cows and improve udder, barrel and back.

The immediate ancestors of the five prize-winning cows on the dam's side were these Durham-Jersey grades, and on the sire's side the Holstein bull, Juliana Lad, a son of Juliana De Kol, who produced over 22 pounds of butter in seven days as a two-year-old, Juliana Lad having been used as herd sire on the Durham-Jersey grades. His prepotency is shown in the increased production of milk, increased size in his heifers and a solid black and white marking of all five winning cows.

To further increase the average production of the 120 cow herd, Dairy Foreman V. L. Heath, under the supervision of Business Manager Owen Duffy, has continually weeded out the boarders by systematically weighing and testing the milk of

exception of number 30, were fed practically the same ration. This contained a mixture of 6 pounds rolled barley, 2 pounds coconut meal, 2 pounds middlings and approximately 30 pounds of alfalfa hay. Number 30 was fed, in addition to the grain mixture, 24 pounds of sliced beets, and cut herself down on alfalfa hay to about 20 pounds a day. Beets would have been used in the ration of all the cows had they been more plentiful, as they are both succulent and nutritious.

Care.—As already stated, the cows were provided shelter both before and after freshening; an old horse barn, equipped with box stalls, affording excellent quarters for this purpose. Mr. Heath states that he finds it a profitable practice to keep all of the cows in these stalls, whether they be on test or not, for a week's time, as in that way he is able to watch both calf and cow at a time when accidents to both are most apt to occur.

Milking of all cows is done in the modern concrete milking barn, which has been completed by the institution during the past year, and the cows have access to a well-drained, rock-covered corral.

Sidelights.—An interesting point brought out by last month's testing was the production of cow number 30. During 1915 she was given the same feed and care that she is now

CONTAGIOUS ABORTION.

To the Editor: Referring to two answers to questions in your veterinary department of December 9, I wish to take the liberty of questioning the advisability of recommending vaccination as a cure for infectious abortion in cattle, inasmuch as the treatment of contagious abortion by vaccines or any other means is considered to be as yet in the experimental stage. Such unguarded recommendations have a tendency to make readers easy victims of abortion remedies, the virtues of which have never been proven. The gen-

TULARE TO JOIN COUNTY LIVESTOCK CIRCUIT.

As a result of the successful livestock show held recently in connection with the Citrus Fair, Tulare county will probably join the County Fair circuit next year.

E. W. Major judged the cattle; W. Bernstein, hogs; and J. D. McCord, jacks and mules. The awards were as follows:

Jersey Cattle.—Peter Lawson, Tulare, 2nd junior yearling heifer and 2nd in 3 yr. over bull. All other awards to A. A. Jenkins, Tulare.

Guernseys.—All awards to W. J. Higdon, Tulare.

Ayrshires.—All awards to O. M. Smith, Visalia.

Dairy Shorthorns.—All awards to Chas. L. Weaver, Tulare.

Holsteins.—Bulls: Tagus Ranch, 1st, four yrs. and over; 3rd junior calf. W. J. Higdon, 2nd, 3 yrs. and over. Geo. Loughery, Visalia, 2nd,

senior yearling. Ed. Leever, Visalia, 1st senior yearling. R. F. Guerin, Visalia, 1st junior yearling and 3rd senior calf. Alex. Whaley, Tulare, 2nd junior yearling and 1st and 2nd junior calf. L. B. King, Visalia, 1st senior calf. J. P. Walker, Visalia, 2nd senior calf. **Championships.**—Tagus Ranch, senior champion; Alex. Whaley, junior champion; Tagus Ranch, grand champion. **Cows:** R. F. Geurin, 1st, 3 years and over and 2nd senior yearling. W. J. Higdon, 2nd and 3rd, 3 years and over; Tagus Ranch, 1st, 2 years and under 3 years and 2nd junior calf. L. B. King, 2nd junior yearling; Alex. Whaley, 2nd junior yearling and 1st and 3rd senior calf. Geo. Loughery, 3rd junior yearling. **Tagus Ranch, 1st on aged herds.** Alex. Whaley, 1st young herd and 1st calf herd, also first on get of sire.

Berkshire Hogs.—All awards to A. M. Smith, Visalia.

Hampshire Hogs.—All awards to R. O. Bagley, Tulare.

Poland-Chinas.—Geo. Loughery, 1st senior yearling and grand champion. All other awards to R. F. Guerin, Visalia.

Duroc-Jerseys.—Boars: W. J. Fulgham, Visalia; 1st and 3rd aged. W. J. Higdon, 2nd aged. Tagus Ranch, 1st senior yearling and 1st and 3rd senior pig, senior and grand champion. Allen Thompson, Tulare, 1st and 3rd senior pig. C. G. Cummings, Visalia, 1st junior pig. Sows: J. L. Dickinson, Visalia, 1st aged and first produce of sow. Allen Thompson, 1st junior yearling, 2nd senior pig, 1st and 3rd junior pig, 1st herd, senior champion. Tagus Ranch, 1st and 3rd senior pig, 2nd herd, junior and grand champion. W. J. Fulgham, 2nd junior pig, 3rd herd.

Jacks.—J. B. Newman, Tulare, 1st aged, 1st yearling and champion. W. J. Fulgham, 2nd aged. J. Holclaw, Tulare, 3rd. R. E. Chenoworth, Visalia, 1st 4-year-old.

Mules.—J. B. Newman, 2nd and 3rd 2 year old and under 3; 2nd 1 year old and under 2; 1st and 2nd under 1 year, and championship. R. E. Chenoworth, 1st 2 yr. old and under 3; 3rd 1 year old and under 2. W. J. Fulgham, 3rd under 1 yr.

Quality A. R. O. Holsteins

PRINCE RIVERSIDE WALKER, 112081

Dam, Aaggie Acme of Riverside 93957, A. R. O., 28.35 pounds butter, 585.10 pounds milk in 30 days, 808.82 pounds butter in one year. Sire, Prince Gelsche Walker 81663, whose first thirteen daughters averaged 19.50 pounds butter in 7 days, including the State record two and three-year-olds.

OPPORTUNITY KNOCKS BUT ONCE AT EVERY GATE.

Dams of our bull calves have already made good, and will make higher records, as they are all young cows. Buying these calves is not a gamble but an investment that is worth your consideration.

SPECIAL.
The wonderful lot of A. R. O. heifers we recently bought in Washington based to the \$10000 bull, Sir Bessie Fobes Tritonia 125865, are freshening and the bull calves dropped will be in great demand.

Their sire is a son of a 35-pound cow, Jessie Fobes Bessie Homestead, former world's record holder for persistent production. She and three of her sisters, her dam, and Tritonia's sire's dam average 31.03 pounds butter in 7 days.

REMEMBER THAT

Eleven of our Holstein heifers, at average age of 3 years, have made an average of 19.53 pounds butter in 7 days. Highest individual record was 23.31 pounds. They include two granddaughters of King of the Pontiacs and four granddaughters of King Segis.

LOOK THIS OVER.

Eight of our 3-year-old heifers have made an average of 440 pounds butter fat in one year with second calf. Highest individual record 460 pounds fat.

NOW IS THE TIME TO PLACE YOUR ORDER. EVERYTHING SOLD AT THIS RANCH IS GUARANTEED AS REPRESENTED.

W. J. HIGDON, Tulare, Cal.
ROYALLY BRED A. R. GUERNSEYS.

El Dorado

Holsteins

My herd consists of 15 A. R. O. cows and 25 registered heifers, all selected females. Bull calves from such cows and sired by a son of a 33-pound cow are worth consideration when buying foundation stock. **SEGIS PONTIAC DE KOL BURKE LUIT, now heading my herd, CORRESPONDENCE SOLICITED.**

His dam, Luit Burke, has an A. R. O. record of 32.76 pounds butter in 7 days as a junior 4-year-old. She is a full sister to Riverside Sadie De Kol Burke—32.29 pounds butter in 7 days.

His sire, Segis Pontiac De Kol Burke, is the senior sire of the A. W. Morris & Sons, Inc., herd, and was grand champion bull at 1916 California State Fair. Correspondence solicited.

Uniform Livestock Very Desirable.

[Written for Pacific Rural Press.]

Whether hogs are being grown for the block or for breeding purposes, it is undoubtedly a decided asset to have them of uniform size, quality, and color, as experienced breeders and raisers will all agree.

To establish such uniformity in one's herd requires, according to M. Bassett of Kings county, first a definite idea of the type you are to grow, herd sires with prepotency to perpetuate their type and continual selection of the offspring for the reserve herd of brood sows.

Probably nowhere in the country can one find a more decided tendency toward uniformity in livestock than on the Bassett ranch, and Mr. Bassett credits it entirely to the above reasons. When he began breeding Poland Chinas nearly 20 years ago, he had a very definite type in mind.

During that time there have been furies in favor of other types of the breed than the one originally in mind, but to these Mr. Bassett has paid scant attention, for he says, "Too many breeders make the mis-

take of changing their ideals with current fancies instead of staying with one type, thus breeding not one but many types into their herds."

No Inbreeding.—But Mr. Bassett is not a believer of inbreeding in order that uniformity may be secured. In his own case he maintains several families of Polands but in each case they are of the same type. To perpetuate this he has purchased his boars from the same breeders in the East for many years because they also have had but one type in mind.

It is not the object to describe the type Mr. Bassett prefers, in fact that should be decided upon by the breeder himself, but the pertinent fact about Mr. Bassett's experience is that it points the way toward uniformity in any and all kinds of livestock. Of course to be successful, the type decided upon should be one that will meet market requirements; for that is the ultimate source of profit to the livestock raiser, be he producer of pork or breeding hogs.

Pig Feed the Year Round.

[Written for Pacific Rural Press.]

Early in October, 1915, George Farmer of Kings county had eight Duroc sows that raised 78 pigs. In December the pigs, then weaned, were turned into a five-acre field of rye, where they ran till May 1, when they averaged 101 1/2 pounds in weight.

After selecting the best gilts and young boars for breeding purposes, there were 45 to be fattened for the butcher. These were put up in pens. The first week they were fed nothing but soaked ground barley and skim-milk, putting on 11 pounds during the seven days.

The following three weeks, they were fed four pounds ground barley and one pound of cocoanut cake, with about 10 gallons of skim-milk a day. At the end of the 30 days they had gained 64 pounds on the average.

Mr. Farmer is a firm believer in both good breeding and good feeding,

using some grain all of the time in connection with rye, alfalfa, or Bermuda grass pasture, and raising pumpkins in the corn field each year that the hogs may have a succulent feed in the winter months when pastures are poor.

Exercise is also an important consideration, and especially is this true with animals that are to be used for breeding purposes.

For example, in the field which is given over to the herd sires, there is a large patch of brush and small tree at the end furthest from the barn. In warm weather this brush provides a cool place for the boars in the day time and if fed at that end of the field the hogs would stay there day and night. But they are fed and watered close to the barn, thus compelling them to make several trips across the field daily. This develops good strong bone and also keeps the boars in good breeding condition.

Sweet Clover for Foothills.

To the Editor: A few lines about sweet clover in Pacific Rural Press would be interesting to ranchers in all California foot-hill districts. Will goats and cattle eat it readily without being starved to it? Do you believe that merely scratching the ground, as some advertising claims, is sufficient cultivation to start the seed to growing? Will it stand our dry hot summer weather without being killed out? What is the best time to sow the seed? Is this the same as was called "wild sweet clover" in Iowa 30 years ago?—G. L., Auburn.

It is the same. It is used considerably in the orange groves for a summer-growing cover crop. The hot summer does not hurt it if it has water. Even scratching the ground is not necessary to start the seed growing except to cover and moisten it. But a better germination and better growth will be obtained by preparing a good seed bed. When cut or pastured before the stalks get woody, it is a valuable stock

feed; but having a bitterish taste, most stock must first be starved to it. Afterward, they eat it readily. Unless there is waste, its feed value is about equal to alfalfa. For cover crops, it is usually sown in the fall and irrigated to start the germination. It may be sown in spring, where winters are severe or the soil waterlogged in winter.

B. F. Kendall of Hardwick, who recently started a herd of registered Duroc Jersey hogs, also has a vineyard and believes that every vineyard and orchard man should have a few hogs to make use of the waste fruit. Mr. Kendall ships by the carload. He makes good use of his cull raisins and grapes by feeding them with a small ration of corn to his hogs. They make a rapid gain, and the pork is solid and of a very fine flavor.

Here's Where it Tells—

It isn't a question of sentiment whether or not your cows are in the pink of condition—but it does make a big difference in your bank account. Since you are keeping cows for milk instead of for meat, better see to it that their milk-producing organs are kept working normally.

At the first sign of decreasing milk-flow, look for the cause. Ten to one it is due to some trouble with the digestive or genital organs, and such disorders are best set right by the use of Kow-Kure, a cow medicine backed by twenty years of success. Try Kow-Kure on your poor milkers and watch results. Hundreds of doubting cow owners have been convinced that this old remedy has no equal for the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Lost Appetite, Scouring, Bunches, etc. Buy Kow-Kure from your feed dealer or druggist; 50c. and \$1.00.

Cows on Alfalfa Pasture All Winter.

[Written for Pacific Rural Press.]

About 70 cattle and 40 young stock were pastured all last winter on the sandy alfalfa field operated by C. H. Snell in San Bernardino county; and the alfalfa was not damaged enough to notice. Alfalfa in some parts of Southern California seems to grow more or less all winter.

"I believe," said Mr. Snell, "that if I pasture the alfalfa late so the first crop will not be ready to cut till the rains are over, I can cure the hay better."

In mid February last spring, the alfalfa began to grow fast on account of the hot weather, and one day the cows came up "awful full and with lots of milk." Then some of the smaller ones came up bloated, so a

cross fence was put in and the Snells "almost lived with the cows" for a while. In early March, they were turning them into the alfalfa for two hours in the morning and again for two hours after dinner, but always watching carefully.

The 58 cows then milking were giving about 1200 pounds of milk per day. They wouldn't eat more than a quarter ton alfalfa hay from the stack to which they had access, but they received 200 pounds dried beet pulp per day.

"We never had a big Holstein bloat, but numbers of the smaller boned ones have, and we would like to know why," says Mr. Snell, who cannot just figure the problem out.

Cactus Nutriment for Stock.

To the Editor: What is the food value of cactus, either mountain or cultivated, for stock and poultry?—W. P. B., Lemoore.

A load of spineless cactus grown in Solano county analyzed 92.77 per cent water, 0.52 per cent protein, 0.12 per cent fat, 4.43 nitrogen-free extract (mostly carbo-hydrates), 0.92 per cent fiber, and 1.24 per cent mineral matter. Possibly mountain cactus would contain a slightly smaller proportion of water. O. L. Linn of Stanislaus county writes that T. H. Branson of Manteca is meeting success feeding the green slabs of cactus to his hogs.

He has three 8-months shoats which are the remainder of a herd of 14 that he brought up to about 180 pounds. Their principal ration was about 3 wheelbarrow loads of cactus every day until about a month or six weeks before he wanted to fatten them, when he began feeding them Egyptian corn in the head. Mr. Branson states that the only ration the hogs received until they were fed the Egyptian corn, besides the cactus, was the swill from the house, perhaps 7 gallons of skimmed milk each day, and about one sack of barley to each hog.

Imperial County Butterfat Contest.

[Written for Pacific Rural Press.]

What the cow will produce of butterfat in two days is the contest for which prizes of \$20, \$10, and \$5 will be awarded at the Imperial Valley Livestock Fair to be held at El Centro four days beginning Dec. 27. The testing will be done as in official testing: the cows will be milked clean Tuesday night; twice on Wednesday and Thursday they will be milked, and the milk weighed and tested in the presence of the judge. Feed will be recorded. No animal producing less than a pound of butterfat in a day will be awarded a

premium. The cows will then be exhibited with complete records of the tests.

Fern's Silver Ray, the Jersey owned by Frank Van Derpoel, which completed in September a record of 700.72 pounds butterfat under the ranch conditions of a farmer who has had to struggle for his home, will be shown at the Fair. She has carried a calf 160 days; and if it is born alive, she will be entered in Class AA of the A. J. C. C. Register of Merit. It is said that no other California cow is in this class.

ORCHARD, COWS, AND CORN HELP EACH OTHER.

(Continued from first page.)

persistent milking was to be encouraged, received cottonseed meal, oil cake, bran, etc. But no cottonseed meal is fed within three months before calving, because Mr. Brown believes it causes retained afterbirth.

Cows are kept day and night in a corral of an acre or two, including a shed open toward the south. Part of the corral is well sodded with Bermuda.

Cattle.—All the cows were grades three years ago, and some of them pretty poor producers, as shown later by Mr. Brown's scales and milk records, and Babcock tester. The poor ones were weeded out. Holsteins were gradually replaced by Jerseys, and only three of the typical high producers retained. Eight purebred cows and a purebred bull have been purchased besides a number of high-producing grades. Some of the cows show a weak back-line,

but Mr. Brown is correcting this by use of the bull Imperial Lady's-Financier, a 22-months animal with beautiful back-line, fine bones and withers, great heart girth, very typey, but all male. Fern's Imperial Lady is an R. M. cow with a record of 730 pounds 13 oz. fat from 11,507 pounds of milk, one of the highest six Jerseys in California, with authenticated records, according to Mr. Brown. One grade giving 3 gallons a day had been fresh 14 months; another gives 6 gallons when fresh and 3 gallons when a year along. Mr. Brown is working into purebreds as fast as his capital allows.

According to reliable informants there have been 136 silos constructed in Stanislaus county during the past year. No district in the State is so thickly dotted with these tall structures as the section adjacent to Modesto and it is the claim of those in a position to know that next year will see an even larger gain in numbers in that and adjacent districts.

Live Stock and Dairy Notes.

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

THE DAIRY.

The scarcity of feed has caused a slight slump in the butter output in Kings Co.

The forty-second annual meeting of the Ayrshire Breeders' Association will be held in New York, January 11.

A milk condensary costing \$150,000 is to be built at Galt by the Utah Condensed Milk Company of Richmond, Utah.

Three creameries of Tulare paid out a total of approximately \$110,000 for cream delivered during the month of November.

The butter situation continues a strong one. The reports of the 54 associated cold storage warehouses, in the Central West and East, December 1, showed that there was in store 52,581,000 pounds.

The organization of a cream-pooling association is under way in Madera county. There are three creameries operating there at present and the perfection of this association will seriously affect two of the three.

A cream pooling association has been organized by dairymen of the Patterson community, having seventy-six members, owning 1564 productive cows, for the purpose of collective marketing of their produce.

Dairymen in Eel River Valley, Humboldt county, are asking the United States weather bureau to establish rain gauges on Eel river, making possible the issuance of flood forecasts by the local weather bureau.

A new dairy is to be established on the Poorman cattle ranch of 1700 acres near San Jacinto, which has been used as a pasture for years. The Poormans own a dairy near Perris, and will bring a number of their cows from there to the San Jacinto ranch.

Dairymen in Stanislaus county are looking forward to one of the best markets for dairy products they have ever enjoyed, as the establishment of condensary, cheese factory and casein factory, together with the various creameries, gives them an outlet in four directions.

W. J. Higdon, Holstein and Guernsey cattle breeder of Tulare, advises us that the Holstein cow Paula Segis has just completed a seven-day record of 30.49 pounds butter without any preparation. She is now on a 30-day test. She was sired by King Segis.

It is reported by the Holstein-Friesian Association that the Holstein-Friesian cow Tietje Queen De Kol 95772, owned by A. C. Howe of New Hartford, N. Y., has completed a production of 525.1 pounds milk containing 32.726 pounds fat in seven consecutive days.

Dairymen of the Patterson community have on foot the organization of a cream pooling association, the purpose of which is to sell, collectively, cream for a given period to the highest bidder and through co-operation to cut down the expense of hauling the cream to market.

Additional contracts with dairymen in Alameda, Santa Clara, and San Joaquin counties, insuring increased control of milk production, have been secured by the campaign committee of the Associated Milk Producers. Bottles have been ordered for its direct delivery service.

A. A. Jenkins of Tulare reports the sale of Jerseys as follows: "Gertie's Lad's Count" to Edw. Whaley of Tulare, and "Gertie's Lad of Tulare" to W. H. Herd of Tulare. They are both sons of Gertie's Lad bred by him and going to improve the herds of these progressive dairy farmers.

The Stanislaus County Farm Bureau has recently organized a cow-testing association in that county with a membership of about 1,200

cows. It will operate mostly in the Denair, Hickman, Turlock and Patterson districts, and in that way not conflict with the old association which operates chiefly in the Modesto district.

Dr. Williams of Cornell, an authority and investigator on barrenness and contagious abortion in dairy cattle, will hold a meeting to be arranged by the Imperial County Farm Bureau with valley veterinarians in January. He is brought to this State by the University of California for a veterinarian's short course.

The following is a list of the owners of cows in the Sacramento-Yolo Cow Testing Association that produced more than forty-five pounds of butterfat during the month of November: John Krull, 57.0; Henry Pylman, 54.6; Henry Pylman, 53.1; Garrett Pylman, 52.8; John Knepfel, 51.3; J. D. Feran, 50.1; John Krull, 47.4; W. H. Nichols, 45.9.

The Northern California Stockmen's Association is strongly opposed to the proposed increase in grazing rates in the National Forests. At a meeting held in Redding recently there were representatives from Siskiyou, Modoc, Shasta and Trinity counties who adopted a resolution protesting against the proposed increase in rates and asking Congressman Raker to intercede at the Washington end.

A number of dairymen of Chico have taken advantage of the opportunity for State inspection under the new milk law, which went into effect Oct. 1, and have applied to the State Veterinary Surgeon at Sacramento for inspection. An inspection will be made every six months of the dairies and creameries which have applied. Those who do not permit State inspections will be forced to withdraw from selling milk.

C. A. Starkweather, State Dairy Inspector, informs us that he has visited all of the dairies supplying whole milk for retail consumption in Merced, Madera and Stanislaus counties since October 1 and that he has sent 225 applications to the State Veterinarian for tuberculin testing of dairymen's herds since that time. He is meeting with very little opposition in the enforcement of the new law, finding dairymen willing to test their herds out as long as the State is willing to do it for nothing.

BEEF CATTLE.

Ten Wisconsin farm boys received \$1,025 for twelve beef calves exhibited by them at the first Wisconsin Boys' Baby Beef show recently held at the State capital.

The Napa County Livestock Association appointed, at its last meeting, a delegate to attend the California Swine Breeders' Ass'n annual meeting in Los Angeles January 18-19.

Three hundred and seventy-two yearlings and 2-year-old heifers were sold to the United States Indian Service, and are intended for distribution among the Indians of the Klamath Indian Reservation for breeding purposes.

The heavy frosts of the past two weeks have seriously affected the feed on the ranges adjacent to Oakdale, Stanislaus county, according to Chas. W. Emart, who says that his cattle have dropped off considerably in flesh just recently.

Haden Smith of Woodland advises us that the Duroc boar Uneeda Wonder, owner jointly by himself and H. P. Slocum and Son of Willocks, has been shipped to Mr. Slocum's ranch for the present. His permanent home, after the next two months, will be on the Smith farm.

F. R. Steel of Grants Pass, Oregon, writes us that consignments to the Western Berkshire Congress sale, to be held at Davis, Feb. 15, have al-

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months, 300 head, both sexes, all ages, reasonable prices. Some fine bred sows and gilts, and top quality young boars. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, E. H. Whitten, Route 5, Box 647, Los Angeles.

FOR SALE—One May 7th Poland-China Boar. Big bone, short head and ear. Also 3 Feb'y 24th sows, bred to an Orange Wonder boar. All broad backs, short heads. \$20 each, registered, crated, f. o. b. N. M. Lester, Grady, Cal.

ready been received from the following: Joseph Wilson Jr., Mason, Nevada; Winona Ranch, Grants Pass, Oregon, and the University of California.

SWINE AND SWINEMEN.

Oakdale is becoming a stock shipping center. Recent shipments were: J. M. Frailey, a car of fine mules to Kansas City; Boone & Ornbaum, three cars of hogs to San Francisco; B. M. Mitchell, a car of hogs for the San Francisco market.

R. J. Yates, a big breeder of Poland China thoroughbred hogs, will move his entire establishment from Goldfield to a newly acquired property in the Murdock tract near Orland early in February.

The stock and swine men exhibiting at the citrus fair stock show, Visalia, are already laying tentative plans for the second annual event which will be held earlier in the fall of 1917, and not made a part of the citrus fair, as was done this year, that they might get a start on an annual show.

Porterville bankers are co-operating with the Department of Agriculture of the State University in their efforts to improve breeds of hogs, and have arranged to distribute purebred gilts to farm boys on their personal notes. The first shipment has been received.

H. I. Marsh of Stanislaus county reports the following sales of purebred Poland Chinas: Four boars to Red River Lumber Co., Lassen county; a boar to B. E. Sponge,

REGISTERED AND UNREGISTERED Shorthorn Bulls and Percheron Horses for sale. Paicines Ranch Co., 320 Sharon Bldg., San Francisco.

CROLEY'S CALF FEED with skim milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

SIMON NEWMAN CO., Breeders of Registered Herefords. Newman, Cal.

GEORGE WATTERSON—Breeder registered Herefords. Bishop, Cal.

SHORTHORNS—Carruthers Farms. Mayfield, Cal.

SHEEP AND GOATS.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and Importers of Shropshire, Rambouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

KAUPKE BROS., WOODLAND, CAL.—Breeders and Importers of Hampshire sheep.

CHAS. KIMBLE—Breeder and Importer of Rambouillets. Hanford, Cal.

HORSES AND MULES.

HORSES FOR SALE—All or any part 170 head. Imported Percheron stallion. 50 grade Percheron mares. 30 three-year-old colts, broke and mated; \$250 to \$300 per span. 30 two-year-olds; 30 one-year-olds; 30 nine months old. S. L. Skaggs, Madera, Cal.

STOCKTON PERCHERONS again winners at Sacramento. Get next, brother farmer. H. G. Learned, Producer, Stockton.

REGISTERED SHIRES—Black Hawk Stock Farm, Importers and Breeders, Easton & Ward, Proprietors, Burlingame, Cal.

REGISTERED IMPORTED PERCHERON Stallion for sale cheap. Hewitt & Hewitt, Dixon, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

THOROUGHbred SCOTCH COLLIES—All bred from our noted prize-winners. Have a few 3 months old puppies—very choice. Write us what you want. Browndale Kennels, Redwood City, Cal.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 531-637 Brannan St. San Francisco.

STOCK RANGES AND FREE RANGE—Different counties. Write for free booklet. Joseph Clark, Sacramento.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES. Gilts bred to 900-lb. boar. Ed. B. Johnson, Turlock, Cal.

Fresno; a boar to J. J. Crane, Fresno; and 4 gilts to Fred Hartsook, Lankershim.

A. F. Busch of Potter Valley writes us that he has just purchased a purebred boar to head his Poland-China herd. This boar was sired by Big Clarinda. His dam is Jumbo's Queen 2d, both owned by B. F. Marmon of Farmington, Ia.

J. D. Crawshaw, M. D., has sold Poland-China boars to the following: Frank Pellissier & Co., Merced; W. Zimdars, Columbia; and Dick Wilson, Laton. He says the hog raisers of the State are just waking up to the profits to be derived from improving their herds by using well-bred boars on grade sows.

CONTAGIOUS ABORTION AND CATTLE DISEASES.

On the evening of Tuesday, December 26, Prof. W. L. Williams of Cornell University, will be at Travelers Hotel, Sacramento, as the guest of J. M. Henderson Jr. Prof. Williams is rated as one of the greatest authorities on abortion and other diseases of cattle, and the evening will be given over to an entirely informal discussion of these subjects. Mr. Henderson cordially invites all breeders and dairymen to be present to meet Prof. Williams, and the evening should prove helpful and profitable to all those present who have problems to meet along these lines.

SOUTHERN CALIFORNIA HOLSTEIN BREEDERS' SALE.

[Written for Pacific Rural Press.]

At the combination Holstein sale of the Edgemont Holstein Farm, Anoakia Breeding Farm, and the Whittier State School, Dec. 12 at Rivera, 33 of the 63 head sold brought \$200 or more, nine brought \$300 or more, and one brought over \$400. Total sales were \$14,127.50, an average of \$224.25 per head including 11 calves.

Salomina Palmer Tuebie, consigned by the Edgmont Farm, sold for \$465 to A. E. Austin of Los Angeles. He bought 15 head. J. J. Jeffries bought 20 head, McAlister & Sons 13. There were 10 other buyers who took one or two head each.

STOCKS OF FROZEN AND CURED MEATS, DEC. 1.

This is the first monthly report issued by the Office of Markets and Rural Organization, Washington, D. C., on the stocks of frozen and cured meats held by wholesale slaughtering and meat packing establishments and public cold storages. As a number of firms have not responded to inquiries, the report does not include all holdings.

Reports from 170 firms show that these firms now hold 122,695,990 pounds of frozen beef; 222 firms report holdings of 33,021,327 pounds of cured beef; 117 firms hold 29,

242,941 pounds of frozen pork; 283 firms hold 124,351,542 pounds of dry salt pork; 352 firms hold 210,902,406 pounds of sweet pickled pork; 318 firms hold 52,168,141 pounds of lard; and 101 firms hold 5,085,796 pounds of frozen lamb and mutton.

The 121,456,942 pounds of dry salt pork reported by 234 firms who held 83,414,521 pounds last year is an increase of 38,042,421 pounds or 45.6 per cent.

Pull Big Stumps by hand

Showing easy lever operation

K Stump Puller

Clear your stump land cheaply—no digging, no expense for teams and powder. One man with a K can rip out any stump that can be pulled with the best inch steel cable. Works by leverage—same principle as a jack. 100 pounds pull on the lever gives a 48-ton pull on the stump. Made of Krupp steel—guaranteed against breakage. Endorsed by U. S. Government experts.

Write today for special offer and free booklet on Land Clearing.

California State Butter Record Broken

by a daughter of

KING MEAD of RIVERSIDE

Butter 7 days 35.36—Butter 30 days 141.00—Average % 4.5.

This is the record just made by Anggie Acme of Riverside 2nd.

If you want a bull that will transmit—

HEAVY PRODUCTION—HIGH TEST—GOOD TYPE,

your best opportunity is in a son of KING MEAD OF RIVERSIDE. Our claims for high per cent of fat are not based upon abnormal seven-day tests, but on the average test of his daughters for the year.

His first five two-year-olds tested for the year average 14,325 pounds milk, 721 pounds butter and 4% butterfat. Two of these made over 21 pounds in seven days, and with second calves have made from 26.17 to 28.46.

We can now offer a beautiful son of King Mead of Riverside from a three-quarter sister to Aralia De Kol, 28,000 pounds milk and 1142 pounds butter. His dam made 819 pounds butter from 19,352 pounds milk in a year.

The calf is an 87½% brother to Aralia De Kol Mead, that holds the highest two-year-old butter record in California, 870.61 pounds butter from 16,669 pounds milk, average test 4.18. Born May 28, 1916. An outstanding individual.

Price and pedigree by request. We are sold out of serviceable bulls and you had better buy now if you need a bull for spring service.

A. W. Morris & Sons
WOODLAND, CAL.

Self-Feeders and Pasture for Hogs.

[By F. R. Steel, Grant's Pass, Ore.]

A half-fed pig is no good no matter how well made nor how well bred. If you are not going to feed your young pigs well there is no use in having good pigs—no use in having any kind of pigs at all. The two chief things that a pig must have to grow well and economically are pasture and grain. He can not do well without plenty of each. A third thing that I think he ought to have, although not so important as the first two, is skim milk.

Good pasture for pigs is provided by alfalfa, clovers, rape, peas and oats, oats and vetch, blue grass, and a number of other grasses and mixtures of these. We have found a mixture of alfalfa, clovers, and grasses the best for permanent pasture in hog lots, because it stands heavy tramping the best. Rape and turnips planted in rows and cultivated make a very good one year hog pasture. For the proper accommodation of a purebred breeding herd of hogs it is a good plan to build a series of hog pastures one-quarter to one-half acre in extent and considerably longer than they are wide. These should be laid out along a central feeding lane. One sow and her litter are placed in each lot with an individual house, a self-feeder, and a trough for wet feed in each, besides the watering device. We have found that better results are obtained by giving each sow and litter a lot to themselves. When the pigs are ready to be weaned, which will be when they are depending chiefly upon what feed they eat themselves instead of upon the mother's milk, and usually occurs when the pigs are about twelve weeks old, the sow can be taken out of the lot leaving the pigs in it until time to ship them or to separate boars from the gilts.

In comparison with the quite usual method of raising a litter practically without pasture and on slop feed alone, we conducted an experiment last spring at Winona. All the litters but one were handled in the method I have described. This one litter was raised practically without pasture and without a self-feeder, but with all the slop feed the sow and her pigs would eat twice a day. This one litter was from one of the best brood sows on the place, a sow that is one of the proved milkers and mothers that we have, and whose pigs have proved themselves large-sized, fast-growing youngsters in former litters. We then weighed each litter each week. The weights were:

Average Weight Per Pig.

Age	Pasture, Self-feeder and Slop	Slop
One month	16.0 lbs.	12.1 lbs.
Two months	36.6 "	26.9 "
Three months	67.2 "	48.7 "
Four months	98.0 "	74.4 "

This gives us a difference in the average weight per pig at four months of 26.6 lbs. or over 25 per cent. This experiment proved to our complete satisfaction that we did not want to raise any more litters by the slop feed alone method.

Pasture should be provided for the growing pigs after weaning, for the dry sows, and for the herd boars, as well as for the sows and their litters. Really first-class pasture will practically carry the sows and

boars when mature without any grain, or at least with a very small grain feed once a day. This method insures plenty of exercise too.

Grain and concentrates for hogs should be supplied liberally in a balanced ration, that is, one in which the proportion of protein to carbohydrates equals the needs of the animal—usually about one part protein to six carbohydrates, depending on whether they are young and growing, carrying litters, etc.

Self Feeders.—We have found the self-feeder one of the best and most economical methods of feeding grain to all hogs on full feed. If a proper variety is used in self-feeder the pigs will balance their own rations very well indeed, the younger ones eating a larger percentage of protein feed and the older ones a larger percentage of carbohydrate feed, which is just as science dictates should be done. The labor cost is far less with self-feeders than by hand feeding, and the pigs are sure to have enough grain.

Our self-feeders are home made, wooden affairs, made with four compartments to each feeder. In one compartment we put rolled or ground barley or ground corn, in another compartment shorts, in a third a half and half mixture of tankage and linseed oil meal, and in the fourth compartment the Lovejoy mineral mixture of one bushel wood ashes, one bushel ground charcoal, 10 lbs. common salt, 5 lbs. sulphur, 2 lbs. copers, and 1 lb. lime. We have found that tankage is the most economical protein concentrate with which to balance barley or corn, but that the addition of shorts and oil meal to the ration gives slightly increased gains. If partly grown gilts and boars begin to get too fat on a self-feeder mix alfalfa or clover meal with the grain.

We have found that more gain can be gotten on growing pigs by the addition of skim milk to the ration than in any other way. The benefit of skim milk is out of all proportion to its protein and carbohydrate content. One reason for this is that the proteins contained in skim milk are twice to three times as efficient for growth as are the proteins of the grains. Aside from this, however, there is contained in skim milk the unknown growth element whose presence in every growth-producing ration has been conclusively proved by the recent experiments of Professor McCollum of the University of Wisconsin. Without this element—called the "Water Soluble B"—and which occurs in large quantities in skim milk and in smaller quantities in the leaves of alfalfa, clover and other green feed, but which does not occur in grains to any extent, no growth can be obtained no matter how much grain is fed. This fact probably explains the beneficial effect of skim milk and pasture which has been universally observed and which occurs, as I have remarked, out of all proportion to the nutritive elements derived from these two sources.

As a cheapener of the ration some roots—turnips, rutabagas, mangels, etc.—and field pumpkins can be used to good advantage for mature ani-

mals not on heavy grain feed. Give growing stock all they can eat of pasture and a balanced ration of grain with skim milk, if possible. Feed mature stuff all the pasture

they will eat with only a light grain ration.

Cocoa shells are being fed to cattle in a course of experiments by French dairymen.

USE LOW GRADE FUEL

BUYING AN ALPHA ENGINE means more than buying cylinders, pistons, gears, wheels, and so many pounds of iron and steel.

It means buying an engine with a personality—an engine that is guaranteed to give you the good service you expect. ALPHA ENGINES permit the use of kerosene and other cheap fuels, resulting in great economy of operation.

Stationary **ALPHA ENGINES** The World's
Semi-Portable Gasoline—Kerosene—or Distillate Standard
Portable 1½ H. P. to 100 H. P.

Built-in, Gear-driven Magneto makes starting easy.

NO BATTERIES.

NO COIL.

NO CRANKING.

Patented kerosene carburetor embodies new ideas in the use of cheap fuel. Cuts fuel cost in half. No torch, no pre-heating, no carbon in cylinders. Deliver full-rated horse power without trouble.

Wearing parts are case-hardened steel ground to size. Gears are drop-forged and unbreakable. Built for the man who wants RELIABLE power and service.

Raising Poultry for Profit

SELECT POULTRY BREEDING STOCK NOW.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

This is the time of year that the breeders should be selected, especially on the farm where they have range. Haphazard hatching results in chicks that are not strong; they turn out poor layers and are unprofitable altogether. Now, in making a selection of breeders, we must either have a knowledge of how to select, or we must depend on trap nests.

The trap nest is really the only reliable information that we can have, but it must be conducted over a certain length of time to be accurate and trustworthy enough to use in selecting the breeders. December, in my opinion, is the time when we should begin to make these selections, because any hen will lay eggs in spring. Nature, at that time is urging all to propagation, and if these eggs are hatched we are just propagating the same kind. Therefore, the hens that are laying now, should be trapnested, their legs banded with numbered bands, and a record kept of what they are doing.

Number the band, write down the numbers in a book, and also on a slate, fasten the slate with pencil attached, to the wall near the trap nest. Then when the attendant goes to liberate a hen her number is taken, and she is credited with an egg. At the week-end the numbers of eggs are copied from the slate into the book, which stands as a permanent record, while the egg record on the slate is wiped off, leaving the band numbers for the coming week.

If we are trying to establish a strain of winter layers, it will be best to continue this work for one year in order to make sure that a hen capable of laying one winter has not used up all of her vitality in that one winter's effort.

After we get the hens' records for, say three months, it will be quite safe to commence to hatch from those hens having the highest records for December, January, and February. In our climate almost any kind of hen begins to lay in March, so, unless a hen had a good previous record, I would not consider her worth while to use in building up a strain of winter layers. Rather would I use pullets or young hens that had been hatched in September or November the year before, because the late laying hen, as a rule, is a good laying hen.

In these days of high-priced feed, we must make an effort to breed up for more eggs. We cannot afford to hatch from anything that lays an egg now and then as a great many hens do. I know from information I get that 100-egg hens are more numerous than are 150-egg hens. This being so we need not wonder that people do not make money in poultry. Hens that can't do better than 100 eggs in 365 days ought never to be propagated; yet I am reliably informed that a great many flocks average only a trifle over that. Even with a 150-egg record, we must feed a hen 215 days in a year for nothing. We want to get away with

the dead-heads of all kinds. All animals have to rest, but in all faith it ought not to be more than half their working time, when their food is furnished.

Under natural conditions a wild fowl lays about the number of eggs she can cover nicely; if her nest is robbed, she immediately lays another batch; thus she doubles her seeming capacity and hustles for her living at the same time. So long as we keep robbing her nest of the eggs and furnish her material for making more, I don't see that the hen has any kick coming; and if the right kind of hen is bred from, she won't kick; she won't have time to kick, because her time will be taken up in laying eggs, when eggs are out of the natural season. The idea is, don't depend on the late spring layer to hatch your chicks from, but commence right now to build for a 200-egg strain of your own; you can do it if you set about it now.

POULTRY QUESTIONS.

[Answered by Susan Swaysgood, Pomona.]

Rabbits Won't Breed.—I did not breed my rabbits in summer, thinking it too hot. About the middle of September I thought it was cool enough and wanted to breed them, but the does would not breed. What is the cause?—P. H.

I am not much versed in rabbit lore, but when any animal refuses, after being bred before, the cause is usually in the animal's condition of health. I would feed them a little higher, give them rolled barley or rolled oats, bread soaked in milk, or anything that would put more life in them. You did not say how you fed, but reason tells me that your rabbits are either too poor or too fat.

Goslings Weakened and Died.—Last spring I raised a nice lot of young goslings to about two months old, when they were getting their wing feathers. Their wings began to droop so badly that they could not raise them from the ground, and some of the goslings got so weak they could not follow the flock and would die, while some would go blind. They had plenty of green feed and running water.—P. H.

The trouble with your goslings was too much traveling. Geese are afflicted with a disease called "blind staggers." In countries where goose raising is carried on to any extent, the old geese are picketed near the water and fed. This induces the young goslings to stay in practically one place all day. Next day the old geese are removed to another section, but are never given their liberty until the goslings are strong enough to tramp around all day. It is too bad you did not confine the goslings to a certain run, even though you had to furnish a little of the feed in the form of a mash. Goose raising is a hobby with me; I love to feed them and watch them grow. If you will try next season to confine them to a limited run until they are nearly full grown, you will not lose any. Too much exercise weakens them, because grass is a diet that is not very staying in quality. If you must turn them loose, feed a good mash once a day, and they will stand it.

Dark Cornish.—Somebody asked about Dark Cornish fowls a short time ago, and I have mislaid the letter; if they will send me a self-addressed envelope, I will give them the address of a breeder, but would prefer some of our advertisers to send in an ad. if they have these good birds.

BROWN-SHELLED EGGS.

To the Editor: In a recent issue of the Pacific Rural Press the poultry editor stated that brown-shelled eggs were discriminated against. When I came to the State a few years ago I was so informed. Later, when I had charge of a butter and egg store in North Berkeley, I found that such discrimination was not justified. Of the customers who expressed a preference between a brown-shelled egg and a white-shelled egg, the ratio was at least four to one in favor of the brown-shelled egg. The great majority expressed no preference.

Hence, those who preferred a white-shelled egg were a very small minority.

I am now producing brown-shelled eggs myself and supplying private trade. Not a person has yet objected to them.

It seems to me that such discrimination is arbitrary and should cease.

E. P. Montgomery.

Walnut Creek.

Those who desire to establish alfalfa in their poultry yards can succeed by ploughing or spading under alfalfa crowns that have been freshly ploughed out from some field near by. Early in the spring is the best time, while the crowns are still dormant. The crowns should be covered four to six inches deep, and the soil wet down and kept moist, and the chickens kept off until the crowns have become established, which will be much sooner than by alfalfa seeding, and will stand much harder pressure.

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from \$15 to \$20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get near \$2 for wheat and raise 20 to 45 bushels to the acre he is bound to make money—that's what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax. Mixed Farming in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

GLOBE MILLS, LOS ANGELES, CAL.

M. M. Welton of Lodi claims to have a pen of thirty-eight White Leghorns that are record breakers in the production of eggs. Last month these thirty-eight hens produced \$24.85 worth of eggs after the Welton family used all the eggs that were needed in a family of two members.

RELIEVING IMPACTED CROPS IN TURKEYS.

An over-distended and paralyzed condition of the crop sometimes appears and is caused by overeating or by swallowing coarse and indigestible substances, such as sticks, pieces of straw or feathers, states G. W. Barnes, livestock specialist of the University of Arizona. The contents of the crop may be removed by forcing the bird to swallow a teaspoonful or more of sweet oil. Then rub the lower part of the gulf. This will soften the contents and they may then be pressed toward the head. Oftentimes this can be done quite effectively by holding the bird head down, and with constant rubbing the greater part of the material may be removed. Do not feed the bird for several hours after it has been thus relieved. If this plan and simple treatment is not successful, the crop can be opened with a sharp knife and the contents removed through the opening. Do not make the opening more than an inch in length. After doing this, wash out with clean, warm water. Take three or four stitches first in wall of crop; after this is completed, take the same number in the skin. Make and tie each stitch separately. Coarse white silk is a good material, but if not at hand, use white cotton. Feed on soft feeds for a day or so, keeping plenty of water before the birds at all times.

SODIUM FLUORID AND POULTRY LICE.

We recently printed in this department of the Rural Press an announcement issued by the Bureau of Chemistry, U. S. Department of Agriculture, that applications of small quantities of fluorid of soda would quickly destroy chicken lice of all forms. We have received several inquiries from subscribers asking for detailed methods of application. This information was not furnished in the Department's preliminary announcement. All poultry raisers who are practically interested in this new suggestion may obtain the desired information by writing direct to Washington, D. C., for the annual report of the chief of the Bureau of Entomology, U. S. Dept. of Agriculture.

POULTRY NOTES.

It does pay to keep pure poultry. Pays better in meat, in eggs, in growth, in satisfaction.

Charles Romwall of Petaluma has been elected president of the newly organized Poultry Producers of Central California.

Leghorns will lay fewer eggs when moulting than the Plymouth Rocks, Wyandottes, or Langshans. Whatever the Leghorns do they do with a will. When they lay they shell out the eggs as though they were paid for the job, and when they moult they simply moult.

The reports of the 54 associated cold storage warehouses of December 1 showed only 1,336,000 cases of eggs on hand against 2,040,000 cases the same date last year, a falling off of 704,000 cases compared with a year ago. There were loaded out of the warehouses during the month of November 881,000 cases against 1,058,000 cases to November of last year. The high prices this year having much to do with the lighter movement of eggs into consumption this year than last. The very light stocks, however, make the market situation a strong one, and the storage supply will doubtless be exhausted early in the new year.

JOTTINGS.

The kelp harvester Alicell, said to be one of the largest vessels of her kind, stranded on a rocky ledge off Point Loma at San Diego last week during a heavy fog.

It is reported that reclamation District No. 1600 in Yolo county has now almost completed its system of levees and within a year will have 6,500 acres of land ready to produce crops.

According to the biennial report of State Engineer W. F. McClure, just filed with Governor Johnson, irrigation in California dates back to the founding of the missions by Junipero Serra.

The annual report of the National Forest Administration says the receipts from timber last year were over \$1,400,000, a twenty per cent increase, while grazing receipts were \$1,200,000 and water power rentals brought in \$100,000.

One hundred and ninety-three different kinds of insects which might prove hurtful to American crops, and 116 plant diseases of similar significance were detected by State and Federal inspection during the last fiscal year on plants and plant products offered for import into the United States.

The Directors of Humboldt County Farm Bureau have named Dec. 23 as the day upon which farmers of Humboldt who expect to receive a long-time loan at the hands of the Farm Loan Association must go to Eureka and assist in the organization of the Farm Loan Board of the Humboldt County Farm Bureau.

The net weight amendment to the Federal Food and Drugs Act requires that all packages of food which are shipped into inter-state or foreign commerce must be marked plainly and conspicuously with a statement of the quantity of the net contents, either by weight or measure. Those who violate this law are liable to criminal prosecution.

The Secretary of Agriculture, in his annual report for the fiscal year ended June 30, 1916, says the decline in beef production reached its lowest point in 1913, and that since that time there has been a very material increase in the number of swine since the census year 1899. The number of sheep has continued to decline, but only to an extent.

A scheme is under consideration in Sydney, New South Wales, for the erection of elevators in the city and country. The Sydney elevator will have an initial storage capacity of 3,000,000 bushels, but will be extended later to hold 15,000,000 bushels on a basis of a 40,000,000-bushel export crop, a conservative estimate of the probable saving per annum is \$3,835,000.

To determine the nature of the soil types in portions of Mendocino county that local farmers may be assisted in adapting crops to soils, the Bureau of Soils in the U. S. Department of Agriculture, co-operating with the University of California Agricultural Experiment Station, has made a soil survey of the Ukiah area of the county. The report of this survey just published by the Department contains a soil map of the county, on which farmers may find the approximate location of their farms, and 53 pages of text, describing the various soils, discussing their capabilities, and suggesting means for utilizing them to better advantage.

Poultry Adviser

Personal advice on all poultry matters. I guarantee to increase the egg yield, the health and vigor of the flock, shorten the molt and prevent disease if you follow the advice. \$1.00 for advice and formulas.

SUSAN SWAYSGOOD
Route 2, Pomona, Cal.

California Poultry Practice

A Practical Treatise on Poultry Raising in California

By Mrs. Susan Swaysgood
Writer and Breeder
Of Utility Poultry.

160 pages of text, besides many full-page illustrations. Cloth bound.

This Book Will Help You in the Many Details of POULTRY RAISING.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

Mrs. Best's Letter.

My dear Friends:—I have seen some very attractive suits for motoring the last week. One was of sage green duvetyne, with full skirt edged with a two-inch band of moleskin. The coat was a Russian blouse model, edged with the fur and having a belt of soft clored embroidery.

The hat to wear with this suit was a touque of moleskin with a soft crown of colored embroidery. A small muff of the same fur completed a very trim, good looking suit.

Another attractive suit was of a tweed mixture with the skirt of five gores with an invented pleat in the back. The coat was a Norfolk model with collar and cuffs of fur. To wear with this, was a stitched Alpine hat of the same cloth with a gay pompon at one side.

Extra coats are much in demand at this time of year and they should be generous enough to slip on over a suit coat. The coats with the raglan sleeves are especially good for that, particularly if made with an invested pleat in the back and under each arm. The convertible collar is another good feature in the winter coats.

For the woman who drives her own car, the white washable kid gloves with snug wristbands are the most practical. The better shoe shops are showing a shoe protector made of patent leather, to strap around the ankle to protect the shoe when driving.

There is a new suede case on the market that is a combination of veil case and vanity outfit. It is about ten inches long, has a flat place for veils and the vanity outfit is on the other side. It swings from the wrist by a strap.

Soft little hats of corduroy are delightful for motoring, for they may be pulled down on the head almost like a cap and do away with the necessity of a veil.

The streaming veils of light chiffon are not worn as much now as formerly—most women who ride a great deal have small hats and face veils fastened snugly over them.

Rosabella Best.

A SPARE LEG.

Jones was old-fashioned and stuck to old-fashioned ways. Smith was modern and bought a fine new automobile. One day he was proudly exhibiting it to some friends when Jones came along.

"Um," remarked Jones, as he sized up the handsome machine. "What's that thing on the side?"

"That's a spare rim and tire," answered Smith. "We always carry an extra one in case one of the wheels goes wrong."

"Just as I always said," was the response of Jones. "I've driven hosses for nigh on fifty years, and I never had to carry a spare leg for one of them yet."

JUST SO.

"Stop, look, listen."

The reflective man stopped to read the railroad warning.

"Those three words illustrate the whole scheme of life," said he.

"How?"

"You see a pretty girl. You stop. You look. After you marry her you listen."

THE HOME CIRCLE

We wish you all a Merry Christmas and a Happy New Year!

DISTRIBUTION OF GIFTS.

Nothing is any more interesting to small children than the hanging of the stockings by the fireplace the evening before and the early rising the next morning to see what Santy brought.

But for a family reunion where there are many gifts to distribute, other methods may seem more attractive.

A Santa Claus shop is a novel idea and can be worked out with material from old dry goods boxes. If one corner of the room is used, you will need one wall and a roof with a counter in front. This should be decorated with cotton and green boughs and a plentiful use of red crepe paper, both inside and out. Use garlands of popcorn, and any glittering ornament suitable for Christmas tree use.

The name "Santa Claus Shop" should hang in front and be surrounded with tinsel, Christmas bells and evergreen wreaths. A jolly Santa Claus behind the counter gives the finishing touch to a very attractive arrangement.

If the party is small, a big cobweb of string that must be untangled and each string followed to a hiding place where the gift will be found affords lots of amusement.

A Christmas grab bag, which is just what the name implies, is good for a Christmas party, where fun and frolic are of more consequence than the value of the gifts. Each article should be securely wrapped and should be of small value.

THE DINNER TABLE.

The centerpiece for the table may be one of the artificial Christmas trees now so popular and so cheap or it could be a star made of holly leaves with holly berries.

A big snowball made of cotton and covered with diamond dust makes an attractive center piece. From it should extend streamers of red ribbon or red crepe paper across the cloth to each place.

Polished red apples in a basket or glass dish can be surrounded by a wreath of green, or a big bouquet of holly berries by itself is an ideal center piece for a Christmas dinner.

Some of the 5 and 10 cent stores show papier mache figures of Santa Claus with a pack upon his back, that would thoroughly charm the children of the household.

Red is the dominant color for Christmas decorations and should be used on the table in some form or another.

Crystal candlesticks with hed candles are very pretty and help carry out the red decoration scheme.

Nut cups made of red crepe paper with a bit of holly tied to the handle are easily made and so effective.

If the holly is not used on the nut cups, a little spray at each place makes a pretty note of color and can be worn by each guest. The artificial holly is really prettier than the real article, and if cared for, can be used over and over again.

For more elaborate table decorations, red tulle is most desirable, used for bows on baskets or candlesticks or as streamers from an overhead light to the four corners of the table.

THE CHRISTMAS DINNER.

The country housewife has a great advantage in the matter of supplies when it comes to preparing a Christmas dinner.

Home-grown fruits, vegetables, fresh eggs, milk and fowls which are right at hand are luxuries her city sister pays dearly for.

In order that Christmas morning may not be overcrowded with responsibilities, preparation for the dinner should begin several days in advance.

The turkey, goose or chicken should be dressed and put one side while the dressing may be prepared all but adding the liquid and filling the bird.

Mayonnaise dressing and cranberry sauce can be prepared days before

before, lettuce can be washed and put in a pail to crisp, while both mince pie and plum pudding are better for the re-heating. With all these things ready, the housewife will have

more time to devote to the jollity of the occasion and a freed mind for guests.

Following is a menu prepared by a noted Domestic Science teacher which may present some new ideas:

Consomme Bread Sticks
Roast Goose Spiced apple sauce
Potatoes in half shells Cauliflower
Grape fruit salad Salted crackers
English Plum Pudding

Brandy Sauce

Salted almonds Bonbons

Black coffee

TRIMMING THE TREE.

In some households, the children are not permitted to see the Christmas tree until time for the distribution of gifts, but if a child is old enough to understand the origin of the gifts, they will usually enjoy helping dress the tree more than they enjoy the surprise.

If possible, use the asbestos snow instead of cotton, the danger of fire from lighted candles is much less.

Strings of popcorn are always good, but large kernels fastened on by a pin give more the appearance of snowflakes.

Tiny baskets of different colors filled with small candies make pretty ornaments and later can be used as gifts for the children who come in to admire the tree. The penny

Floral Department.

[By Geo. N. Tyler.]

As there is not much to do in the garden in this cold and damp weather, I have failed to write an article for three weeks, as I did not care to repeat.

In starting the floral corner I did not know how it would be received, so did not go about it in a systematic way from the start; but as I find it is well received and in fact looked for by quite a few, I will now go back to what I consider the beginning, and at the first of the year take up the plants, etc., as their season arrives—both outside and greenhouse plants—and try and give, as far as I am able, the correct way to start, grow, and care for them, so that my articles can be used for future reference by those who care to cut them out, date and preserve them. The main thing I consider is the correct soil the different plants require. In fact the main secret in growing plants successfully is the soil. I will start with soils and composts.

The principal soils used in gardens, either alone or mixed, to form what are called composts, are loam, sand, peat, leaf mould and fertilizers, and various mixtures and combinations of these made up to suit the different subjects under cultivation.

Loam is the staple soil for the gardener. It is not only used in the pure and simple state but enters into most of the composts prepared especially for plants. For garden purposes loam should be rather soapy or greasy to the touch when moderately dry, not clinging nor adhesive, and should readily crumble when a compressed handful is thrown to the ground. Loam which contains much matter (iron) should be avoided. Sand is by itself of little value except for striking cuttings, for which purpose, fine, clean, sharp, silver sand is best. River sand and sea sand, if the salt is thoroughly washed out, is also good, and may be used, both for propagating purposes and for mixing in composts. For the growth of pot plants sand is an essential part of most composts, in order to give them the needful porosity to carry off all excess of moisture from the roots.

Peat is largely used in the culture of orchids and ferns, but as I am not going into orchids in these columns, I will not further describe it.

Leaf mould is suited for the growth of many free-growing plants. In any state most plants feed greedily upon it, and when pure and free from decaying wood or sticks, is a very safe ingredient in composts. For quick growing plants, as, for example, most annuals cultivated in pots, such as balsams, colias, combs, etc.

(To be continued.)

PRAULINES.

Mix together one cupful powdered sugar, ½ cup maple syrup, ¼ cup of cream and a few grains of salt. Bring to the boiling point and let boil until a soft ball can be formed in cold water. Remove from fire and beat until creamy. Add 1 cup cut walnut meats. Drop from tip of spoon in oblong piles on buttered paper.

CHRISTMAS CAROL.

Oh, ring, glad bells, clear and sweet!
The winds your echoes shall repeat,
And in each heart shall glad
thoughts swell

Responsive to the Christmas bell.
For years ago on Judea's plain
Was born our Lord as King to reign
First star in heaven's bright diadem,
The blessed Babe of Bethlehem.

Be glad, oh earth, on Christmas
night.

Be clad, oh fields, in spotless white.
Let hearts put by the care that
frets;

Cast off all vain and sad regrets;
And in the holy Christmas tide,
Draw nearer to the Savior's side;
To him who died for us, and them
Who hailed him King of Bethlehem.

The song the angels sung on earth
In honor of the Savior's birth
Will we repeat on Christmas eve,
And as we sing may we believe
That "Peace on earth, to men good
will,"

The angels sing on Christmas still.
So ring, glad bells, the while we sing
In praise of Jesus Christ, our King.
—Eben E. Rexford.

SANTA CLAUS IN SEARCH OF A HELPMATE.

He's reached home tired, chilled,
and hungry, to find his wee cottage
dark and his fire nearly gone out.

"I'll just have to get myself a
helpmate," mused he, with a gusty
sigh,—he was well aware really,
truly helpmates do not grow on
every bush!—as he raked the gray
embers into ruddy glow and filled
the kettle, "and that right soon, too,
so's she can give me a bit of a lift
next week. I wonder, now, where did
I put that 'How to Choose Her' Dan
Cupid sent me for my birthday?"

While waiting for his kettle to
boil, he rooted the small volume in
question out from where it had slipped
behind his pile of summer night
caps, and spent from tea till bed-
time studying it with so much ad-
vantage that he was able to add to
the long string of Nellies, Edwards,
Claras, Tobys, and addresses adorn-
ing his little red note-book the fol-
lowing memoranda: "She must be
industrious, but not fidgety; she
must be indulgent, but not extrava-
gant; she must be spry, but not
heedless; she must be capable, but
not bossy," and above all things she
must just love her job." Then he
shut up his books and went to bed.

All next day he kept his shrewd
though merry eye upon the throngs
of women, all shopping and other-
wise preparing for the Day; from
them he singled out four for a closer
scrutiny; and from these four he
was now making his final selection.

All one long forenoon he followed
—unknown to her and at a good
safe distance—the serenely smiling
Aunt Sadie as she skimmed from
shop to shop, closely consulting and
rapidly filling out the long list she
was carrying about with her.

"How very spry she is!" chuckled
Santa, and thought he'd found his
helpmate already, when the swift
shopper suddenly cried out in dis-
may: "Why, here 'way back in my
reticule, is another list which I had
quite forgotten; so now I'll have to
begin all over again, and my money's
almost gone, too!" Once more she
burrowed into the crowd besetting
the dressed doll table.

"She's not the one for me!" sput-
tered Santa, "heedless creature!
Supposing—just supposing—she was
to mislay lists and neglect children
when working with me!" and he at-

tached himself closely (but entirely
unbeknown) to Cousin Flora, who
just then came hustling in. She also
was poring over a long list and won-
dered—while tapping the counter
with a reflective pencil—whether
she could afford that rocking-horse
for Richey and Drusilla's longed-for
doll. "They want them," she con-
cluded, "and shall have them, the
darlings; and Phil shall have his
fiddle, and Polly her pat-a-pans,"
and went right at it, ordering things
till the delighted Santa was just
about stepping forward to ask her,
"Won't you?"—when he overheard
the rash purchaser telling the pa-
tient young woman behind the count-
er "just to charge these few, I hav-
en't money to pay for them; and
send the bill!"

Shocked beyond expression, San-
ta hurried out of the shop, declaring
from under his long beard, "She
won't do one little bit, for all she's
so anxious to give 'em what they
want! Fancy me with bills coming
in to be settled 'way on into the New
Year!"

Next morning he peeped in on Sis-
ter Maria, who, though it was still
very bright and early, was busily do-
ing up things in holly paper, and ty-
ing them up with poinsettia-decorat-
ed baby ribbon, giving the latter an
occasional vicious jerk when, as will
happen, they snarled up a bit.

"Now, she's a wonder and just
about right," crowed Santa, raising
his hand to the door-bell, when he
heard a sharp snappy "Dear me! I
wish Christmas and all its bundles
and buyings and wrappings were
over and done with for good!" which
so scared him that he crossed the
street on a run and rushed into the
little red brick church where Aunt
Sophy was seated among a lot of
young folk, all busily stringing pop-
corn, and filling bon-bon boxes,
while a lot more were standing on
ladders and chairs trimming a tall
and beautiful Christmas tree.

"She's the one! Aunt Sophy's the
very, very one," laughed Santa,
rubbing his hands in glee, "so full
of taste, so neat; so quick to see
what's needed and where, so quick to
know just what to get and just
where and how to place it. She's just
the one I need to help me with work,
and I'm going to ask her to name the
day!" and Santa stepped forward
and had just opened his mouth to
say "Sophy, dearest," when that
energetic person waved him back
with an imperious white hand.

"You're way ahead of time," she
called out, "and we're not nearly
ready for you! Don't stop to talk,
but go right back, and don't you
come rushing in again until I ring
the bell for you!" and, as the dis-
comfited Santa turned and fled, he
heard Aunt Sophy's strident voice
instructing two young men and a
small boy to "take that all right
down again, and loop it up in this
way."

He never stopped running till he
got to the church wall, upon which
he sat down to wipe his heated face.

"What an escape!" he gasped,
"oh-h-h-h-h, what an escape! What
would I be doing with one hectoring
my poor elves and fairies, and boss-
ing me—Me! and here it's most
Christmas, and I've been wasting the
precious days and have no helpmate,
after all!" and Santa shook a deep-
ly dejected head.

Suddenly he sat up and sniffed
and sniffed.

"What is that delectable smell,"
he muttered "it's not cookies nor
spice-cake nor gingerbread, but a
bit like all three of 'em all rolled in-
to one. I know," he shouted slapping
his knee, "it's German Christmas
cakes, and those weird and wonder-
fully decorated lebkuchen I'm smell-
ing; and I'm going to follow that
smell and see where it leads me!"

It drew him into a bit of a house
directly opposite, up two rickety
stairs and into a small and plainly
furnished room, as neat as wax. The
cakes were there, sure enough; pep-
pernuts, honey-cakes, anise stars,
and gingerbread animals and brown-
ies, gay with pink and blue and
green and yellow icing and knobby
with almonds and citron, and sitting
close by, contentedly making ging-
ham frocks for two indestructible
dollies, sat a small, elderly, red ap-
ple-cheeked lady.

"Ach, liebster, bester Santa
Claus," said she greeting him with
outstretched hands. "How very, very
glad am I to see you! Sit down and
try my Christmas cakes—they're not

bad, nicht wahr?—and these other
things I'm making for your Christ-
mas stockings. Will they do?" And
she spread out before him wristlets
and muffetees, penwipers and mit-
tens, book-marks, doll-caps, and
needlebooks all beautifully home-
made of worsteds, scrap of silk, and
bits of ribbon.

"Do!" cried Santa; "well, I should
just think they would! They're just
precisely what I need for filling the
chinks in the stockings. But don't
you want 'em yourself for your own
folks?"

"Ach, nein," sighed the little lady,
"my sons and daughters have quite
altogether outgrown Christmas, and
the children of the neighborhood for
whom I made things and trimmed
trees have moved far, far away. So
take them all, dear Santa, and let
me feel that I am helping along a
bit."

"All this saving and planning and
sewing and baking," exclaimed the
puzzled Santa, "for children you
neither know nor care for; all this
work and bother!"

"Oh, but I do care for them very
much, for the children," answered

Climbing and Trailing Plants

Parcel Post —
Every pair
guaranteed.

If not sold by your dealer, order direct from
us. A new pair or your money back if they
do not fit.

BUCKINGHAM & HECHT, San Francisco

the little lady; "and I love the work and what you call the bother. I love to make things and bake things and just to soak myself in Christmas smells and sounds and sights. Why, Santa dear, you cannot know how I love Christmas and everything that goes with it."

"Affectionate, industrious, and quicker'n a wink!" deliberated Santa, "she's all that and more, too, and, moreover, dead in love with her job!" Whereupon he then and there secured the little elderly lady for his helpmate; he carried her (and her cakes and Christmas contributions) back with him to his wee cottage which ever since has been warm and bright and cosy for him and his helpmate.—Kate Hudson.

Good Health.

[By H. E. Pastor, M. D.]

Sleep.

We all like to sleep, but we like to enter the sleeping state with a pretty positive assurance of waking up again. The sleep that knows no waking has no allurements for the average wooer of Morpheus. Poets, scientists, visionaries, and psychologists have, many of them, exhausted themselves on the subject of sleep, but have far from exhausted the subject itself. It is ever a fascinating and puzzling theme of speculation. While poets have raved over it in meter and the seer has used it in mystic symbolism, the scientist has been studying it cold-bloodedly and trying to correlate its phenomena with other phenomena of a more or less material and explicable kind. But though the scientist has thrown much light on this interesting phase of our existence, his explanations of the phenomenon never exactly explain to the satisfaction of the eager inquirer.

We are told by these scientists that there is a lessening of the blood flow to the brain during that period of unconsciousness of semi-conscious we call sleep; but whether this diminished blood flow to the cerebral centers is the cause of sleep, or merely an accompaniment, is still an open question. We are also told that during our waking hours certain toxic products resulting from the breaking down of the minute cells which form the different tissues of our bodies poison the nervous cells forming the centers of consciousness, exerting a sort of paralyzing effect on them, which produces the condition we call narcosis, or sleep.

The chances are that the sleeping and waking states are part of a natural rhythmic order that seem to pervade all cosmic processes. Suns light up and then die down, seasons of heat alternate with seasons of cold, darkness follows light, and light follows darkness in the diurnal revolution of our planet, plants have their seasons of activity succeeded by a season of dormancy; likewise the brain has its period of active functioning followed by its period of torpor. It is probably inherent in us, and is no more explainable than why we eat, why we think, why we love, why we live at all. Even our Lord rested after a period of six days' toil, and no amount of physiological dissertation could explain to us why this was necessary. The principle of alternating periods of activity and

rest was probably impressed on creation in the beginning, and defies human scrutiny.

Anyway, we have learned, a few things about sleep whether these things do us any good or not, and a few of the things we have learned are these:

(1) As a prelude to sleep, there is a change in the composition of the blood flowing through the capillaries or minute blood vessels of the cortical or outside cells of the brain, where the centers of consciousness reside. The blood-vessels then convey to the brain a larger proportion of the waste or toxic products of the body, and less oxygen; and the toxic effect is expressed by the sense of fatigue.

(2) The blood circulation slows down, causing the cells of the cerebral cortex to become less active.

(3) During sleep, however, conditions are reversed. About double the amount of oxygen is carried to the brain by the blood current that is conveyed there during the waking hours. The accumulation of waste products is rapidly carried to the excretory organs and discharged, and the process of repair or recuperation goes rapidly on.

(4) The benefit derived from this constructive process is proportioned to the depth and intensity of the sleep rather than to its duration.

Muscular labor is more conducive to sleep than is mental labor, because there is a determination of the blood from brain to muscle, and because the toll involved in muscular labor is more onerous and exhausting, which calls for a longer period of recuperation and more profound repose.

These few remarks on sleep are merely intended to make more intelligible a practical hint or two on the subject of sleeplessness, which will be given in the next issue, as our allotment of space has petered out.

To Get Rid Of Warts.

Can warts be removed? Yes, commonly they can. Soften the wart by soaking in water for awhile and apply a few drops of oil of cinnamon. Do this repeatedly and some day when you go to apply the treatment the wart will not be there. "It folds its tent like the Arab and as silently steals away." If this advice (which the writer has frequently tried with success) is too commonplace and homely, the following looks more professional, and is really pretty good:

Take Sulphur sub. 5 oz.
Concentrated acetic acid. . 2½ oz.
Glycerin 2 drams
Make a paste and apply to the warts on small pieces of linen or spread with a brush at night. Wash off the next morning. Repeat till the warts drop.

Don't Lose It Before You Value It.

People love to talk grandiosely of the "main issue of life," and usually put forth some pet and petty hobby as about filling the bill. Being ourself somewhat of a hobbyist, and inclined to the worldly view of things, we here set forth the belief that the conservation of personal health is the main issue with each individual, for without a modicum of good health most other advantages of mundane existence go a-

SAN FRANCISCO.

San Francisco, Dec. 20, 1916.

WHEAT.

While the Eastern market shows extreme sudden fluctuations from day to day, due to the effect of peace talk on speculative conditions, the local market shows little change, failing to reflect even northern changes very promptly. Local trading, in fact, is extremely quiet, owing partly to the holiday season, and partly to the fact that, while buyers demand lower prices, holders take quite a firm view. [First-hand prices on strictly first-class grain, San Francisco.]

Sonora wheat	\$2.75@2.80
Northern club	None offered
Calif. club, cti	2.60@2.65
Northern Bluestem	2.80@2.90
Northern Red	None offered

BARLEY.

Business is dull, with a considerable tonnage sold for shipment but awaiting cars, while local requirements are well supplied. Values appear fairly firm.

Seed, cti.	2.50
Shipping, cti.	\$2.35@2.40
Choice feed, cti.	2.20@2.30

OATS.

A few more Texas reds are coming in, with a fair demand for seed. The market, however, shows the usual holiday quiet, and values are unchanged.

Texas Red seed, cti.	\$2.85@3.00
Red feed	1.80@1.85
White	2.15@2.20
Black seed	2.50

CORN.

Very little Eastern corn is appearing, but with an easier feeling in the primary markets, California yellow is quoted considerably lower, a good deal of it being offered. Samples of Milo are shown, but are generally held far above buyers' views.

[First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, cti	None here
California	\$2.25@2.35
Milo Malze	2.10@2.25
Egyptian, new	2.25@2.35

BEANS.

The usual year-end quiet prevails, with buyers devoting their attention to holiday affairs, while a good many sellers are anxious to clean up odds and ends, and are shading prices on several varieties. Thus most colored beans—bayos, cranberry beans, pinks and blackeyes—have been marked down a little. However, this indicates no underlying weakness, as supplies still available in the State are much less than usual at this season, and a renewed demand is expected later on. There is still a fairly large supply of limas in the South, but they have been moving well, and prices show another slight advance. The prices quoted are for uncleaned stock of average quality, extra dirty lots being lower.

[On wharf, San Francisco.]

Bayes, per cti.	\$5.50@5.75
Blackeyes	4.75@5.00
Cranberry beans	6.50@6.55
Horse beans	3.25@3.50
Small Whites (south) new crop	7.00@10.50
Large Whites, new crop	8.10@9.50
Pinks	6.00@6.75
Limas (south)	7.75@7.90
Red Kidney	9.00@11.00
Mexican Reds	6.50@6.75
Tepary beans	5.90@6.00

SEEDS.

There is little activity at the moment, but alfalfa seed has been moving off well, and guaranteed stock is slightly higher. The other lines quoted receive little attention now, and vetch and mellotus indica are easier, while mellotus alba is cleaned up.

(Ton lots or over, to planters, S. F.)		
Alfalfa, per lb. (guaranteed)	19@21c
Oregon Vetch	4@4½c
Mellotus Indica	5@8c
Mellotus Alba	Nominal
Bur clover, re-cleaned	12½c

HAY.

Local arrivals show further curtailment, and supplies are hardly sufficient for requirements, though so far actual needs have been met by working off surplus supplies in local barns. Most of the hay now arriving is of the better grades, and there is quite a strong inquiry for cheaper grades, causing a very firm feeling as to prices. A good many large buyers are getting into the market for stock hay. Prices here are governed mainly by lack of cars, as there are still liberal stocks at many outside points. According to local dealers, the average arrivals here last month from Southern Pacific points were six cars a day. It is estimated that an unusually large acreage will be planted for hay this season.

[Prices per ton, carload lots, San Francisco.]

Wheat, No. 1	\$16.00@18.00
No. 2	14.00@16.00
Tame oats	13.00@16.50
Wild oats	13.00@15.00
Alfalfa	12.00@15.00
Stock hay	10.00@13.00
Straw, per bale60@.80

FEEDSTUFFS.

Alfalfa meal is kept well cleaned up, and is now moving at \$21 to \$22 per ton. Dried beet pulp is scarce, with holders asking as high as \$31, though few buyers will pay that price.

POTATOES, ONIONS, ETC.

The potato market is a little easy, as the heavy Eastern movement of Oregon potatoes that started some time ago has been checked, throwing larger supplies to the Coast. Some holders with large supplies are endeavoring to boost the market, but there is no real strength, and Delta stock is a little lower. Onions remain steady, with all stock closely held in storage. There is a heavy local

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

movement of Delta celery at firm prices.

Lettuce, L. A., crate50@1.00
Sacramento75c
Celery, Delta, crate	\$3.00@3.50
String Beans	10@17½c
Lima beans	10@12½c
Peas, lb.	5@12½c
Tomatoes, lugs, L. A.	1.00@1.25
Rhubarb, lugs75@1.00
Potatoes, cti, Delta	2.00@2.10
Salinas	2.40@2.60
Oregon	1.90@2.25
Onions	3.00@3.25
Garlic, new crop, per lb.	3@4c

POULTRY.

While the high prices at Thanksgiving curtailed the demand somewhat, leaving a hold-over at the close, it is expected that the Christmas market will close quite firm. So far supplies have not been excessive, and all offerings are moving rapidly at full prices. Chickens, though in good supply, move well, and several lines are higher. There is quite a large demand for geese. Belgian hares are slightly lower. Turkeys, dressed, large, lb. 23@30c
Turkeys, live, lb. 25@26c
Broilers, 18 lbs. to doz. and less, lb. 26@28c
do, over 18 lbs. to doz. 23@25c
Fryers 22@23c
Hens, extra, per lb., colored 20@21c
Small leghorn 17@18c
Smooth Young Roosters, per lb. (3 lbs. and over) 22@23c
Squabs, per lb. 38@40c
Geese, per lb. 17@18c
Old 17c
Belgian Hares 12@13c

BUTTER.

The recent decline in prices has attracted attention in the East, and there has been considerable buying for shipment, causing the market to stiffen a little the first of the week, though it has receded somewhat since. The shipping business, however, will be against any further decline.

Thurs. Fri. Sat. Mon. Tu. Wed.						
Extra	33½	33½	33½	34½	34
Prime 1sts	33	33	33	33	33½
Firsts	32½	32½	32½	32½	32½

EGGS.

The close of last week brought quite a strong local holiday demand, as well as some shipping business to distant markets, which cleaned up all offerings closely and caused a sharp advance Monday. Demand since then has been less active, however, and with production increasing prices have fallen back.

Thurs. Fri. Sat. Mon. Tu. Wed.						
Extras	39	30	39½	43	39½
Sel. Pul.	35	35	35	36	34

CHEESE.

All grades are cleaning up very well, with some outside business and a little extra holiday demand. Both flats and Monterey cheese are higher.

[S. F. Dairy Exchange prices.]

Y. A. s fancy	19½c
Fancy Calif. Flats, per lb.	18c
Monterey Cheese	19@20c

DECIDUOUS FRUITS.

Supplies of cranberries are rather in excess of requirements, causing a sharp break in prices. Local apples are moving off well, most of the Newtowns now being taken out of storage, and only a few cars remain in the country, with prospects that everything will clean up in good shape in the spring. Northern apples are fairly firm. Cranberries, Cape Cod, bbl. \$9.50@10.00
Apples:

Christmas apples, box	\$2.00@2.25
Bellflower, box	1.00@1.10
Newtown90@1.10
Pears, Winter Nellis	2.25@2.75
Persimmons, box, dbl layer65@.90

DRIED FRUITS.

The primary market is very quiet in all lines, as attention is now concentrated on the retail movement. In view of the generally large consuming demand, however, it is expected that inquiries for additional supplies in consuming markets will begin to appear early in the new year, and everything in packers' hands is firmly held. Growers have no very large holdings in any lines, and are exceptionally well sold out for the end of the year in the principal varieties. The outlook, accordingly, is favorable for a firm market, with possibly a slight advance on desirable stock, from now until the new crop comes in.

[Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop	8 @ 8½c
Apricots, per lb. 1916	15 @ 16c
Pigs, white, 1916	None offered
Plum, blk.	5½ @ 6c
Calimyrnas, 1916	None offered
Prunes, 4-size basis, 1916	6½ @ 7c
Pears	8½ @ 7c
Lake County Pears	11 @ 12½c
Peaches	7½ @ 8c

HONEY.

A few scattered lots are still being shipped out of the country, but most of the crop is cleaned up. Local supplies are very moderate, with the cheaper grades in good demand, and prices are well maintained.

Water white, comb	13@14c
Amber	8 @ 9c
Light Amber	10@12c
Water white, extracted	None offered
Light amber	6 @ 7c
Dark	5 @ 5½c

HIDES.

The peace talk has had a rather demoralizing effect on the hide market, causing a decided slump, and prices are so irregular and subject to fluctuation that it is impossible to give quotations with much assurance of their validity from one day to the next.

A good many interests are holding off from the market entirely until conditions settle, and others will only take hold at figures attractive to them.

Steers	21 @ 23c
Cows	21½ @ 23c
Light hides, 25 to 48 lbs.	21½ @ 23c
Kip	25 @ 24c
Calf and veal	31 @ 32c
Dry Hides	32½ @ 33½c
Dry Kip	35 @ 36c
Dry Veal and Calf	38 @ 40c
Pelts, long wool	\$1.75@1.90
Short wool85@1.10
Horse hides, wet, large, ea.	5.00@5.50
dry, large	3.00@3.50

HORSES.

As usual around the holidays, there is very little doing locally in work stock, as few drafters are coming in and buyers are taking little interest. A rather unusual offering here this week is a good-sized lot of saddle horses, brought from the Sacramento Valley.

Drafters, 1700 lbs. and up.	250
Drafters, 1550 to 1650 lbs.	150@200
Chunks, 1350 to 1500 lbs.	150@175
Wagon horses, 1050 to 1350 lbs.	110@150
Green Mountain range horses, 950 to 1200 lbs.	20 @ 75

GROCERIES.

Sugar has been marked down twice in the last week, being quoted on the granulated basis of \$7.05.

Special Citrus Market Report.

Los Angeles, Dec. 19, 1916.

Shipments of oranges from Southern California from November 1 to December 17 were 2,152 cars of oranges and 641 cars lemons against 928 cars of oranges and 631 cars lemons the same time last year.

Shipments of oranges from Central California from November 1 to Dec. 15 were 3,048 cars oranges and 95 cars lemons, against 2,821 cars oranges and 51 cars lemons the same time last year.

Shipments of oranges from Northern California from November 1 to December 15 were 729 cars oranges and no lemons, against 423 cars oranges and no lemons the same time last year.

With the market better supplied the market the past week showed weakness, yet the best fruit sold very well and brought paying prices. The oranges coming forward are well colored and testing very well. The shipments so far are much ahead of this time last year and the weakness noted must be ascribed to this increased movement to market. Lemons were also weaker and the market lacked life and in some instances were lower.

Locally the market was hardly so active as the week before, the trade being pretty well stocked up for the time being. Hence local packers were bidding lower both for oranges and lemons. The larger sizes of new navels were in very fair request, but small sizes were dull. Grapefruit steady and in fair demand. Packers were bidding 1c per pound for oranges in the grove, 2@2½c per pound for grapefruit in the grove. Lemons 1@

1½c per pound in the grove for good stock. Poor stock has to be sold for what it will bring. Weight of oranges, loose box, 50 to 55 pounds; grapefruit the same. Lemons, loose box, 55 to 60 pounds.

EASTERN AUCTION MARKETS.

New York, Dec. 13.—Twelve cars California navels, one car Arizona navels and one car California lemons sold. California navels higher, especially small sizes; Arizona slightly higher. Lemons unchanged. Weather fair. Navels averaged \$2.10@3.15. Arizona navels averaged \$2.60.

Boston, Dec. 13.—Seven cars sold. Market doing better on oranges and lemons. Navels averaged \$2.75@3.25. Lemons averaged \$2.35@2.75.

Philadelphia, Dec. 13.—Five cars sold. Market lower on navels, unchanged on lemons. Navels averaged \$2.75@3.25. Lemons averaged \$2.65@3.00.

New York, Dec. 18.—Twenty-five cars of California navels, one car Arizona navels, two cars California lemons sold. Navels steady on best stock, all other grades lower. Lemons steady on 300s but easier on 360s. Weather fair. California navels averaged \$1.85@3.25. Arizona navels averaged \$2.75@3.45.

Boston, Dec. 18.—Nineteen cars sold. Market easier on oranges and lemons. Navels averaged \$2.10@3.10. Lemons averaged \$1.85@3.20.

Philadelphia, Dec. 18.—Nine cars sold. Market higher on navels and doing better on lemons. Navels averaged \$1.65@3.00. Lemons averaged \$1.65@2.75.

LOS ANGELES.

Los Angeles, Dec. 19, 1916.

BUTTER.

Receipts of week ending Dec. 19, 1916—263,200.
Receipts of week ending Dec. 19, 1915—218,910.

The butter market rallied a little the past week under more moderate receipts, and demand fairly good for all extra creamery, and there was a better movement in prime first. While the consumptive demand was very good, the outside movement was light. In San Francisco the market also made a little improvement. Fresh extras advancing 1c up to Monday and Chicago improved the same, while New York is 2c higher than a week ago. All this had a sympathetic influence upon the market and encouraged better trading on exchange. Tuesday brought little change. San Francisco was off ¼c, while Chicago was up ¼c, and New York unchanged. Here the market remained the same as for the past few days and no trading.

We quote extra creamery	35c
Prime first	33c

Wed. Thu. Fri. Sat. Mon. Tu.		
1916	34 34 35 35 35
1915	28 28 28 28 28

EGGS.

Receipts (railroads) for week ending Dec. 19, 1916—837 cases.
Receipts (railroads) for week ending Dec. 19, 1915—728 cases.

There was little life in this market the past week. The fact that the season for high prices is over, and the receipts were somewhat better than the same week last year caused traders on 'change to hold back and do little. The street trade was fair, encouraged by the approach of the Christmas trade. The outside movement, however, was light. The market showed no change here for the week up to Monday, fresh ranch count on call ruling at 38c throughout up to Monday. San Francisco advanced up to Monday 5½c on fresh extras, while Chicago for the same time improved 1c and New York 4c. This, however, had no influence upon the market here. Tuesday there was no change in the market here on call. Chicago, however, was off 2c, while Boston was up 1c and New York was down 1c. Estimated receipts by truck the past week was 600 cases, which with the rail receipts made a total of 1437 cases against combined receipts the same time last year of 1328 cases.

We quote fresh ranch one count, 40c. Pullets, 36c. Candles 2c, and selected 3c over quotations.

Wed. Thu. Fri. Sat. Mon. Tu.						
1916	38	38	38	38	38
1915	36	34	37	36	34

POULTRY.

With the approach of Christmas the market the past week brightened up. Receipts were the lightest for some time and the market was steady and firm. Broilers, fryers and heavy hens were all in good demand. Turkeys were also in very good request and so were ducks. Light hens and geese slow sale.

We quote from growers:

Broilers, 1½ to 2 lbs.	23@24c
Fryers, 2½ to 3 lbs.	20@22c
Hens, over 4 lbs.	18@19c
Ducks	17@18c
Geese	16@17c
Roosters, 3 lbs. up (soft bones)	18c
Turkeys, heavy, 12 lbs. and up	23@24c
Turkeys, light	21@22c
Squabs, live, per doz.	\$1.50@2.00
Dressed	3.75@4.85

HAY.

It was quiet in this market the past week. Receipts were fair and dealers were inclined to hold back and buy sparingly, and only moderate arrivals prevented a decline. Only such lots being taken as had to be had for immediate use. Receipts 193 tons.

[F. o. b. Los Angeles.]

Barley hay	\$16.00@18.00
Oat	18.00@20.00
Alfalfa, Northern	15.00@16.90
Alfalfa, local	17.00@18.00
Straw	7.50@8.00

BEANS.

A quiet market was had the past week owing to the approach of the end of the year. Prices, however, remained steady and firm, the light stocks making holders independent.

We quote from growers:

Limas	\$7.75@8.00
Large white	9.25@9.50
Small white	9.50@10.00
Pinks	7.25@7.50
Blackeyes	6.25@6.50
Tepary	5.75@6.25

WALNUTS.

With the association having closed up its season and out of the market and the independents having exhausted their supply, there was nothing doing from first hands the past week. No. 1 and 2 walnuts were to be had from first hands. They were bid for at ¼c over Association prices, but were not to be had at this advance. Some culls continue to come in and are selling at 5@6c per pound.

The Associated prices this year and last are:

	1916.	1915.
No. 1	15.50c 13.50c
No. 2	12.50c 10.60c
Budded	19.90c 17.00c
Jumbos	17.50c 16.60c
Orchard run 3c less.		
Culls, per lb.	5@6c

Publisher's Department.

A Merry Christmas to every reader of this journal.

Use a little of your spare time during holiday week and secure a new subscriber for the Rural Press.

We haven't said much of late about our book "Second Thousand Answered Questions in California Agriculture," but we are selling it in increasing numbers, which proves its value. Every reader of the Rural Press should have a copy of the book handy for ready reference. Price \$1.50 postpaid.

As the end of the year approaches we are cleaning up tag ends of business in order to close our books in the best shape possible. Our book keeper has two dollars, which were sent in some time ago, that can not be placed upon the books because we do not know who sent the money. One of these dollars came in a letter from Hollister last May, and the other came from Los Banos in Oct. If the parties sending the money will write us we will gladly credit them, but a letter containing a dollar bill or stamps with no name absolutely gives no means of identification.

SPECIAL LIVESTOCK MARKET REPORT.

San Francisco, December 20.

CATTLE: The present supply is proving sufficient for the demand but there is still a strong tone to the market. A few cattle are coming from Utah but the market here is not quite good enough to compete in any large way with Utah prices.

SHEEP remain as last reported, supplies coming from feed lots and market remaining firm as last quoted.

HOGS: Receipts the past week have not been so heavy as for the week previous and another falling off in shipments is looked for the coming week. Prices continue strong as last quoted. The first small shipment of Utah hogs arrived during the week, selling f. o. b. San Francisco at prices quoted. They were of good quality. Heavy runs of hogs are reported in Eastern markets but prices are well sustained.

WOOL: Inactivity in country buying characterizes the present wool market. Buyers are endeavoring to contract for the spring clip but without apparent success. From 5 to 10 per cent advance over our quotations may be looked for in this early contracting for year's fleece, providing it is good long staple wool. With present high values ruling, long staple goods will sell for more, comparatively speaking, than shorter staple goods. A letter from a large eastern operator says that general satisfaction is being experienced in importing foreign wools, even at advanced prices over domestic supplies because of their superior worth. The last of the series of London sales is now on, prices higher at the beginning and market holding particularly strong.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

Fall wool	10 @ 20 c

Los Angeles, Dec. 19.

CATTLE: The past week brought no noticeable change in this market. There was a fair run of good grass-fed steers both from California and Arizona and they met with a very good demand. Killers were all in the market and wanted supplies, and in sympathy with strong market East prices were firm, though not quotably higher. Fat cows and heifers also sold fairly well.

Quotations f. o. b. Los Angeles: Beef steers, price 1000 to 1100 lbs. \$7.00 @ 7.75

Stockers and feeders 5.50 @ 6.00 Prime cows and heifers 6.25 @ 6.50 Good cows and heifers 6.00 @ 6.25 HOGS: A steady and rather firm market was had the past week, though the market was hardly so active. California furnished most of the supply, but the arrivals as a rule were light weights and in only fair flesh, showing that raisers are marketing their hogs before they are finished to save high-priced feed. Killers were all in the market and wanted supplies and what hogs coming in were sold without trouble.

Per cwt. f. o. b. Los Angeles: Heavy, averaging 250 @ 300 lbs. 9.25 @ 9.50

Mixed, 200 @ 250 9.25 @ 9.50 Light, 175 @ 200 9.25 @ 9.50 SHEEP: The market the past week was much the same as the week before. Arizona, Utah and Idaho furnished most of the supply and some very good yearlings and lambs, which made up most of the supply. Not many heavy sheep coming in. Killers were all in the market and wanted supplies and prices were firm without being quotably higher.

Per head f. o. b. Los Angeles: Prime wethers 7.00 @ 7.25 Prime ewes 6.50 @ 6.75 Yearlings 6.50 @ 7.00 Lambs 6.50 @ 7.00

CALVES: Not many coming in and the market continues steady and firm. Selling at \$8.50 @ 9.50 per cwt.

CHUBBUCK'S IDEAL GOPHER TRAP
Larger than runaway: catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. Price 50c. If not at your dealer's will send it to you postpaid; 2 for 95c; 6 for \$2.70; 12 for \$5.10. Money back if you are not satisfied. Free circulars. E. J. Chubbuck Co., Dept. B San Francisco, Cal.

California Garden Flowers

TREES, SHRUBS, VINES.

By E. J. Wickson, A. M.

is just what you need as an aid in your every-day work in the yard. It is written by a Californian who knows, to meet your conditions. It tells the how, when and why, and is very practical in its suggestions.

The book is divided into six divisions and these parts are divided into twenty-six chapters, which cover California conditions, cultural suggestions, California garden year, ways with garden plants, shrubs, trees and vines, methods against pests and diseases.

The work contains 258 pages of closely packed information of absolute value to plant growers, besides numerous illustrations—handsomely bound in cloth. Price, \$1.50 postpaid.

Range Management of a Beef Herd.

[Written for Pacific Rural Press.]

HERD management is a contributing factor to success in all branches of animal husbandry work, but nowhere is it more important for the grower to formulate definite ideas on this subject by his own and others' experience than with beef cattle.

It was to answer a subscriber's query relative to the management of a beef herd that the following views have been secured from W. Mayo Newhall. As Mr. Newhall's advice is based on almost a lifetime's experience and as he is conceded to be one of the most successful cattle growers in California, his ideas should carry more than ordinary weight with both experienced and inexperienced cattlemen.

Proportion of Bulls.—The number of bulls that should run with a given number of cows varies according to the ages of both cows and bulls and the character of the range. With bands of 100 to 150 cows three years and upward, three bulls, three years and upward, will serve 100 cows. With bands of more than 150 cows three years and upward in larger fields, four bulls, three years or upward, will be necessary for each 100 cows. If the country is rough and the cows are scattered it would, Mr. Newhall believes, be better to use five bulls for each 100 cows.

In Mr. Newhall's own operations he exercises great care in mating cows of a given age with bulls of the same age. This overcomes the use of heavy bulls on young cows and excessive service by young bulls. He thinks that two-year bulls should be used with heifers 18 to 24 months old, being bred for the first time, in the ratio of five bulls to 100 heifers. Bulls under three years of age should not be used with cows four years or over, neither should they be used with heifers being bred for the first time. He is decidedly opposed to the indiscriminate mixing of bulls of varying ages, as loss both through bodily injury and smaller percentage of cows bred, invariably results from such practice.

Replacing Bulls.—On the ranches of the Newhall Land and Farming Co. the graduation of service bulls is almost automatic, the replacement of the older bulls being accomplished by the introduction of the same number of two-year-olds each year. As they grow older they are graduated into bands of cows the same age, or as near the same age as practicable.

The period of usefulness of bulls on large areas depends upon their increasing weight and retention of vitality and activity. All bulls vary in these respects; but it has been Mr. Newhall's observation that Hereford bulls seem to have a period of usefulness one to two years longer than Shorthorns. It is possible to extend the usefulness of all bulls, if they are taken out of the breeding herd in the late summer or early fall and cared

for separately through the winter.

When put into service as two-year-olds and cared for as mentioned, they should as a rule be usable till six or seven years old if Shorthorns, and seven or eight years if Herefords. Assuming a normal

preservation of vitality, the usefulness of a bull is impaired by increasing weight and consequent development of laziness.

When practicable, bulls under four years old should not be put in the same fields with maturer bulls, and it is always advisable to have a few extra bulls in reserve above the number actually needed, to replace any that might have been injured or become out of condition. Frequently this supply of reserve bulls overcomes a shortage of serviceable animals in the middle of the breeding season, thus increasing the percentage of cows that calve. Another insurance of high percentage of cows bred is accomplished by Mr. Newhall by turning the bulls with the cows at different times. For example, if 20 bulls were in service he turns out 15 first and then turns out the other five at a later date. Those turned out last are more vigorous than the others by that time and breed some cows that would not otherwise be cared for.

Replacing Cows.—Properly a cow herd should be so managed as to turn off cows at seven years of age and never later than at eight years old. They become "shelly" after that and their beef value is diminished. This plan gives cows a breeding period of four years, having their first calf at three years of age and their last at six years.

A proper plan for the management of a good herd of 100 breeding cows is to take out 25 old cows and 15 of various ages that have become incapacitated with spoiled udders, and those that are inferior breeders, and to replace the number taken out each year with an equal number of two-year heifers. Care should be taken that the two-year heifers get with calf and that they are not too fat, as missing the first breeding year tends to make irregular breeders of them later. Heifers should not be bred younger than 18 or 20 months old.

Total Number Sold Annually.—By practicing the above methods Mr. Newhall finds it possible to market 80 steers and cows a year from each 100 breeding cows. Taking a 100-cow unit as an illustration, the calf crop should be 86 per cent—43 steer calves and 43 heifer calves. Reserving 40 of the heifers for replenishment of the breeding herd, the beef output each year, less loss by death and accident, should

be 43 steers and 40 aged cull cows. If the ranch or range is properly fenced to permit necessary segregation of breeding cows, steers of several ages, cows not to be rebred, and yearling heifers, the beef turned off annually will far exceed the amount a great many cattlemen are now contenting themselves with. Owing to the increasing cost of production with the higher land and labor costs, without proportional increase in market value of beef, it becomes increasingly necessary to apply scientific precision to the operations of production.

The Proper Management of Beef Herds on the Range Calls for Well-bred Cattle, Such as Are Seen on (top) A. E. Noyes & Sons' Ranch, (middle) T. S. Gibson Est., (lower) C. U. Hawkins' Ranch.

GOOD CROPS AND BETTER MEN.

CALIFORNIA received on the eve of Christmas the greatest gift possible at this season of the year—a great rainstorm, which poured down volumes of water in all parts of the State. The south vied with the north in measures of bounty, and all producing districts will now go forward with confidence in the seasonable sowing and planting, for which ample early water gives assurance of success, and the markets will generously welcome the first contribution to the food supply of 1917, in this hemisphere, which the earliness of the California harvests will render most timely. We cannot recall a year in which both cultural and commercial conditions joined to warrant producing effort and investment, as they now do, and the fact is being generally recognized. The acreage of grain, hay, and other field crops will be notably increased, and there promises to be not a ton too much. Preparations for fruit planting are also being pushed with an extent and confidence greater than have been noted for a decade or more, because prices have shown the capacity of a demand which is chiefly American, and because of earnest belief that intelligent, co-operative organization will constitute producers something more than hewers of wood and drawers of water for the financial and commercial interests. And this remark is made without reflection or rancor against any individuals or classes of our present population. The unfairness has come down to us from remote ages. Perhaps the world started right when it made nobles of Adam, Cain and Abel, but it took a sad misstep at some later date, when it placed the warrior at the head and the farmer at the foot of the social scale. The distressing experience of Europe during the last two and a half years warrants that conclusion at least. And the outcome of that distress should not be, and will not be, the inversion of this obsolete social order, but something immeasurably better—equality of opportunity and reward to every man according to his ability and the value of his service to mankind.

INSTITUTIONAL ALTRUISM.

LAST week we noted the wonderful increase in individual Christmas observance this year. Rather more significant than that is what we may call the institutional outburst of the Christmas spirit until some one suggests a better name for it. Charitable institutions have long seized this opportunity for beneficence, which has shed much kindly light upon the pathways of the unfortunate and the distressed, but the events of this year have made all such relief efforts appear but as twinkling starlights in the glow of sunshine. Great corporations have found their souls, and have dispensed millions among their employees. Municipalities have installed great Christmas trees in public places, and have welcomed to the gladness of them all the children—without discrimination for or against poverty or wealth. From slum and boulevard, and all points between, the little ones have come running to merriment and feasting. The more one thinks of this

new thing under the sun the deeper the significance it embodies. It is the Declaration of Independence, spoken in the child-language of sparkling lights and bulging cornucopias. And though its meaning is beyond the ken of childhood, there will be a feeling in the fact which will grow with the child. Its deepest, immediate, significance is for the elders—that they have seen the sweetest, cleanest thing on earth, an emotion of joy in the heart of a child. These public provisions for Christmas, which have arisen in our great civic and other corporations this year as never before, appeal to us as evidence that we, as a nation, are learning our lessons from the horrors of Europe. Inhumanity abroad is teaching humanity at home. We are learning a new patriotism. We are receiving deeply a new conception of Christmas observance as not alone an institution for ourselves, for our offspring or our own social set, but as a gift of God to uplift mankind.

ALTRUISM AND SUGAR BEETS.

WE HAVE to admit that as one advances in altruism beyond the jollification of the kids, difficulties arise. Between the brilliance of the future, in which every man will love his neighbor as himself and a little better, and the darkness of the past, in which every man did his neighbor if he could, there is a great gulf fixed. In the present we are trying to get far-sighted discernment across that gulf through a perspective which is not always clear. We may as well illustrate with the sugar beet because that issue is now arising in concrete form. Last week sugar-beet growers of Milpitas district, dissatisfied with what they declare is a low return for their crops in the face of increased sugar prices, appealed to Harris Weinstock, state market director, to investigate their difficulties and aid them in getting higher prices. The letter to the market director was signed by ten growers cultivating 800 acres of land. Allan M. Standish, one of the growers, says that the sugar-beet raisers hope to form a State organization. At present, according to Mr. Standish, sugar companies are paying \$5.50 a ton for beets testing fifteen per cent sugar. A ton of sugar beets, he said, would make 300 pounds of sugar, which the refineries sell at wholesale for \$18."

Although the figures cited by Mr. Standish are variable and subject, on the selling side at least, to very sharp fluctuations, the position taken by him and his associates rests on a good foundation of growers' experience. Not only individual growers, but whole sections of them, have abandoned beet-growing, because they could not get a fair margin above cost of production, unless they limbered up their backs and went down on their own knees in the beet rows. This they have solemnly refused to do, so long as there is a vacant seat in a saddle or on a tractor which they can vault into. The result is that beet growing has yielded profits chiefly to Orientals or Europeans who could bend the pliant hinges of their knees that thrift might follow weeding. Is this right? From the point of view of an owner of good beet land, certainly not. A crop which requires such good land and such a large pay-roll should pay a profit on both. We apprehend that Col. Weinstock, if he undertakes to investigate the matter, will find that the margin in the past has been far too largely on the side of the manufacturer of beet sugar, and shared only with those who commanded a cheap labor supply in growing. But the whole question is not as simple as this. Sugar manufacturing requires large capital, and though it is in some instances amassed by co-operative effort of beet growers, such an undertaking is difficult and risky. It is also quite risky when the capital is not supplied by growers' cash or credit. The investment is likely to be almost swept away by a crazy free-trade administration, as it was in 1913, to be snatched from the pit by a world-war. Fortunately neither free trade nor war are likely to recur in this generation, so capital invested in beet-sugar making may be expected to be as stable and productive as it was previous to 1913. How was it then? It was too productive to the sugar-maker and yielded too little to the beet grower. Does capital expect this? Surely. Recent investment in factories and adjacent beet lands have not

been made on the basis of war prices of sugar. They have been reasonably made on the conviction that it will take the world some time to return to its old figures of sugar production, and that our government policy must favor American sugar for an indefinite period. How shall the grower get his share of this reasonable outlook? The investment in a factory is insured against everything but free trade by the factory-owned beet lands on which it can grow beets by a sawed-off tenantry with knee-joints bending both ways. Can the proprietary beet grower insure his returns by reversing the process of the factory owners? Shall we buy a factory near to his land and get the manufacturers' profit for his margin above cost of beet cropping?

But some reader may say this is not altruism at all; it is economic warfare. Oh, no, not in the long run; altruism is a product of war. The altruistic product of the present world war is perhaps the surest outcome of it. If we could have a good stiff fight over sugar beets, we might be able to see a great deal farther than we can now.

ALTRUISM IN ELECTRICITY.

ANOTHER problem in practical altruism is to be found in California transmission and sale of electricity, if current reports are accurate. They are that two millionaire electric promoters of Los Angeles recently fell apart, and in dividing their property and prospects, one took control of Southern California and the other the control of the San Joaquin Valley—each agreeing to keep off the preserve of the other. It is often said that a Los Angeles promoter is never satisfied with anything but the whole earth, and it seems that the Southern California magnate is invading the San Joaquin, despite the "gentleman's agreement" aforesaid—thus casting a shadow upon the proverb that there is honor among aspirants for the penitentiary. We do not guarantee these statements to be facts; we simply give them as we get them. If they are facts, and we have seen other things among control-artists which indicate that they might be, is it not humiliating to think that two men, with powers and supplies for manipulation, can dare divide California into spheres of individual influence, even if they do get to fighting about it afterwards. For we know very well that getting into a fight of this kind means getting together afterwards and employing the squeezing powers of both, released from each other, upon the general public. Fortunately we have now the intervention of the Railway Commission as a public protection against the altruism with which reconciled magnates yearn towards each other when their cruel wars are over. But the possibility of applying "addition, division and silence" to subdivisions of this great State does humiliate us, although we have fortunately protected ourselves in some degree against the most obvious evils of it. It makes us feel like shouting aloud the declarations of the National Conference on Marketing and Rural Credits, which assembled in Chicago last month, in these words:

"We protest against the passage of the Shields and Myers waterpower bills (now before Congress), or any substitutes for them, which fail to protect the public interest by requiring compensation for valuable public rights and by fixing a definite time at which each waterpower leased shall revert to the people, so that the conditions under which it is used may be readjusted to meet the public needs of that time. We call upon our senators and congressmen to defeat the Shields and Myers bills, and to pass water power legislation providing for compensation and effective time limits in all water-right grants, together with full publicity and effective regulation of charges so as to prevent monopoly and extortion."

WHAT THE EAST DID MUST THE WEST REFUSE?

BUT here again altruism (which in this case may mean the loss of present development for the sake of our great-grandchildren) is not as clearly advantageous in practice as it seems to be in principle. Suppose the pioneers of California had been as warm-hearted as all our professional conservationists now seem to be, and had forborne enterprises based upon individual appropriation or quit-claim purchase, for fear that some later comer might be thereby prevented from measuring

up to the Declaration of Independence, where would California's present industrial achievement be? And the same question might be asked about everything west of Plymouth Rock. And must the individual freedom and opportunity which built up the East and Middle West be restrained from operation west of the Rocky Mountains or the Sierra Nevada? It is, perhaps, possible that the far East should see most clearly, and the Mississippi Valley somewhat less clearly, that individual initiative and inducement should be merged in altruism and conservation. It seems to be about the only way in which the East can get a second draw on the national domain without undertaking again the pioneering by which the grandfathers of the present conservators enriched themselves at the East. From one point of view these zealous Eastern conservators are saying: "Our grandfathers grabbed everything in sight, but either there was not enough to grab, or else they had too many grandchildren; give us of your oil, for the lamps are

going out." And so, it seems to us, that the Western view should be that the development game with natural resources must be fairly played. Fair play has always been a Western attribute, and there should be fair play in altruism as in everything else. How can we build up strong States for national advantage and for the prosperity and joy of the inhabitants thereof, and still not lose our share in individual initiative and reward which have built up the older parts of the country? The resolution of the Chicago conference which we have quoted above, seems to embody the principles which should be applied. Regulation of possession, which shall on the one hand welcome and safeguard enterprise and investment, and of operation, which shall reasonably requite actual investors, and not make millionaires out of shoe-string promoters, will be best for this generation, and if our grandchildren do not like the condition which comes to them, they can shovel it over for a new fermentation.

alfalfa in the spring in time for a Sudan crop?—R. W. C.

Sudan cannot be successfully sown anywhere until frost danger is over. This is about corn-planting time. Your plan seems to be to get a winter growth of Sudan, which will not work. It would hardly pay to try for a catch-crop from May sowing to plow up in July. If you intend to re-sow alfalfa you had better plow up now and get the land ready for as early sowing as is safe. You can, of course, plow in the spring in time for Sudan just as you could for corn, but it is better to break up the land now for either and work it over again in the spring. Sudan does not give you anything permanent. It has to be resown annually to get what you can between spring and fall frosts.

Plowing Under Tomatoes.

To the Editor: Will plowing under at this time the scattering tomatoes that are on the ground injure trees which will be one year next spring? The soil is part clay and part gravel. My reason for plowing so early is that the last two irrigations were not followed by cultivation, consequently the land is run together and, should it become dry later, might bother me in getting it plowed.—J., Santa Clara.

No harm will result from plowing under tomatoes as you propose. It is conceivable that one could cover in so much fermenting stuff that roots might be injured or soil soured, but the litter from a crop cannot injure trees or coarse grain though it might reduce the stand of some garden seeds. Your idea of early plowing, under the conditions you describe, is good.

Peach Gum and Peach Blight.

To the Editor: There was something wrong with our peaches this last season: gum appeared some times on every peach on the tree. The gum came from the kernel of the pit. Is it peach blight? Can peach blight be identified at this season of the year?—G. R. S., Hemet.

Gumming of the fruit of the peach was discussed on page 635 of our issue of December 9. Cause and cure are not known. It is not peach blight which is manifested by gumming from little pustules on the bark of the new wood and you can see it now if you have it. The treatment for it is Bordeaux mixture. It should have been applied a month ago to be most effective but may perhaps reduce the trouble somewhat now, if the disease has been late in appearing owing to the dry air condition which has prevailed.

Barley or Oats for Wet Land.

To the Editor: Will oats stand wetter land than barley?—R. E. S., Bishop.

Barley has the general reputation of caring most, and oats are reputed to care least of all the cereals about soil and moisture conditions under which they are called to grow. Therefore oats will take wetter land than barley. But there are aerial conditions, and influences therefrom, which might make the fastidious barley better locally than the careless oats. For example, in the greater part of Northern California, oats are better near the coast and in the mountain valleys and barley better in the interior valleys.

Run Away From Wireworms.

To the Editor: Some of the bean land here is infested by a little yellow worm (some call it a wireworm) that bores up into the hollow stalk of the young bean plant and kills many and cripples many more and makes a good stand difficult to get. What can we do?—Reader, Marysville.

Run the land into grain or hay for a year or two. You ought to get a big crop after the beans and wireworms could not do much with it. Wireworms are one of the pests which have to be fought by rotation of crops.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., December 26, 1916.

STATIONS	Rainfall Data		Temperature Data	
	Past Week	Seasonal To Date	Normal To Date	Max'm Min'm
Eureka	2.70	10.46	15.62	59 34

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address

Plants for Alkali.

To the Editor: I have several acres that are very damp and perhaps water-logged during the irrigation season. Some of this land is strongly alkaline, although several kinds of weeds and wild millet seem to thrive. Part of this land is very rich, having been used for two years as a stock pasture. I have been thinking of planting stock beets next month. If this would not be advisable, could you suggest some grass that would be likely to grow? Would perennial rye grass do, and if so, has it much value for dairy stock?—G. R. E., Turlock.

To the Editor: What are the surest crops to raise on alkali land for chickens and cows, and when to sow them?—C. F. C., Fresno.

Some weeds like alkali well enough to grow on the roof of a soap factory. If you learn the lesson they try to teach, they may tell you that useful plants will not grow. Such weeds are not an indication that the land is good, but of the contrary. Still if stock found stuff they would eat, the chances are that the alkali is not as bad as it might be and you should determine that by trying to grow what you want. Long red mangel wurzel, which grows largely above ground, will pump out more alkali and water than any other forage plant and will help you to shift the alkali into your cows, with what effects you will have to find out from the creamery man. Do not plant beet seed in cold, wet ground. If it is that way in January plant a little later. Rye grass will stand more alkali than most other good grasses and it likes the water, but you will have to try it to see how it likes you. It makes a good dairy pasture.

Our second querist can take some hints from the foregoing. What other plants you can grow depends on how strong the alkali is, and the plant itself is the handiest chemist available to all farmers. Therefore try a little of a number of plants and see what they say about it. If you cannot get a crop of barley there is little need to try other grains of winter growth, and of summer growers the sorghums are most tolerant. Sow as early as you can after good amount of rainfall all plants which will stand frost, for the rains carry alkali down and that helps to start the seed and most plants are most sensitive just after germination. Tender plants like sorghum must be started as soon as possible after frost dangers are passed.

Cabbage Troubles.

To the Editor: I have planted a half acre of cabbage in October and some have small heads already, but the cabbage worm, a green worm $\frac{1}{4}$ in. long, is at work pretty hard eating the leaves. A gray louse is at it on top. Please tell me the best way to get rid of them. Will Paris green mixed with bran and put on the cabbage poison the cabbage or burn it?—Subscriber, Fresno.

The Paris green and bran mixture will not hurt the cabbage nor poison anybody. It is usually made of a teaspoonful of Paris green and a pound of bran stirred into a gallon of water and the moist bran is then sprinkled over the cabbages. A cheaper treatment is two pounds of lead arsenate

powder (or four pounds of the paste form) to 50 gallons of water—to be sprayed on the plants. To hit the louse also, add four ounces of tobacco extract (40 per cent) for each 50 gallons. The plants ought to be watched and sprayed again later, for both these pests are liable to keep coming.

As for poisoning the cabbage with the arsenate, a late government report says that one must eat 28 head of cabbage at once to get poison enough to make him sick. Still, outer leaves should be removed before cooking. We would not use the tobacco spray on heads nearly ready, as most people prefer plug to extract. A good hard rain or a stiff spray with cold water will dislodge most of the lice.

Gypsum Not Indicated.

To the Editor: Some of my neighbors say that I should use gypsum on my land as it needs a fertilizer. Another says that gypsum is useless on it as the land is too sandy. What would you advise me to use on very light soil for trees and vines? The land is under irrigation and I can not get stable manure.—J. L., Dinuba.

Gypsum furnishes lime directly: indirectly it makes other plant food in the soil available; mechanically it makes a heavy soil more mellow. As you probably need none of these things, the use of gypsum is not indicated for you. As you have no stable manure you are prevented from making the best possible application for your purposes. The next best thing is to buy a complete fertilizer from one of our advertisers and use it to grow green stuff to plow under. With such a fertilizer and water wisely used you can grow rye and vetch in the winter and cowpeas in the summer and keep at it until you sand into a rich dark loam which people will come miles just for the joy of kicking into.

Fertilizers for Beans.

To the Editor: On account of the poor yield of rice here, much of that class of land will be abandoned next year. I have been asked if there is a fertilizer for beans that may be drilled along with the seed which will cause this poor land to yield?—Subscriber, Yuba City.

Of course land can be strengthened for beans as for other crops by use of stable manure spread early and leached out by rains so as not to interfere with spring working. To this (or without it if none is available) use 200 pounds of complete fertilizer running it in with the seed as you propose. There is some question of the need of the nitrogen item for beans, and excellent results have been secured by using superphosphate and potash, three parts of the former to one of the latter.

Alfalfa and Sudan.

To the Editor: How early can Sudan grass be sown in Fresno county? I have an alfalfa field which is running out. Would it pay to disk this with Sudan and get a mixed crop? I expect to plow this field up in the summer but would like to get a Sudan crop from it. Could I plow up the

Cherry Future Bright for Fittest.

[Written for Pacific Rural Press.]

Great adversity to an industry gives great profits to those who escape that adversity by reason of natural advantages or superior manipulation. It has proved true in the pear industry of California, and seems to be proving true of cherries.

The grand old cherry orchards to be found in many districts of California, horribly mutilated by removal of branches as big as 10 inches in diameter, and made lonely in their old age by the death of gummed or gophered trees, tell a tale that makes a man pause before deciding to plant, and points the way to prosperity if he has the right conditions.

The die-back which has resulted in so many mutilated old trees and the removal of whole orchards, has not been explained more reasonably than as being due to the death of root hairs. The fuzzy growth of root hairs at the terminals of the roots, which supply the moisture and soil food for tree and fruit, seem, on the cherry, peculiarly tender in case of overwetness or overdryness. When they are rotted or drowned by too much water or killed by drying out, the tops of the trees die back.

Magnificent trees had thrived in many parts of California for decades, but since the drouth of 1912 and '13, they have been butchered because the great tops were not supplied with enough moisture and food from the dried-out roots.

The other great drawback to the cherry industry has been gum disease. There are several causes of gumming; but there is reason to believe that many of the really serious losses due to gummosis are caused by bacteria. They affect the sweet cherries principally. Pockets of gum form and spread under apparently healthy bark; and only when it breaks out is the trouble discovered. Many trees seem to have recovered naturally, and control measures have been worked out more or less satisfactorily to those who apply them conscientiously.

Die-back and gummosis have discouraged so many orchardists that, like the pear industry, those who have the right conditions and treat their trees right may expect rich reward.

The Right Conditions.—We have seen thrifty cherry trees on many kinds of soil. The soil does not seem to us to be the deciding factor except as it influences the amount of moisture around the tender roots.

Clay soils, so far as we know, are out of consideration for cherries. They hold the water too closely in the wet season.

Sandy loams seem best adapted because they drain well. If so located that they do not drain, they are out of the question. But if they dry out late in summer, die-back is almost sure to follow to greater or less extent.

Irrigation.—Previous to the past few years, it was considered that the cherry did not need irrigation; and the principal cherry districts did not have it. Santa Clara county, which leads with over 1800 acres, has recently put in many irrigation plants, but this has not occurred to so great an extent in the other dis-

tricts with less favored conditions.

Atmospheric moisture seems equally necessary, for it is only in the bay districts and neighboring valleys that cherries continue to thrive. Sunburn and small fruit seem the rule in the interior valleys away from the Delta.

Acreage of Cherries.—San Joaquin county, open to the ocean breezes and not far above ocean level, has almost equal acreage with Santa Clara. Alameda had 1000 acres bearing last spring; Solano and Sonoma about 700 each. Napa, Sacramento and Placer had about 350 each, and Contra Costa had about 200. Placer, the farthest removed from coast influences, has some of the oldest cherry trees in the State, on the American River bottoms where, as W. R. Fountain says, "It is sandy and there is no bottom." But in the granite foothills of the New-castle fruit district, the trees are dying back and being removed, though in several cases, Mr. Fountain relates, no expense has been spared to make them a success.

Napa County Horticultural Commissioner J. J. Fox suggests an east slope and perfect drainage as the locations where cherries will do well.

For Sonoma county, L. Hillis says that he believes the redwood soils desirable for cherries; but not "pine or hardwood soil." A rolling situation, with natural drainage and volcanic formation, is preferred.

One of the best orchards we have seen in Santa Clara county was on sandy soil over 30 feet deep, and was judiciously irrigated.

F. B. McKevitt, president of the California Fruit Distributors, sums up the cherry situation in the following words:

"I would not recommend that cherries should be planted, rather than other fruits, in any district in the State, unless it would be in a limited way on soil specially adapted to the requirements of this fruit and in locations where the climatic conditions would justify it. There are very few places in California where all conditions seem suitable for the cherry; and even in those places the crop is considered more uncer-

tain than most other varieties of fruit. I would not advise any one to plant their entire acreage to cherries, even in those localities best suited to it. This uncertainty of cropping offsets to a great extent the prices obtained for the early product.

"The particular points to be specially observed in the planting of cherries are: the selection of soil, which should be preferably a deep sand loam, rich and well drained, and if possible, subirrigated. The location for a cherry orchard should be as free from heavy winds as possible, and if it can be planted in the lee of a hill which would protect it from the north winds particularly, it would be very desirable. It is unnecessary, of course, to state that nothing but first class, clean, and well-grown stock should be planted. For this purpose a tree four to five feet is my preference, one year from the bud.

"Before planting, the ground should be deeply plowed, subsoiled if possible, and well harrowed. Thorough cultivation and good care are essential to a continued and healthy growth of the trees.

"The best varieties for shipping purposes are: Chapman, Burbank, Advance, Tartarians, Royal Anne, Bing, Lambert and Black Republican. There are other varieties not extensively grown that promise well; and it may be experience will determine that the above selection can be improved upon.

"For canning purposes Royal Anne is probably the best; it is also one of the best bearing varieties. If the locality does not produce early shipping cherries, it would undoubtedly be better to plant for canning purposes.

"Probably there is no tree grown in California that is more liberal in its setting of buds than the cherry; and it is more than likely there is some well-defined reason why these buds fail to mature, and if they do mature, why the young fruit drops off when about the size of a pea. Thinking orchardists and scientific investigators from the universities have here a problem that I believe can be studied to great advantage, as it is my belief that the trouble can be controlled when the cause is once understood."

Making Buds Bad to Birds.

To the Editor: Do you know of any spraying mixture to spray on the apricot trees to prevent the birds from picking the buds? The birds were hard on them last year and I see they are at it again this fall. I am going to spray them now with bluestone and lime and I thought it might help to put on a good coat of lime. If you have some spray that will keep the birds away and not hurt the buds you will do me a great favor to describe it. I have planted alfalfa in my orchard this fall and would like to ask if you think the lime and bluestone mixture will hurt it now when I spray the trees.—H. B. C., Fresno.

[We do not know that any of the frequently mentioned poisons and repellants have been demonstrated to be effective. If any reader has succeeded in solving this problem, we shall be glad to hear from him. It

is not likely that your Bordeaux spray will hurt alfalfa unless you tip over the spray tank.—Eds.]

LIME FOR SOUR LAND.

To the Editor: Which is best and cheapest to apply to sour land, air-slaked lime, or ground oystershells at \$7 a ton f. o. b. Berkeley?—E. B. P., Lincoln.

Theoretically both are of the same nature and the same value; but air-slaked lime may contain a lot of water now which you can get cheap at home. Ground limestone will cost about \$5 a ton at main line points in carlots. Some of it may leach or wash away before it becomes available. Hydrated lime contains about twice the value and is more quickly available. It will cost about \$11 per ton delivered at main line points.

Prune French Prune Trees Every Year

[Written for Pacific Rural Press.]

Vociferously we were told that prunes should not be pruned oftener than every three years. But we didn't believe it. Everywhere in Santa Clara Valley are old prune orchards of declining vigor and no recent big crops. Frequently we see orchards pruned every third year, in which a crop is lost by being about all cut off at once and by the vigorous wood growth of the next season robbing what fruit buds are left. In many cases not much of a crop is lost, for there wouldn't have been much. The French prune of mature age tends to make fruit buds too thickly and wood growth too short.

Perhaps the sap cannot freely pass through thickened cell walls. Anyhow vigor is lacking, and the old clogged-up wood must be removed. If it is removed annually, there will be enough new growth to keep the tree supplied with all the fruit buds it can mature fruit on; and do it every year.

Because the prune bears near the terminals, where new growth is short and full of fruit buds, it cannot well be cut back. But weak brush can be thinned out. This is now the practice of W. A. Yerxa of Colusa county, who bought a 15-year declining prune orchard twelve years ago and now has healthy annually renewed tops on the old trees.

"Size up a tree for vigor before you start to prune," says O. N. Featherston of Santa Clara county, who has 12 acres which produced $3\frac{1}{2}$ tons green per acre last year which dried to 44 or 44½ per cent. "Thin it out more if it is less vigorous as shown by last year's growth. But do not cut it back." J. M. McKinnon is another who gets new growth and spurs down on the limbs all through the tree, by thinning only.

Everywhere among the old prune orchards we see where trees have been heavily cut back. The exposed limbs have been sunburned or become barkbound. The stubs have sent forth some new growth which could not protect them from decay

before decay became established.

N. Perusina, now working for A. W. Johnson in Santa Clara county, was experienced in the Bosnian prune orchards of Europe before coming to this country. "The main thing is pruning every year," says he. This to avoid making big cuts and subsequent rotting. He would leave growth low on the tree, but cut it enough to keep out of way of horses.

Broken Limbs Teach Lessons.—

The damage done by allowing all fruit to set at the ends of limbs was well illustrated last season in an orchard whose crop was not heavy but which was full of props and broken limbs some time before the fruit ripened. In almost all cases the broken limbs were about four feet bare and then tipped with fruiting brush. If the same fruit had been distributed down the limbs it would have been saved, and the limbs would be there next year.

This orchard illustrated other points to be avoided. Most of the broken limbs were horizontal back to a diameter of over two inches. One had simply split and buckled the lower half of its circumference. Far less strain would have been put on them all if they had been pruned to grow diagonally upward and to fruit more along the limbs. Less strain would have occurred at their junctions with the main limbs, where most of them had broken loose. One had grown out from the side of the older limb, and easily twisted away under the weight of fruit. Another had joined the older limb in a wide flat thin junction in which there was little strength. Another had broken off where the limb from which it sprung had been cut off, leaving a stub which rotted downward in the heart. The break disclosed the rotten, weakened wood. Another broke a foot above where two two-inch branches had been cut off. The upper third of the remaining branch had rotted clear to the center and upward to where it broke. It was five feet upward from the break to the first brush.

Planting Grape Cuttings.

To the Editor: In starting a Seedless vineyard, would time be saved by setting out cuttings instead of rooted plants?—W. A. A., Ceres.

Although vineyards are often planted with cuttings it is well to remember that the first year after a cutting is made, might as well be spent in a propagating bed so that the proposed vineyard acreage may be used for some crop that will put it in good shape for the vines and yield a return, without plowing and cultivating around the cuttings. The

vines will make as good growth the second year as if the cuttings had been set in place. By planting rooted vines you avoid loss of space for a year's time where cuttings might not grow or where they would be damaged during the first year's cultivation.

TRANSPLANTING TWO-YEAR FIG TREES.

To the Editor: Can fig trees that have been planted and grown two seasons be successfully transplanted? I have a piece of land that I wish to plant figs on. The only trees that I can get this year of the kind that I want to plant are two-year-old trees and they have made a good growth. I have blasted the holes. Do you think it would be all right to dig large holes, save all the roots I can and cut back the tops pretty well?—F. M. Reedley.

You plan is safe and sane. Settle the dirt in the blasted holes before planting, so you will not find later that the trees are too deep.

TALKS ON Nitrogenous Fertilization

Number 5

WHAT amount of SULPHATE OF AMMONIA should you apply? That depends somewhat on circumstances, including soil, crop and climate. Generally speaking, 100 to 300 pounds per acre will prove profitable on field, truck or orchard crops. For well grown citrus orchards, say, $8\frac{1}{2}$ to 10 pounds per tree per year in several portions; for younger trees, half this amount.

SULPHATE OF AMMONIA

Much depends on the humus content of the soil. The more humus and the more favorable the conditions for the nitrifying bacteria, the more ammonia a given soil can handle and pay a profit on the investment.

The best advice is to try a moderate application at first, watch your results carefully and be guided by them. In this way you will learn whether your maximum profit is at 100, 200 or 300 pounds per acre, or even more.

Do not forget that your crops must have phosphoric acid, lime and potash, as well as nitrogen.

Cory's Thornless Blackberry.

The Thornless Mammoth Blackberry was first discovered by Martin Meuli on his ranch in Tuolumne county in 1909 in a patch of regular mammoth blackberries. One vine had one branch which was practically thornless. A Mr. Beede working for him was interested in vine culture, and he took a few tips from the first cane. He went to Grass Valley and from his few tips he got about 75 tips. Then W. C. Cory rented the Meuli place, and Mr. Beede came to work for Cory for two years. In that time they propagated about 3,000 plants, but only one-third of them were thornless. Mr. Cory then propagated from the old thornless a true thornless blackberry which is nearly free from seeds, entirely free from thorns, and of gigantic size. This berry has a distinct flavor of its own, unlike any other blackberry. Cory's Thornless Mammoth Blackberry is the largest blackberry grown anywhere, averaging the size of a man's thumb, and the meat is firm enough to ship.

While it is a prolific bearer, one

of its most essential features is its early maturity, being the first blackberry ripe. Strong one-year plants set out in February bear ripe fruit the first of June. The plant is hardy, thriving in almost any soil but preferring sandy loam. Its yield is commensurate with the amount of cultivation, irrigation, and fertilizer used. One acre which is in bearing on Mr. Cory's place produced three hundred crates, and about half of the canes were used in tipping for new plants. Much nourishment is diverted from the usual growing of thorns to improving the size, quality, and quantity of the berries.

The cost of picking the fruit is cut in half owing to the absence of thorns. Also, the cost of pruning and trellising up the new wood is more than cut in half.

[Several sample canes sent to this office bear out the thornless quality, even canes $\frac{3}{4}$ inch in diameter having only a few very small short points in place of the thorns that make the ordinary Mammoth pruning a mean job.]

Pollenization of the Almond.

To the Editor: I have a lot of two-year Nonpareil and IXL almond trees set in alternate rows. The nurseryman told us they would interpollenize to make each other bear. Others are telling us they will not. Should we graft over one variety, and to what?—I. O. R., San Francisco.

Evidence conflicts as to which varieties interpollenize best, because climate and location seem to alter cases. From the "University Farm Agricola" we quote regarding experiments begun three years ago:

"At the present time the experiments seem to show that certain varieties will not cross-fertilize when placed side by side in the orchard. Good examples of this are Nonpareil and IXL. Others, such as the Ne Plus Ultra, seem able to pollinate several other varieties, including Nonpareil and IXL."

P. D. Bane of Glenn county, whose 20-year orchard consisted of Nonpareil, IXL, and Ne Plus, cut out the Nonpareils gradually on account of alternate bearing, but retained the IXLs. In planting new orchards he used IXL and Ne Plus, with Drakes outside, because the latter are "the strongest pollenizers." In the

new orchards he secured a succession of ripening, which enabled him to keep a small force busy through a long season—IXLs ripen first, then Ne Plus, then Drake. Nonpareils ripen at the same time as IXL, but tend to close again so are harvested first of those two. Texas Prolific is a great pollinizer, but blooms a little later than Nonpareil and IXL, so that only its early blossoms can fertilize the late blossoms of the others. Ne Plus grafted into non-bearing Nonpareils in Sacramento county resulted in heavy crops.

Since Nonpareils and IXLs are the highest priced varieties, if we could get dependable harvest help we would not graft over either of them, but graft into one high branch of each alternate tree a scion of Ne Plus, Drake, or Texas Prolific. Ne Plus come next in price below IXL. The varieties must be kept separate at harvest, or the whole lot will sell down toward the price of the poorest variety. If harvest help is not dependable it might be well to replace every fourth or fifth tree each way with one of the pollenizers mentioned.

Orange Soil Hardened.

To the Editor: I have 20 acres of orange trees on red soil underlaid by hardpan. Have been irrigating and cultivating these trees for a number of years. Now the ground seems to be getting very hard and runs together. Am thinking of fertilizing this year with either ground lime rock or air-slaked lime. Which would be best and how much would you use per acre?—H. B., Orosi.

You want quick action on that soil, which can be obtained best by hydrated lime, about one ton per acre. Air-slaked lime may contain a lot of water now, which would be expensive at the price. Ground limestone would act more slowly. Lime is not a fertilizer, but when worked into intimate contact with soil particles, it loosens them and softens the ground.

If it were our orchard we would also dynamite it as described in an article recently printed in Pacific Rural Press, and then plow under all the cover crops we could possibly grow for all the years to come—and we would expect results.

TEPARY BEANS.

To the Editor: Where is the tepary bean grown most in California?—F. W. R., Modesto.

Probably around Stockton, though we know of no figures on acreage. They are grown in considerable amounts in your own neighborhood, around Fresno, in Southern California, and in Arizona. A place to sell them should be found before planting them extensively.

Armstrong Nurseries

ESTABLISHED 1889

Don't Fail to Plant Some

ASCOLANO OLIVE TREES

Every Olive orchard should contain at least one-third Ascolano trees. The largest and best ripe pickling Olive grown; one of the earliest to ripen. On account of its large size, attractive appearance and superior quality, demands the highest market price.

OUR TREES ARE OF THE LARGEST AND BEST "STRAIN" OF ASCOLANOS;

producing extra large fruit of highest quality:—and, by our method of propagating and growing Olive trees, the best obtainable are produced: Straight, clean, thrifty, well-rooted stock; also, by our system of digging, packing and shipping, they reach the planter in best of condition.

CAN SUPPLY IN ANY QUANTITY. PRICES ON APPLICATION.

Can also supply high-grade Mission and Manzanillo Olive trees in all sizes and any quantity, at right prices. Write, stating your "wants."

PRUNE TREES

On Peach and Myrobalan Root.

A choice lot of clean, thrifty, well-rooted trees, ready for immediate shipment; any size or quantity wanted. French, Imperial, Standard, Sugar, Tragedy and other varieties. Write for prices, stating number of trees, size and variety desired.

Other Fruit Trees

Deciduous, Citrus and Other Tropical Fruits. Every desirable variety in all sorts.

"Armstrong" trees, planted along-side of other, or ordinary trees, will soon convince you of their superior quality; vigorous growers; early bearers; producing highest quality fruit.

Write NOW—today, for a free copy of our 1917 Catalog and price list; make your selections and send in your order early. The BEST will be sent you.

BARTLETTS FREQUENTLY NEED POLLINATION.

To the Editor: Am sorry to say that I must take issue with you when you make the statement in issue of December 16 that the Bartlett needs no pollinizer. Think you really have not meant to make so broad a statement.

My own experience has carried me far in the other direction, and I contend that the Bartlett frequently needs a pollinator, particularly throughout the entire foothill fruit belt. Under valley, conditions, where the vigor of the tree is developed to the fullest degree, I know of many instances where pollination appears as if it might be superfluous. However, even there I am inclined to believe that pollination would make for more regular cropping. It is true, thinning would frequently have to be done, but it's so much easier to pull fruit off than it is to stick it on.

In tests made here in our orchard we have had a tremendous increase in fruitfulness since placing pollinators in a block of old Bartletts. In many other orchards throughout the foothill belt I find certain blocks of Bartletts are uniformly and heavily productive, and practically without exception find some other variety of pear close enough for pollination.

An experiment in pollination is now under way in the State under test conditions where an increase in fruitfulness of the Bartlett of 1000 per cent was realized this year, but as this experiment is not yet complete I am not at liberty to give details.

We have under way the planting of nearly 300 acres in our orchard to pears. We plant not more than six rows of Bartlett in a block and then two rows of another sort for pollination, using for this purpose principally Anjou and Comice. There are several other desirable sorts blooming with Bartlett that would also be desirable as pollinators.

With plums, cherries, apples, and pears I am convinced that there is greater need of pollination than we generally recognize, and not a year goes by without giving me concrete evidence of the benefits to be derived from this practice.

Instead of making the sweeping statement that heads your comment, tell the fruit growers that we have much to learn upon this subject and recommend a careful observation on the part of the thousands of orchardists of the State until we have accumulated conclusive evidence as to the conditions under which pollination may or may not be beneficial.

A. L. Wisker.

Grass Valley.

[Thank you. We wish all of our readers were as prompt to point out desirable modifications in our statements and to tell us their experience.]

The Federal Farm Loan Board announces that the blank form of articles of association to be used in forming National Farm Loan Associations has been printed and is now ready for distribution. If interested persons will address a letter to the Federal Farm Loan Board, Treasury Department, Washington, D. C., these articles of association will be sent, with instructions for further action.

Roeding's Page

APRICOTS

ON TREES

IF THERE is any one thing for which California stands out pre-eminently it is Horticulture. Those who depend on the soil to make their livelihood must necessarily realize a profit, otherwise they cannot go on with their venture. If there is any one thing that has militated against the building up of the fruit interests of California more than any other it is the cry, and quite frequently a very insistent one, that a certain variety of fruit has been planted more extensively than it should be. The word "over-production" stands out so prominently to the man who has practically made up his mind what he intends to plant, that it causes him to waver and it is more than likely that he embarks in the very venture which he should not have engaged in.

\$50 A TON FOR PITS

It is the unexpected which has probably contributed more to the building up of the fruit industry in California than possibly any other cause. Who would have thought ten years ago that apricot pits, which were selling for \$8 per ton — (and their only use was for the raising of seedling stocks by the nurserymen and for fuel in the homes of the orchardists) — would within such a short period have a commercial value and that the price would advance steadily, which it has done, reaching what

might be termed a maximum in the year 1916 when apricote pits sold for \$50.00 a ton.

A CALIFORNIA MONOPOLY.

We did not realize then that this magnificent fruit, grown under conditions which seem to be more favorable in California than in any other place in the world, would with the intelligent effort displayed by the grower, cause our

product to be so highly appreciated that at least 60 per cent of the output should be used for export. Here are the figures from the annual report of the State Agricultural Society, which speak for themselves. In the year 1902 we exported 1,928,237 pounds. In the past nine years the average annual export has been in the neighborhood of 18,000,000 pounds, and in 1915, under the adverse conditions of transportation, and with Germany, the heaviest purchaser of this fruit, practically out of the market, we exported 27,764,342 pounds.

FRESH, DRIED OR CANNED

Bearing in mind that the apricot is such a delicious fruit when fresh and apparently it loses none of its piquancy when dried and canned, it is not surprising that this industry which is typical of California should present such great possibilities. It is a well-known fact that apricots do very well in many of the interior valleys, but it is in the Coast counties more particularly where the tree luxuriates and the fruit is of exceptionally large size and highly flavored.

PLANT APRICOTS

In view of the above facts we can see no reason why you shouldn't profit by planting apricots. We will be glad to advise with individual growers as to whether their soil and climate is adapted to this fruit. Write us.

True Trees

—True to Name
—True to Quality
—True to the Reputation of Character and Reliability Built up by 33 years of Fair Dealing.

A Splendid Stock of Apricot Trees

—in all the best varieties awaits your selection at these nurseries. We can safely say that our stock this season is the best we have ever had—and this applies not only to Apricots but also to

PRUNES—PLUMS
OLIVES—PEARS
NECTARINES
WALNUTS—PECANS
ORANGES—LEMONS
POMEGRANATES
BERRIES—GRAPES
ETC.

Send us your list for prices and suggestions. Let us advise with you as to what is best for you to set out this season.

Now Ready:

—our big new illustrated catalog.

We have just received from the printer our 1917 Catalogue, which is the most complete one we have ever issued. It is attractively illustrated; lists and prices over 2000 varieties of fruit and ornamental trees, vines, shrubs and plants. If you haven't already sent for a copy, it will pay you to send us your name and address now. A postcard will do.

Why Not Set Out Some Ornamental Trees or Vines

There is nothing that will improve the appearance of a place like a few well selected trees, vines or shrubs.

We have a wonderful assortment of

EVERGREENS
PALMS
CLIMBING and TRAILING VINES
BORDER PLANTS
Hardy Field Grown ROSES, Etc.

Send for a copy of our new booklet "How to Grow Roses."

Experience in Dry Farming.

[Written for Pacific Rural Press by J. W. Lyle, Sheridan, Cal.]

I have been requested to give the readers of the Press some of my experiences in dry land farming. My experience was gained chiefly in the dry land belt of eastern Oregon, Washington and Idaho, and a limited experience in Central California. I have found the methods that I will describe equally good wherever I have tried them, with slight modifications to suit local conditions. The only doubts I have in my own mind in California are the exact time of seeding and amount of seed per acre. There is so much variation in types of soil and climatic conditions in this State that each locality will have to work out these problems to suit local conditions. However, I wish to emphasize the fact that the methods I give in regard to preparing the soil will give as good results in California as in the north.

The climatic conditions in the north are rather severe, the thermometer frequently going to 20 degrees below zero in winter. Usually there is little rain and sometimes little snow. During the growing season there will be days of raw, chilly winds followed by days that are calm and very hot. Sometimes when the wheat is in the dough there will be dry, hot winds from the north. The only way to dry-farm is the bare summer fallow. If the soil is in such condition that the plow will turn clods under, the surface should be disked or harrowed or both until the clods are thoroughly pulverized before plowing. If a plow sole has formed, it should be broken up. A subsoil plow is better for this purpose than to turn the soil from too great a depth to the surface. After plowing and before the soil has had a chance to bake or dry out, it should be worked down and finely pulverized and then it should be cultivated at intervals all summer. The time between the different cultivations is governed in a measure by the character of the soil and climatic conditions, and will vary from two weeks to a month, and even longer under very favorable condi-

tions. A man has to mix judgment and brains with his work to be a successful dry farmer; and no farmer no matter how good, under favorable conditions, can become an expert dry farmer in one year or two. If the soil is very retentive of moisture and there are no adverse conditions, such as dry winds, and the soil has been well saturated with moisture, a month or more will not be too long between cultivations. If the soil is of such character that the loss of moisture by evaporation is rapid and there is little moisture in it, two weeks between cultivations is too long. To make a success of dry farming it takes experience, intelligence and work, work, work, and more work.

For cultivating a summer fallow a good spring tooth is a splendid implement; on some soils a good drag harrow does very well—anything to keep a good dust mulch and keep down the weeds. If the summer work has been well done there will be an ideal seed bed at seeding time. A drill, preferably a press drill, should be used. Do not seed broadcast and do not seed too heavy; for fall-sown wheat never under any circumstances more than 45 pounds per acre; and under some circumstances considerably less. Again, experience and brains.

SULPHUR ON ALMONDS.

To the Editor: What is the right mixture of sulphur and water for spraying four-year almonds?—H. P. H.

Sulphur does not mix practically with water except in such special preparations as atomic sulphur, etc., directions for dilution of which are on the packages. The only use of sulphur that would pay on your trees while dormant is lime-sulphur which can be obtained from our advertisers ready to mix with water. It will kill the eggs of the brown almond mite often called the "red spider."

FARM LOAN BLANKS READY.

Word comes from the Federal Farm Loan Board at Washington, D. C., that they expect to announce the location of the twelve new Federal Land Banks before Christmas. The interest manifested in these banks has been most gratifying to the officials having their establishment in charge, and they are sending out the following instructions for the information of farmers who may wish to form associations for the purpose of borrowing money:

The Federal Farm Loan Board announces that the blank form of articles of association to be used in forming National Farm Loan Associations has been printed and is now ready for distribution. If interested, persons will address a letter to the Federal Farm Loan Board, Treasury Department, Washington, D. C., these articles of association will be sent. When they reach you, call a meeting of the prospective members of your association, adopt these articles, and have each member sign them and acknowledge them. Fill in the blank space at the top the name your association adopts. Then, at your first meeting, elect a board of five or more directors and have the directors meet and elect a president, a vice-president, a secretary-treasurer, and a loan committee of three members. The loan committee may begin at once to value the lands of the members and prepare its written report of these valuations, which must be unanimous.

Do not send the signed articles of association to Washington, but hold them until the Federal Land Bank of your district is located. Then, write to the bank asking for forms which include an application for a charter. When these come, fill them out and send them, together with the articles of association and the report of the loan committee, to your Federal Land Bank.

Alfalfa Silage Experience.

[Written for Pacific Rural Press.]

The most complete manual of alfalfa, where and how much it is grown, how to grow it for hay and seed, how to feed and market it, is just published by the Kansas State Board of Agriculture. It shows that Kansas led with nearly a million acres of alfalfa in 1910 by the U. S. census, while California was fourth with 484,134 acres.

In Kansas, the California trouble of rain on the first cutting is sometimes extended to several cuttings. There, as here, the silo is empty about the time for the first cutting. Probably, also, they have weeds in the first cutting, which might make poor hay. We quote the experience of a Kansas farmer as published in the manual:

"Under ordinary conditions, the making of alfalfa into silage is not profitable. . . . On our farm, dairying is the main business. . . . For a cow to do her best, part of her ration must be succulent as well as nutritious. Silage is one of the most inexpensive of the succulent feeds.

"When the Silos are Emptied, before the succeeding corn and cane crops are ready, we use alfalfa silage.

"The alfalfa is cut for silage when

in proper stage to cut for hay. The rake follows the mowers, and the green alfalfa is hauled at once to the silo. We put it into the silo without running it through the cutter. This materially lessens the cost of filling. We are extremely careful in spreading the alfalfa evenly to insure even settling and to avoid 'pockets.' It is also well dampened when put in, which aids very much in getting it tramped tightly.

"Fermentation begins within 12 hours, and progresses rapidly. The silage may be fed after 36 hours without danger of bloat. In color, alfalfa silage is a light brown, nearly tobacco-colored, has an agreeable odor, and is relished by the stock. If fed outside, it should be fed in racks instead of bunks, to avoid waste.

"According to reliable authority, alfalfa does not make as good silage as many other crops that are used for silage, as it is lacking in sufficient sugar to produce the proper fermentation. However we have secured better results from alfalfa silage than from any kind used; but not enough better to warrant its use in place of the crops ordinarily used."

FUNDS FOR FARM LOANS.

To the Editor: Can you advocate the enactment of a law by Congress to allow the Postal Savings Banks to buy the bonds issued for rural credits? It is the safest investment for such money or the money of estates or widows, and if the amount of money that each one could deposit in postal banks was raised, I believe that an abundance of money could and would be deposited for all rural needs, and the bonds could bear a very low interest. I with others would like to borrow on farms, but fear the first issue will bear a higher rate of interest than later ones.—J. B. G., Napa.

This matter was very strongly urged upon the attention of Congress before the enactment of the existing law and found impracticable at present, at least. There is no use agitating the question until this law has had trial on its present provisions. It may be very important later. As for getting stuck on higher rates than may be available later, the mortgagor can release his debt by buying and surrendering bonds which have run five years from date of issue and that will cancel his loan and mortgage at any time. It is hardly likely that such bonds will be worth premium enough to make the operation expensive.

SUDAN FOR FOOTHILLS.

To the Editor: Is it necessary that Sudan grass be grown on loamy ground or will it do well on ordinary red soil? Does it have to be irrigated the same as alfalfa or can it be grown to advantage with one or two waterings or without water at all? What time of the year is the best time to sow it? When is it fit to cut? How many pounds are sown to the acre?—H. J. A., Fourth Crossing.

It will do well on ordinary red soil if the climate is warm. An irrigation or two are very desirable, but monthly irrigations are unnecessary. Plant it broadcast about 20 pounds per acre or in drill rows 32 inches apart about 3 pounds per acre after danger of frost is over and the

ground warm. Mow it for the best quality of hay at full bloom; but to get two or three cuttings you may have to cut it less mature. It will ripen seed in about three months from sowing. Be sure the seed do not contain Johnson grass. If in doubt, send a sample to the University for a free test.

Kerman farmers have organized a permanent Farm Bureau local with a membership of more than 150.

NITRATE OF SODA FOR APPLES.

[Written for Pacific Rural Press.]

Nitrate of soda increased the size of fruit when sprayed on apple trees and when applied to the soil, in experiments conducted by Prof. C. I. Lewis of Oregon Agricultural College. The thrifty green of the trees was noticeable a mile away in comparison with untreated trees nearby. The same amount of nitrate was ap-

plied to each tree whether in the spray or on the ground; and the difference was slight in total production per tree. But of sizes larger than 100 per box the sprayed trees produced 33 per cent; those treated with dissolved nitrate on the ground produced 48 per cent; and those to which dry nitrate was applied produced 68 per cent of sizes over 100's. Untreated trees produced only 5 per cent larger than 100's.

Cheap, Effective Flood Control.

[Written by F. M. Olmstead, Los Angeles, to San Diego Chamber of Commerce.]

As promised, I send you the following notes on the subject of Flood Control:

The "Levee System Only" has almost invariably proved a disappointment for flood control wherever it has been tried in the whole world, so far as I have been able to secure data. Large storage reservoirs, where possible, when used for flood prevention, are the surest remedy against flood damage; but it is seldom that good reservoirs exist, and it is prohibitive generally from financial reasons to use them solely for protection against floods. To combine the use of a reservoir for storage, for irrigation use and as a regulator for flood flows, in many cases, such as exist in San Diego county, there may be practically a combination of these uses; but I maintain that there is need of a clear definition as to whether any large dam built to store water is primarily a conservation proposition or a flood prevention measure.

Many of the rivers in the old country are leveed, and releveed until the beds of the streams are as high as the roofs of the houses. Here in California the streams come out of the mountains riding on top of the detrital cones.

Now if clear water alone was to be provided against, these levees would probably be the best, simplest and most permanent protection, but this is not the case. The waters of any mountain stream come down a channel of very steep gradients, which gradually, or possibly at one point, are pronouncedly reduced, creating conditions in the water course that sooner or later spell disaster.

A stream running five feet a second has three thousand times the transporting power for moving detritus along down the channel that a stream has which runs one foot a second, or, differently expressed, a mountain stream running five feet a second will drop 2999-3000 of its load when the grades change to one foot a second velocity, other factors of flow remaining equal. This means at these points where grades change to lesser, the sand, silt, cobbles, etc., are deposited until the stream breaks over the levees or restraining walls and seeks better grades. This almost uniformly has been the ultimate result of levee construction alone.

Cheap Check Dams Stop Silt.—The system of check dams in mountain streams, which has of late frequently been called the "Olmstead Check-dam system," has been used

for at least forty years in the old country, and I cannot claim more than to have recommended it to Los Angeles county. The system I advocate is a combination of small, inexpensive checks made of rock or timber, or of both rock and timber, in the small mountain ravines, and the loose rock dams (porous, but substantial) at certain favoring narrows in the larger canyons. With the opportunities which naturally exist in most watersheds, the danger from flood damage can be at least wonderfully minimized, by substantially reducing the crest of the flood and by eliminating most of the silt, sand, gravel, etc., that menace the restraining walls below.

It would seem that this system would long ago have appealed to observing men everywhere as the one sensible first thing to do. It is inexpensive; and of necessity, to some extent, conserves the golden water crop, which, moving down in flood flows, so seldom does anyone good and so often does many harm.

The data on hand for estimating the benefits to be derived from check dams are first the foreign work of Austria and Switzerland, about which the United States Government furnished me information in 1915, and second, the results of my own observations on the work of the Los Angeles County Experiment Station in Clear Creek, Big Tujunga, and the check dams built during the last two years in Haines Canyon. The knowledge we have of foreign work is derived from authentic data, but not greatly in detail. We only know that immense sums of money have been spent in controlling mountain torrents by check dams, and that the work is based on the theory that grades must be reduced below the debris transporting power of the floods to be able to maintain the confining structures below.

Our Own Work in Los Angeles County, although observed only over two flood periods, and most of it only through the floods of 1915-16, is entirely reassuring. The exact degree of reduction of flood water peak is unknown, and the exact degree with which the low water supplies of a treated watershed are reinforced are still in question, but that the flood crest will be decidedly reduced under average conditions and that the minimum summer flow will be greatly improved, there is no doubt in my own mind from my own observations. There is no need in any particular district to depend upon what has been done in Europe or even in Los Angeles county. A few dollars spent in checking any mountain stream in San Diego county will show the zone of saturation extending out into the crevices of the rocks and the interstices of the disintegrating side slopes from the immediate flood channels, and the vegetation springing up, so that when the next succeeding rainy season sets in there will be observed altogether new conditions; the stream will be running clear and this clear water will be seeking entrance into every possible opening in the soil under the heads created by these little dams. The conditions will be

MISSION OLIVES EARLY RIPENERS.

THE EHMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.

Mr. W. A. Hayne, Box 461, Marysville, Cal.

Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Fogg grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners.

We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know.

Yours very truly,
(Signed) E. W. EHMANN.

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive trees, and like the Fogg trees, they are all propagated from the large size cuttings.
W. A. HAYNE.
Box 461, Marysville, Cal.

different, so that the more water that is passed into and through the thirsty soil the more open the interstices become, instead of being quickly clogged up with the silt as before. This particular detail is of greater importance than at first thought possible. Any surface covering of the earth soon becomes highly porous from the action of an infinite variety of insect and animal life, but generally after the first rush of flood waters carrying alumina binding material, there is formed a matrix that more or less effectively seals over any minute opening over which the flood has passed.

The stability and cost of these small dams have been fairly well demonstrated by the Clear Creek and Haines Canyon work. Structures that would be indefensible from an engineering standpoint, if placed in a stream uncontrolled above, are perfectly secure when placed in line below a string of structures that have subdued velocities to not over four feet a second. The average cost of the many structures so far built under my direction has not been over \$20 each when separated from overhead and trail building expenditures incidental to the work. Trail building and overhead charge will have to be added in almost every case, but in any particular estimate the relative importance of these factors can readily vary from two to

thirty per cent of the cost of the whole work, and should be considered separately when discussing the actual cost of the building of the retarding structures. The general treatment of a watershed, as well as the location of the structures and the detail plans, should all be intelligently planned, having in mind the amount of money available. Especially is this true where only a limited amount of money can be had, for in this case structures in certain places have a more positive effect in diminishing the crest out of the whole watershed than if located elsewhere.

Since I first commenced to make careful observations on the relative flood run-off of different canyons and to co-relate these run-offs to the natural conditions back in the watersheds themselves, I have been surprised to note the wide range of discharge from adjacent watersheds where the rainfall itself must have been much the same.

If the people of San Diego county will only commence to study their own problem in detail they will find that without prohibitive expense, and whether the U. S. Government or any great private enterprise goes ahead with the work, they, themselves, can, if they will combine, furnish their own relief against ordinary flood conditions and add very materially to their minimum water supplies.

Sugar Beet Growers Organizing.

[Written for Pacific Rural Press.]

Sugar beet growers of Santa Clara county have started the ball rolling for a higher price than they got last year and are being offered this year. Ten white growers representing practically all of the 800 acres produced last year in the Milpitas district, have petitioned State Market Director Weinstock in the following words, and Mr. Weinstock has agreed to address a meeting of the growers at Milpitas Jan. 3.

"We, the undersigned growers of sugar beets, request that an investigation be made by you and advice given, whereby we may be aided in obtaining better prices for our crops. In view of the high prices which have prevailed for the past two years, and the likelihood of their continuance, we believe the prices we are obtaining are not what should be had."

Sugar beet growing in the Milpitas district revived two years ago with perhaps 600 acres. Last year about 9,000 tons were produced on 800 acres according to A. M. Standish, one of the signers of the petition. Only two factories are near enough to use the beets of this district, the Alameda Sugar Co. of Alvarado and the Spreckels Sugar Co. of Spreckels. Both have paid \$5.50 per ton for the past two years at Milpitas, the former paying a flat rate. They are now offering to contract at \$5.50 for 16 per cent beets, with 25 cents per ton extra for each additional per cent of sugar.

The growers feel that \$7 would be a fairer basic price. Sixteen per cent beets yield 320 pounds of sugar per ton, which the factories have been selling around \$20, of which the growers got \$5.50.

Since tomato canners are offering high prices and beans are very prof-

itable, much of the Santa Clara county beet acreage will be devoted to these crops unless beet prices are raised.

IRRIGATION COST.

To the Editor: What price can one pay per acre or by the inch for water for irrigation in the foothill region and make the investment pay? W. H., Angels Camp.

It depends on the kind of a crop you can grow, how much you can grow of it, and how much net profit you make in marketing it. You could pay very much for water to irrigate vegetables if you can sell them well; and very little for hay. For shipping-fruits in the Placer county foothills they are paying \$45 per miner's inch per season of 5 months, getting that amount of water in multiples and by turns. This irrigates about five acres as they irrigate. A miner's inch running continuously would cover an acre one inch deep in about 50 hours.

SULPHUR AND GYPSUM FOR ALFALFA.

To the Editor: Would it be better to mix sulphur and gypsum for alfalfa than to use gypsum alone?—Sub.

[Answered by J. M. Bomberger, Modesto.]

At present prices of sulphur and gypsum, it is more economical to use all gypsum. Sulphur alone has not shown good results on old alfalfa that evidently needed other plant foods besides sulphur. Sulphur seems to require the presence of stable manure for best results.

A syndicate of San Jose capitalists, headed by Wm. C. Anderson, has purchased 610 acres in the Linden section. In the spring the land will be set out to walnuts.

"Second Thousand Answered Questions in California Agriculture"

PUMP AND EARLY SOWN COVER CROPS HELPED MAKE POOR PRUNE ORCHARD PRODUCTIVE.

[Written for Pacific Rural Press.]

A 28-year prune orchard that bore close to 70 tons green on 18 acres last season is to the credit of G. W. Cox of Santa Clara county, where many such old orchards are bearing less than half that much.

"Four things you must do to get prunes," says Mr. Cox: "Prune right, cultivate well, give it water and lots of it, and grow a cover crop to turn under."

For many years this orchard did not bear over 1½ tons green per acre. It was on light soil from which brush had been cleared, and on which natural grass had never grown. It was producing about eight sacks of barley or five of wheat before the trees were planted.

For ten years he tried to grow bur clover without inoculation or nitrogen fertilizer, though some potash and phosphoric acid had been applied. Finally natural inoculation was worked up to the point of giving a good crop of bur clover in 1912-13 and each year since. It grew 2½ feet high a year ago last winter. Last winter's crop dried up because he irrigated, then sowed bur clover in October and waited for rains which did not come soon enough.

Another irrigation could have been given, but the preferred way now is to sow and then irrigate; because if irrigated first, it must dry enough

to cultivate before sowing—then it gets too dry to sprout the seed properly. About 50 pounds of seed are broadcasted on the 18 acres. It is plowed under in April, though if irrigated and allowed to grow longer, it would make that much more humus and nitrogen.

Early sowing of the cover crop is made possible, and late plowing also, by the well which has been put down since the two dry years reduced his crop. A gas engine lifts 600 gallons per minute 120 feet and supplies both Mr. Cox and a neighbor.

BREAKING HEAVY MARSH SOD WITH TRACTOR.

[Written for Pacific Rural Press.]

On the ranch of the Napa State Hospital there are several hundred acres of low bottom land which formerly overflowed from a nearby slough in the winter months, making it of little value for farming purposes.

In late years, this land has been reclaimed by the erection of a small levee that protects it from the overflow water. While there is still more or less salt and alkali in the soil, deposited there by the tide waters, good grain crops are grown on it after the first year's plowing.

In its virgin condition this soil is covered with heavy marsh grass sod and tules, presenting an almost impenetrable condition for the plow even when a large tractor is used. On that account a double disk is hooked onto the track type tractor and run both ways across the field

before plowing is attempted. This cuts the heavily matted sod and the top portions of the roots into comparatively small pieces. When the heavy disk plows are attached to the tractor for final plowing, it is only necessary to cut the roots in the bottom of the furrow. This makes a much finer seed bed possible; and after being exposed to the weather in this manner for a year, the land has produced as much as 24 tons of silage corn to the acre.

AUTOMOBILE HISTORY.

[By C. S. Rieman, Elgin Motor Car Corporation.]

The first internal combustion engine was invented by Abbe d'Hauteville in 1678, in which the explosive power of gunpowder was employed to drive a piston in a cylinder. This was the forerunner of the modern gasoline engine. Some years later John Street developed an engine operated by liquid air ignited by a flame. The first internal combustion motor which used gas

was invented in 1884 by Gottlieb Daimler. In 1885 he successfully applied this engine to a bicycle, and in 1886 Carl Benz invented his Single Horizontal Cylinder, water-jacketed engine, which he applied to a three-wheeled carriage. The first practical gasoline automobile built in America was constructed by C. E. Duryea in 1892, but it was found to be under-powered.

In 1894 he built a new four-cylinder car which proved quite successful in the Chicago "Times-Herald Race." The first automobile endurance race of international importance was held in France in 1894. Two Panhard machines contested. Both claimed a 3.5 horse power and were driven by Messrs. Panhard and Peugeot. In 1895 the second automobile endurance race was held in France and covered a distance of 1,730 miles at the then remarkable average speed of 15 miles per hour. Six years later, however, the same course was covered at the rate of 50 miles per hour. In 1897 at the

Highest Competitive Awards

at both the San Francisco and San Diego Expositions, were given to Zerolene—an oil made from asphalt-base crude.

ZEROLENE

the Standard Oil for Motor Cars

Sold by dealers everywhere and at all Service Stations of the Standard Oil Company (California)

WHAT YOU CAN DO WITH A YUBA

You can get good cultivation within reasonable time, as did Mr. Brown, of the Santa Clara Valley.

You can harrow 30 to 40 acres a day, as do Davis & Son, of Spokane.

You can turn sharp corners in your orchard, and go under the limbs of trees, as do the Mills Orchard Co. in Yolo County.

You can PLOW—20 acres a day at a cost of 40c an acre, as did Mr. Hughes, of Kahlotus, Washington.

You can DISC—30 acres a shift at a profit of \$25, as did Mr. Morrison in Sutter County.

You can HAUL—426 sacks of barley on one load, as did Mr. Leathers, of Woodland.

You can do ROAD WORK—receive pay for 96 days out of 100 working days, as did Mr. Russell, of Saratoga.

You can plant eight rows of beans at a time, as do Chew Mock and Chew Fook.

You can pull a 30-foot heavy clod-masher, or a 42-foot corrugated steel roller, as does the Sutter Basin Company.

You can save time and make money with a YUBA—let us prove it to you.

Paris-Trouville road race, a speed of 29 miles an hour was developed in a gasoline automobile. What a difference today. Not long ago a 300-horsepower car raced at a terrific speed of 143 miles an hour. Even pleasure cars easily run off 50 miles an hour. What next?

ELECTRICAL EFFICIENCY ON A DAIRY.

[Written for Pacific Rural Press.]

The profitable uses to which electricity may be put on the farm seem almost endless in scope; and particularly is this true where districts are favored by a low rate, as is so often the case in California.

In illumination alone, electricity has a place on every farm, as was evidenced by a recent visit of the writer to a large dairy in Stanislaus county.

Besides lighting the dwelling and the interior of the barns and stables, this dairyman had erected high candle powered globes on lofty poles in front and back of the residence, in the horse corral, near the hog pens, in the cow corral and between the silos and dairy barn. Both of the silos were lighted on the inside also; and we were told that early morning or late evening work could be performed as well, with the strong illumination of these lights, as in the middle of the day, at a cost very low in comparison to the added efficiency of the hired help.

But illumination was only one of the electrical advantages. At the well was installed an electric motor to furnish the power for pumping the water into a high water tank which furnished water to the various parts of the ranch and also provides excellent fire protection. Cream separator and washing machine were also run by electric power facilitating the work and reducing labor cost in both instances.

AUTO-TRACTOR ATTACHMENT.

[Written for Pacific Rural Press.]

Another effort to utilize a small automobile as a tractor is now on the market to pull two plows. The auto wheels are replaced by tractor wheels, the rear ones being large and heavy to get good grip on the round. Pinions are put onto the driving gear of the car to run in a cog circle inside the rim of the wheel. The power of the car is claimed to be multiplied 13 times by the gear reductions which make it travel slowly enough for plowing while the motor runs at the speed used for 18 to 20 miles per hour as an automobile. The outfit is cheap and easily put onto or off from an automobile, and it opens a use for second-hand cars as well as those being used regularly.

It must always be remembered that a tractor works steadily for hours at a time; while the high-speed automobile engines are not always designed for unremitting work, the down grades giving them a chance to rest and cool off. However, the man who has only a little tractor work or who could use a tractor for only a short season of the year, and who is willing to watch his cooling and oiling apparatus, can have the use of his machine as a touring car when he isn't plowing or hauling loads, etc., with it. This avoids idle investments.

A Motor for Every Need

Just a glance at these illustrations will show you a few adaptations of

G-E Motors

to various farming operations.

Whatever the service required, G-E motors will give efficient and profitable results.

Wherever the machinery is situated, the wires will reach it—after that only "throw on the switch" and the power is instantly available.

Your local power company will gladly demonstrate the advantages of electricity on the farm; or, write to our nearest sales office or G-E Motor Agency for information.

General Agricultural Review.

FIELD CROPS.

The rice season has practically closed.

The prospects for a season of heavy tree planting are not good around Stockton.

More than twenty growers of potatoes of the famous Fruit Ridge district near Placerville have formed a potato growers' association.

Application has been made to the State Railroad Commission to have rice classified as stock feed in order that it may take the lower railroad rate.

The Spreckels Sugar Co. has purchased 449 acres one mile east of Manteca, in the South San Joaquin district, as a site for a \$2,000,000 sugar refinery.

It is said that Balfour-Guthrie Co. plan to erect a cotton seed oil mill at Calipatria before another season. Calipatria is also to have a meat-packing house.

It is announced from Calexico that a cotton-picking machine has been invented there that promises to solve the labor question for the cotton growers of Imperial Valley.

Northern California can grow cotton, says the Gridley Globe, both the short fiber and long fiber varieties, but cheap labor to make cotton growing a success is not available.

The distribution of \$166,532.90 to the members of the Ventura Lima Bean Growers' Association has been made by Secretary Frank J. Sifford. It represents the December payment for November deliveries.

Geo. Hecke, State Commissioner of Horticulture, has visited Gridley, Butte City, Hamilton and Chico sections to look into conditions as they relate to Johnson grass, the yellow star thistle and other noxious weeds.

One step towards the eradication of the yellow thistle pest in some sections will be the planting next spring of several hundred acres of sugar beets. The sugar beet is known to be effective in destroying the thistle.

Inspector Frank Reading has just given out the official figures for Imperial Valley for cotton ginned prior to December 1 which shows that the output for the present year was almost double that of 1915 in the valley.

Ranchers in Kings Co. are hard at work preparing for the coming season, which will see approximately 200,000 acres in the lake bottom lands in grain alone. This should give the district under ordinary circumstances more than 5,000,000 bushels.

In the vicinity of Bogue in the Sacramento Valley the pumpkin has been placed on a paying basis. The Libby, McNeill and Libby Co. is operating its canning plant day and night and the growers are being paid \$3 per ton, which averages from \$40 to \$50 per acre.

The big crop of rice grown in the Oakdale district this year is being used to feed poultry and hogs. The rice mills are offering about \$1.75 per hundred for rice this year, while without being hulled or polished it is worth \$2 as chicken and hog feed,

and is thus cheaper than either barley, oats or wheat.

Tulare honey, made from orange and alfalfa blossoms, has been made for account of a San Francisco brokerage firm to the commissary of the British army at Liverpool. This is the first of several such shipments which will be made during the present season.

Two hundred and fifty acres are planted to lettuce in the Fullerton district, according to Arthur Osborne, manager of the vegetable department of the Benchley Fruit Co. The yield per acre is approximately 350 crates, bringing the grower \$175 an acre or 40c a crate.

It is announced from Pomona that men have been sitting up nights to kill bugs in Pomona Valley this month. The Growers' Fumigation and Supply Company of Pomona had eleven fumigation gangs at work in an effort to finish its winter campaign against the scale before the end of the year.

H. J. Stephens, president of the Pacific Rice Growers' Association, advises California rice growers to hold their rice crops, as California rice is the only rice on the market. Rice in the Southern States is practically in the hands of the millers, no independent rice being on the market at the present time, he says.

It is estimated that 150 carloads of beans including blackeyes, Teparys, pink, red Mexican, Navies and Lady Washington will be shipped from the Turlock district this season. The average value of these cars is \$2200, making a total of \$330,000 for the entire crop. Approximately 500 cars of Egyptian corn will be shipped from the Turlock district and will add about \$300,000 to the wealth of the farmers.

Sugar beet growers around Milpitas claim that they have not been getting enough for their beets in the face of the high price of sugar. They want Harris Weinstock, Market Director, to investigate their troubles and see what can be done to improve matters. Allen M. Standish, one of the growers, hoped for a State organization similar to the raisin and prune growers' associations, and steps to that end are now being taken.

The final estimates of this year's production of the country's principal farm crops, announced by the department of agriculture, are: Corn, 2,583,241,000 bushels, compared with 2,732,457,000, the 1910-1914 average; wheat, 639,886,000 bushels, compared with 728,225,000, the five year average; oats, 1,251,992,000 bushels, compared with 1,157,961,000, the 1910-14 average; barley, 180,927,000, against 186,208,000, the 1910-14 average.

All records for value of the country's important farm crops were exceeded this year, despite the smaller size of the crops. Their value has been placed at \$7,641,609,000 by the Department of Agriculture in its final estimates of the year. This is \$1,750,000,000 more than the same crops were worth last year. Higher prices, due partly to reduced production and partly to the demands for

American food from the warring nations of Europe, were responsible for the vast increase in value as against decreased production.

CITRUS, NUTS, SEMI-TROPICAL.

Receipts from the orange groves of Ojai Valley for this season were \$136,850.

The Federal authorities have prohibited the entrance of frosted oranges into interstate commerce.

Shipments of oranges from the Lindsay district up to December 19 were 1200 cars, which is 50 per cent of the crop.

E. B. Collier, well-known fruit man of Corona, has taken the management of the Central Lemon Growers' house at Villa Park.

It is said that the fumigation of Tulare county citrus orchards to control the gray scale during the year 1916 cost the growers \$38,361.

The loss to orange growers in the Fresno section on account of frost will be somewhere between 25 and 50 per cent, according to estimates of growers.

A heavy lemon crop is in view for Santa Barbara Co. this season, according to local fruit dealers. The "snappy" weather has had no effect on the fruit.

One lot of oranges sent from the Hermosa Colony, near Porterville, sold in the Chicago auction at \$4.10 and another lot from the same colony in the Canadian market at \$4.05.

Commission merchants of San Francisco are objecting strenuously to the unloading of cull oranges on the local markets, and several of the houses have refused shipments of this nature.

Growers in the lowlands of the San Joaquin valley were the heaviest losers from the frost this year. The frosts of last October, together with the recent frosts, spoiled practically their entire crop.

The weather has been quite frosty throughout Southern California the past week and smudge pots were lit every night in the orange orchards. So far no serious damage has been done to the growing fruit.

E. P. Rouillard, Co. Horticultural Commissioner of Fresno Co., recommends the local Board of Supervisors to revoke the ordinance enforcing the 8-to-1 test before next year's crop is put on the market.

Orange growers of Fresno Co. claim to have lost in the neighborhood of \$90,000 on the season's orange crop because of the 8-to-1 sugar and acid test, according to C. A. Campbell of the Stewart Fruit Company.

Jeff Walbridge of Orchard Dale, near Whittier, is growing successfully the thin-skin variety of a Mexican seedling avocado. It is of medium size, skin deep purple, seed small, and pulp delicious, and free from strings.

All the fourteen big packing houses of Lindsay have announced that they will resume packing operations soon after the holidays and that from present indications the season will be extended for six weeks after the resumption of work.

Most of the orange crop in Orange Blossom Colony was ruined by the killing frost when the thermometer dropped as low as 22 degrees, according to the Oakdale Graphic. Part of the oranges already had been picked and shipped, so the season is not a total loss.

The Pasadena Orange Growers' Association reported unusual heavy shipments of navel oranges for the Eastern Christmas trade. The Sparr Fruit Company, the only independent concern operating in Pasadena district, made the heaviest early shipments in years.

More than 200,000 select fruit-bearing buds from citrus trees with known performance records have been placed in the hands of co-operators of the Bureau of Plant Industry of the United States Department of Agriculture, who are to per-

mit the Department to secure progeny records from the trees so propagated.

The first dividend on Pool No. 1 has been received by members of the Butte County Citrus Association, netting the growers \$2.64 a box for navel oranges. The selling price, f. o. b. at Oroville, was \$3.16 a box, from which was deducted 52c for packing and selling.

The orange shipments from the Redlands district up to December 15 reached 296 cars, compared with 82 cars last year. The tests made by the various packing houses of Redlands show that practically all of the fruit in the district that is well colored will pass the 8-to-1 test.

Basing their statements on total acreage of fruit signed up at the beginning of the year, and figuring from shipments which have been made to date, Porterville packing house managers declare that not more than 6 or 7 per cent of the oranges of the Porterville district were damaged in the frosts.

A meeting was held recently in Riverside of committeemen representing eight southern counties of California urging on the Southern California legislators preparation and support of a bill for an appropriation of \$500,000 for the establishment of a farm school in connection with the State Citrus Experiment station.

C. W. Buswell of the Sunnyside section, near Porterville, is another who has demonstrated the value of orchard heaters. During the recent cold snap Mr. Buswell kept smudge pots burning near his lemon trees which are carrying a crop of 5,000 or 6,000 boxes, the result being that he was able to keep the temperature above the freezing point. Had it not been for the pots Mr. Buswell believes that his crop would have been frozen.

C. M. Brown of the Golding Banner Packing House, Redlands, says the 8-to-1 test is not fair. The fruit that was well colored tested over 15 per cent of sugar, but had enough acid to make it impossible to pass the 8-to-1 test, the ratio being about 7.22 to 1. The tests were made by Homer P. D. Kingsbury and Mont. P. Chubb, both chemists. The fruit that was not colored had about 9 per cent of sugar and only a small amount of acid, it passing the test by 9.15 to 1. Mr. Kingsbury tested fruit for all parts of the district and several samples from each grove to show that the 8-to-1 test could not be adopted without testing all the fruit packed, which would be impossible.

DECIDUOUS FRUITS.

Recent estimates place the unsold supply of prunes in California at 10,000 tons.

The Sebastopol Berry Growers made a payment of \$10 per ton on berries of the 1916 crop this week.

It is announced from Bryn Mawr that the deciduous fruit crop promises to be the biggest next summer for some years.

Circular containing 100 mechanical movements mailed free.

Over \$89,000 in net proceeds and dividends were paid to its growers this season by the Penryn Fruit Growers' Association.

A most successful meeting of the Prune and Apricot Growers' Association took place recently at Oakley, Contra Costa county, at which all of those present signed, or had signed, the merger agreement.

Two hundred and fifty-five acres at Ramada are to be planted this season to prunes alone, according to a statement made by Butte County Horticultural Commissioner Earle Mills. There will also be considerable planting to almonds and figs, he says.

F. H. Dietrich, representative of the California Prune Growers' Association, has been in Yolo county explaining the plans of a co-operative system of marketing. It is said 45 per cent of the State crop is in a pool and that 70 per cent will make an "air-tight" market.

Reports from 450 cold storage plants in the United States show that their rooms contain 2,603,584 barrels and 3,913,290 boxes of apples. On Dec. 1, 1915, holdings by cold storage plants were 4,213,202 barrels and 3,684,557 boxes. Apples are moving out of cold storage in San Francisco at the rate of two carloads per day.

GRAPES.

The Acampo Fruit Growers' Association shipped 52 cars of grapes on which they averaged \$1,308.84 per car this season.

Checks for 8 per cent dividend on the capital stock of the California Associated Raisin Company have been mailed to about 3700 stockholders. The dividend will amount to about \$80,000. Last year it was 6 per cent.

Table grape growers in the Alta district near Dinuba says the past season was the most profitable in the history of the industry. Carrah Brothers are said to have marketed from their eighteen-acre vineyard, half in Malagas and half in Emperors, \$9,000 worth of grapes.

An option has been taken on the Ripperdan ranch, lying south of Madera and consisting of 1600 acres. The prospective buyer is Krikor Arakelian, the reputed cantaloupe king of California. It is understood the property will be improved at once, and 160 acres planted to Thompson seedless grapes and the balance cultivated the following year.

Special Agent Webster of the Department of Justice, who has had personal charge of the local Federal inquiry into the high cost of living, has turned over to the United States district attorney his findings in connection with the so-called "raisin trust," that has headquarters in Fresno. The investigation in this section of the country was largely confined to looking for possible violations of the Sherman anti-trust law.

THE RAINS IN SOUTHERN CALIFORNIA.

The whole of Southern California has been drenched the past week by the heaviest December rain in many years. The storm ceased Sunday night, giving us a bright, clear day for Christmas. Showers were again had, however, on Tuesday. The rain was a gentle one, and will do much good to put the soil in excellent condition for spring work, and adds an inch more water to the subterranean channels than usual this time of year. The precipitation from the first rain was (at Los Angeles) 2.52 inches, and for the season 6.81 inches, against 3.21 inches the same time last year. At Glendora the rainfall was 4.05 inches, and for the season 11.01 inches, against 6.02 inches the same time last year; at Covina this storm was 2.78 inches; for the season 8.55 inches; Riverside this storm, .90 inches, for the season 3.56 inches, and the same time last season 2.86 inches; Santa Ana, this storm 2.25 inches, for the season 5.75 inches, and the same time last season 3.14 inches.

We manufacture levelers for all sizes of tractors

A Schmeiser Giant Leveler will Work Wonders on Your Farm

MOVING IMMENSE AMOUNTS OF DIRT DAILY, and working on ground too tough for horses and Fresnoes to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success on the larger ranches of California, saving their owners time, labor and money.

Three Sizes—"Giant," "Junior," "Midget"

SCHMEISER "GIANT" LEVELER — Bucket 11 feet wide, 3 feet high, 4 feet sides; capacity of 3.5 cubic yards. With 2 men and tractor does the work of 9 men and 36 horses with Fresnoes. Price, f. o. b. Davis, Calif., \$900

SCHMEISER "JUNIOR" LEVELER — Bucket, 8 ft., wide, 3 ft. high, 3 1/2 ft. sides; capacity 2.43 yards. Price, f. o. b. Davis, Calif., \$650

SEND TODAY FOR FULL INFORMATION.

Schmeiser Manufacturing Co. 12 MECHANIC ST., DAVIS, CALIFORNIA

Economical!

The BEAN is an economical sprayer. It will do more work, cover more ground, and spray more trees in a given time than any other sprayer of approximately the same size and horse-power. This holds true for all

BEAN Power Sprayers

The chief difference between the various Bean outfits is in size and capacity. BEAN economy is the result of —**BEAN PATENTED PRESSURE REGULATOR**, which saves one-third the gasoline and wear and tear on engine and pump. When spraying the overflow simply runs back into the tank under no pressure (not through a safety valve under full pressure), as in all other types of control. When not spraying the engine runs free.

—**BEAN PUMP WITHOUT STUFFING-BOX**. This pump is made with molded cup-shaped plunger and on the upstroke when there is no pressure there is no friction. Power saved is money saved.

—**UNDERNEATH SUCTION**, which enables pump to throw considerable more liquid with same power.

—**DIRECT CONNECTED ENGINE AND PUMP**, which eliminates the loss of power that results from the use of a belt.

There are other economy features, also, described in our catalog

See your nearest Bean dealer—or mail the coupon at once.

Livestock Facts and Fancies---XIV.

[By the Editor.]

Rumination upon the suggestion made in this place last week, that there should be recognized by our great California cities an obligation to contribute more definitely and directly to the building up of the State's industries by substantial contributions to the advancement of our livestock interests, certain practical points arise which seem worthy of consideration. Obviously there are two directions in which progress should be striven for.

First and fundamental is the placing within reach of our farmers a better supply of purebred sires of all desirable classes of farm stock. We are not attacking that problem in the right way in California. We have already intimated that we had such a conviction, and we may have more to say about it at another time, but we will not pursue it now. The fact remains that we have not an adequate supply of purebred sires. Take, for example, Shorthorns, for the breeders of them have most recently moved toward broader, organized, co-operative effort. It was stated at the meeting, to which we alluded last week, that one could not find a hundred Shorthorn bulls of the right age and quality purchasable in this State at this moment. This forces owners of large herds to buy bulls by the carload in the Middle West or eastward, at considerable cost and some risk, and sends all that money to build up the pure-breeding interests of distant states. Probably there are other breeds which are just as short in the locally grown supply of that great agency toward the improvement of our whole animal product—the purebred sire. It requires enthusiastic interest and confidence, capital and publicity effort to make our California sire-supply adequate and adequately recognized and patronized. The average farmer, no matter how enthusiastic and experienced he may be, cannot accomplish all this. He needs capital, alert business promotion and responsive public interest. These are the things which city land owners and money investors are best equipped to accomplish for the State and for their own better health and broader citizenship.

Second: the effort for the upbuilding of our pure-bred interests on the business side, should be given an institutional character. Things are now going, as never before, by organization, and the fruit of organized effort is an institution. California is now shining in the eyes of the other States as the land par excellence of organization and of incorporation for great and specific purposes. We are making corporations of our own in the public interest and

we are regulating corporations organized for private purposes, to an extent unknown in other states. Public utility corporations, protective corporations of producers to regulate produce distribution and hosts of other organized efforts to keep the sky blue and trespassers off the grass, are thriving in this State and bringing us either reputation or notoriety, according as one likes them or not. We will not rise to a question of taste, but it is clear enough that these institution-building forces are very influential in the common life of the State and their efficiency as compared with unorganized individual efforts, even if they proceed from the same convictions toward the same purposes, is indisputable.

Third: in the advancement of the livestock industries of California we have just scored grandly in one line of institutional achievement—the educational. By virtue of its deeds the animal industry division of the College of Agriculture has arrived at a condition needing neither apology or promotion. It will need funds for fuller equipment and extension of its influences, and it will always need funds. We have an idea that the University Farm needs new and fuller equipment for research, instruction and demonstration in livestock lines. We believe it needs stock farms in different sections operated with animals belonging to special lines which different geographical districts particularly favor—practically operated stock farms to which groups of graduated students can go for training by actual participation in producing operations. In this way it may in due time have farms on which range work, herd work, flock work, etc., will be provided for as finishing courses in practical operation. We do not need to worry about that now. We may accept the fact that institutional work on the educational side has arrived in California and will show the force needed for its enrichment and extension.

Fourth: passing this point, what then do we need of an institutional kind for the advancement of the animal industries in California? Many things, perhaps, but we think of two which are so fundamental and indispensable that if they are successfully provided their operation is likely to bring the fulfillment of all other needs in their train:

One is the establishment and maintenance of an open livestock selling institution in San Francisco. We do not say that open livestock markets are not needed at all central points. If so they will come as soon as we have broken down the barriers of blind-selling which now exist

and which make it impossible to tell what a carload of any stock is actually worth or what it can be calculated to sell for on its merits at any time. Published market figures are opinions, not facts, and these opinions too often represent what buyers desire to buy for rather than what they are actually willing to pay. Possibly they are sometimes put forth to smooth the pathway of the traveling buyer into the affections of the country seller. But we do not need to inflame the subject. Country sellers know how it is and language about it which would represent their feelings might set this sheet on fire. Every one knows we cannot get livestock producing anywhere near its duty and opportunity in this State without some sort of an institutional selling outfit which will be open, fair and clearly intelligible to all interested in buying and selling.

The second institution which is indispensable, and which would naturally associate itself more or less with the first, is a regularly established institution for exhibition and sale of breeding stock. It must be an annual stock show in San Francisco where all ways meet and where all people come and where prizes are hung up largely and freely so that breeders and feeders will be justified in going to effort and expense to do their best for public education and entertainment. This sort of thing San Francisco must provide, equip and endow or hang her head in shame for inability to hold her own against the greater enterprise and patriotism of smaller towns along the coast. Will San Francisco give the livestock industry such an institution as it needs and which she herself cannot afford to withhold?

In addition to great local institutions in the livestock interest which shall lead and command the California field of production we need

an effort on the part of all local organizations, small and great, to put us in the sphere of influence of national organizations. We need at this moment to catch onto the movement started by the "National Conference on Marketing and Farm Credits" held in Chicago December 4 to 9 ult., which made this declaration:

We earnestly urge upon Congress the imperative need of a prompt and thorough investigation by the Federal Trade Commission (assisted by the Department of Agriculture) of the marketing of livestock and the meat packing industries in this and other countries. We urge that this investigation be followed by a report with constructive recommendations for the improvement of the conditions and methods under which livestock is marketed, and the products thereof manufactured, distributed and sold.

Such an investigation will show us what is the matter with our stock selling and how conditions may be improved.

CALIFORNIA Hog Book

A Practical Treatise on Hog Raising in California

By W. S. Guilford,
Director of Agriculture, Sacramento Valley Irrigation Company and a practical swine breeder.

First Edition—1916
256 pages of text; 31 pages half-tone engravings, besides line cuts. Cloth bound.

The author has had large personal experience in hog breeding, besides the opportunity of observing many plants in this and other States. He has brought together a wealth of practical and scientific information concerning the hog, its anatomy, the breeding, feeding, marketing, as well as diseases and remedies.

Price, \$2.00 per Copy, Postpaid.

RICE FOR STOCK AND POULTRY.

To all our friends who read Mr. Barnard's rice communication recently, Greeting: Rice for feed seems unavailable. The \$5 price in the communication was a typographical error. It should have been \$35. But we find that San Francisco mills have sold themselves out of cracked rice at \$40 to \$50 per ton; though more may be available early in 1917. Rice bran may be had at \$25 per ton. Its composition is about 5.3 per cent digestible protein, 45 per cent carbohydrates and 7 per cent fats, varying according to who puts it up.

Finding the Good Cows by Testing.

[Written for Pacific Rural Press.]

If one could compile all of the surprises that are met in weighing and testing the milk of dairy cows, he would have a book full of facts so convincing in character as to convert the most skeptical dairymen into seeing the need for cow-testing work.

It surely does seem strange that dairy cow owners will hatch up so many excuses for not weighing and testing the milk of their cows when they alone are to be the benefactors.

Just as an example of the early returns that are sometimes encountered, the story of the Riverina Farms' first month's experience in the Stanislaus County Cow Testing Ass'n is of interest.

The herd of 25 grade cows had recently been purchased at a surprisingly low figure when they were put on test for the first month. In the lot was a slab-sided cow, lacking most of the points that a good cow is supposed to possess, and giving a stingy mess of milk.

It had been agreed before the tester arrived that this cow would be sold regardless of price, but the matter had been delayed. What, then, was the surprise when this supposed boarder showed by the scales and test a daily production of .95 pounds of butterfat, a trifle under the average for the herd, which was .97 pounds daily. Needless to say she will be kept in the herd as long as she can keep up that pace, whether she is nice to look at or not.

The experience demonstrates the old saying that testing, not only shows the culls in the herd but the good cows as well. In this case the finding of this one producer paid for the Association's yearly charge on the entire herd, for she would doubtless have been sold for considerably less than her worth.

The Gotschall Cattle Company of Ripon announces a sale of high grade Holstein cows, 175 in number, at Ripon, January 11th.

HOW THE GRAND CHAMPION STEER WAS FED.

Written for Pacific Rural Press by Prof. Gordon H. True, Head of the Animal Husbandry Department, University of California.

In response to the request for a statement of the feeding of the University of California show steers at Chicago, the following may be said:

The cost of fitting steers for show is a regularly outlined project of investigation in the Division of Animal Husbandry. All feed is regularly weighed, and weights recorded, so that it is possible to report to the last pound.

The grain mixture regularly fed to show steers at the Farm consists of two to three parts of barley to one each of oats and bran and one-fourth of a part of oil meal. At such times as the steers are supposed to be on full feed this mixture is moistened with hot water in which molasses forms a part, in the proportions of about six pounds to sixty-five pounds of grain.

California Favorite.—Of these various ingredients California Favorite, the Grand Champion, ate the following:

865 lbs.	barley
272 "	oats
238 "	bran
60 "	linseed oil meal
22 "	molasses
140 "	sorghum silage
530 "	hay
2240 "	green feed other than pasture.

This was in addition to the milk of one cow, the cost of feeding which, as well as the cost of a year's maintenance of his dam, is charged against the calf. This makes the feed-cost of producing the calf amount to \$77.98, or an average of 7.35 cents a pound—at war prices for feed.

University of California Jock, the two-year-old Angus steer, was not shown as a calf. His mother was a good milker and it was for only a short time that he and another calf had a nurse cow between them. He was fed for the Panama-Pacific International Exposition from some time in March, being fed four times a day until a few days before the show. During this period he had some 277 pounds of corn, all the corn he ever saw. Between showing at San Francisco in October and Portland in December, he was fed only three times a day, and after Portland only twice a day, until about a month before the State Fair at Sacramento in early September.

During his nearly three years of life, Jock ate 7603 pounds of grain, his total feed cost being \$161.23, an average of 9 cents a pound and an average daily gain of 1.7 pound.

The one ingredient entering into the making of the grand champion to which it is difficult to assign a definite value in terms of dollars and cents, is the infinite care and skill with which Herdsman McDonald used the materials put into his hands. Someone has said, "The Scotch brains have formed the most important ingredients in the feed of the great show herds." 'Tis an old German adage, "The eye of the master fattens his cattle." Science has taught much of the principles underlying successful stock feeding, but the supreme art of producing the finished bullock must be learned from the man who lives with and loves his beasts. The road by which the feeder and his student come into their own is the long road of experience.

REMCO Air-Dried Redwood

PIPE For Irrigation—Water Supply—Power. Sizes 8 inches to 12 feet. For pressure up to 400 feet head. Guaranteed for 100 per cent overload. Costs less than any other pipe of equal capacity, efficiency and endurance. Not affected by worms or insects, acid or alkaline soils, electrolysis or roots. Withstands extremes of heat and cold, dryness and moisture. Outlasts any pipe except cast iron, and maintains its full flow capacity to the end.

TANKS For Water—Wine—Vinegar—Oil—Acids—Solutions. For Storage—Mixing—Fermenting—Pickling—Leaching. In all shapes and sizes—500 to 650,000 gallons.

SILOS For Dairymen—Stockmen—Feeders. Sizes, 25 tons to 300 tons. The STANDARD.

ALL REMCO PRODUCTS are manufactured to your order from CLEAR, AIR-DRIED REDWOOD. Selected from our stock of forty million feet. Their outstanding features are HIGHEST GRADE MATERIAL, SUPERIOR EFFICIENCY, MECHANICAL PERFECTION, MAXIMUM DURABILITY.

Sold direct to users. Catalogs sent on request.

Caring for Sows at Farrowing Time.

[Written for Pacific Rural Press by R. H. Whitten, North Glendale.]

[In a separate communication from the following, Mr. Whitten states that the worth of the following methods is proved by the fact that 32 sows, which farrowed during September, October, and November, farrowed 311 pigs, an average of nearly 10 to the litter, which is exceptionally good considering that about one-third were gilts with their first litters. Not a pig was born dead and only one deformed. They raised 281 pigs, or over 90 per cent of all that were farrowed. To some, his method may seem to entail a lot of labor, but labor in this case seems to be more than compensated by additional numbers of pigs raised.—Eds.]

Before Farrowing.—Put the sow in her farrowing pen 3 or 4 days before farrowing, to get her accustomed to her new surroundings. Have pen cleaned and disinfected, and put in fresh bedding. Keep it clean and dry. Wet bedding will cause scours in pigs.

For 48 hours before farrowing, give all the water she wants, but feed lightly, so as not to force too much milk into the udder. If there is more than the pigs can take at the start the udder is liable to cake and cause scours in the pigs, and perhaps death.

The skim milk slop should depend upon the condition of the sow. If her bowels are loose, use mostly shorts; if she is constipated and feverish, use mostly bran—two parts of one or the other to one of ground barley—one part of this dry mixture to three of skim milk.

While the sow is in the farrowing pen, before she farrows, pet and scratch her, and get her to know that you will not hurt her.

At Farrowing.—Be on hand when she farrows, which will generally be 5 to 10 hours after she makes her nest, and as the pigs come take each one away from her, dry it with a cloth, and put it in a box or barrel with clean bedding in the bottom, and with sides high enough to afford protection from the wind. In cold weather, fill a jug with hot water, wrap a sack around it and put it in the middle of the box or barrel.

As you dry them, notch their ears, as a cut made at this time will not bleed. Make the cut about half as big as a pea. It gets larger as the pig grows.

Also, at this time clip the black teeth. They should be snapped off, and not pulled out. This prevents them from starting canker sore mouth and from injuring themselves in fighting, and it keeps the sow from rolling over on her belly and refusing to allow them to suck.

After all are farrowed, place them at teats and see that each one sucks good. Watch carefully for 24 hours. After that, they will learn to get out of the way of the sow.

At farrowing time remove the cold water, and keep it away for 24 hours. Put lukewarm water before her after she finishes, and give her nothing more for 24 hours. The lack of food will help to keep the fever down.

After Farrowing.—After 24 hours give a light slop of skim milk and shorts or bran, according to the

condition of her bowels. Make it thin and feed her lightly.

On the second day begin the regular slop for nursing pigs, but start with a small amount and increase very gradually, allowing 10 days to reach the full feed. This is to retard the flow of milk and prevent it from being too rich until the pigs are old and strong enough to take it all. Too much and too rich milk at the start will result in fever and caked bag in the sow, and scours, thumps, and death to the pigs. The third day after farrowing is the critical period, and until that time is past, watch the effects of the feeding very carefully.

After the sow has reached full feed, she should be given enough so that the pigs have all they want, yet no milk is left in the udder.

If the pigs all nurse well and then lie quietly and sleep, they are getting just enough. But if they keep sucking away at the sow and squeal, and their hair stands up, the sow needs more milk-forming food. If the udder is inflamed, bathe it freely with hot water, and rub it well.

Exercise is very essential, and just as soon as the pigs are strong enough to move around, little holes should be made leading to the alley. Unfold newspapers and scatter them along the alley. The pigs will come out and get exercise tearing up the papers and fighting among themselves, as well as amusing the on-lookers. Exercise is the best cure for thumps in young pigs.

It is important to get the sow and pigs out on pasture as quickly as possible. This should be done in two weeks if the weather is favorable—if not, then just as soon thereafter as is possible.

When the pigs are three weeks old, start them on grain slop in their creep. Begin gradually, but after they get used to it, feed all they will clean up readily. Do not allow any feed to get sour and contaminated.

The boar pigs that are not to be kept for breeders should be cut either two weeks before weaning or two weeks afterwards. To do it at weaning time gives them too much of a setback.

If the sow is to be bred right away for another litter, the pigs should be weaned at 8 weeks; otherwise they may remain with her for 10 or 12 weeks.

Weaning.—At weaning time, reduce the sow's feed and give her dry stuff, so as to check the flow of milk. Take the larger pigs away and do not return them at all. Leave the smallest two for a couple of days, then only one for two or three days more, by which time the flow of milk will have been so gradually diminished that no injury will result to the sow, and her udder will be in perfect condition for the next litter. Also the extra supply of milk will push the smaller pigs along, and enable them to catch up with their mates. Be sure to see that the sow's udder is dried up properly.

As soon as her udder has dried up, feed the same ration as for growing gilts, but grain her heavily until she is back to full flesh, as

she will probably be thin from nursing her pigs. This is so as to have her in good condition for breeding. A sow in full muscular flesh (not fat) will breed more quickly and have a larger litter than a thin sow.

After she is bred she should be put on a half grain ration for 60 days, if she is in proper flesh. If not, continue the full ration until she is. Then keep her on a half ration until 6 to 8 weeks before farrowing, when the grain ration should be increased to three-fourths the

regular, in order to furnish sufficient nourishment for the rapidly developing pigs.

But watch carefully and see that she grows in muscle, not fat. If she gets overfat, reduce the amount of grain, or omit it entirely, as may seem necessary to keep her in proper condition.

Two weeks before farrowing, reduce the feed, and continue with this reduced amount until 48 hours before farrowing, when treat as already directed.

Culling Purebred Hogs.

[Written for Pacific Rural Press.]

Not all purebred hogs are sufficiently representative of their breed to warrant their sale for breeding purposes in the opinion of E. B. Ballis, Farm Superintendent of the Whittier State School of Los Angeles county, where a herd of Berkshire hogs have been maintained for a number of years.

Here two cullings are made of every litter regardless of their breeding: one when the pigs are three months old, and another when they are five months old.

Those that do not successfully pass this culling process are by no means a loss to the school. In fact they are put right into the fattening pens where they are swill-fed on concrete floors till seven or eight months of age when they weigh between 170 and 180 pounds. They are then butchered to supply the school with fresh pork.

As a result of this culling practice, every hog that goes out as a breeder from the establishment is a good representative of the breed and pretty certain to prove satisfactory to the grade hog raiser as a herd sire.

Overfeeding and irregular feeding is the cause of more sickness among horses than any other known cause. The stomach of the horse is so exceedingly small compared to his size that he should be fed and watered at least three times per day, the capacity of the horse's stomach being 18 pints. The capacity of a cow's stomach is 52 gallons.

HOLSTEIN CATTLE

\$123,000 has been expended in the past eight years, by the Holstein-Friesian Association of America, in advertising the merits of the great "Black and White" breed. To the farmer who owns Holstein cattle, this far reaching publicity work is a positive benefit. The continually increasing interest in Holstein cattle throughout America makes for an advance in value, and the breeder of Holstein cattle, wherever he may be, reaps greater profits on the rising market prices of his stock. Look Out for Infected Cows.

[Written for Pacific Rural Press.]

The selling of tubercular dairy cows to unsuspecting dairymen in other districts would seem to be a practice that no self-respecting man would engage in; but reports at hand from various parts of the State indicate that such business tactics are being pursued by some.

A case in point was related to us last week by a dairyman in Stanislaus county who had purchased a registered cow for \$200. This was one of a carload shipment of cows from a distant county, made by supposedly reliable parties.

When tested by a competent veterinarian, some two months after the purchase, she was found to have tuberculosis in its advanced stages and was later killed. Others in the shipment met a like fate, the sellers

in the meantime having gone home. The matter was taken up with them, but as there had been no written or verbal guarantee, the buyers were compelled to stand the loss.

Dr. Chas. Keane has recently directed attention to the illegal practice of selling dairy cows that have reacted, when tested by the State; but as there is no provision in the law to brand or otherwise identify these reactors, it is very easy for unscrupulous parties to buy them up for sale in other communities.

While there may be danger of having too many laws, some form of protection should be afforded dairy cow buyers. In the lack of such laws everyone should make it a point to "look out for tubercular cow peddlers."

Test Cows or Pasteurize Milk.

To the Editor: I have been in the dairy business for 11 years; and for the last 8 years have had my herd tested every year, as I also did this year in August. Now the State Dairy Inspector was here and says I have to have the State Veterinarian test them with what they call the "tail test." Can they force that tail test on my cows which have already been tested and passed?—J. B., Menlo Park.

It makes no difference how many times your cows have been tested, they must be tested again under the new law by the State Veterinarian or his deputy, free of charge.

He gives what you call "the tail test" because he believes it more certain to tell the truth because the temperature test may be influenced by nervousness of the cow. It also takes less time.

They can either force the tail test on your cows or force you to pasteurize all milk that is sold for direct consumption. If it is sold or used for butter making, it doesn't come under the law, due to a technical error in the heading of the bill, but this is likely to be amended at the next session.

ALKALI WATER REDUCES MILK FLOW.

To the Editor: A while back I came to this part of the country with a bunch of A No. 1 grade cows, that averaged 1 to 1½ pounds of butterfat per day. Since coming here, the same cows, with the same care, do not make half a pound average a day. Instead of four to six gallons of milk a day to the cow, they run two to three per cow. Been fresh two to five months. They have always been used to good water to drink, but down here the water is strong with alkali. Will alkali water cause cows to go dry? These cows, when fresh, milk their full flow, but in two months they commence to drop.—C. J. F., Riverdale.

[Answered by Geo. T. Farmer, Hanford]

The trouble is very likely alkali water, which often affects the milk flow very materially especially in warm weather, when, if stagnant, it is dangerous to the health of the stock. But if the cows have come from the northern part of the Valley, they will likely improve in another year.

GRIND OR SOAK GRAIN FOR HOGS.

To the Editor: Is it better to fatten hogs with dry grain or to soak it up? Is Egyptian corn more fattening than barley?—R. C., San Jose.

When you feed dry grain, you will see some of it coming through whole. This may not be wasted, but shows it is harder to chew and digest. Since digestion is what makes a hog valuable, it is most economical to feed it the most digestible foods in the most digestible form, up to the point where cost becomes prohibitive. It has been shown by repeated

and numerous experiences of California farmers that soaked or ground grain is more economical to feed good hogs, than dry or whole grain. Egyptian corn and barley are of about equal value in fattening hogs.

CALIFORNIA WOOL GROWERS TO MEET.

[Written for Pacific Rural Press.]

We are informed by Fred A. Ellenwood, Secretary of the California Wool Growers' Ass'n, that the annual meeting of that association will be held at the University Farm, Davis, January 5-6.

Besides the business meeting of the association there will be special addresses and demonstrations on subjects, such as carcass, docking, shearing, and dipping, report and inspection of a test in fattening old ewes for market which has been under way at the University Farm, and a comparison of different methods. A banquet will be given at the University Farm the first night and a general good time promised to all who attend.

MILKING SHORTHORN IMPORTATION.

Alexander and Kellogg of Suisun inform us that their importation of English Milking Shorthorns arrived in Suisun Dec. 17, consisting of six young cows, six heifers, one bull and four calves. The cattle were selected with great care by Frank Peer, the importer, and are from the best Milking Shorthorn herds in England. All six cows have good milk records, a five-year-old having a record of 9,952 lbs., and a four-year-old having a record of 8,360 lbs. with first calf. They are large-framed cows, showing beef as well as milk; all from the north of England with the exception of the bull and

INDISPUTABLE PROOF OF DE LAVAL CREAM SEPARATOR SUPERIORITY

SINCE 1892 the National Buttermakers' Association has held butter scoring contests each year in connection with its Annual Convention; and at every such Convention, butter made from cream separated by a De Laval Separator has scored highest. This is a 100 per cent record for the De Laval. Twenty-three wins out of twenty-three contests. No room for chance there. Only unusual merit made such a record possible.

But that is not an unusual record for the De Laval. At the great National Dairy Show at Springfield, Mass., in October, 1916, butter made from De Laval-produced cream scored highest in both the creamery and dairy classes, while De Laval cream scored highest in the cream classes.

The juries at the great national and international expositions have invariably acknowledged the superiority of the De Laval. They awarded the Grand Prize to the De Laval at the Panama-Pacific Exposition, as also at Buffalo, Chicago, St. Louis, Paris, Brussels, and all the great world expositions for 25 years.

As a matter of fact, it is very easy to prove De Laval superiority. All that is needed is a careful comparison with any other machine, either as to design and construction, or, more important still, as to performance. But such proof is no longer necessary to a well-informed dairyman or farmer. He has seen proof of De Laval superiority piled up and multiplied so many times that it is no longer open to question by anyone. It is an accepted fact.

If you are without a cream separator, or need a new one, the only question you need to ask is, "Which is the proper size De Laval for me to buy?"

See your De Laval agent immediately, or, if you don't know him, address the nearest De Laval main office as below for any desired particulars.

De Laval Dairy Supply Co.

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST. We specialize in Alpha Gasoline and Distillate Engines, Ideal Green Feed Silos, Irrigation Equipment, Centrifugal and Deep Well Pumps and Alpha Spraying Outfits. Send for special catalog.

SAN FRANCISCO,

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER.

two heifers. In his description of them Mr. Peer writes: "These North country animals have had no special care of feeding to enable them to produce big records. Most of the records are made on grass alone. They are to the dairy born, tough and hardy, can stand hard work, are good and know how to grub for a living. They will improve with any kind of a fair chance and treatment."

The bull, Kelmscott Viscount 19th, is from the famous herd of R. W. Hobbs Sons and is a fine type of the Dairy Shorthorn bull, with good back and spring of ribs. He is splendidly bred, his pedigree showing large milk records back for several generations on both sides.

Sheep raisers from all sections of California have signified their intention to attend the eighth annual convention of the California Sheep and Wool Growers' Association which will be held at the University Farm at Davis, Jan. 5 and 6, 1917. Rapidly changing conditions in the sheep industry in California are compelling attention just at present and it is desired to get as representative a delegation at Davis as possible, in order that conditions in all sections of the State may be learned.

Some of the causes in animals of colic are overloading the stomach, dirty alimentary matters, retention and hardening of excrementitious matters, calculi and concretions, intestinal worms, prolonged fast, unusual movements (rolling on the back when cast), retention of urine

"Selecting and Developing the Jersey Herd"

Is a booklet by Prof. Hugh G. Van Pelt. It tells how you can build a well-developed, money-making Jersey herd by proper selection and judicious breeding. The future of your dairy herd depends upon how you select your foundation animals and how they and their offspring are developed. The Jersey cow combines beauty with dairy conformation. Healthy, vigorous and profit-producing, she lifts the mortgages and increases bank accounts. Send for book today.

Nevada Hog Growers Ship Together.

[Written for Pacific Rural Press by L. E. Cline, Fallon, Nev.]

I was much interested in the contributed article entitled, "Marketing His Own Hogs," in the issue of December 16th. It will have to be admitted that too large a proportion of the farmer's time and attention is devoted to the production of farm crops and far too little time to the marketing of the same. It is not uncommon to see a speculator come into a farming community and buy up some line of produce, hold it a short time, and make more net profit than the producer who grew the crops. The farmer has himself to blame for such occurrences. He must be a student of markets as well as of production, if he is to reap the reward of his own labor and investment. As mentioned in the article referred to, Mr. Peters of Bakersfield had the initiative to take his own hogs to market and by so doing received \$100 more than a speculator would pay, but a man with less than a car of hogs will probably say that he is at the mercy of the local hog dealer, because he cannot ship and pay local freight rates to market. For the benefit of those who grow hogs on a small scale, the method of co-operative marketing of hogs from the Truckee-Carson Project, Fallon, Nevada, may be of interest. Farmers desiring to market hogs from one up to a carload are able to dispose of them at actual Pacific Coast market quotations less shipping expenses. It might be of interest at this point to state that 200-pound hogs such as were marketed in the article mentioned and which netted the owner 8c, would have netted the Truckee-Carson farmer 8 1/4 to 8 1/2 cents with a \$62 rate and 9 1/2c per pound quotation

in San Francisco, which has been received this month.

Under the co-operative marketing of hogs from this locality, each consignee reports to the writer the number of hogs to be shipped, and the date on which they will be ready for shipment. When a sufficient number has been reported as being ready for a certain date, the owners are notified to bring in their hogs. Each owner's hogs are given a mark for identification at the selling point. This mark is made by blazing a spot on right or left ham, right or left shoulder, back or side, etc., by means of barber's clippers or horse clippers. One of the consignors accompanies the shipment to market, carrying with him the identification and inventory. At the market the hogs are unloaded, graded and weighed, each lot being sold independently. The expenses of the caretaker are added to the freight bill, and the whole apportioned among the shippers by the purchaser and deducted from each shipper's check according to the weight of hogs consigned. In this way, the purchaser deals directly with each consignee, the shippers having simply co-operated in purchasing car space for making the shipment of their respective consignments.

Since all shipments so far have been consigned directly to the packing house, the freight charges have been charged to them, thus simplifying the operation for the shippers. All checks are mailed directly to the shippers. This method of marketing has been a great relief for farmers in this section far from market, and might with profit be introduced into any community.

amount of protein, carbohydrates and fat in cocoanut meal and its feeding value for hogs.—R. W. Stockton.

Digestible nutrients per 100 pounds: 18 pounds crude protein; 39.8 carbohydrates; 12.6 fat. This is an average sample. The value in fats depends largely on how well the cocoanut cake has been pressed for the oil of which it is a by-product. It is not generally used for hogs, though it has been found satisfactory in Europe for them. Cocoanut meal should not comprise over one-third the concentrate ration. It turns rancid quickly in hot weather and should not be fed in that condition.

Spokane Seed Co., Spokane, Wash.

The Value of Silage.

Dairymen who are feeding silage for the first time this winter are in a better position to realize its merits than those who have used it in recent years, on account of the ruling high prices of feedstuffs at the present time.

The thought is sometimes expressed that we are experiencing a silo fad which will run its course in a short time, but progressive dairymen have come to realize that the silo is an economic necessity where the greatest possible financial gain is the chief consideration.

A compilation of this year's experiences would be of interest just as the following one of A. W. Morris and Sons, with their large herd of registered Holsteins in Yolo county.

Besides the cows which they have on official test most of the time, they milk large numbers of cows in their regular strings. Some of these are in preparation for official work, others have completed weekly or monthly tests and still others with records already made in previous years are kept in the milking strings for their milk and calves without regard to present or future official work.

All are handled in the same manner that any ordinary grade herd would be, except that alfalfa hay is supplemented with other feeds. The supplementary feeds usually com-

prise some grain or mill feeds, silage, and in times past beets, but this year, on account of the high price of mill feeds, the entire ration has been made up of corn silage and alfalfa; and it is the conclusion of Frank Morris that this ration is not only by far the most economical, but that it also holds the milk flow up to the maximum. In fact he believes it worth almost as much as alfalfa, inasmuch as three parts of silage will replace two parts of hay and also increase the milk flow.

COCOANUT MEAL FOR HOGS.

To the Editor: Please tell me the

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Nat'l Promotion for Wool and Mutton.

[Written for Pacific Rural Press.]

The first organized effort at sheep promotion work embracing all of the various interests dependent upon wool was started at the Sheep Conference held at Philadelphia, November 23 and 24, under the auspices of the Wool and Textile Ass'n and participated in by farmers, wool-growers, representatives of the U. S. Dept. of Agriculture, various State Depts. of Agriculture, agricultural colleges, wool merchants, woolen and worsted manufacturers, railways, bankers, wholesale and retail clothing manufacturers.

Speakers showed that the manufacturers of woolen and worsted goods now need each year 600,000,000 pounds of wool, that the production in the United States has decreased from 325,000,000 pounds to 288,000,000 pounds in the past five years despite the fact that there has been a distinct reduction in the size of New Zealand and Australian flocks since 1910 and a decline is noticeable in the Argentine. The existing supply in the Argentine is said to be incapable of movement because of lack of ships; and rumor has it that the supply there is already being bought up by Germans and others for use after the war.

Considering the discouraging outlook for possible supply the conference adopted the following recom-

mendations and appointed a committee to prepare a plan for the formation of a development bureau which will be financed by the Wool and Textile Manufacturing Trades: (1) Immediate conservation of breeding flocks; (2) increase in the number of farm flocks; (3) survey of the location and the number and the price of breeding sheep for the establishment and improving of flocks; (4) enactment and enforcement of adequate dog laws; (5) encouragement and support of farmers' co-operative and club sales of wool and lambs; (6) encouragement of buying methods which will guarantee to the individual grower and producer the true market value of his products, and instruct him as to market requirements; (7) preparation and distribution of clearly written bulletins and similar matter on the production and marketing of wool and mutton; (8) local business interests in various counties to be stimulated to aid in the establishment of County Farm Bureaus; (9) encourage the formation of boys' and girls' lamb clubs; (10) encouragement of close relations between, and an appreciation of the mutual interdependence of, town and country; ((11) national publicity as to the wholesomeness and economy of mutton and lamb.

First Two Months' Calf Feed.

To the Editor: I have a calf that I want to sell for veal. Will it be necessary to feed him all whole milk, or would it do to mix some skim milk with the whole milk? How old should he be to sell for veal?—G. B. W., Oakland.

Unless he gets whole milk the first two weeks, he is likely to have digestive troubles. At two weeks old, begin to add skim milk and reduce the whole milk. Increase skim milk gradually till no whole milk is fed after 10 to 14 days. While changing to skim milk, keep clean hay, clean water, and salt available; and if you want to make a good veal, add a grain mixture to the skim milk. Prof. Woll of University Farm gives several good mixtures, one of which is ground barley, ground oats, fine wheat middlings two parts each and linseed meal one part. Make it into a mush then thin to a gruel with skim milk or water. One-third pound per day at first, gradually increased to one or two pounds, will do till the skim milk is discontinued. Three or four quarts of milk per day are required at first, always feeding it warm as it comes from the cow. At two months old it will have been gradually increased to 6 or 8 quarts. At this age a good well-fed calf should weigh 150 to 200 pounds.

Care and personal attention are necessary daily to see that digestion is not deranged. If signs of scouring appear, reduce or withhold the feed or, in bad cases, as suggested by Prof. Woll, stir a teaspoonful of dried blood into the milk at each meal or a teaspoonful of a 2 per cent solution of formaldehyde per pint of milk.

Many dairymen sell their veal calves at two or three weeks old;

and they bring the highest price per pound then without requiring any more milk or care. But if feed is available, it often pays to keep veal calves up to two months old.

Commercial calf feeds are pretty well standardized, and have directions with the feed.

A CHEAP HOG HOUSE.

[Written for Pacific Rural Press.]

While there is no one type of hog house that is best suited to all needs, the A-shaped building is probably better suited to a larger number of conditions than any other; particularly when considering cost of construction.

Various plans for the construction of these individual houses are used; but the one used by H. I. Marsh for his purebred Poland China sows in Stanislaus county is the cheapest constructed one the writer has ever seen.

These houses are five feet wide, six feet long, and should be six feet high, although Mr. Marsh built his but five feet high. They are made of rough one-by-twelve Oregon pine, having a board floor of the same material which is laid on two runners, made of 3x4's.

The top of the building is fastened to the floor with two hinges on one side of the floor, making it possible to swing the entire upper part of the structure off the floor so that cleaning out the building may be accomplished with ease.

Not counting the cost of labor, which is performed on rainy days or at other odd times, these houses represent an outlay of only \$2.90 each, a figure which is so low that any farmer can own one.

THE DAIRY.

Three creameries of Tulare paid out a total of approximately \$110,000 for cream delivered during the month of November.

F. W. Andreason, Secretary of the State Dairy Bureau, advises us that the preliminary report of the value of casein produced during 1916 in the State should have read \$186,431 instead of \$503,365.

Checking 600 acres of land to be seeded to alfalfa, on the old Gray brothers ranch, between Oakdale and Knights' Ferry, has begun. The ranch was recently purchased by the Stanislaus Dairy Farms Co., in which San Francisco men are largely interested.

A new record for butter production has been established by a cow belonging to M. J. Smiley of Belle Fourche (S. D.), it is claimed. The official test made by Professor Larson, of the S. D. State College shows a production of 47.77 pounds of butter in seven days.

The highest average production in the Yolo-Solano Cow Testing Ass'n for the past month for herds of over 20 cows was 1.10 pounds fat made by the O. P. Gillman herd of Dixon. The highest average for herds of less than 20 cows was 1.32 pounds fat made by the F. Beebe herd.

A movement for the formation of a milk inspection district in Stanislaus county has been undertaken to enable residents of unincorporated towns, as well as incorporated towns, to enjoy the benefits of the new State law requiring all milk, retailed to customers, to be pasteurized or obtained from tuberculin-tested cows.

A letter from Mr. Frank Morris informs us that the cow Aaggie Acme of Riverside 2nd has finished her 30-day record with 141.42 pounds butter from 2680.3 pounds milk. He also says that the senior two-year-old K. P. Melanie Beryl, a daughter of the King of the Pontiacs, has completed a seven-day record of 22.50 pounds butter.

We are advised by Malcolm H. Gardner, Supt. of A. R. work of the Holstein-Friesian Ass'n, that the cow Changeling Tidy Abbecker Wayne has just made a seven-day record of 588.3 lbs. milk, 32.49 lbs. fat at six and a half years old. She is the fifteenth cow to obtain place in the list of cows with productions of fat exceeding 32 lbs. fat in a week.

Mrs. M. A. Haupt and F. A. Heroux, of the Buena Alta ranch, north of Modesto, returned from the Pacific International Livestock Show, held in Portland the first week in December, where they purchased 12 of the prize-winning Holsteins. The addition of this stock to their herd will make the Buena Alta ranch Holstein herd one of the finest in Stanislaus county.

A subscriber from Humboldt county advises us that because of the fall rains being late and followed by cold weather, green feed has been very scarce in that county all fall and early winter. He says a very large proportion of the dairymen have shipped alfalfa hay from San Francisco at a cost of about \$20 a ton laid down at Humboldt county railroad stations.

The Ripon Cream Pooling Association, composed of 83 dairymen in the South San Joaquin Irrigation District, between Stockton and Modesto, has secured for their product an attractive price for the next 12 months, the accepted bid being based on the daily quotations on the San Francisco Dairy Exchange, which is substantially above the San Francisco market figure.

BEEF CATTLE.

Reports from Santa Fe, New Mexico, say that there are now in New Mexico 1,100,000 cattle. Shipments

out of the State so far this year have been 270,000, according to a report of the Sanitary Board just issued. The same reports put the value of the cattle at \$22.50 to \$45.00 per head.

Wm. Carruthers advises us that he has a shipment of Shorthorn and Hereford cattle en route to Carruthers Farms at Mayfield from the Middle West. While at the International Livestock Show at Chicago he purchased a heifer which he considers a very good show prospect for the next year. The Herefords he is bringing out are for Miller and Lux.

The Kern County Cattle and Land Company shipped last week to Wilson and Company, packers of Los Angeles, two yearling past Hereford steers weighing 1860 and 1830 lbs. of their own feeding. They were the finest beeves seen on this market for many a day. They were fed mostly corn and cut alfalfa hay. Both were raised and fed in the same pen. One of them won the grand sweepstakes prize at the Panama-Pacific International Exposition last year. It is said that Wilson and Co. paid 40c per pound for them. They were slaughtered for the Christmas trade.

SWINE AND SWINEMEN.

A carload of Visalia hogs brought \$8.85 per hundred pounds f. o. b. Dec. 15.

Shipments recently from Woodland to the Isthmus of Panama of six purebred, pedigreed Poland-China hogs, by W. H. Browning, to a syndicate which proposes raising purebred stock on the isthmus, puts Yolo county on the map as a place where purebred stock may be had.

Members of the executive body of the California Swine Breeders' Association will hold the annual meeting of the organization at the University Farm in May. The organization will support the movement for better facilities at the State Fair grounds, particularly for the exhibitor of hogs.

It is said that fully 500 stockmen and hog breeders will attend the annual meeting of the California Swine Breeders' Association that will be held in Los Angeles January 18 and 19. The railroads have provided for a fare of one and one-third for the round trip. A special effort is being made to bring the hog producers and packers together for the purpose of creating a better and mutual understanding.

Several months ago R. H. Whitten of Los Angeles, owner of the Whitten Ranch at Terra Bella, purchased the boar Mouw's Long Smooth Jumbo from Peter Mouw of Orange City, Iowa. Mr. Mouw is the originator of the Big Type Poland-Chinas. He has nine herd boars, the best of which is his \$2,600 Smooth Jumbo. Mr. Whitten's new boar is sired by Smooth unbo and out of Mollie King 2nd, an 875 lb. sow of Long King and Chief Price breeding. Mr. Whitten has bred 32 of his best brood sows to Long Smooth Jumbo for spring farrow, and naturally expects a fine lot of pigs.

SHEEP.

The Lake county wool market opened this week and up to the present time about 50,000 fleeces have been contracted for by the buyers. The prevailing price here is 30 cents.

Douglas Walker, one of Potter Valley's prominent and prosperous ranchers, brought down a band of sheep lately for shipment to a stock-buyer of Woodland. There were 550 sheep in the band.

Henry R. Timm has sold his 80 acres of alfalfa land in the Mayes tract, near Dixon, to Milton S. Eisher of San Francisco, the man who is associated with Messrs. Bissell and Grady in the sheep business. The

DUROC JERSEYS—My hogs won highest honors at State Fair, taking first prize herd, first prize sow, second prize boar. Were the largest of their age exhibited. Stock all ages for sale. Prices reasonable. Breeding and satisfaction guaranteed. Haden Smith, Route 1, Box 84D, Woodland.

REGISTERED DUROC-JERSEYS—Service boars from prize-winning stock are money-makers. They grow faster. New England California Corporation, Ripon, Cal.

DUROC JERSEYS—Herd boars. E. N.'s Colonel and Tulare Boy. Sweepstakes winner at Fresno, 1915. Choice breeding stock. J. P. Walker, Visalia.

REGISTERED DUROCS—Service boars and open gilts from High Model, Defender and Crimson Wonder stock. River Bend Farm, St. Helena, Cal.

RANCHO RUBIUS DUROCS—All sold except a few July and September gilts. Extra good. Write for prices. Elmer Lamb, Ceres, Cal.

REGISTERED DUROCS of guaranteed breeding. All ages. Weaned pigs, \$10. H. E. Boudier & Son, Napa.

HEAVY BONED DUROCS—A few service boars for sale. Ormondale Co., Route 1, Redwood City, Cal.

REGISTERED DUROCS—Crimson Wonder stock. Young stock, both sexes. L. D. Collins, Denver, Cal.

REGISTERED DUROC-JERSEY SWINE—Both sexes. Big-boned type. B. F. Kendall, Hanford.

WINTON DUROC-JERSEY FARM, Winton, Cal.—High-class pure-bred hogs both sexes, any age.

DOS HERMANOS REGISTERED DUROCS—Duroc and Berkshire. H. Uchak, Cal.

CURTIS DUROCS of either sex at all times. E. C. Curtis, Napa, Cal.

REGISTERED DUROC-JERSEY SWINE—Frederick M. Johnson, Napa, Cal.

REGISTERED DUROC-JERSEYS—S. S. Southworth, Napa.

Yorkshires.

LARGE YORKSHIRES—Choice spring boars, gilts, and weaned pigs from Champion sow P. P. I. E., or from breeding of champion boar and sow, Sacramento, 1916. If you see them grow you will like them. Haverina Farms, Paradise Road, Modesto, Cal.

LARGE YORKSHIRES—The ideal hog for the progressive farmer. Young stock for sale. A. L. Tubbs Co., Calistoga, Cal.

Chester Whites.

BILLIKEN HERD OF CHESTER WHITE Swine—Registered and Cholera Immune. 4 bred gilts due to farrow the latter part of January. 10 young boars of service size. 20 open gilts that will be bred to suit the buyer. Write for the booklet "Chester Whites" and find out what the breed is and what they are doing. This herd represents the very best blood lines the breed produces. C. B. Cunningham, Mills, Sacramento County, Cal.

EASY FEEDING—Quick grower type Chester White gilts and boars for sale. Address M. Lane Co., Oak Knoll Ranch, Napa, Cal.

REGISTERED IMPROVED CHESTER Whites—Grizzly Bear Ranch, East Auburn, Cal.

Essex.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd L. W. Millap, Yolo, Cal.

Hampshires.

BELLA VISTA HAMPSHIRE SWINE—From prize-winning stock. J. W. Henderson, First National Berkeley.

DAIRY CATTLE.

Holsteins.

REGISTERED HOLSTEINS—Herd sire King Korndyke Hengerveld Ormsby 7th, 86623. His full sister as Junior 3-year-old made 32.04 lbs. butter in 7 days. The record of his dam and his sire's dam averaged 30.98 George Koonias, Modesto, Cal.

25 HIGH-GRADE HOLSTEIN Heifers, sired All tuberculin tested. Also 35 yearling heifers sired by same bull. Terms and prices apply to W. H. Nichols, 2562 Haste St., Berkeley, Cal.

REGISTERED BULLS by King Korndyke Pontiac and out of A. E. O. cows. A splendid selection old enough for service. Write or call. J. H. Harlan, Woodland, Cal.

REGISTERED HOLSTEINS—Grandsons of King Segis and of world's record cow Creamelle Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

A NICE YOUNG SON from El Prado Wayne Colantha and from a 24.26 lb. dam. J. W. Benoit, Breeder of Registered Holsteins, Route C, Modesto, Cal.

TULARE GUERNSEY AND HOLSTEIN Farm is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Higdon, Tulare, Cal.

THE McLOUD RIVER LUMBER CO., McCloud, Cal.—High-class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

THE HENDERSON CO.—Breeders and importers. Registered Holsteins. Sacramento Bank Bldg. Sacramento.

BREEDERS OF REGISTERED HOLSTEIN cattle and Berkshire p.g.s. Whittier State School, Whittier, Cal.

REGISTERED HOLSTEINS—A. W. Morris & Sons, Corp., Importers and Breeders. Woodland, Cal.

BREEDERS OF REGISTERED HOLSTEIN Cattle—McAlister & Sons, Chino, Cal.

SUNNYSIDE HERD—Registered Holstein cattle. B. F. Guerin, R. 3, Box 58, Visalia, Cal.

FOR SALE—Registered Holstein Bulls. Prices right. E. B. Church, Sierraville, Cal.

REGISTERED HOLSTEIN BULLS, \$50 to \$150. Glorieta Stock Farm Woodland, Cal.

CHOICE HOLSTEIN bulls for sale. No females. Millbrae Dairy, Millbrae, Cal.

HOLSTEIN COWS for sale with records. Dr. Stetson, Napa, Cal.

REGISTERED HOLSTEIN CATTLE—E. E. Freeman, Route B, Modesto, Cal.

REGISTERED HOLSTEIN-FRIESIAN CATTLE—J. M. Campbell, Escalon, Cal.

REGISTERED HOLSTEIN BULLS for sale. Sunnybrook Ranch, Willits, Cal.

REGISTERED HOLSTEIN BULLS for sale. C. L. Morse, Route B, Modesto, Cal.

REGISTERED HOLSTEIN BULLS from A. R. O. dams. B. F. Anderson, Modesto, Cal.

A. R. O. HERD OF HOLSTEINS—Alex. Whaley, Tulare, Calif.

Jerseys.

JERSEY BULLS AND BULL CALVES—Sons and grandsons of 2 and 3 lbs. cows. None better. Cheap for quality. N. H. Locke, Lockeford, Cal.

VENADERA HERD OF JERSEYS is now offering the heifer calves from register of merit cows with official yearly record. Guy H. Miller, Route 1, Modesto, Cal.

REGISTERED JERSEYS—Herd established 1868. Young bulls from best cows. Rancho Dos Rios, R. 2, Modesto.

BREEDER OF REGISTERED JERSEY CATTLE—Duroc Swine. Young stock for sale. W. J. Hackett, Ceres, Cal.

JERSEY BULLS AND HEIFERS from Register of Merit Cows for sale. C. G. McFarland, R. 2, Tulare.

YOUNG REGISTERED JERSEY BULL Calves at reasonable prices. O. J. Ames, Oakdale.

JERSEY BULLS—Sons of Gentie's Lad and Gentie's Son's Victor. A. A. Jenkins, Tulare, Cal.

REGISTERED JERSEYS—Young bulls and bull calves. T. B. Purvine, Petaluma, Cal.

JERSEY BULLS from Register of Merit cows. C. D. Hayworth, Modesto, Cal.

Guernseys.

PACIFIC GUERNSEY HERD—Cattle selected from best imported and Advanced Register Stock. Now offering choice bulls. C. S. Rasmussen, Lodi, Cal.

EDGEWOOD FARM GUERNSEYS—First in the show ring and in official records. Few animals of either sex for sale. Edgewood Farm, Santee, Cal.

BELLA VISTA GUERNSEYS—Males from A. R. dams, \$100 up. J. W. Henderson, 1st National, Berkeley.

Other Breeds.

BREEDERS OF REGISTERED SHORT-HORN—Milk strain. Choice young stock for sale. John Lynch Ranch, Box 321, Petaluma, Cal.

INNISFAIR DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, Cal.

AYRSHIRES—Registered; all ages. E. B. McFarland, 412 Claus Spreckels Bldg., San Francisco.

BEEF CATTLE.

1500 HEAD HIGH GRADE HEREFORD cows. Some calves by their side. 300 head one yearling steers. 200 mixed weaned calves. Sixty head exceptionally well-bred grade Hereford bulls. Ten head of very choice registered Hereford bulls ready for service. G. R. Patton, Porterville.

SHORTHORNS—Herd headed by grandson Whitehall Sultan. Calves sired by \$10,000 Prince Imperial for sale. One or a carload for sale. Get our prices before buying. Butte City Ranch, Box P, Butte City, Glenn Co., Cal.

SCOTCH AND SCOTCH-TOPPED SHORT-HORN—We have the largest herd of straight Scotch cows in California. Foundation stock of both sexes for sale; also a choice lot of range bulls. Barco Ranch Hollister Cal.

SIXTEEN HEAD of very choice Shorthorn Heifers for sale. Roan and red in color. Aged from 18 to 22 months and bred to high-grade bull. Will take \$60 per head for cash deal. J. M. Maxwell, Dixon, Cal.

REGISTERED YEARLING SHORTHORN Bulls—Heavy-boned, thick-meated Scotch and Scotch-topped breeding. Ormondale Co., Route 1 Redwood City, Cal.

FAIR OAKS RANCH, Willits, Cal.—Young registered Shorthorn bulls for sale. Sired by Landseer 379318, grandson of Imported Villager 295884.

REGISTERED HEREFORDS—H. H. Gable, Diamond G Ranch, Esparto, Cal.

place was bought for \$25,000, and every acre of it is in alfalfa. It will be used as a lambing range, and several hundred ewes of the 8,000 head which the company owns have been turned on.

Fred Ellenwood of Red Bluff states that this is one of the most severe winters sheep men in that vicinity have experienced in 20 years in so far as feed conditions are concerned. He says that he is feeding three of four bands a ration of barley, beet pulp and cottonseed cake as a supplement to what little grass there is on the ranges. The condition was caused by the rains being late and followed by heavy frosts when they did come. Others, he says, are also being forced to feed concentrates to their large bands. In spite of this though, prices of ewes continue high, one band selling for more than \$12 a head last week.

TO DISCUSS HOG-MARKETING TROUBLES.

[Written for Pacific Rural Press.]

The various controversies which have been passed back and forth between hog raiser and packer are to be threshed out on open ground at the annual meeting of the California Swine Breeders' Ass'n in Los Angeles, January 18 and 19, if the plans of the program committee are carried out.

It is the first time in this State that the packers, as a collective body, have met and discussed the troubles of the industry with the growers as a collective body and for that reason the results should be far-reaching.

REGISTERED AND UNREGISTERED Shorthorn Bulls and Percheron Horses for sale. Paicines Ranch Co., 320 Sharon Bldg., San Francisco.

CROLEY'S CAFE FEED with skim milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

REGISTERED IMPORTED PERCHERON Stallion for sale cheap. Hewitt & Hewitt, Dixon, Cal.

MISCELLANEOUS

SAN FRANCISCO LIVESTOCK EXPORT Co. Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office, 319 Underwood Building 525 Market St. San Francisco.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co. Inc. 531-637 Brannan St. San Francisco.

STOCK RANCHES AND FREE RANGE—Different counties. Write for free booklet. Joseph Clark Sacramento.

D. O. LIVERY, 218 Hobart Building, San Francisco. Buys and sells livestock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES. Gilts bred to 900-lb. boar. Ed. E. Johnson, Turlock, Cal.

It is the hope of those in charge of the convention that this will be more than a breeders-versus-packers meeting. While breeders will of course be welcomed, market pork producers will be doubly so for it is their dealings with packers that are most in question, and without their views and experiences there is a chance of it being a packers' gathering. If all of the subscribers who have complained to us of markets during the past few months will take a few days off to attend this meeting there will surely be two sides of the question presented. Los Angeles is making elaborate preparations for entertainment and the meeting should mark a new epoch in livestock conventions for the State.

BRIDGFORD CO. IMPORTS HOLSTEINS.

The Bridgford Co. of Knightsen, Contra Costa county, advise us that they have just shipped from New York 30 head of registered Holstein females, among the lot being two heifers sired by King Segis Pontiac Alcartra, the \$50,000 bull; one out of a 31-lb. dam; one out of a 19-lb. two-year-old who has a 37-lb. dam. The first six dams of this heifer average over 31 lbs. butter in seven days.

There are also three granddaughters of the 44-lb. cow King Pontiac Cornucopia, these heifers being out of 30 lb., 29 lb., and 27 lb. dams and three daughters of Spring Farm Pontiac Segis, a 37-lb. son of King of the Pontiacs. They are out of 31-lb., 28-lb., and 27-lb. dams. Two heifers in the lot are by King Pontiac Konigen, a son of King of the Pontiacs and out of a 37-lb. cow.

Six granddaughters of King Walker and Paula of Chagrin Falls 3rd, who has a 30.82-lb. butter record and was a winner in the aged cow class at the last National Dairy Show, are in the shipment. All of these are out of good A. R. O. cows with records up to 30 lbs. in seven days. Besides these there is a heifer by a 33-lb. son of Pontiac Korndyke and several good record cows bred to the 44-lb. bull Spring Farm Pontiac Cornucopia.

14 COUNTIES COMPETE IN DAIRY COW COMPETITION.

[Written for Pacific Rural Press.]

Fourteen counties were represented in the California Dairy Cow Competition for the month of November, according to information just received from the University of California. This indicates that interest is general in the competition all over the State and while the number of entrants was not so large as had been hoped for it is significant that almost three times as many cows were entered for the full month's testing in December as completed the full month of November and about 300 entry blanks have been sent out altogether.

There were 23 cows entered last month that made over 40 pounds of fat, the registered Guernsey, Imp. Cherry of the Effords Hill, owned by Hollow-Hill Farm, Colton, having the highest record with 77.293 pounds of fat from 1577.4 pounds milk. The second highest record was made by the grade Jersey Edith, belonging to J. M. Bomberger of Modesto, by producing 72.560 pounds of fat from 1343.7 pounds milk. Of the 23 cows producing over 40 pounds of fat, 10 were grades. Jerseys were represented by larger numbers than either Ayrshires, Holsteins or Guernseys.

STATE RECORD FOR JR. 2-YEAR HOLSTEINS.

McAlister and Sons of Chino advise us that they have just broken the seven-day and 30-day State records for butter with their cow Queen Pontiac Butter Boy with records of 22.64 pounds and 86.07 pounds respectively. She is a daughter of Spring Farm King Pontiac and out of Queen Pontiac Butter Boy. They also state that their cow Orndyke Duchess Korndyke has recently completed a seven-day record with 26.35 pounds of butter.

NORWALK TIRES

The perfection of every detail

in the construction of Norwalks can be attributed to the painstaking care which every member of the Norwalk factory organization brings to his individual task—from the selection of the raw materials to turning out the finished product. Norwalks give master mileage. Ask for folder.

Milk Marketing Stabilized.

[Written for Pacific Rural Press.]

Milk producers who depend upon the large city milk distributors for their markets can profitably sustain a producers' organization. Such is the conclusion one must make after studying the work of the California Milk Producers' Association which operates in the southern counties of the State and which was established in June, 1915.

Like most producers' associations, this one was formed primarily with the intention of improving and stabilizing the Los Angeles milk market, on which they largely depended. It was in the same poor condition which is found everywhere that dairymen attempt to do individual rather than collective bargaining.

But the organizers realized that there are other factors, equally fundamental in scope, as the raising of prices a few cents a gallon. They understood that after establishing a uniformly fair price for their product they must formulate methods for increasing consumption. This meant, besides a better standard of quality and more uniform distribution, a careful study of the milk industry in all of its phases and a careful gathering of information in order that the consuming public might have a better knowledge of the value of dairy products and methods of their production.

Securing Members.—To accomplish these purposes, the first thing necessary was the securing of members with enough milk or cream to effectively influence the distributors' supply. Also it was necessary that funds be available. This latter factor was solved by each member subscribing \$5 per cow belonging to him; and in order to insure the co-operation of every member, it was deemed advisable to secure the consent and contract of each member that should he fail to market any of his products through the medium of the Association, he would not only forfeit this membership fee but pay to the association an amount equal to 10 per cent of the value of the product marketed outside. Ninety per cent of this subscription is held, however, as a reserve fund; and where a member sells his herd, the amount of his subscription is returned at the end of two years, pro-

vided he does not re-enter the dairy business. To overcome any possible unfairness of larger operators, each member has equal voting powers, regardless of the amount of stock he holds.

Better Conditions.—No attempt has been made to market direct from producer to consumer, the policy being to contract with the large distributors collectively. Secretary-Manager S. N. Ayers informs us that records for the first year's operations showed that there had been a material increase in the price received by members over previous years; and that the entire expense involved in the association's service was only two cents a hundred pounds of milk. This included over 50 per cent of the milk consumed by the city of Los Angeles. Monthly settlements are made by the association with every member, thereby insuring prompt payments.

That the practical working out of these plans has proved beneficial in a larger way, to both producer and distributor is evidenced by the co-operation extended to the Association by all of its distributors in installing a system of bacteriological work, to better comply with the new dairy laws that went into effect in October of last year.

Improving Quality.—As a further step in this direction, which is in its final analysis an attempt to improve quality, the laboratory work is followed up by field men who visit the dairies and assist the dairymen in producing milk in a more sanitary manner. This advice is welcomed by members because they realize it is the surest way to enlargement of market and improvement of price.

Breeding and Feeding have been considered of vital importance. During the past year about 1,000 tons of alfalfa hay a month was purchased for members at a saving of \$1.50 to \$3.00 a ton. Like savings were made on concentrated feeds. These were possible owing to the large orders which the Association was able to place, and a consequent saving in commission, freight, etc. Purchase of registered bulls is advocated in all cases by the Association, and collective purchases may be made in the future.

An Easily Cleaned Corral.

[Written for Pacific Rural Press.]

Muddy corrals are the rule at this time of the year and especially is this true on the level valley lands where dairying is an important industry.

Unless the soil is extremely sandy or there is a very abrupt slope where the cows can be corraled, mud is inevitable unless some permanent form of corral covering is provided.

As a general thing gravel is unsatisfactory on the average irrigated soil because of the tendency of the cows to tramp it down into the mud.

Owen Duffy, business manager of the Napa State Hospital, says that he used to put gravel on the corral every fall and haul it out every spring with the manure, but now he has overcome that trouble by applying a course of heavy crushed rock

followed by a course of lighter crushed rock. This is rolled with a heavy roller and followed with a course of still finer rock, which is also gone over with the roller. A little crude oil, heated with live steam to about 150 degrees, is added with the last course of rock, cementing the loose pebbles together and making a corral that withstands both water and tramping and one that can be cleaned off as well in the winter as in the summer.

GETTING HIGH PERCENT. AGES OF CALVES.

[Written for Pacific Rural Press.]

Use plenty of bulls with your range bands of cattle if you would get large percentages of calves, is

Breed for Butterfat

Beryl Clothilde Hengerveld, Champion in Butter-fat Contest, Sacramento, 5-day record, 21.11 pounds, test 4.7 per cent.

The quickest and surest way to make your Holstein herd more profitable in spite of high cost of feed is to introduce blood from high-testing ancestry.

My herd has a larger percentage of high-testing cows than any other herd in the State.

My young herd bull, **DUTCHLAND SIR PIETERTJE CREAMELLE**, has high-test breeding, and is transmitting this breeding to his sons and daughters. Your tested daughters have records averaging 21 pounds, all testing better than 4%. One of these, **Clothilde Pontiac Creamelle**, is California Champion 2-year-old, with a record of 22.52 pounds at 2 years 1 month; test 4.72%.

Have a few fine young bulls that will soon be ready for service.

the advice of C. H. Emart of eastern Stanislaus county, who operates on low rolling range land in the Oakdale district.

Last year Mr. Emart secured close to 90 per cent calves from his 125 cows by running five vigorous bulls with the band. On rougher land it would require a larger percentage of bulls.

Another interesting feature of Mr. Emart's operations last year was a comparison of stubble with dry

range grasses in carrying steers through the summer. About two hundred acres of this stubble was rented last summer and a portion of the steers turned on it while the balance were left on the hills. After three months, the ones that ran on the dry hill feed were seen to be in much better flesh than those running on the stubble, which led Mr. Emart to conclude that his dry hill pastures are better than stubble fields for carrying steers.

Raising Poultry for Profit

SELECTING MALES FOR BREEDING.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Last week we told you about selecting the layers for breeding purposes. Of course it takes time and observation to find out the value of hens by the trap-nest methods; but for the average person it is the safer way. When the Hogan system is understood and practiced, the trap nest can be dispensed with, but thousands of farmers and their wives will never take the trouble to learn how to Hoganize, although it takes but a few minutes to test a hen, after you understand it.

Now, in choosing males the trap-nest is no good; at least it appears that way because a male bird does not go in the nest to lay, so we have to judge the male bird by the record of the hen that laid the egg he was hatched from. Very few farmers or small breeders will take that much trouble, but the fancier who sells you a male bird that he says is from good utility stock has a record of all his hens' doings. He can tell you the mother and sire of every bird he breeds and offers for sale. If he does not know he is not a breeder, but just a dealer.

But suppose we want to pick out a male bird to head a pen of good, likely-looking hens and we have no record of any of his ancestors.

He must show signs of being healthy and vigorous. These signs are most prominent about the head, the eye is full, comb bright, wattles red, beak short and stout (a long-beaked fowl is never strong), the head must be held up, as if in defiance; legs wide apart, back broad across the saddle, deep breast and no matter what breed, the body must be long according to that breed.

Such a male will at least have vigor and health to his credit and it is safe to say that he is from stock that has been well worth perpetuating, or he would not have so many good points and, therefore, it will pay to use him. Unless you have a record of his ancestors, or are able to Hoganize him, that is as far as you can go in choosing a male bird.

How Many Do I Need?—This question is one of breeds, in a great measure. The heavy breeds can never serve as many hens as the small, active males can; but here is another point: they will last longer. I have known people to mate a Leghorn cockerel with 25 hens and get fertile eggs, too, but it did not last. It is impossible for the vigor of a

bird to last under such stress. If you only want eggs for a month or six weeks and you will go to the trouble of feeding a male about a quarter pound of fresh meat every night, you can breed him to 20 to 25 hens and get fairly good results, but unless he is something extra good and you are anxious to get as many chicks from him as possible it does not pay to bother.

For best results, it is always best to have two sets of male birds. Then while one lot are in service the others are recruiting and getting more vigor. They should be changed about once a month. If this is done the yards can be mated up at the rate of one male to fifteen hens in all small breeds; but if only one set of males is to be used, allow one male to every ten hens.

In the large breeds such as Orpingtons, Rocks, etc., one male to ten hens is the rule. But unless the yards are kept mated up a long time they do not need changing, provided you feed them a little on the side. Sometimes they get very poor because they are so very gallant they do not eat enough; but if you feed them on the side they will hold out a good long season.

Next week I will tell you about choosing the eggs to hatch from.

QUESTIONS ANSWERED.

Rheumatism.—Will you please give a remedy for rheumatism?—Mrs. T. C. A.

Get one ounce of iodide of potassium and put fifteen grains to one quart of water. The druggist will show you the right amount. This is for internal treatment. In addition keep the floor dry where the fowls roost and keep them fairly warm. If you notice swollen joints you can rub them with tincture of opium and weak alcohol.

Rye for Chicks.—Is rye good for young chickens as well as laying hens? If not, what grain would you suggest planting in the chicken enclosures? There are about twelve acres.—Mrs. E. F. M.

I almost commenced to figure how many chickens I could raise on that lot of land; but seriously now, rye is good for all kinds of chickens. But is it necessary to plant all that land at one time? That is the question, because by making several plantings you can have green feed all the time and some dry grain falling towards summer time for the chickens to eat and grow on. A good part of that acreage ought to be planted to winter wheat, then towards July it would be ripe enough to fall out for the growing chickens and hens to help themselves to; and my, how they would grow! Rye, too, will ripen and be just as good, but for continual green feed only a part of it should be planted at once, because in good growing weather it will get tough unless kept down.

To Sprout Oats.—I wish to enquire about the best method of sprouting oats for five or six hundred hens. After three days' sprouting I notice a white mold on top of the oats. Is this harmful to chickens? In cold weather they do not sprout well. Mrs. Swaysgood says one bushel of

dry oats make four bushels of feed. Does this mean in bulk or food quantities?

Answering the latter question first, it means bulk, when they are sprouted right. Your oats are being kept too wet and not warm enough. Soak them five or six hours in warm water, then cover with gunny sacks and not sprinkle for at

least two days, leaving the oats in a heap, not spread out until they have started to sprout. Sprinkle a little dry sulphur over the boxes or ground where you sprout, but don't overdo it. Too much sulphur will cause paralysis. Certainly the mold is harmful. Any kind of mold is harmful; but don't quit because of that. Learn to overcome it.

Loyal to the Service

They Uphold Each Other's Hands

The public *must* be served. This is the dominating thought of the entire Bell organization from the president down. Every employe feels the sense of responsibility that this working principle implies. The public must be served—efficiently, uninterruptedly.

In the fulfilment of this policy, the management of the Bell System realizes that every individual employe must give undivided and undistracted effort and interest to his work.

To assure this, every worker receives adequate remuneration, ample protection in case of illness and provision for old age. All these personal matters are cared for so that the employe has the least pos-

sible worry regarding his own welfare. His whole-hearted attention can be devoted to serving the public.

While each employe realizes that he is but a single factor, he understands that not only is supreme personal effort expected of him, but also a loyal support to every other telephone worker.

There is something in the telephone organization which imbues every employe with a spirit of loyalty to the public. All feel a direct responsibility for each other because each recognizes that only by mutual endeavor can they render the high standard of service which is expected of them. They uphold each other's hands so that the public may be served.

California Garden Flowers

TREES, SHRUBS, VINES.

By E. J. Wickson, A. M.

is just what you need as an aid in your every-day work in the yard. It is written by a Californian who knows, to meet your conditions. It tells the how, when and why, and is very practical in its suggestions.

The book is divided into six divisions and these parts are divided into twenty-six chapters, which cover California conditions, cultural suggestions, California garden year, ways with garden plants, shrubs, trees and vines, methods against pests and diseases.

The work contains 258 pages of closely packed information of absolute value to plant growers, besides numerous illustrations—handsomely bound in cloth. Price, \$1.50 postpaid.

Pointers to Amateurs
How to Read Poultry Diseases

GLOBE MILLS, LOS ANGELES, CAL.

Remedy for Lice.—Will you tell me of a remedy for a long white louse that seems to stay on my chickens? I use a good spray for the house and roosts, but it does not kill these lice.

No amount of spraying will kill the body louse, unless the fowls are confined over the fumes, as is sometimes done by painting the bottom of a box with a strong liquid lice killer, putting the hens in the box and covering them up for several hours. This method is not practiced as much now as formerly, because it has not been found to do as well as simply dusting the hens with commercial insect powder from a feed store. Dust your hens twice, ten days apart, and you will not be bothered with lice for quite a while. To dust a hen, put her on her back in your lap and commence at the tail, opening up the feathers as you go; sprinkle the dust and rub into the feathers, going down to the skin, under the wings and along to the breast and throat; now turn her over and dust around the tail feathers, all along the back, neck, and head; and as a sure job I always put the hen in a gunny sack for about ten minutes. This light imprisonment is to prevent her from shaking all the dust out of her feathers before it does the work.

Pullets Don't Lay.—I have white Plymouth Rocks, hatched in March, now seven months old and not laying yet. What is the cause? I feed gyp head corn in the morning and skim milk. They have range.—H. G. W.

Seven months is not unusual for white Rocks to go before commencing to lay; your ration is too scant to induce pullets to go into the egg business. Give them a good hearty feed at night as well as morning; and a little beef scrap or ground bone will help the milk out. This cold weather, hens that are not fed mash drink very little in comparison with what they should to induce them to lay eggs. Your pullets are all right, and as soon as you feed a little more generously they will respond.

DROOPY WINGED CHICKS.

While a few beginners, observing the long wings of their Leghorn chicks, congratulate themselves on rapid growth, a great many of the more observing beginners write to Helen Dow Whitaker of the State College of Washington, asking how to prevent them. In reply, Mrs. Whitaker states that droopy wings and loose feathering are more frequent among the Leghorns and other light-weight breeds than among the heavier birds which seem to use food first for frame and muscle and later for feathers. In general, drooping wings show lack of assimilation of sufficient nourishment in the food to keep up with rapid feathering. The following are conditions favoring them: Overheating, crowding, impure air; but especially lack of exercise and lack of green food in a rather rich ration, which finally results in indigestion. The chick is unable to assimilate the nutriment in his food and he suffers from lack of nourishment just as surely as though he were underfed.

To avoid droopy wings, avoid the conditions that induce them. Feed a ration containing oats, first rolled oats, breakfast food form but un-

NOW!
YOU SHOULD
PAINT YOUR
HOME

—This is far and away the best time of the year to paint—dust is all settled—flies out of the way—the first rains have cleaned off a summer's accumulation of dirt—heavy storms of winter but a few weeks away—paint NOW is the advice of all master painters, and keep the greatest good in preserving your home and keeping the rain out.—Best of all our famous Standard Paints are all ready mixed and can be put on without the help of an experienced painter.

Standard House and Floor Paint,
\$1.85 per gal.

—The quality of this paint cannot be equalled even at a much higher price—prepared after our own special formula and shipped to us by the carload direct from the factory. All wanted colors. Write for color card.

Standard Porch and Floor Paint,
\$2.25 gal.

—Will withstand a great deal of hard usage, wet and sun. All desirable colors.

Black Graphite Roof Paint 60c gal.
—Unequaled for an old roof, as it fills up the cracks and makes it like new. This price in five-gallon lots.

Shingle Stain 85c gal.

—The famous Standard brand, red, green, and grey at this price in five-gallon lots. Mixed with high grade colors. Will last and wear excellently.

OUR SPECIAL READY ROOFING \$1.00

—Anyone can lay this roofing without previous experience; all nails and cement included in each roll, which covers 100 square feet of roof surface, each roll containing 108 square feet, to allow for lap at joints.

Elastic Roof Paint 65c

—Finest thing out for use on an old "paper" or "ready" roof. Easily applied and will make an old leaky roof good for from three or five years longer. This price in five-gallon lots.

Asphalt \$3.75 bbl.

—Hard asphalt, preferred by many for repairing old roofs, must be heated to be applied.

Green Shingle Stain 60c gal. in 5 gal. lots
Dark Red and Brown Shingle Stain 50c gal. in 5 gallon lots

cooked, from the fourth week on sprouted oats; also feed cracked wheat and after the 14th day an equal bulk of finely cracked corn. For a mash, use to every 10 pounds of bran at least one pound each of dry granulated bone and high grade beef scrap. Best of all, give chicks all the clabbered milk they will drink, but do not let the milk become bitter before feeding. Keep the chicks hungry and keen for each meal, feeding little and often. Twice a day feed an abundance of tender, juicy green food. Send every chick to bed with a comfortably full crop. Under these conditions, if the chicks are not of weak stock, few will have droopy wings.

RICE FOR CHICKENS.

To the Editor: Would you inform me if rice would be a good substi-

Coulson Co. Petaluma Cal.

tute for wheat as chicken feed, seeing that wheat is so expensive?—P. A. K., Elmira.

Unless you are fattening the birds, rice should be fed considerably with protein foods, for it is not much of an egg-making feed. If laying hens get fat, they have ovary troubles, and anyhow they get too lazy to be good layers. Cracked rice is \$50 per ton.

The business of the Tulare Co-operative Poultry Association in 1916 will exceed \$75,000, it was announced by Manager I. N. Foss.

Mrs. Best's Letter.

My dear Friends: At this time of year, the thrifty housewife (if she has any funds left from Christmas) stocks up her own wardrobe and that of her family and looks after the needs of the house as well.

All the big stores have white sales in January that include bed linen—sheets, tablecloths, pillow cases and towels and also all white wear for women, nightgowns, petticoats, corset covers, etc. These articles are always below the regular price and are well worth investing in. This year the prices will be higher than usual owing to the advance in raw materials. These sales usually last the entire month and if you are unable to come yourself to make selections at the store, you will find them more than willing to send you anything you desire at a price you wish to pay.

The mail order business in the large stores is in charge of capable clerks who shop over the store for you as carefully as you could yourself.

In other lines of household articles you will find substantial reductions also. Lamps, clocks, china-ware, desks and nearly all odd pieces of furniture are much reduced. The plan seems to be to get the stock back to normal again.

Most of the stores ship free within a hundred miles while some send anywhere in the U. S. free of charge.

In wearing apparel, the prices are cut very pronouncedly. Garments that sold as high as \$50.00 will sometimes be offered at \$25.00. Coats are always very much reduced, as it is only a short time until spring garments arrive. If you use good judgment in selecting you can often pick up a garment at reduced prices that will be almost the same style as the models which are coming in at high prices.

Unless you expect to wear the garment out very speedily or can afford to discard it, do not select styles that are too extreme nor colors too pronounced, no matter how great the reduction in price. A more conservative garment that can be worn indefinitely is much cheaper even though higher in price to begin with.

Clearance sales in suits, blouses, hats and shoes are in evidence everywhere. The difficult matter is to decide what one really needs and what will be harmonious with the other garments you possess.

If we could all of us decide on the becoming color to us and confine ourselves to it in varying shades, there would be fewer conflicts in colors than we see now. Yours devotedly,
Rosabella Best.

SEA-TURKEY PIE.

Disc 4 potatoes and 4 carrots and stew until tender. Cream with 1½ cups of milk, 1 tablespoon butter, 1 teaspoon salt, ¼ teaspoon pepper, a dash of mace and 1 teaspoon flour. Make a biscuit dough of 3 cups flour, 2 tablespoons shortening, 2 teaspoons baking powder, 1 pint milk. Line a baking dish with part of the dough, fill with creamed vegetables and 1 can of tuna diced. Place cover on and bake 20 minutes. Serve hot, garnished with parsley and cranberries.

THE HOME CIRCLE

AN INTERESTING PARTY.

The holiday season always seems the time for a party. A novel one is arranged by inviting the guests to come as advertisements. Inexpensive costumes are quickly put together if one has the idea.

Domino sugar is prettily represented by a black dress decorated with white dots arranged in domino patterns and little cut-out masks pasted on the dress.

Dutch cleanser is easily gotten up with old full clothes made into a Dutch costume and by carrying a big club with which to "chase dirt."

The Gold Dust Twins of course will add gaiety to the party and if stockings and black gloves are used, the blacking can be used sparingly.

Heinz 57 varieties will become some one who wears green well. Pickles, etc., pasted on will trim the dress and a necklace suspending 57 will identify the costume.

The smiling Cream of Wheat man with his white suit and black face will remind one of the breakfast dish.

A coffee advertisement of M. J. B. Why? could be portrayed by a huge question mark and "Why" on the front and back of a Yama Yama costume.

Sperry Flour in the baker's costume, with the familiar cottage with the sun rising behind it cut from a paper, will furnish another costume.

Scotch Rye could be portrayed by a youth in kilts and rye stuck in the cap.

A dainty white dress with wired cheese cloth wings would make a little Fairy for Fairy Soap.

Arrows applied on any foundation would signify Spearmint chewing gum.

Roger Bros.' silver could be easily portrayed by a colonial costume and the regulation bonnet and package; 1847 pinned on or worn in some way would help identify this person.

The Firestone tires would be the easiest advertisement to represent by merely carrying a brick or stone.

Many other ideas will present themselves no doubt, and much pleasure and fun can be had trying to identify each other.

ENGLISH PLUM PUDDING.

Scald 2½ cups stale bread crumbs with 1 cup milk. Work ½ lb. beef suet until creamy; add ½ cup sugar, ½ cup maple syrup, 4 eggs well beaten, ½ lb. raisins stoned and cut in pieces, ½ lb. citron, cut in thin strips, and ½ lb. currants dredged with 3 tablespoons flour and 2 teaspoons baking powder; then add ½ cup of brandy. Turn into buttered mold and steam 24 hours. It may be steamed 12 hours one day and 12 hours the next. Reheat for serving 1½ hours.

STUFFED DATES.

Shell and remove meats from English walnuts, breaking them into quarters. Make a cut the length of the dates and remove the stones. Fill cavities with the nut meat and shape in original form. Roll in sugar and pile in rows on a small plate.

THE BAMBINO.

On the Capitoline Hill, in the old city of Rome, is the church which has the honor of being the home of the Bambino.

The word "Bambino" is the Italian for "baby" and this particular baby is a wooden image which was carved by a pious monk in the city of Jerusalem about the time that Columbus discovered America. The little figure was finally sent to Rome and became such an object of love and reverence that people have for hundreds of years been giving it presents of precious stones. On its head is a little crown ablaze with rubies, diamonds, and sapphires. It has a robe of royal purple, also resplendent with gems.

This little sacred image is usually carefully concealed, but on Christmas week it is brought out and put into the arms of the Virgin Mary in one of the chapels of this church of Aracoeli.

A wooden platform at that time is built before it, and the little children of Rome come up and speak their pieces, telling of what the good Christ-child has done for them through the year. The fathers and mothers are gathered around on the stone floor below and listen with quiet reverence.

To me this is a very beautiful ceremony. I think of the sacrifice it has cost many poor people to give these rare presents, and I have no doubt that they have been made better for such gifts of love. The children too, have done their share in repeating their lines, which are their own little attempts to show love and devotion.

During Christmas week a stately procession passes through the streets of old Rome, and in the midst is borne, on a raised platform, among white-robed priests, a beautiful figure of the Virgin Mother Mary sitting with this same Bambino in her arms.

The sidewalks are all lined with people bowing low, and many of them kneeling upon the stones.

It is all a beautiful and impressive sight, and, though we have not been brought up to worship in this way, we cannot help feeling that the true spirit of religion, wherever we see it, is really a beautiful thing that in one way or another should come into the lives of us all.—By Dr. William B. Harlow.

TRAVELING GIFT.

For the friend who is to make an extended trip, a hat bag of silk or linen makes an acceptable gift. Make the bag about 24 by 26 inches of some dark dust-shedding material preferably silk and run a draw-string at the top. A simple monogram makes the best ornamentation.

COOKING IRISH POTATOES.

To get the most food value out of boiled potatoes, they should be boiled with the skins on. When done, drain, hold on a fork and pare as rapidly as possible. Sprinkle with a little salt and serve. This preserves the valuable outer layer of the potatoes lost by deep paring.

Floral Department.

[By Geo. N. Tyler.]

[Note.—Last week Mr. Tyler's article upon soils was continued over to this week, but as the matter sent in later was so timely, we have transposed the articles. Next week we will print the balance of the articles on soils.]

Owing to the extremely cold weather we have been having the last two weeks, there is very little to do in the garden, except pruning of deciduous plants and shrubs.

Roses should be pruned by this time, and if you wish to plant or transplant any, do it now.

During Christmas week a great many flowering bulbous and other plants are given as presents. Remember that these have been forced in greenhouses, with excessive heat and moisture, and do not be surprised at their dropping their leaves and flowers. All bulbous plants require a great deal of water while in flower, and as soon as the flowers wilt, plant them out in rich garden soil and encourage them to make as much growth as possible.

Watering Plants.—There is no set rule for watering house plants. You have to watch and study your plants and find out the best way to treat them, and remember also that the winter season is the natural resting period of most plants, and while they are resting require very little water. There is a great deal of difference between allowing a plant to get wilting dry and one that has used up the moisture in the soil and is ready for more. Plants should never be kept at the same degree of moisture at the root all the time, except an aquatic. Any plant that does not dry out at the root in a reasonable length of time is not in good condition, as it has no feeding roots to take up the moisture. When they are in this condition, water sparingly, and let them go on the dry side till new feeders are formed. Most people, when a plant is in this condition, give more water and either sour the soil or rot all the roots, so that the plant will never recover.

Don't Make Sudden Changes.—You must use judgment in giving plants sun, etc. If you follow nature you will find that deciduous trees in their wild state shed their leaves, letting the plants, ferns, etc., growing under them have all the sun possible during the short winter days, and as soon as the days grow longer and the sun gets too strong, the trees leaf out, giving the necessary shade. Another thing, remember that plants do not like extremes. That is, they do not like to be shut up in the dark one day and put out in the wind and sun the next. Move your plants around as little as possible, for when they get used to one location, they dislike to be disturbed and it checks them to move them around from place to place. It does them no harm to turn them around once in awhile so they will grow evenly. A plant cannot stand a strong draft any more than you can yourself. A plant is like a human being—it wants a good drink when it is thirsty and no more until thirst again.

They also like a syringing of the foliage, but plants such as rex begonia dislike too much moisture.

TOMMY.

[From Grandpa, Christmas, 1915.]

Oh, Tommy's the boy for me, though;
 Yes, Tommy's the boy for me!
 He can run like a squirrel,
 And hop like a frog,
 Jump over a fence
 And walk on a log.
 May Santa Claus come
 With a fife and a drum,
 A monkey, a pocket-knife,
 Lots of pop-corn,
 A dancing black bear,
 And a big tooting horn!

Oh, Tommy's determined he won't
 be a fool,
 So he gets all his lessons at home
 and at school;
 He reads Mr. Crusoe and reads Robin
 Hood,
 And Mr. Swiss Robinson he thinks
 very good.
 Oh, Tommy rides a bicycle;
 And he can almost swim,
 And wouldn't I give a gold piece—
 A big gold piece for—him!

THE STORY OF THE WILLOW
PATTERN.

There are many versions of the story illustrated on the old-fashioned china known as old blue willowware. There are three variations of design, called the "one man," the "two men," and the "three men."

All share one scene, but the actors in the drama vary. The very humble home of a lover is shown at the upper left-hand corner, while below, to the right, is depicted the handsomer dwelling of his loved one, surrounded by walled-in gardens, the extent of which indicates great wealth. The willows are always there, as is the stream, with its bridge and boat.

The lover going over the bridge to see his lady is known as the "one man" pattern. The second output of the Caugley potteries was the "two men" pattern, which showed in reality two lovers on the bridge: they were eloping, so goes the story, with intent to hide, till nightfall, when they could leave by boat.

The "three - men - on-the - bridge" design is that in which the lovers are followed by the irate mandarin father, from whom, it is said, the lovers escape to the boat, are rowed across, live happily forever after, and are at their deaths turned into birds as a reward of faithfulness.

The story, as generally told, is thus related by Edith Roberts in the Family Friend:

"A certain mandarin, or Chinese nobleman, had a beautiful daughter named Li-chi, with whom a humble secretary called Chang fell deeply in love. In spite of the difference in their positions Chang wooed and won Li-chi, but, when he asked the mandarin's permission to marry his daughter, the great man flew into a terrible rage and absolutely refused ever to give his consent to such a union. The lovers, being exceedingly devoted to one another, felt that they could not live apart, so they arranged to run away together and get married. Now, the palace of the mandarin stood near the waterside, while Chang's home was upon an island not far distant. Thither the young man thought to take his beloved, so, assisted by the mandarin's head gardener, who was his friend, he laid plans for a boat to come one night to take Li-chi and himself across the water. But, alas! very soon after the mandarin learned whither the runaway lovers had fled and quickly followed them. So ter-

rible was his wrath that he was about to flog them to death when, by the merciful power of magic, they were turned into turtle doves, and so escaped his cruel rage. And as turtle doves we may think of them living happily ever after!

"Now, if we look at the 'willow pattern,' we shall see Li-chi, Chang, and the friendly gardener crossing the bridge on their way to the boat, which lies in the middle of the water. The upper left-hand corner of the plate is filled with the picture of Chang's island home, while the doves which are seen flying about near the top represent the lovers af-

ter they had been transformed. On the right-hand side of the plate stands the mandarin's palace, in front of which is a pagoda, or sacred tower. An orange-tree overhangs the pagoda, while peaches grow beside it, and a willow-tree stands near the bridge. The peaches are said to stand for marriage and also to mean long life, while orange blossom is always a favorite flower at weddings. The willow-tree, which has given its name to the pattern, no doubt stands for the sadness which overhung the lovers' courtship, owing to the mandarin's unkind behavior. We have all heard of the weeping willow.

"It will be noticed that the bridge is zigzag, and this is because the Chinese believe that evil spirits cannot turn corners, but must go in straight lines. They therefore build their bridges and walls in a zigzag fashion, that demons may not follow them. In Shanghai the bridge is built in this way and the pavilion believed to be thus placed beyond all evil influence. A high zigzag wall is built across the entrance, some distance from the door, of nearly all government buildings and many private residences, for the purpose of preventing the entrance of evil spirits."—Christian Advocate.

All the Lumber, Millwork, Hardware and paint for constructing this California House for \$325

Since the introduction of the READY-CUT method of construction we are able to offer you not only a large saving on the cost of materials but also a substantial saving of 25 to 33 1/3% on carpenter labor by providing All Materials CUT-TO-FIT.

No waste, no extras to buy because all the material you need is included in the price.

Mail the Coupon Today and we'll send you complete information showing many other kinds of California Ready-Cut Bungalows at savings of from \$100 to \$500 each.

Good Health.

[By H. E. Pastor, M. D.]

Sleeplessness.

Last week we sought in this column to convey to the readers of the Rural Press some general notion of the nature of that condition of physiological unconsciousness called "sleep." In this issue we will devote a little space to insomnia, or the absence of sleep when sleep should be the normal state of the body. Insomnia is a very commonplace and troublesome affection these days, when strenuousness is something more than a fashionable affectation; and while the forms of this trouble are as various as its causes, it is practicable here to consider only a few of them. The commoner cases of sleeplessness result from some temporary functional disturbance, while the persistent and more intractable cases are incidents of some brain disease, or other bodily disease having pain as a prominent symptom. These latter can be controlled, as a rule, by the use of hypnotic drugs only, and such medication should not be attempted except under medical guidance.

The neurasthenic who complains of not sleeping well, or at all; the pale, anaemic girl, who is restless at night and sleepy in the daytime, without being able to get satisfactory sleep at any time; the sufferer from malaria, gout, uraemia, etc.,

which poison the blood current, which in turn irritates the brain and so inhibits sleep—these are cases where the only chance of relief is to treat and cure the disease. Excessive smoking, tea, coffee, or cocoa-drinking overcharge the brain with toxic products which seriously disturb the tranquillity of the sleeper in his efforts to obtain rest. The obvious remedy is to quit using these drugs.

Where sleeplessness arises from worry, overwork, eating too much or eating too little, relief may be obtained by correcting the causative bad habit. Various mechanical means are resorted to alleviate the effects, with more or less success. The excess of blood can be diverted from the brain to other parts of the body by brisk rubbing with a coarse crash towel, especially along the spine. A hot footbath on retiring is good, so also is a glass of hot water or milk drunk slowly. Late, heavy suppers should be avoided, and no mental work that taxes the brain even slightly, should be undertaken. Argumentation, anger, and deep emotion of every kind should be shunned. Read some dull and monotonous literature—anything uninteresting will do. It tends to lull the brain to overpowering drowsiness.

Don't stint yourself of sleep, for too much deprivation of sleep destroys the capacity for sleep. If you have got to get up early, don't go to bed late; and if you have got to go to bed late, don't get up early—circumstances permitting. But whether circumstances permit or not, depend upon it the physiological effect is the same. A cold, well-ventilated room is better than an opiate to induce deep sleep, but you must have warm bed-covering. Don't sleep with the pillow too high or too low; in either case free respiration is interfered with, and oxygen is not freely supplied to the brain cells for reparative work.

Fresh air, with its abundance of oxygen, is a splendid sleep-persuader, and when combined with balmy sunshine, is the sovereign soporific. Of both these things, however, the rural dweller fortunately, has a great abundance, and is blessed accordingly. Still, farm life, like other phases of human existence, has its trials and tribulations. Worries over crops or the herds cannot be avoided betimes, and worry is a corroding canker to the sensitive brain matter, and fatal to sound sleep. The orange grower cannot sleep on a cold night fearful that Jack Frost will nip his oranges, the financially straitened rancher lies awake wondering why the Farm Loan Law limps along so slowly in the direction of his ranch with its hand-out of cheap money, and the poultry farmer wakes up about half-past two in the morning and worries the remaining hour or two of his rest period over the high cost of feed, and so it goes on through the whole gamut of rural occupations. Cases of this kind are beyond the reach of medicine or the physician's skill. But remember, worry won't mend matters.

Finally, don't use hypnotic drugs; they are dangerous and treacherous. When they have broken down

Perfection Oil Heater

Ready and glowing at the touch of a match—giving a cheery, odorless warmth. Burns PEARL OIL, the clean, cheap fuel. In blue or white enamel or plain black—harmonizing with the finest surroundings. Dealers everywhere.

Prices: \$3.75 to \$7.75

STANDARD OIL COMPANY

(California)

Uni-Lectric
GASOLINE-ELECTRIC UNIT
LIGHTING SYSTEM

Electricity for Farm Homes

At one-third cost of juice from Power Company (this includes interest on cost of plant). It is the simplest and most economical plant on the market.

No Batteries - No Switchboard - No Rheostat.

Will operate 50 lights 7½ hours for 11c. Will also operate electric fans, irons, small motors, etc. If your buildings are not wired, send us plans and we will give you full instructions so that you can wire them yourselves. Material furnished at lowest cost.

your health and mastered your will power—they then fail utterly in bringing the boon sought. They first woo sleep, then murder her.

How Colds Are Caught.

For the edification of whom it may concern, the California State Board of Health announces: "You can 'catch' cold only from a person who has a cold. Acute colds are not caused by overeating, or lack of fresh air and sleep. These are but predisposing factors. All acute colds are due to infection received from another person who is so infected." All of which makes one curious to know how the fellow with the first cold caught his.

Swat the Squirrel.

Claiming that the common ground squirrel of California harbors the flea, which transmit to man the inoculating virus of bubonic plague, the California State Board of Health is co-operating with those who are aligned against the squirrel on economic grounds to reduce the squirrel population of the State. The farmer will welcome this new ally.

California FRUITS

And How to Grow Them.

A Manual of Methods Which Have Yielded the Greatest Success; with Lists of Varieties Best Adapted to Different Sections of the States.

SAN FRANCISCO

San Francisco, Dec. 27, 1916.

WHEAT.

The Eastern decline due to peace talk continues, and has begun to affect the Coast markets, especially as more northern grain is coming in. Several grades have accordingly been marked down a little, and there are some indications of a further drop, as it is understood that several cargoes of wheat are coming here from Australia.

BEANS.

The market remains extremely quiet, as usual at this time of year, when the trade is occupied with inventory. It is expected, however, that buying will be resumed comparatively early in the new year, as there does not appear to be much surplus in dealers' hands; while the light supplies remaining in the country indicate a generally firm market. A few holders of pink beans have been more anxious to sell, causing a little easiness in this line; but red kidney beans are getting very scarce, and Mexican reds are higher. Limas also are very firm, with most of the crop out of growers' hands. While tepary beans have not been well received here, carload shipments have been going East from Porterville.

[Uncleaned, on wharf, San Francisco.]

HAY.

Arrivals have been a little larger than for some time, and it is believed that the car shortage will be less acute from now on. This has caused a little easier feeling locally in regard to prices, though so far there has been no drop in prices. The strongest demand at present is for the cheaper grades, which have been scarce here, and are wanted in large quantities in the principal feeding districts. Local arrivals consist mainly of the better grades, which move slowly, the consuming demand here having decreased somewhat. Stocks in local barns, however, have been pretty well depleted, and as conditions become easier there should be a general movement to replenish supplies.

[Prices per ton, carload lots, San Francisco.]

POTATOES, ONIONS, ETC.

Potatoes receive practically no attention just now, and it is uncertain whether the market will pick up next month, the present feeling being one of weakness, with large stocks in River warehouses, and limas potatoes available from Oregon. Onions are very firm. Storage stock is being picked over, and \$3.25 is the inside price; though arrivals from Oregon have relieved the shortage a little. Garden truck is rather scarce, with little appearing from the south in most lines. Lettuce is higher, and celery holds firm.

DECIDUOUS FRUITS.

Supplies in the fresh fruit market are now limited almost entirely to apples. Bellflowers are getting pretty well cleaned up, and with holders anxious to dispose of the remainder the price has eased off. Newtowns, however, are firmer, with warehouse stocks moving off well both locally and for shipment.

Apples:
 Christmas apples, box\$2.00@2.25
 Bellflower, box75@1.00
 Newtown1.00@1.15
 Pears, Winter Nellis2.25@2.75
 Persimmons, box, dbl layer.65@.90

DRIED FRUITS.

In view of the shortage in other lines, ordinary pears have been marked up a little, and are expected to clean up without difficulty. This week there is no trading of any consequence anywhere, as the attention of the trade is taken up with seasonal activities; and the general condition of the consuming markets may be a little uncertain for the next few weeks. It is believed, however, that no large surplus will be carried into the new year in any branch of the trade, and that there will be renewed inquiry early in the year. The country is more closely cleaned up than usual in practically every line, and from present indications there is likely to be quite a general shortage before the new crop appears. Peace talk tends to increase the firmness of the market, as an end

to the war would bring a strong European demand.
 [Net to growers, bulk basis, f. o. b. shipping point.]

HORSES.

If it were not for buyers from outside points, the local market would be a dull affair, as there is very little interest on the part of large users of horses. The present tendency is illustrated by a sale this week of a good lot of wagon and delivery horses from a local firm which is putting in motor power; and a great many such sales have been held in the last few months. Values as a rule are maintained within the range quoted, but sales are slow.
 Drafters, 1700 lbs. and up.250

GROCERIES.

Sugar continues on its downward course, being now quoted on a granulated basis of \$6.95. Codfish is very firm, with a light catch and active foreign demand; and canned salmon is bringing record prices. Coffee, pepper, etc., are very firm. Advances are noted on many brands of matches, candles and some lines of syrup.

LOS ANGELES.

Los Angeles, Dec. 28, 1916.

BUTTER.

Receipts of week ending Dec. 26, 1916—254,840.
 Receipts of week ending Dec. 26, 1915—179,940.

There was no especial interest in this market the past week. It being the week before Christmas and the receipts light, traders on 'change were disposed to go slow. A very good consumptive demand was had for extras at steady prices, but there was very little outside movement. Prices, however, showed no quotable change up to Saturday, though the tone of the market was firm. In sympathy with an advance of 1/2 c in San Francisco on Saturday an effort was made to spring prices a little, but it failed. On call one small lot of extras was sold at 36c, an advance of 1c, but the market finally closed at 35c for extras the same as the previous days of the week. We quote extra creamery36 1/2 c
 Prime first34 c

SPECIAL LIVESTOCK MARKET REPORT.

Los Angeles, Dec. 26.

CATTLE: The market situation here is unchanged from a week ago. Receipts only fair and what good to prime beef steers coming in meeting with a very good demand. California and Arizona furnished us most of the supply and are giving up some very good grass-fed steers. Killers all in the market and wanted supplies and the offerings were disposed of without trouble.
 Quotations f. o. b. Los Angeles:

Special Citrus Market Report.

Los Angeles, Dec. 26, 1916.

Shipments of citrus fruit from Southern California from November 1 to December 21: Oranges 2276 cars and lemons 686 cars. The same time last year, oranges 962 cars and lemons 687 cars.

Shipments from Central California from November 1 to December 20, oranges 3311 cars and lemons 93 cars. Same time last year, oranges 3630 cars and lemons 53 cars.

Shipments from Northern California from November 1 to December 20, oranges 778 cars and lemons none. Same time last year, oranges 483 cars and lemons none.

There was an easier tone to the Eastern markets the past week. More offerings and bad weather worked against the trade. Still there was a fair movement and the more popular brands brought fair prices. The movement to market so far has been much heavier than last season, the shipments to December 20 and 21 being 6365 cars against 4775 cars last season the same time. Lemon shipments 782 cars, against 740 cars same time last season. Locally the market has been very quiet since our last report, though

prices are quotably unchanged. With the opening of the new year, however, a better movement is expected. Local packers are bidding 1c per pound for oranges in the grove, 2@2 1/2 c per pound in the grove for grapefruit, and lemons 1@1 1/4 c per pound in the grove for good stock; poor had to be sold for what it would bring.

Weight of oranges, loose, per box, 50 to 55 pounds; grapefruit the same. Lemons, loose, box, 55 to 60 pounds.

EASTERN AUCTION MARKETS.

New York, Dec. 22.—Fifteen cars navels and two cars lemons sold. Navels easier especially on the large sizes, and lemons easier on 300s. Raining hard. California navels averaged \$1.80@3.15. Lemons averaged \$2.05@2.60.

Boston, Dec. 22.—Seven cars sold. Market easier on both oranges and lemons. California navels averaged \$2.05@2.40. Lemons averaged \$1.75@2.25.

Philadelphia, Dec. 22.—Three cars sold. Market doing better on oranges, lower on lemons. California navels averaged \$1.55@2.25. Lemons averaged \$2.50.

Prime cows and heifers 6.25@6.50
Good cows and heifers 6.00@6.25
HOGS: With the markets East holding up well under heavy receipts and the run the past week only moderate caused a firm tone to the market. But while killers were all in the market and wanted supplies, at the same time they refused to advance prices. California and Arizona furnished most of the supply and of late the arrivals have been light weights and lacked finish, showing the effects of the high-price feed.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs. 9.25@9.50
Mixed, 200@250 9.25@9.50
Light, 175@200 9.25@9.50
SHEEP: A firm and fairly active market was had the past week for all offerings. The receipts were only moderate and mostly made up of yearlings and lambs from Utah and Arizona with a few from Idaho. Not many heavy sheep coming in and they were especially firm. While the offerings were not large, what sheep and lambs coming in were in very good condition. Killers were all in the market and wanted supplies and those on sale found a ready demand, and more could have been disposed of if here.

Per head f. o. b. Los Angeles:
Prime wethers\$7.00@7.25
Prime ewes 6.50@6.75
Yearlings 6.50@7.00
Lambs 6.50@7.00
CALVES: Receipts continue light and under light offerings a firm market and fair demand was had the past week for all arrivals. Selling at \$8.50 @9.50 per cwt.

San Francisco, Dec. 27.

No change is reported except a quarter cent reduction on light hogs with which the market was flooded last week. No change in sheep because none are offered except from packers' and butchers' own feed lots. Movement from Utah reported last week has not continued and is not likely to become important. Not much movement of cattle.

WOOL sales in London closed 5 per cent higher but there is weakening in this country on account of peace talk. Contracting for spring wool in Southern California at prices up to 25 cents for choicer lots. No contracting in Northern California reported, but some Nevada farmers are signing up as high as 29 cents. Reports indicate that spring prices will be no higher.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

Publisher's Department.

This issue closes the year, which we trust has been a prosperous one to all our readers. With the Pacific Rural Press the year has been kind. In each department growth is shown—that is, our subscription list is larger and better paid than ever before, the paper has carried more advertising, in value, by nearly 50 per cent than in any previous year; and our agricultural books show advanced sales. All the above, we believe, reflect the prosperity of the State. Plans now nearly perfected will enable us to issue a better and more valuable journal next year than before; so that it is with keen anticipations ourselves, that we wish to all of our great family of readers a prosperous and happy New Year.

The fine rains of the past week have been of great value to the State. Grain growers who had their ground seeded are to be congratulated. Intending tree planters could hardly ask to have conditions more favorable—but a word of advice may be given—buy your nursery trees at once.

"The Pruning Manual," by L. H. Bailey, has just been revised and reprinted and appears in its 18th edition. This book is the latest to cover the subject of pruning, which work, the author says, is much more than the cutting off of limbs and the shaping of plants. Macmillan Company of 66 Fifth Avenue, New York, are the publishers, and the price, cloth bound, postpaid, is \$2 per copy.

Permission has been granted the old-established firm of the Los Angeles Saddlery and Finding Company to change its name to Lichtenberg-Ferguson Company. This firm has two stores in Los Angeles and one in San Francisco. Besides saddlery merchandise, automobile accessories are being handled, and this latter adjunct is getting to be the big end of the business.

Classified Advertisements

MISCELLANEOUS.
